

**MICROBIOLOGY**

# **INTRODUCTION TO MEDICAL MIKROBIOLOGY,**

**BASIC DISCIPLINES. ROLE IN HEALTH CARE  
SYSTEM. CHARACTERISTICS OF MICROORGANISM  
- BACTERIA, VIRUSES, FUNGI AND PARASITES**

*Libuše Kolářová*

**Institute for Immunology and Microbiology  
1st Faculty of Medicine, Charles University**

# PRACTICAL BLOCKS GENERAL MEDICINE summer semester 2020 groups time schedule

**Start: 8 a.m.**

GEN MED MICROBIOLOGY I - 2020			
		ALEK	8.30
Week	Date	Work group	Teacher
1	24.02.2020	2051	Petříčková
3	09.03.2020	2051+52	Pavlík
4	16.03.2020	2053	Bobek
5	23.03.2020	2053	Pavlík
6	30.03.2020	2054	Bobek
12	11.05.2020	2055	Petříčková
13	18.05.2020	2056	Petříček
14	25.05.2020	2056 + XXXX	Petříčková

# PRACTICAL BLOCKS

**Rescheduling** due to illness is possible only  
**as agreed with dr. Jan Bobek**  
**(jan.bobek@lf1.cuni.cz)**

## EXAMS, PREREQUISITES, ETC.

**Mgr. Kateřina Petříčková, Ph.D.**  
**(katerina.petrickova@lf1.cuni.cz)**

**MUDr. Emil Pavlík, CSc.**  
**(pavlik.emil@seznam.cz)**

# RULES

**attending practical lesions**

**+**

**passing the test**  
(end of the semester)

**or**

**registered presence**  
**on 10 lectures at least**  
(no test)

**CREDITS**

# HISTORY

c. 4 BC

## Fundamental medical procedures

till 15th century

lack of information on causes of infectious diseases (e.g., in cholera, black death it was assumed to be caused by miasma = a noxious form of „bad air“)

**Hippocrates** (born 460 BC, Kos, Greece)  
Father of Medicine - founder of the Hippocratic School of Medicine

Source: [https://en.wikipedia.org/wiki/Miasma\\_theory](https://en.wikipedia.org/wiki/Miasma_theory)

A representation by Robert Seymour of the cholera epidemic of the 19th century depicts the spread of the disease in the form of poisonous air.

# HISTORY

4. st. BC

## Fundamental medical procedures

till 15th century

lack of information on causes of infectious diseases (e.g., in cholera, black death it was assumed to be caused by miasma = a noxious form of „bad air“)

1553

G. Fracastoro: a hypothesis on epidemic diseases are caused by small particles or „spores“ which spread by

- direct contact
- indirect contact
- without direct contact for long distances

Girolamo Fracastoro  
1478-1553

# Robert HOOKE

(1632-1723)

Probably, the first observer of microorganisms.

Hooke's microscope, from an engraving in *Micrographia*.

Source: [https://en.wikipedia.org/wiki/Robert\\_Hooke](https://en.wikipedia.org/wiki/Robert_Hooke)

Memorial portrait of Robert Hooke at Alum Bay, Isle of Wight, his birthplace, by Rita Greer (2012).

Source: [https://en.wikipedia.org/wiki/Robert\\_Hooke#/media/File:Memorial\\_portrait\\_of\\_Robert\\_Hooke\\_at\\_Alum\\_Bay,\\_IoW\\_for\\_Carisbrooke\\_Museum.JPG](https://en.wikipedia.org/wiki/Robert_Hooke#/media/File:Memorial_portrait_of_Robert_Hooke_at_Alum_Bay,_IoW_for_Carisbrooke_Museum.JPG)

# Antonie van LEEUWENHOEK

(1635-1703)

Often considered to be the first acknowledged microscopist and microbiologists. He is best known for his pioneering work in the field of microscopy.

A replica of a microscope by van Leeuwenhoek.

Sources:

[https://en.wikipedia.org/wiki/Antonie\\_van\\_Leeuwenhoek#/media/File:Leeuwenhoek\\_Microscope.png](https://en.wikipedia.org/wiki/Antonie_van_Leeuwenhoek#/media/File:Leeuwenhoek_Microscope.png)

# BACTERIOLOGY

## Ferdinand Julius COHN

(1828 -1898)

- the first who classify algae as plants, and defined what distinguishes them from green plants
- established classification of bacteria into four groups based on shape (sphericals, short rods, threads, and spirals) – still in use today
- described the life-cycle of *Bacillus* spp.

Source:

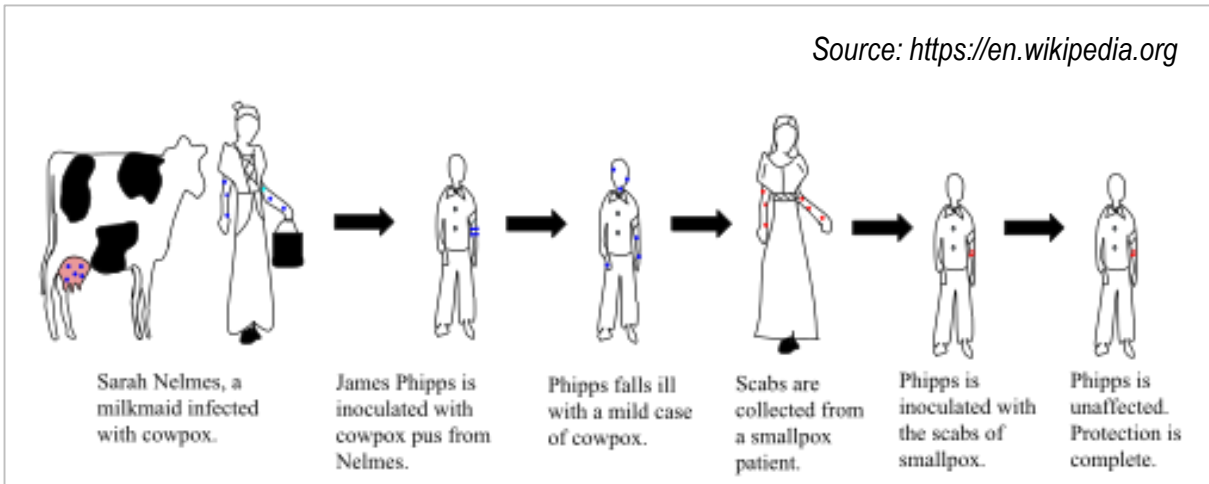

[https://en.wikipedia.org/wiki/Ferdinand\\_Cohn#](https://en.wikipedia.org/wiki/Ferdinand_Cohn#)

# Edward JENNER

(1749 -1823)

Source: <http://wellcomeimages.org/indexplus/object/63/06/f922c4b86c952df78a555cd9eba8.jpg>

The steps taken by Edward Jenner to create vaccination, the first vaccine for smallpox. Jenner did this by inoculating James Phipps with cowpox, a virus similar to smallpox, to create immunity, unlike variolation, which used smallpox to create an immunity to itself.

The terms "**vaccine**" and "**vaccination**" are derived from *Variolae vaccinae* (small-pox of the cow), the term devised by Jenner to denote cowpox. He used it in 1796 in the long title of his *Inquiry into the Variolae vaccinae known as the Cow Pox*, in which he described the protective effect of cowpox against smallpox.

# Ignác Fülöp SEMMELWEIS

Ignaz Philipp Semmelweis  
(1818-1865)

Source: <https://en.wikipedia.org/wiki/>

An early pioneer of **antiseptic procedures**.

- discovered that the incidence of puerperal fever (also known as "childbed fever") could be drastically cut by the use of **hand disinfection** in obstetrical clinics.

**Puerperal fever yearly mortality rates for the First and Second Clinic at the Vienna General Hospital 1841-1846. The First Clinic evidently has the larger mortality rate.**

**Puerperal fever** monthly mortality rates for the First Clinic at Vienna Maternity Institution 1841–1849. Rates drop markedly when Semmelweis implemented chlorine **hand washing** mid-May 1847.

# Louis PASTEUR

(1822-1895)

He is regarded as one of the three main founders of bacteriology together with F. Cohn and R. Koch.

Remembered for his remarkable discoveries of the principles of vaccination, microbial fermentation and pasteurization, i.e. for breakthroughs in the causes and prevention of diseases.

L. Pasteur

Source: [https://cs.wikipedia.org/wiki/Louis\\_Pasteur](https://cs.wikipedia.org/wiki/Louis_Pasteur)

- Provided direct support for the **germ theory of diseases** and its application in clinical medicine.

principles of vaccination

remarkable breakthroughs in the causes and prevention of diseases

reduced mortality from puerperal fever

created of the first vaccines for rabies and anthrax

- discovered pasteurization (warming of milk - to stop the bacterial contamination)  
prevention for TBC, salmonellosis, brucellosis, diphtheria, etc.
- discovered microbial fermentation

# GERM THEORY OF DISEASE

bacteria, protists, fungi, viruses, prions, viroids

**Many diseases are caused by microorganisms** (too small to see without magnification) which invade:

humans  
animals  
other living hosts

that cause disease = **pathogens**

**infectious disease**

Although pathogens are the principal cause of diseases, environmental and hereditary factors often influence the severity of the disease, and whether a potential host individual becomes infected when exposed to the pathogen.

# Joseph LISTER

(1827-1912)

Pioneer of **antiseptic surgery**.

Championed the use of carbolic acid as an antiseptic, so that it became the first widely used antiseptic in surgery, i.e. he successfully introduced carbolic acid (now known as phenol) to sterilize surgical instruments and to clean wounds.

Lister spraying phenol over patient.

# Heinrich Hermann Robert KOCH

(1843-1910)

**1892: Identification and cultivation of the causative agents tuberculosis (TB)**

***Mycobacterium tuberculosis***

*Mycobacterium tuberculosis*

Source: wikimvisua.com

*R. Koch.*

*M. tuberculosis* in the tissue

# Heinrich Hermann Robert KOCH

(1843-1910)

1876:

Identification of *Bacillus anthracis* -  
causative agent of anthrax

*R. Koch.*

50

Source: Wikipedia

<http://textbookofbacteriology.net/Anthrax.html>

# Heinrich Hermann Robert KOCH

(1843-1910)

- began to utilize **agar** to grow and isolate pure bacterial cultures
- implemented the staining of bacteria by aniline
- performed the first photos of bacteria
  
- his research led to the **creation of Koch's postulates** (series of four generalized principles linking specific microorganisms to specific diseases)

Zdroj: Wikipedia

# Koch's postulates

Identical  
microorganisms

# Alexander FLEMING

(1881-1955)

Scottish physician, microbiologists and pharmacologists  
Saint Mary's, London; coworker: A. Wright

1922: bactericide enzyme - lysozyme

**1928** **Discovery of benzyl peniciline (Peniciline G) –  
from the mould of *Penicillium chrysogenum*  
(syn. *P. notatum*)**

Source: www.herbarium.usu.edu

## Howard Walter FLOREY

(1889-1968)

## Ernst Boris CHAIN

(1906-1979)

**1940:** isolation and concentration  
of the **germ-killing agent in  
penicillin.**

**Since 1941:** PNC application in  
treatment

In the CR: after 2nd World War

# ERNEST DUCHESNE

(30.5.1874 – 12.4.1912)

LYON  
ALEXANDRE REY, IMPRIMEUR DE LA FACULTÉ DE MÉDECINE  
4, RUE GENTIL, 4  
—  
Décembre 1897

In 1897, 32 years before A. Fleming, discovered the antibiotic properties of penicilin, but his research went unnoticed.

