Bloodstream infections (BSI)

Pavel Drevinek

Department of Medical Microbiology

BSI

Primary = a condition where the focus of infection is the bloodstream itself

- Infective endocarditis
- endarteritis, thrombophlebitis
- catheter related BSI

26.11.2024
Prof. Nemec: Introduction to HAI, Catheter Infection; Surgical Site Infections; Hospital-Aquired & Ventilator-Associated Pneumonia

Secondary

- pneumonia
- pyelonephritis