# VIROLOGY

1915, Frederick W. TWORT

1917, Félix d'HÉRELLE

Discovery of viruses that infect of bacteria  
= **bacteriophages**

---

→ **1930:** cultivation of viruses – experimental animals

**1931:** cultivation on chicken embryos

**1949: J.F.ENDERS, T.H.WELLER, F.Ch.ROBBINS:**  
discovery that poliomyelitis virus is capable of growing  
in **cultures of different tissues**

# PARASITOLOGY

## Karl Georg Friedrich Rudolf LEUCKART

(1822-1898)

# Theodor Maximilian BILHARZ

(1825 – 1862)

Identified the agent of urogenital schistosomiasis.

# Patrick MANSON

(1844-1922)

Under studies on filariases suggested that malaria is transmitted by mosquitoes.

Manson in the Albert Dock Seamen's Hospital 1901

Source: Wikipedia

# William Boog LEISHMAN

(1865-1925)

With Ch. Donovan identified causative agent of kala-azar (Leishman-Donovan bodies – protists *Leishmania* spp.).

Source: Wikipedia

Source: Biblioteca Virtual Carlos Chagas

# Carlos Justiniano Ribeiro CHAGAS

(1879-1934)

Working in primitive conditions, described in detail a previously unknown infectious disease (Chagas disease = American trypanosomiasis) – identified its pathogen, vector (bugs, Triatominae), clinical manifestations and epidemiology.

Source: Wikipedia

# CZECH REPUBLIC

## August Josef CORDA

(1809-1849)

- under the microscope, observed algae, ciliates under and fungi

## Vilém Dušan LAMBL

(1824-1895)

- identified *Giardia lamblia*

## Jaroslav HLAVA

(1855-1924)

Founder of Czech bacteriology

## Ivan HONL

(1866 – 1936)

Besides other things, one of the early researchers on antibiotics and serological examinations.

*Giardia lamblia*

# **INFECTIOUS DISEASES AND PATHOGENS**

# PATHOGEN

Germ that that can produce a **DISEASE**

**PATHOGENICITY** the ability of an organism to cause disease and harm the host

- ability represents a **genetic** component of the pathogen
  - **pathogenic species**
  - **non-pathogenic species**
  
- the overt damage done to the host is a property of the **host-pathogen interactions**
  
- lack of ability to cause disease in primarily healthy individual is typical for
  - **commensals**
  - **opportunistic pathogens**

# **PATHOGENICITY AND VIRULENCE OF MICROORGANISMS**

# PATHOGEN

Germ that that can produce a **DISEASE**

**PATHOGENICITY** the ability of an organism to cause disease and harm the host

determined by  
**VIRULENCE FACTORS**  
i.e., pathogen abilities to infect or damage a host

Molecules produced by particular agent that add to their effectiveness and enable them to achieve the following:

- to settle („colonization“) at the host niche (this includes attachment to cells)
- immunoevasion, evasion of the host's immune response
- immunosuppression, inhibition of the host's immune response
- entry into and exit out of cells (if the pathogen is an intracellular one)
- obtain nutrition from the host

# INNATE PATHOGENICITY

Includes mode of transmission which is necessary for natural spreading of a disease in a population

- **obligate (primary)** pathogen: induce a disease in a healthy individual
- **facultative (opportunistic)** pathogen: induce a disease under particular (i.e., defined) conditions only

# OBLIGATE PATHOGENS

- **Causal agent of „classical“ infections:** *Corynebacterium diphtheriae* (diphtheria); *Salmonella Typhi* (typhoid fever); *Neisseria gonorrhoeae* (gonorrhoea)...
- **Differences between various species/strains** (*Yersinia pestis* is more pathogenic than *Streptococcus pyogenes*)
- **Host specificity – specialization on**
  - **one** host species only (e.g., *Shigella* spp., gonococci – humans only)
  - **various** host species (staphylococci, Lyssavirus virus – humans as well as other vertebrates)

# FACULTATIVE PATHOGENS

## INDUCTION OF INFECTION IS BASED ON PARTICULAR CONDITIONS

- **change of natural occurrence** (*Escherichia coli*: intestine x urogenital tract, blood system...)
- **immunosuppression**  
(diabetes, corticosteroids, antibiotics, tumours, presence of strange units)

# COLONIZATION

The presence of pathogenic bacteria on a body surface (like on the skin, mouth, intestines or airway) **without causing clinical evidence** of infection in the person.

Example: *S. aureus* on the skin

# PATHOGENS

INFECTIOUS AGENTS THAT CAUSE DISEASE

- viroids
  - prions
  - viruses
- } subviral particles

- 
- bacteria
  - yeast cells
  - protists
- } **PROKARYOTE** - lack of membrane-bound nucleus, mitochondria
- } **EUKARYOTE** - nucleus and other organelles enclosed within membranes

} **UNICELLULAR ORGANISMS**

- 
- helminths
  - arthropods

} **MULTICELLULAR ORGANISMS**

# THE RANGE OF SIZES SHOWN BY PROKARYOTES, RELATIVE TO THOSE OF OTHER ORGANISMS AND BIOMOLECULES

# DIFFERENCES BETWEEN MICROORGANISMS

## I. NUTRITION

- autotroph
- heterotroph

## II. OXYGEN REQUIREMENTS

- aerobes
- facultative aerobes
- microaerophiles
- aerotolerant
- obligate anaerobes

## III. METABOLISM

- fermentation
- aerobic respiration
- anaerobic respiration

## IV. TEMPERATURE REQUIREMENTS

- psychrophiles
- mesophiles
- thermophiles

= factors influencing the settlement in a particular host organism

# NUTRITION

- **autotrophs** („self-feeding“ organisms) produce organic compounds from simple anorganic substances present in its surrounding; they do not need a living source of energy or organic carbon (e.g., algae, come bacteria
- **heterotrophs** – unable to produce organic compounds from anorganic; their nutrition depends on the existence of autotroph organisms

Source: <https://en.wikipedia.org/wiki/Matthewiparker>

Source: [https://en.wikipedia.org/wiki/Norman\\_Kuring](https://en.wikipedia.org/wiki/Norman_Kuring) – NASA Earth Observatory

Cyanobacterial bloom near Fiji.

# GROUPS OF ORGANISMS AND THEIR METABOLISMS

GROUP OF ORGANISMS	OXYGEN REQUIREMENTS	METABOLISM
<b>obligate aerobes</b>	survive and grow only in an oxygenated environment	aerobic respiration
<b>facultative aerobes</b>	can tolerate different concentration of oxygen, but in the presence of oxygen grow better	aerobic and anaerobic respiration, fermentation
<b>microaerophiles</b>	require oxygen for energy production, but in lower than atmospheric concentration	aerobic respiration
<b>facultative anaerobes</b>	do not use oxygen, but are not harmed by it	fermentation
<b>obligate anaerobes</b>	do not use oxygen which can kill them	fermentation or anaerobic respiration

# TEMPERATURE

## Psychrophiles

- survive under temperatures of **below 20 °C**

## Mesophiles

- survive under temperatures of **20° - 45° C**

## Thermophiles

- survive under temperatures of **45° - 60 °C**

# PSYCHROPHILES

- survive under temperatures of **below 20 °C**

Toleration to extreme cold: *Athrobacter* spp., *Pseudomonas* spp. *Hyphomonas* spp., etc.

***Pseudomonas* spp.** - known for its ubiquity, can cause disease in plants and animals, including humans

***Pseudomonas aeruginosa***: Gram-negative, rod shaped bacterium of medical importance – multidrug resistant pathogen associated with serious illnesses – hospital acquired infections (ventilator-associated pneumonia, various sepsis syndromes)

# MESOPHILES

- survive under temperatures of **20°- 45° C**;
- grow **optimal at 37 °C**

## *Staphylococcus aureus*

Under a very high magnification of 20,000x, this scanning electron micrograph (SEM) shows a strain of *Staphylococcus aureus* bacteria taken from a vancomycin intermediate resistant culture (VISA).

## *Escherichia coli*

# THERMOPHILES

- survive under temperatures of **45° - 60°C**

Occurrence: geothermally heated regions and deep sea hydrothermal vents, as well as decaying plant matter (peat bogs, compost)

**Grand Prismatic Spring and Midway Geyser Basin,**  
Yellowstone National Park: bright color produced by thermophiles

**Why to know these properties?**

# REQUIREMENTS OF MICROORGANISMS

**NUTRITION, ENERGY, TEMPERATURE, OXYGEN**

**+**

**OTHER FACTORS INFLUENCING GROWTH AND REPRODUCTION  
(.g., hydrostatic pressure; concentration of hydrogen ions; etc.)**

## **CULTIVATION OF MICROORGANISMS *IN VITRO***

**→ IDENTIFICATION OF INFECTIOUS AGENT**

**STUDY →**

**ADEQUATE THERAPY**

**PREVENTION OF INFECTION**

# **BASIC GROUPS OF MICROBIAL PATHOGENS**

## A. VIRUSES

+ subviral agents (viroids)  
+ prions

## B. BACTERIA

## C. MIKROMYCETES (YEAST CELLS)

kvasinky

## D. PARASITES

protists  
helminths  
arthropods

Giardia

# PRIONS

**Abnormal transmissible pathogenic agents (PrP<sup>Sc</sup>)**

- ability to induce abnormal folding of specific normal cellular proteins called prion proteins (PrP<sup>c</sup>)
  - - abnormal folding leads to tissue-brain damage

# PRIONS

## Abnormal transmissible pathogenic agents (**PrP<sup>Sc</sup>**)

- ability to induce abnormal folding of specific normal cellular proteins called prion proteins (**PrP<sup>c</sup>**)
  - - abnormal folding leads to tissue-brain damage

## **Prion diseases** (transmissible spongiform encephalopathies, **TSEs**)

- rare progressive neurodegenerative disorders in humans, animals
- long incubation periods
- characteristic spongiform changes associated with neuronal loss
- failure to induce inflammatory response.

Sponge-like lesions in the brain tissue of a classic CJD patient. *Source: CDC*

**Creutzfeldt-Jakob Disease (CJD)**

**Variant Creutzfeldt-Jakob disease (vCJD)**

**Bovine spongiform encephalopathy (BSE)**

**Chronic wasting disease (CWD)**

# VIRUSES

- **Small infectious agents** - most have a diameter between 20 and 300 nm (i.e., cannot be seen with optical microscope).
- **Transmission:** travelling within a fluid, such as mucus droplets from a sneeze.
- **Replication only inside the living cells.**
- **Infect all types of hosts** (animals, plants, microorganisms, including bacteria and archaea)

Source: <http://www.printablediagram.com/labeled-virus-diagram/>; image via [imgarcade.com](http://imgarcade.com)

# VIRUSES

- **Small infectious agents** - most have a diameter between 20 and 300 nm (i.e., cannot be seen with optical microscope).
- **Transmission:** travelling within a fluid, such as mucus droplets from a sneeze.
- **Replication only inside the living cells.**
- **Infect all types of hosts** (animals, plants, microorganisms, including bacteria and archaea)

## STRUCTURE OF VIRAL PARTICLES (VIRIONS)

- genetic material - **DNA** or **RNA** (long molecules that carry genetic information)
- protein coat (**capsid**) – surrounds and protect genetic material
- envelope of lipids in some of them
- shape from single helical to isohedralforms

Source: <http://www.printablediagram.com/labeled-virus-diagram/>; image via pstudy.com

<b>Genomic diversity among viruses</b>	
<b>Property</b>	<b>Parameters</b>
<b>Nucleic acid</b>	<ul style="list-style-type: none"> <li>- DNA</li> <li>- RNA</li> <li>- Both DNA and RNA (at different stages in the life cycle)</li> </ul>
<b>Shape</b>	<ul style="list-style-type: none"> <li>- Linear</li> <li>- Circular</li> <li>- Segmented</li> </ul>
<b>Strandedness</b>	<ul style="list-style-type: none"> <li>- Single-stranded</li> <li>- Double-stranded</li> <li>- Double-stranded with regions of single-strandedness</li> </ul>
<b>Sense</b>	<ul style="list-style-type: none"> <li>- Positive sense (+)</li> <li>- Negative sense (-)</li> <li>- Ambisense (+/-)</li> </ul>

**A virus has either a DNA or a RNA genome and is called a DNA virus or a RNA virus, respectively. The vast majority of viruses have RNA genomes. Plant viruses tend to have single-stranded RNA genomes and bacteriophages tend to have double-stranded DNA genomes.**

# **CORONAVIRUS DISEASE 2019 (COVID-19)**

Other names:

- 2019-nCoV acute respiratory disease
- novel coronavirus pneumonia (2019-nCoV)

# **CORONAVIRUS DISEASE 2019 (COVID-19)**

## **Initial identification**

**Wuhan (Hubei province, China, December 2019)**

# CORONAVIRUS DISEASE 2019 (COVID-19)

- **infectious disease**
- causative agent: **severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2)**  
(formerly 2019 novel coronavirus 2019-nCoV)
- spread: **between people via respiratory droplets**
- time from exposure – to symptoms: **generally 2-14 days**
- limitation of spread: **handwashing and other hygiene measures, wearing a surgical mask**

# **CORONAVIRUS DISEASE 2019 (COVID-19)**

- symptoms: **the infection may initially present with few or no symptoms or develop into fever, coughing, shortness of breath, pain in the muscles, tiredness**
- complications: **pneumonia, ARDS, kidney failure**
- diagnostic method: **PCR testing, medical imaging**
- treatment: **symptomatic and supportive only  
no specific antivirals available**

**ARDS** – acute respiratory distress syndrome

# CORONAVIRUS DISEASE 2019 (COVID-19): SYMPTOMS

Systemic:

- Fever
- Fatigue

Kidneys:

- Decreased function

Intestines:

- Diarrhea

Respiratory:

- Sneezing
- Runny nose
- Sore throat
- Dry cough
- Shortness of breath

Circulatory system:

- Decreased white blood cells

less frequent

# CORONAVIRUS DISEASE 2019 (COVID-19): TRANSMISSION MODES

## Transmission:

→ direct

→ contact

→ aerosol

- someone touches a surface contaminated with tainted respiratory droplets
- inhalation of air contaminated with tainted respiratory droplets

Scanning electron microscope  
image of SARS-CoV-2 (yellow)

# **CORONAVIRUS DISEASE 2019 (COVID-19): LIMITATION OF SPREAD**

- frequent washing of hands with soap and water
- not touching the eyes, nose, or mouth with unwashed hands
- practicing good respiratory hygiene

## **PREVENTION OF TRANSMISSION**

- infected individuals stay at home except to get medical care
- call ahead before visiting a healthcare service
- wear a facemask (especially in public)
- cover coughs and sneezes with a tissue
- regular wash hands with soap and water
- avoid sharing personal household items

# **CORONAVIRUS DISEASE 2019 (COVID-19): LIMITATION OF SPREAD**

- frequent washing of hands with soap and water
- not touching the eyes, nose, or mouth with unwashed hands
- practicing good respiratory hygiene

## **PREVENTION OF TRANSMISSION IN HOSPITALS**

recommendations see [www.who.int](http://www.who.int)

# HEPATITIS

Hepatitis A virus (HAV)  
Hepatitis B virus (HBV)  
Hepatitis C virus (HCV)  
Hepatitis D virus (HDV)  
Hepatitis E virus (HEV)

## Symptoms:

Yellow discoloration of the skin and whites of the the eyes, poor appetite, vomiting, tiredness, abdominal pain, or diarrhea.

## TRANSMISSION

- fecal-oral
- by infectious fluids (blood, mucus)
- fecal-oral
- by infectious fluids (blood, mucus)
- by infectious fluids (blood, mucus)

# BACTERIA

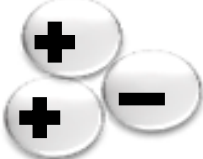

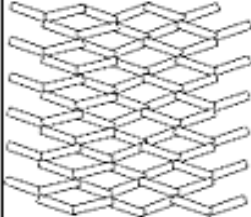

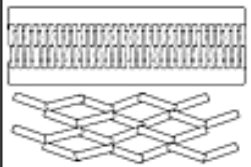

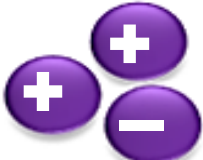

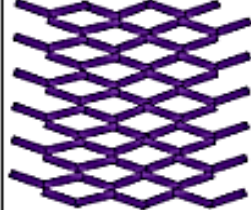

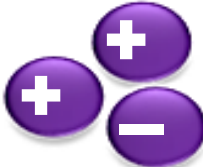

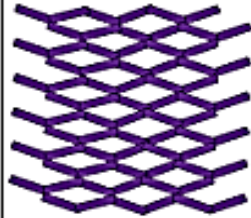

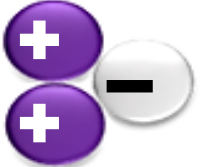

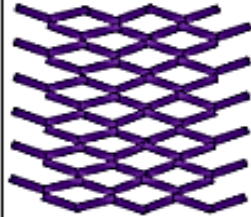

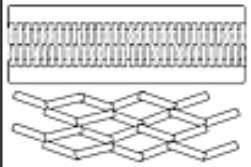

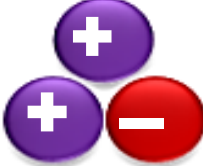

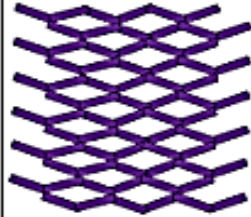

- ▶ **Wide diversity in:**
  - **sizes** (typically 0.5–5.0  $\mu\text{m}$  in length)
  - **shape** (**cocci, bacilli, vibrio, spirilla, spirochaetes**)
- ▶ **Unicellular**
- ▶ **Lack of membrane-bound nucleus, mitochondria and membrane-bound organelles**
- ▶ **Own metabolism**

# MORPHOLOGY AND ARRANGEMENT OF BACTERIA

# GRAM STAINING

Gram staining procedure		Gram- <u>positive</u> cell wall		Gram- <u>negative</u> cell wall	
Process of test	Appearance of Cells	Effect of Step	Effect on Cell Wall	Effect of Step	Effect on Cell Wall
<b>Step 1:</b> Begin with heat fixed cells  <b>fixation</b>		<b>Step 1:</b> Cell wall remains clear.		<b>Step 1:</b> Cell wall remains clear.	
<b>Step 2:</b> Flood slide with crystal violet dye for 1 min.  <b>crystal violet</b>		<b>Step 2:</b> Peptidoglycan cell wall is flooded with crystal violet and appears purple.		<b>Step 2:</b> Cell wall is stained purple from the crystal violet dye.	
<b>Step 3:</b> Add iodine solution for 1 min.  <b>iodine</b>		<b>Step 3:</b> A crystal violet-iodine complex is formed within the peptidoglycan cell wall trapping the purple stain.		<b>Step 3:</b> A crystal violet-iodine complex is formed but does not adhere to the cell wall due to the thin layer of peptidoglycan.	
<b>Step 4:</b> Wash slide with alcohol for 20sec.  <b>alcohol</b>		<b>Step 4:</b> The crystal violet-iodine complex is trapped with the peptidoglycan cell wall and doesn't wash out.		<b>Step 4:</b> The crystal violet-iodine structure is washed out of the thin peptidoglycan layer.	
<b>Step 5:</b> Counter stain with safranin.  <b>safranin</b>		<b>Step 5:</b> As the peptidoglycan cell wall remains stained purple the red safranin has no effect.		<b>Step 5:</b> The red safranin stains the washed gram negative cells.	

# Overview of Bacterial infections

## Bacterial meningitis

- *Streptococcus pneumoniae*
- *Neisseria meningitidis*
- *Haemophilus influenzae*
- *Streptococcus agalactiae*
- *Listeria monocytogenes*

## Otitis media

- *Streptococcus pneumoniae*

## Pneumonia

Community-acquired:

- *Streptococcus pneumoniae*
- *Haemophilus influenzae*
- *Staphylococcus aureus*

Atypical:

- *Mycoplasma pneumoniae*
- *Chlamydia pneumoniae*
- *Legionella pneumophila*

Tuberculosis

- *Mycobacterium tuberculosis*

## Skin infections

- *Staphylococcus aureus*
- *Streptococcus pyogenes*
- *Pseudomonas aeruginosa*

## Sexually transmitted diseases

- *Chlamydia trachomatis*
- *Neisseria gonorrhoeae*
- *Treponema pallidum*
- *Ureaplasma urealyticum*
- *Haemophilus ducreyi*

## Eye infections

- *Staphylococcus aureus*
- *Neisseria gonorrhoeae*
- *Chlamydia trachomatis*

## Sinusitis

- *Streptococcus pneumoniae*
- *Haemophilus influenzae*

## Upper respiratory tract infection

- *Streptococcus pyogenes*
- *Haemophilus influenzae*

## Gastritis

- *Helicobacter pylori*

## Food poisoning

- *Campylobacter jejuni*
- *Salmonella*
- *Shigella*
- *Clostridium*
- *Staphylococcus aureus*
- *Escherichia coli*

## Urinary tract infections

- *Escherichia coli*
- Other Enterobacteriaceae
- *Staphylococcus saprophyticus*
- *Pseudomonas aeruginosa*

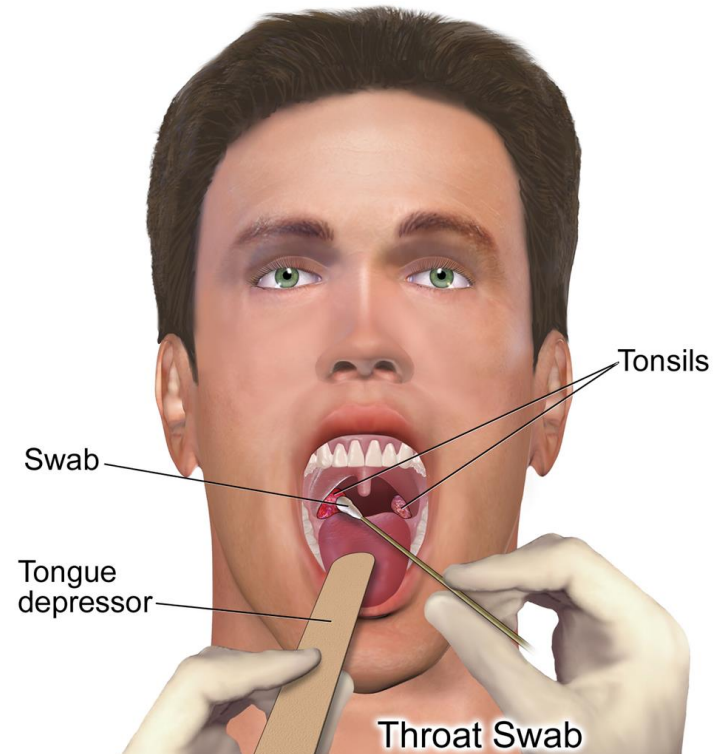

# TONSILLITIS

group A streptococcus (G+)

**Streptococcal pharyngitis.**

# SCARLET FEVER (SCARLATINA)

**Source:** a group A *streptococcus* (Group A strep) infection (G+)

**Signs and symptoms:** sore throat, fever, headaches, swollen lymph nodes, and a characteristic (red) rash – sandpaper; the tongue may be red and bumpy. Mostly affects children between five and 15 years of age.

**Strawberry tongue seen in scarlet fever.** Source: <https://en.wikipedia.org/wiki/>; foto von Martin Kronawitter, Kellberg

(1843-1910)

**1892: Identification and cultivation of the causative agents tuberculosis (TB)**

***Mycobacterium tuberculosis***

*Mycobacterium tuberculosis*

Source: wikimvisua.com

*R. Koch.*

*M. tuberculosis* in the tissue

# TUBERCULOSIS

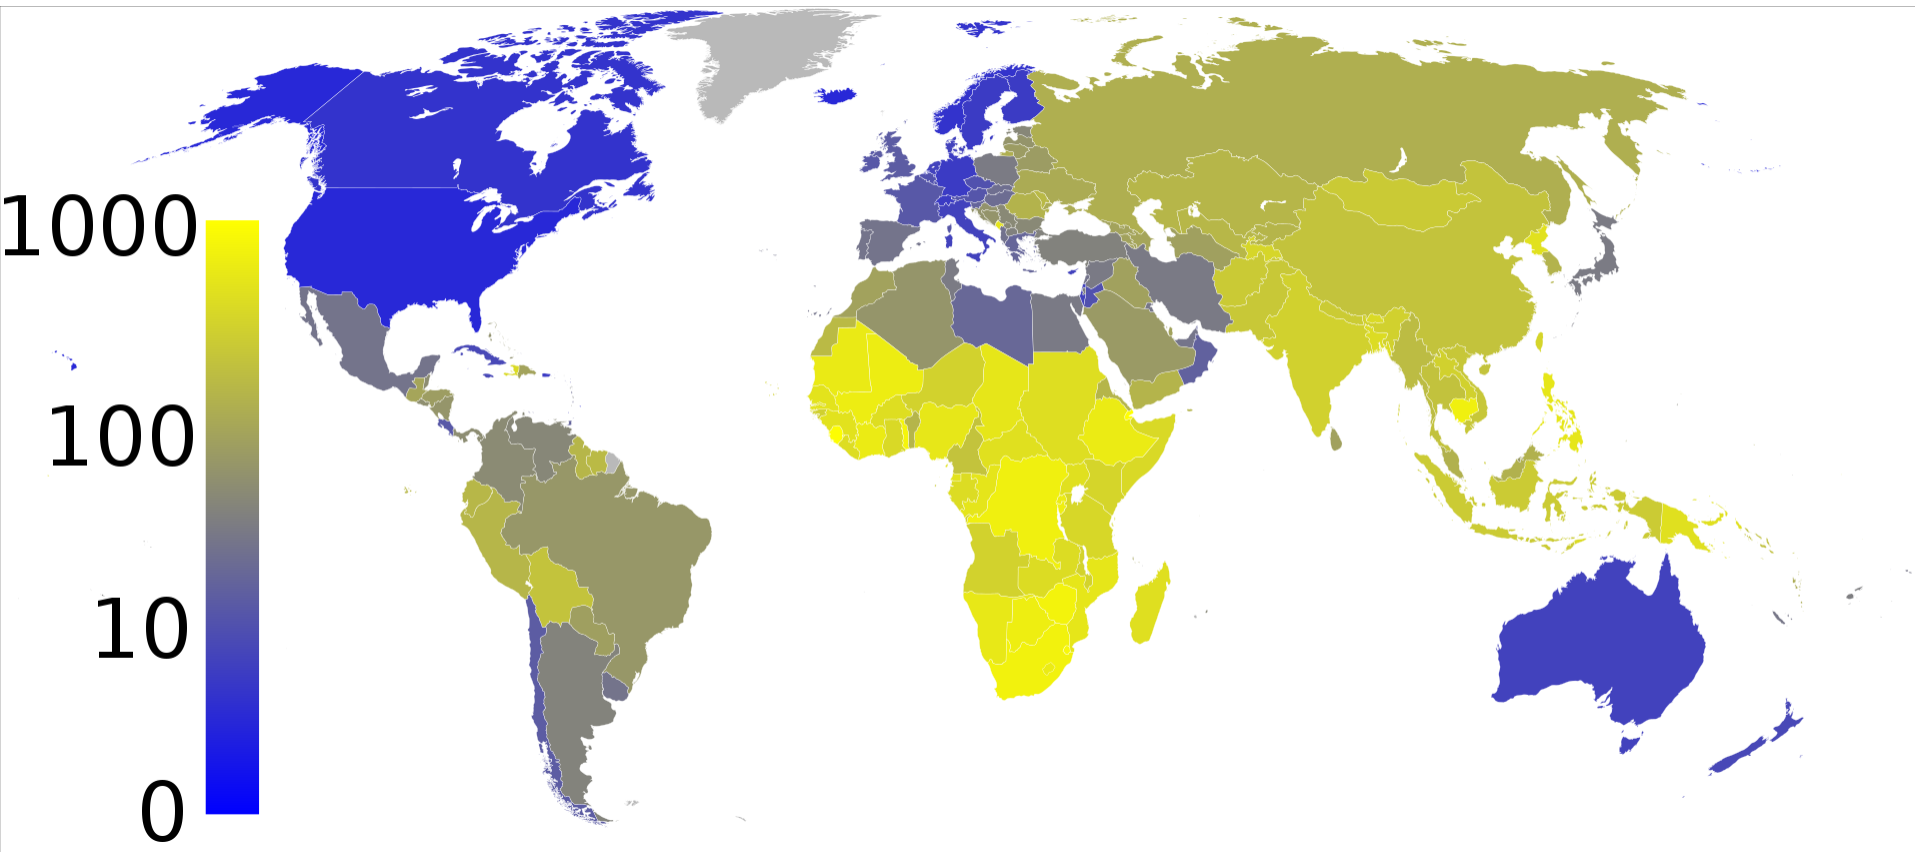

Causative agent: *Mycobacterium tuberculosis* - a small, aerobic, non bacillus

- an unusual, waxy coating on its cell surface primarily due to the presence of mycolid acid

- coating makes the cells impervious to Gram staining, and as a result, the bacteriae can appear either Gram-negative or Gram-positive.

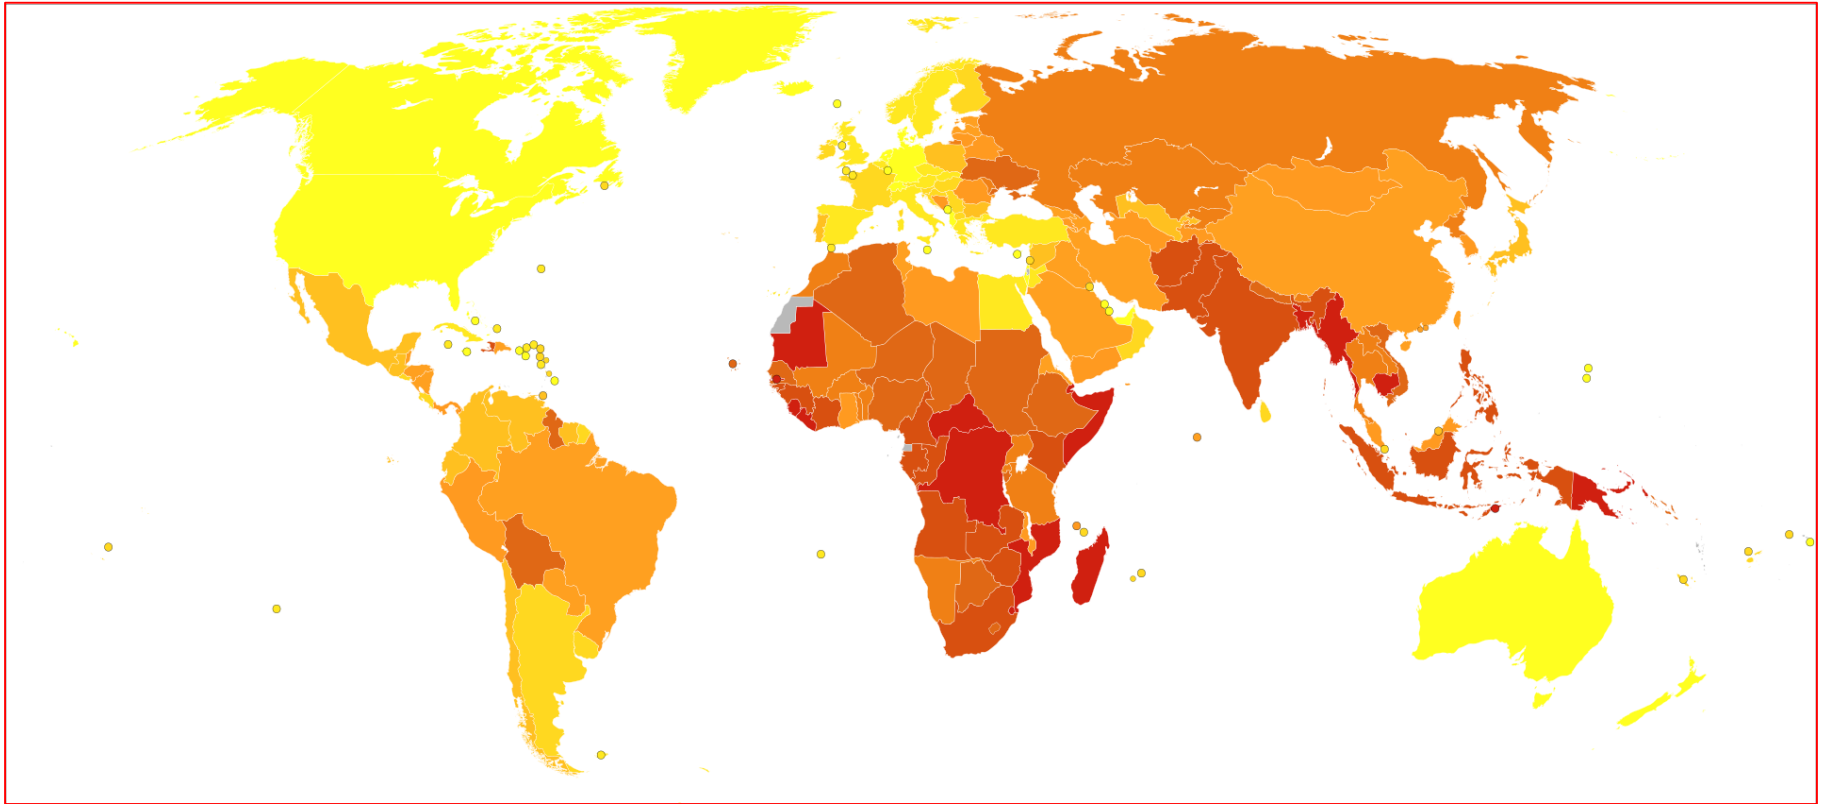

- acid-fast stains [e.g., Ziehl-Neelsen or fluorescent stain (e.g.auramine)] are used instead to identify the bacteria microscopically

**In 2007, the number of cases of TB per 100,000 people was highest in sub-Saharan Africa, and was also relatively high in Asia**

# Tuberculosis deaths per million persons in 2012

**0–3 4–7 8–16 17–26 27–45 46–83 84–137 138–215 216–  
443 444–1,359**

**Egyptian mummy in the British Museum – tubercular decay has been found in the spine.**

# SYPHILIS (BEJEL, PINTA, YAWS, etc.)

Causative agent:

spirochate bacterium (with subspecies) *Treponema pallidum*

Under light microscopy, treponemes are visible only by using dark field illumination.

Model of a head of a person with tertiary (gummatous) syphilis that is located in Musée de l'Homme, Paris.

**BORRELIOSIS  
(LYME DISEASE)**

# YEASTS, MOLD

- Eukaryota.
- Reproduce mostly asexually, and many do so by the asymmetric division process known as budding.
- Do not form mycelia (only **pseudomycelia** – similar to single-celled colonies)
- **Yeast** - fungi that can adopt a single-celled growth habit
- **Mold** - microscopical fungus that grows in the form of multicellular filaments called hyphae

**Cross-sectional 2D diagram of a yeast cell.**

**Some of them can cause severe human diseases.**

# CAUSATIVE AGENTS OF HUMAN DISEASES - EXAMPLES

## YEASTS, MOLD

Penicillium spp. and Aspergillus spp. in axenic cultures

Examples of human pathogens	DISEASE
<b>YEASTS</b> <i>Candida</i>	candidiasis (thrush) ( <i>Candida albicans</i> ), systemic candidiasis
<i>Cryptococcus</i>	in immunosuppressed hosts, fatal pulmonary infections, meningitis, sepsis
<i>Pneumocystis</i>	in immunosuppressed hosts, interstitial pneumonia
<b>DIMORPHIC FUNGI</b>	in immunosuppressed hosts, severe pulmonary infections
<i>Penicillium</i>	In the past, <i>Talaromyces marneffe</i> (syn. <i>Penicillium marneffe</i> ) was considered non-pathogenic, however, it can cause disseminated penicilloles in AIDS patients (reservoirs bamboo rats)
<i>Fusarium</i>	attack food, contamination of clinical material
<b>Dermatophytes</b>	infections of hair and nails

*Anopheles gambiae*

# CAUSATIVE AGENTS OF HUMAN DISEASES - EXAMPLES

## PARASITES

Examples of human pathogens	Disease
<b>plasmodia</b>	malaria ( <i>Plasmodium falciparum</i> , <i>P. vivax</i> , <i>P. ovale</i> , <i>P. malariae</i> )
<b>amoebae</b>	dysentery ( <i>Entamoeba histolytica</i> )
<b>leishmania</b>	visceral and cutaneous leishmaniasis
<b>toxoplasma</b>	toxoplasmosis ( <i>Toxoplasma gondii</i> )
<b>roundworms</b>	ascariasis ( <i>Ascaris lumbricoides</i> ), larval toxocarosis ( <i>Toxocara canis</i> , <i>T. cati</i> )
<b>tapeworms</b>	cestodoses, cysticercosis, hydatidosis, echinococcosis
<b>schistosomes</b>	schistosomiasis ( <i>Schistosoma mansoni</i> , <i>S. haematobium</i> , <i>S. japonicum</i> )
<b>hookworms</b>	ancylostomiasis intestinal symptoms and anaemia
<b>filaria</b>	filariasis

# MALARIA

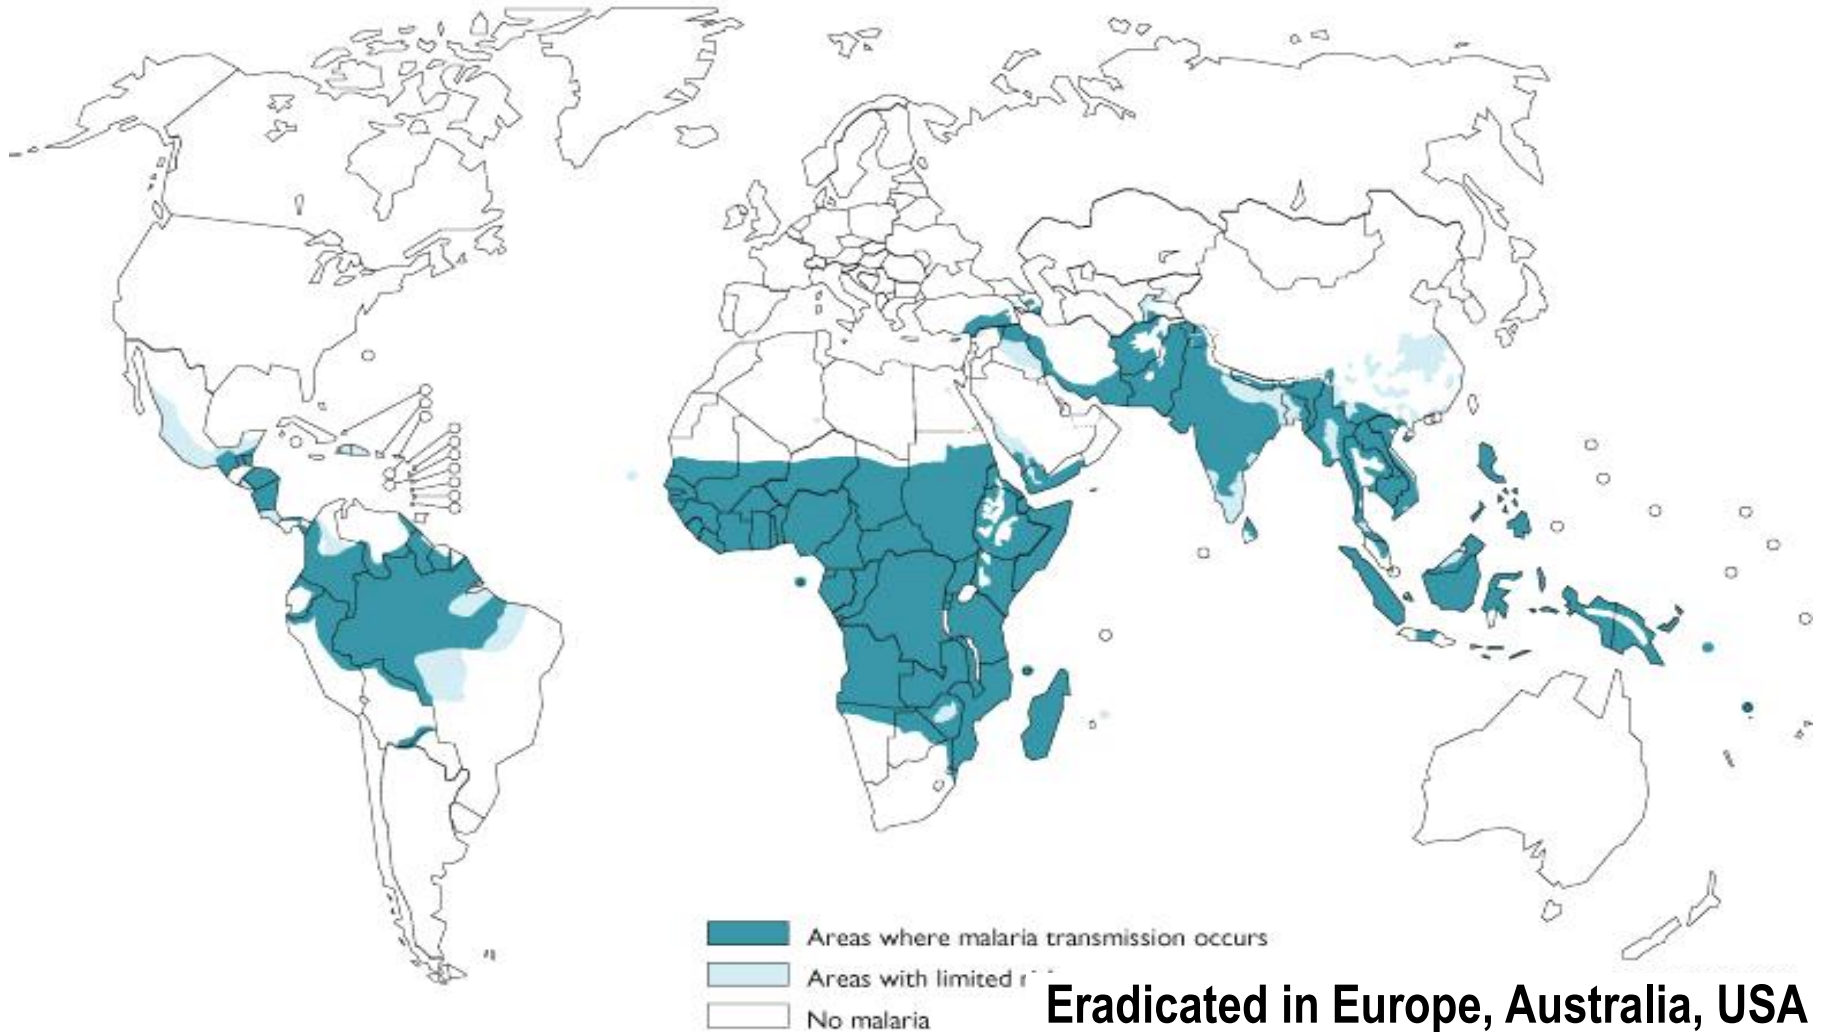

- causative agent: *Plasmodium falciparum*  
*P. vivax*  
*P. malariae*  
*P. ovale*  
*P. knowlesi*
- vector: mosquitoes of the genus *Anopheles*
- endemic occurrence: 103 countries of tropics and subtropics
- the most important parasitic disease
  - 300 – 500 millions infected
  - >100 millions reported cases/year
  - 1.5 – 2.7 millions of fatal cases/year (mostly children under 5 years)

Source: CDC

# MALARIA: OCCURRENCE

Source: WHO, 2003

**Eradicated in Europe, Australia, USA**  
**Reduced in North Africa ( eradicated in Tunisia)**

# LEISHMANIA & LEISHMANIOSES

- Occurrence: tropical and subtropical countries  
(except of Australia)  
risk of infection: 350 milion people  
prevalence: 12 millions  
incidence: 1.5-2 millions per year
- Vectors: sanflies (*Phlebotomus*, *Lutzomyia*)
- Host: humans and animals

# REZERVOIRS

## LEISHMANIA SPECIES:

- **Mostly ZONOTIC** (approx. 100 animal species)
- **Few ANTHROPONOTIC** (e.g. visceral caused by *L.donovani*)

### dogs

Source: <http://www.vet.uga.edu>, Noah's Arkive, University of Georgia.

### rodents

Source: [www.moscowzoo.ru/galeng/asp](http://www.moscowzoo.ru/galeng/asp)

# *Leishmania* sp.

CDC/Dr. L.L. Moore, Jr.

## **CUTANEOUS LEISHMANIOSIS**

SOURCE: G. Eric a Edith Mason Photograph Collection, Library  
Congress

# VECTOR

**Old World:** *Phlebotomus*

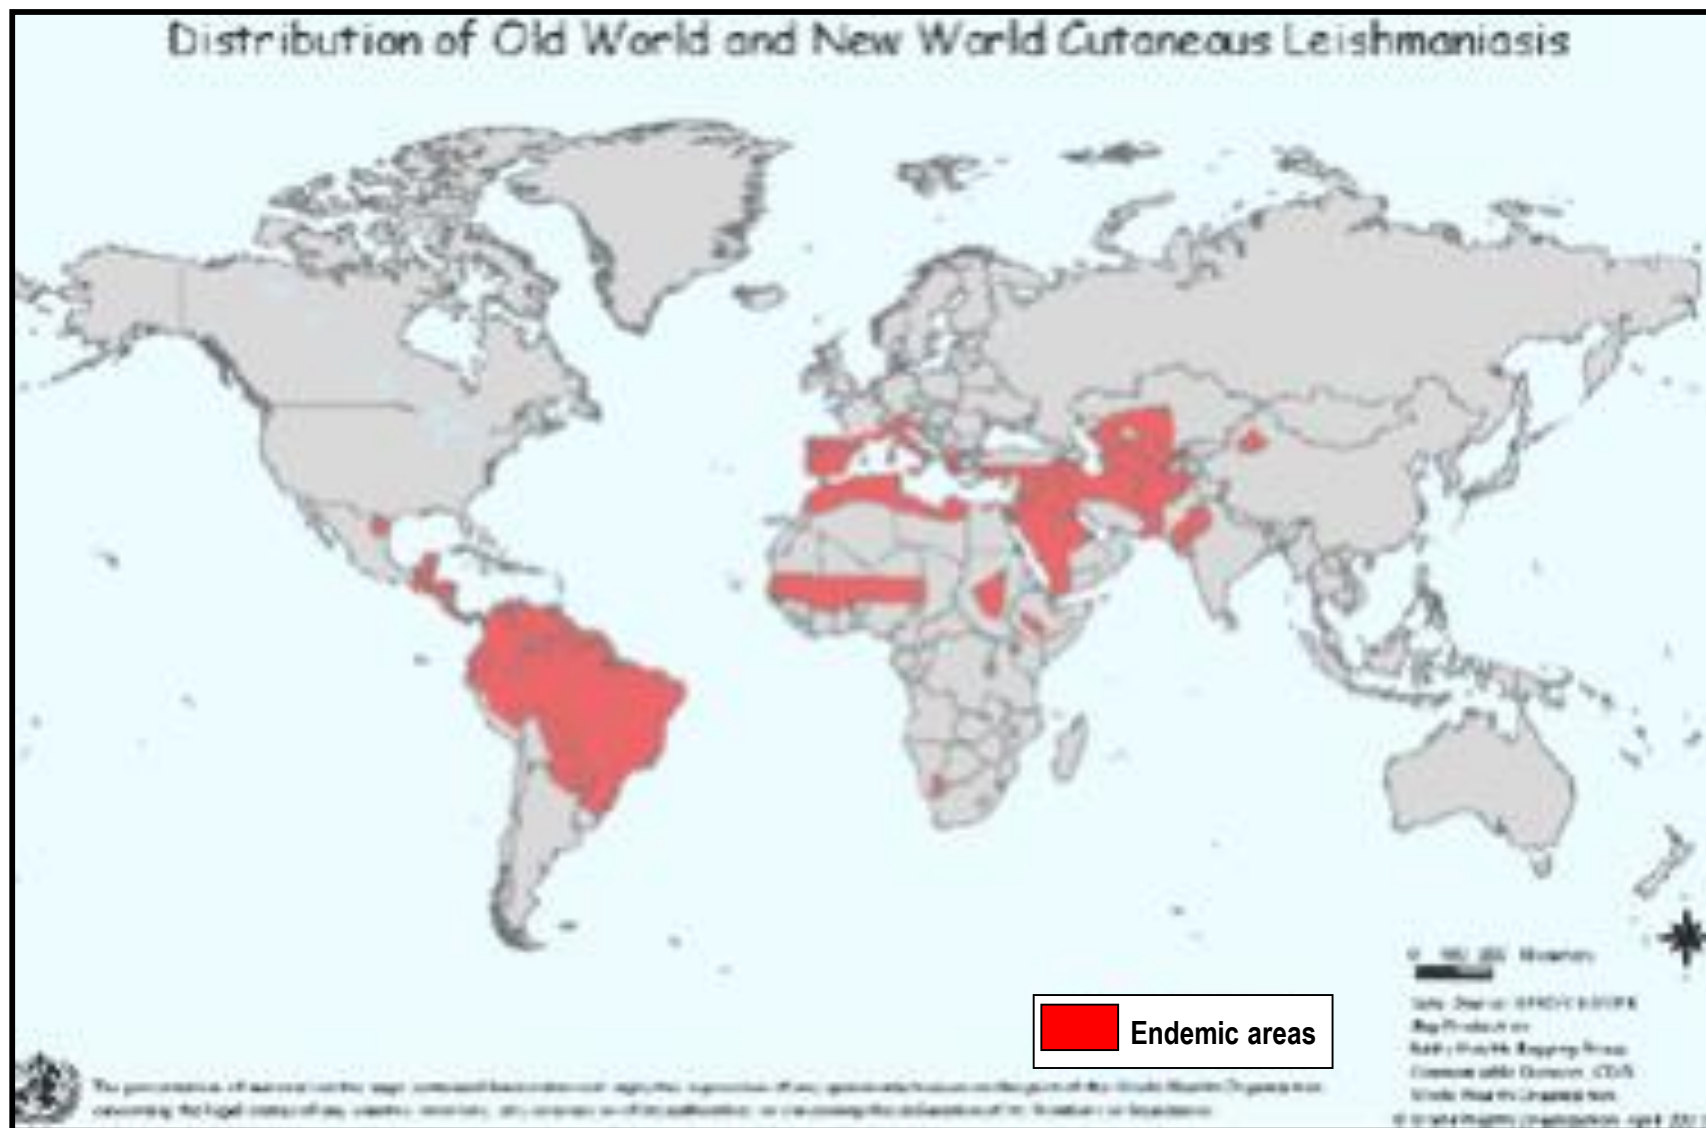

**New World:** *Lutzomyia*

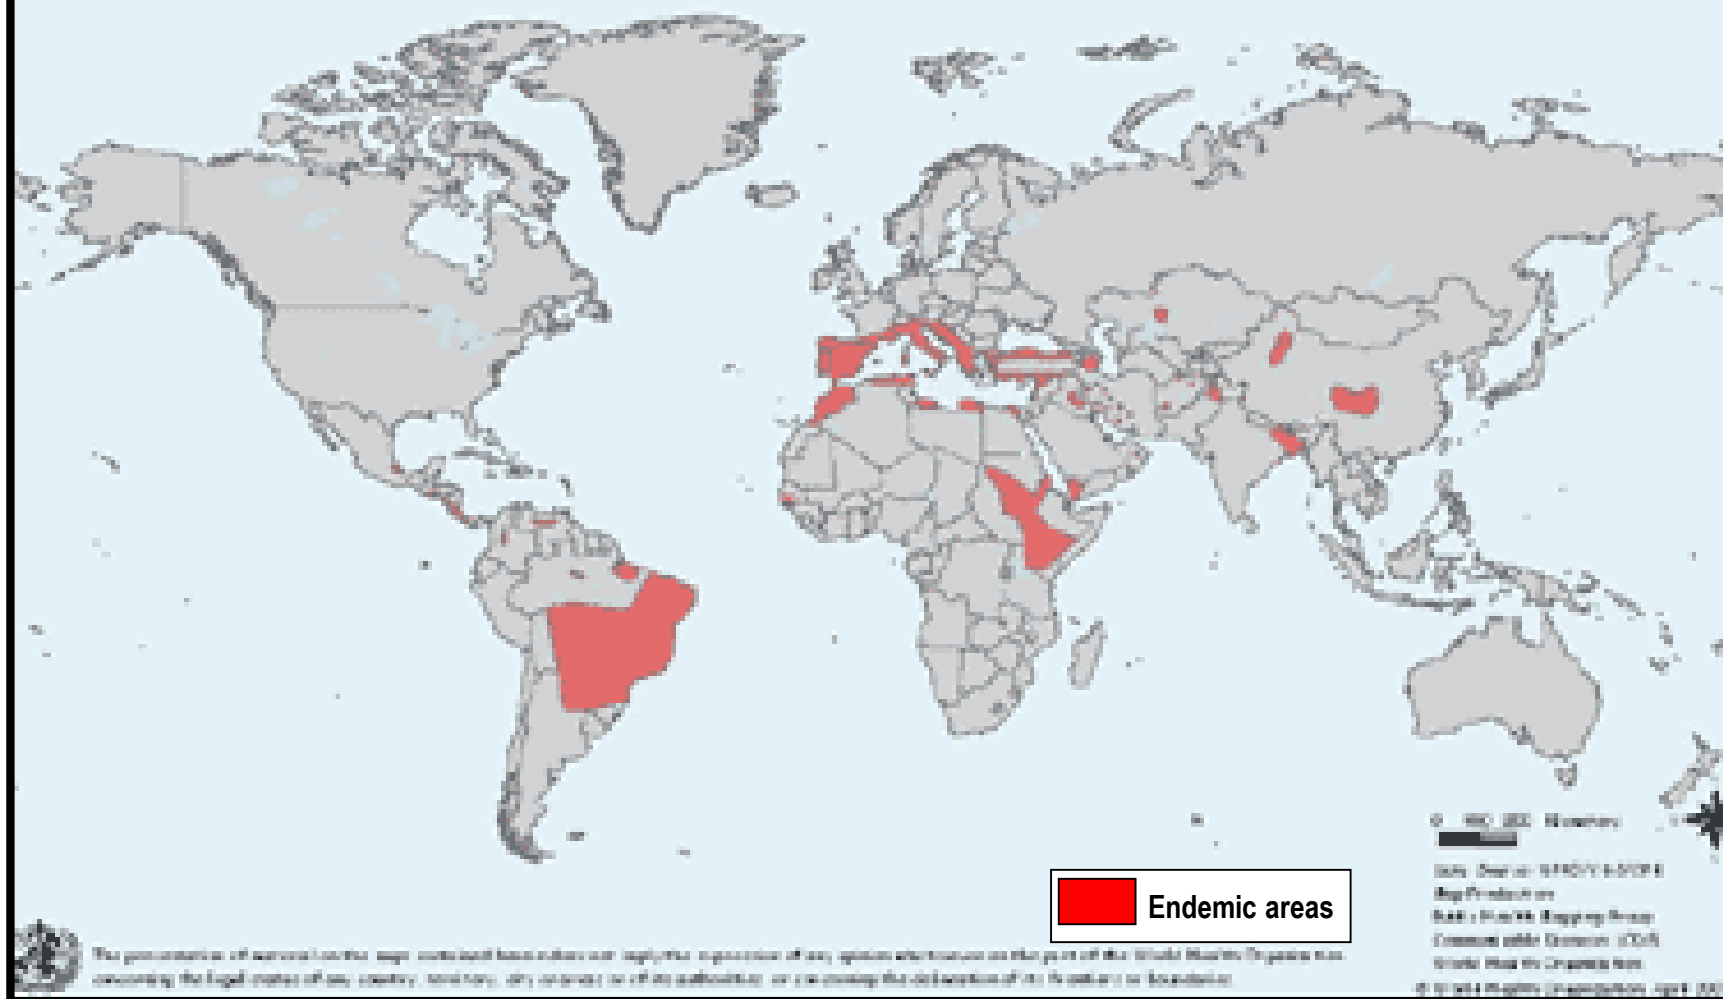

**size: 2-3 mm**

- daylight-inactive (most active at dusk)
- silent flying downstairs

**Data source: WHO/CSR/EDC-UNAIDS Map production: Public Health Mapping Group  
 Communicable Diseases (CDS) World Health Organization, October 2003**

## Distribution of Old World and New World Visceral Leishmaniasis

**Data source: WHO/CSR/EDC-UNAIDS Map production: Public Health Mapping Group  
Communicable Diseases (CDS) World Health Organization, October 2003**

# CLINICAL SYMPTOMS AND SIGNS

**VISCERAL LEISHMANIOSIS** skin phase asymptomatic

- **escape** of infected macrophages **from skin to blood and lymph**  
**silent spread to liver spleen, bone marrow and lymphatic glands**
- proliferation of parasites → increasing load of infected macrophages → reticuloendothelial hyperplasia → splenomegaly

Source: WHO

# ***Entamoeba histolytica* & AMOEBOSIS**

- amoebosis: - **intestinal** (diarrhoea, dysentery, colitis)  
- **extraintestinal** (liver abscess)
- transmission: **per os** (contaminated food, drinks, + anal-oral sex)
- occurrence: **cosmopolitan** (mainly in developing countries )  
hyperendemic: Mexico, Egypt, India, Vietnam
- prevalence: approx. 50 millions of invasive infections with  
40-100 thousands of fatal cases per year
- epidemiology: risk factors - inadequate disposal of human feces; poor  
personal hygiene; use of human feces as fertilizer for  
vegetables; freshening of vegetables and fruits by contaminated  
water

# *Entamoeba histolytica*: LIFE CYCLE

source of infections: **a carrier with no or minor intestinal disturbances**,  
by the stool of which the parasitic cysts are released

Conversion due to changes  
bacterial flora, redox gradient,  
mucus quality, etc.

**FORMA MINUTA**  
**NON PATHOGENIC**

**FORMA MAGNA = dysenterica**  
**PATHOGENIC (does not form cysts)**

- invasion to the host tissues
- complication → perforation

**INTESTINE**

# AMOEBIC DYSENTERY

**The colonic mucosa invaded by *E. histolytica* trophozoites**

# EXTRAIINTESTINAL AMOEBOSIS

centre of the  
lesion: necrosis

More common in adult  
men  
(15-55 years old)

spread to other  
organs rare

- **always secondary:** follows after intestinal infection (the spread of amoebae by venous system)
- in 80% the lesions develop in upper right liver lobe
- **fever (38-40 °C)**, serology show the presence of specific antibodies

# HYDATID DISEASE (ECHINOCOCCOSIS)

## 1. Form: CYSTIC (CE)

AGENT: larval stages of *Echinococcus granulosus*

The eggs are infective for intermediate host immediately after their release into the surroundings.

**LIFE CYCLE**

## Distribution: worldwide

The highest infection risks:

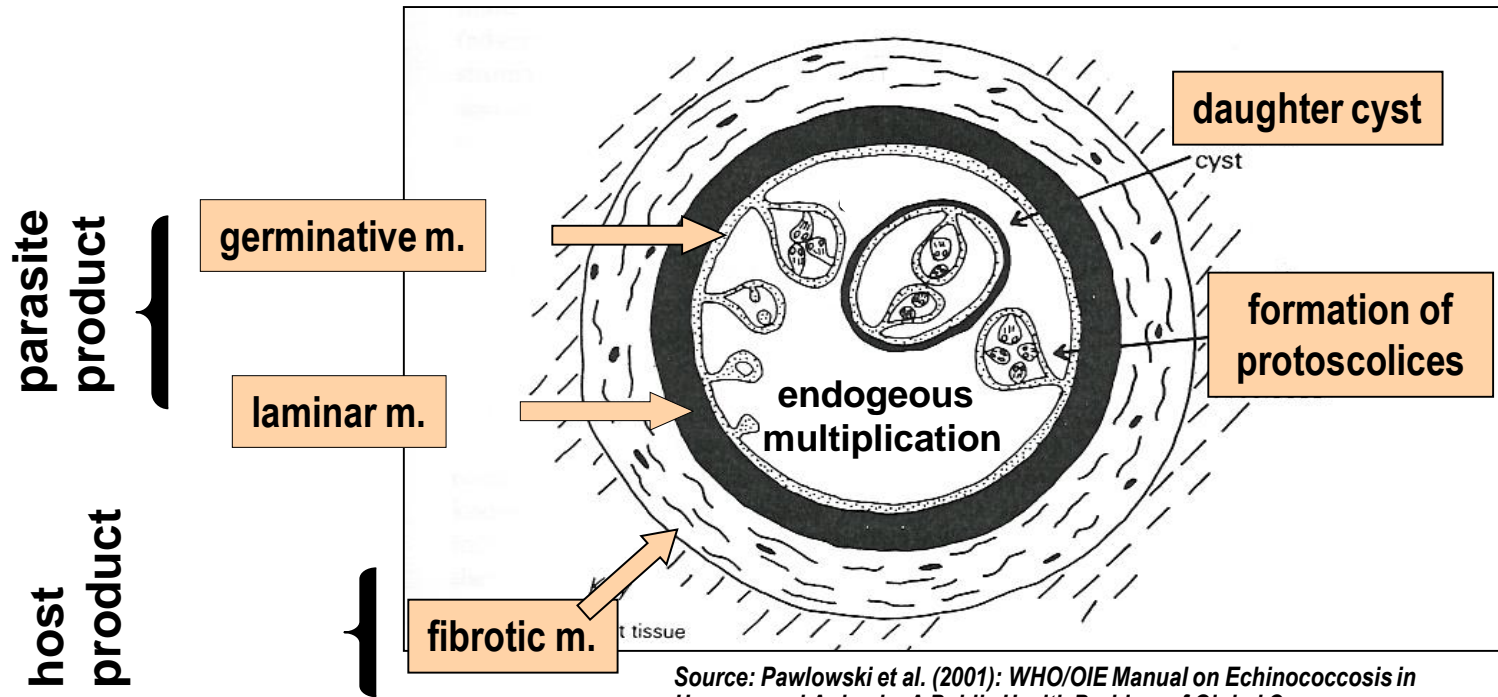

- certain areas of China
- North and East Africa
- South America (Uruguay)

Approximate Geographic Distribution of Hydatid Disease in Humans  
(Parasites and Parasitological Resources)

**No risk: Iceland, Greenland**

# ***E. granulosus*: LARVAL STAGES**

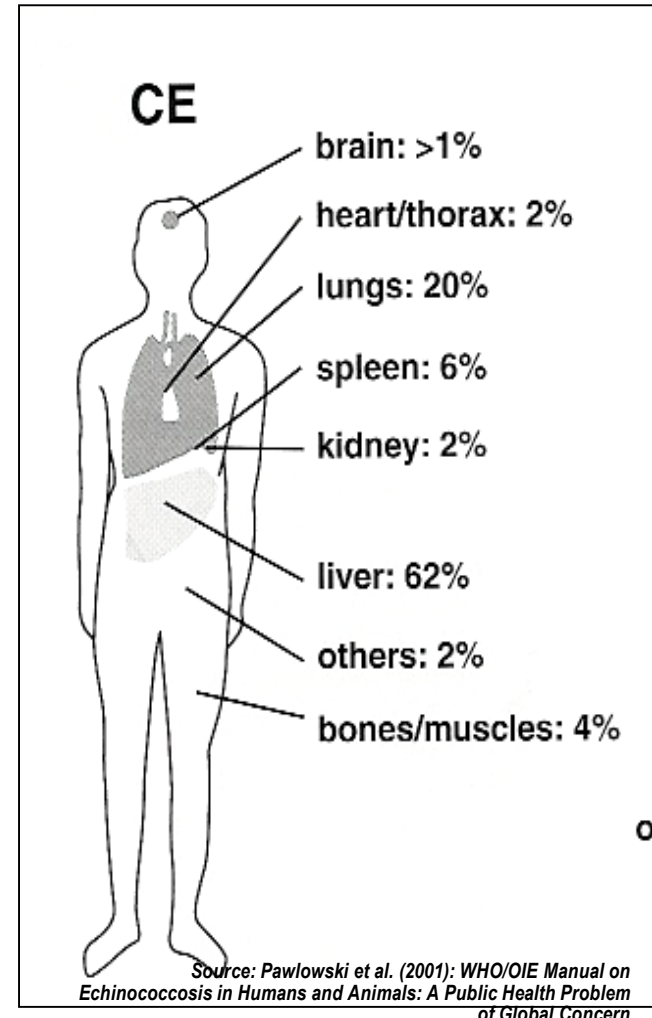

- **slow growth (1-5 mm/year)**
- **life-span:**  
man.....even 53 year

# CLINICAL SYMPTOMS AND SIGNS

- **character of symptoms: dependence on cyst localisation**
- **early phase of the infection: asymptomatic**  
manifestation delayed (several years)
- **most common: hepatic and pulmonary forms**

hepatomegaly,  
bloody sputum in pulmonary form  
cerebral form - neurological symptoms

cyst rupture - allergic symptoms, anaphylactic  
shock, death

**CE: primary location of cysts**

# CE: LIVER INFECTION

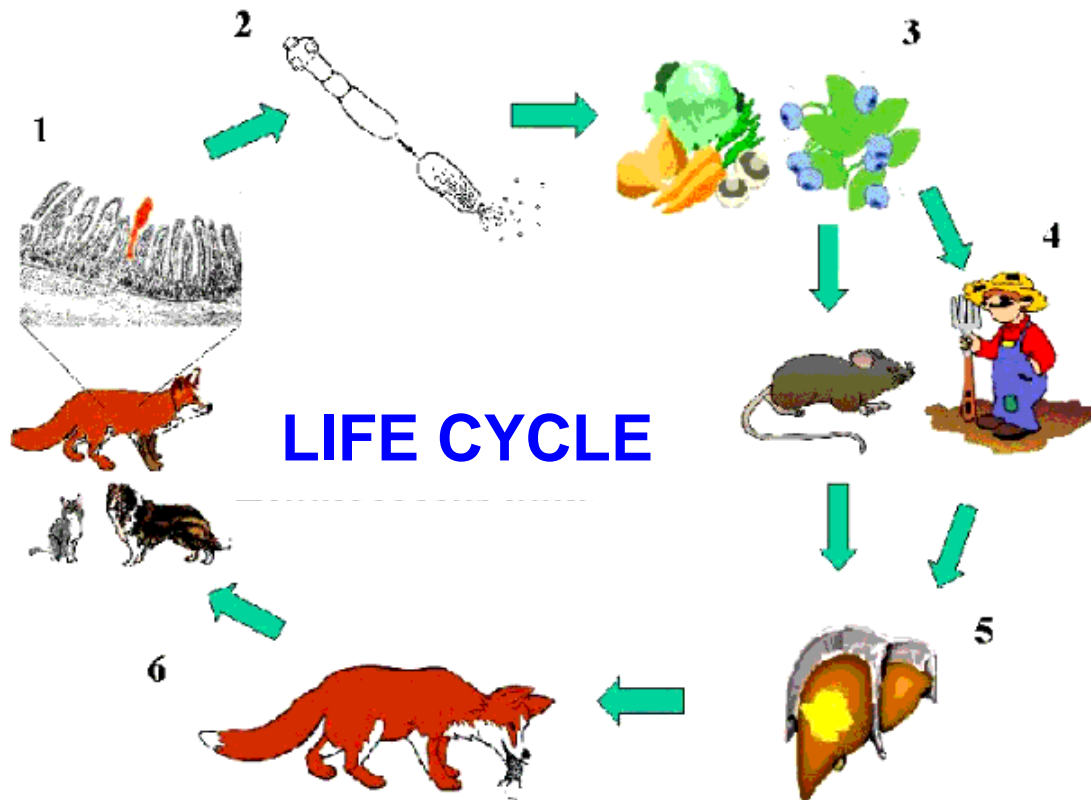

**in the liver: up to the size of 5 cm in diameter:  
usually, no symptoms**

# HYDATID DISEASE (ECHINOCOCCOSIS)

## 2. Form: ALVEOLAR (AE)

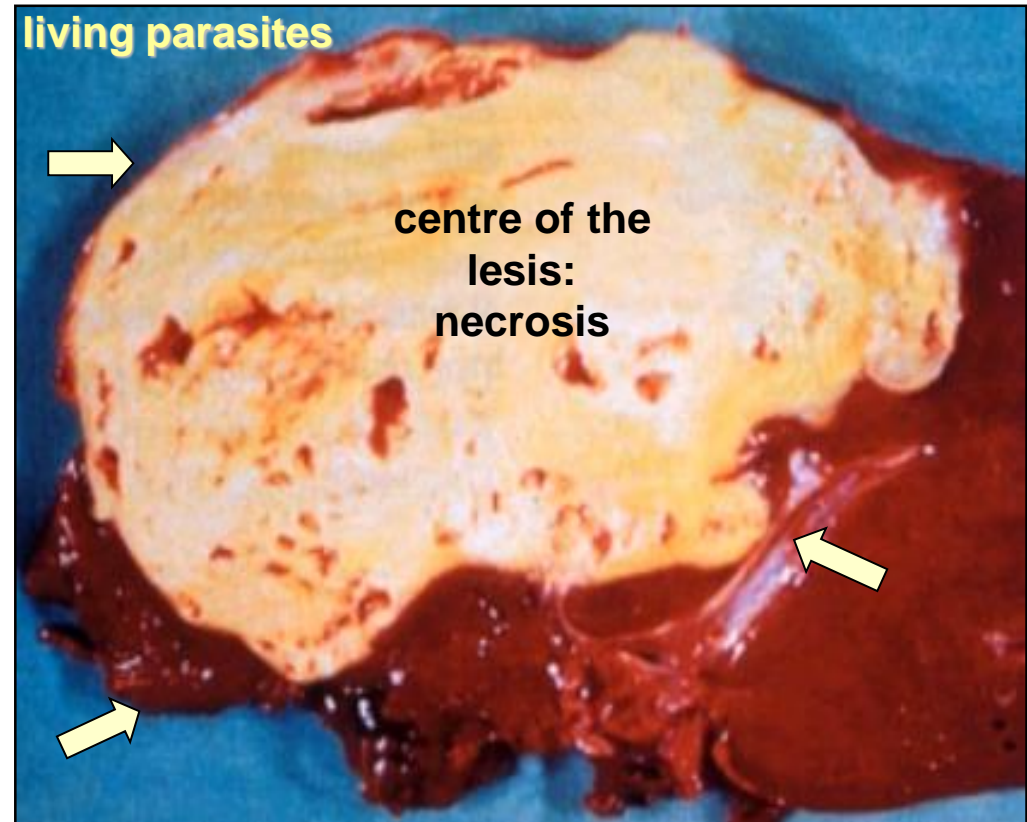

AGENT: larval stages of *Echinococcus multilocularis*

**Occurrence:**  
Northern Hemisphere

## ***E. multilocularis*: LARVAL STAGE**

- development in the liver (99%)
- **extremely slow growth (mm per year)**  
+ in the centre necrosis  
↓↓↓  
**INCUBATION PERIOD:  
VERY LONG**  
(5-30 years)

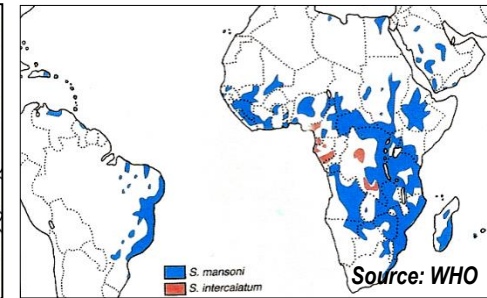

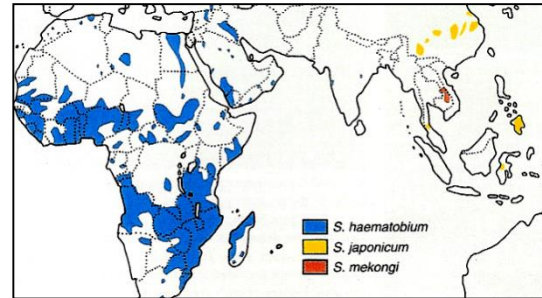

*Foto: Prof. P.Kern, Stuttgart*

with progression of the infection:  
invasion of surrounding tissues - malignant tumour  
(metastases of the parasite)  
fatality up to 100 % when untreated

# SCHISTOSOMIASIS (BILHARZIASIS)

THE MOST IMPORTANT HELMINTHIC DISEASE.

- infected: 193 millions of people
- at risk of infections: 652 mil. osob
- susceptibility to the infection: no differences in host sex and its age
- **85% of infections – Africa**  
→ from which 20% (i.e., 33 millions) of pregnant women from Sub-Saharan area

Forms of the disease:

urogenital: ***Schistosoma haematobium***

intestinal: ***S. mansoni*, *S. japonicum* group**

# SCHISTOSOMIASIS: CLINICAL SYMPTOMS AND SIGNS

hepatosplenomegaly

portal hypertension

involvement of other organs -  
lungs, heart (cor pulmonale),  
etc.

# FILARIASES

# ***Wuchereria bancrofti*** ***Brugia malayi, B. timori***

- disease: **lymphatic filariasis, elephantiasis**
- vectors: **mosquitoes** of the gen. *Aedes*, *Anopheles*, *Culex*, *Mansonia*

# SYMPTOMS AND SIGNS

The main pathogenic agent: **adults in lymph vessels** in the groin, scrotum, axillae etc.

excretion of antigens and toxic metabolites  
thickening of the walls of the lymph vessels  
(lymphangitis, lymphadenitis  
elephantiasis)

+ allergic reaction, secondary bacterial

infections

# **Loa loa**

- vector: horse or **deer fly** (g. *Chrysops*)
- patobiology: **adults in subcutaneous tissue (freely migrating)**
  - acute inflammation – mechanical injuries, allergic reactions, toxic metabolites
  - edema in focus with infiltrated eosinophils  
(Calabar swelling)
  - occasional migration in the eye or inner organs – specific symptoms

# ***Onchocerca volvulus***

- disease: **1. onchocerciasis or 2. river blindness**
- vector: **blackflies (g. *Simulium*)**
- pathobiology: **1. adults in subcutaneous nodules (onchocercom, non migrating nodules)**  
**2. microfilariae in the eye**

Source: Bayer Manual of Pest Control
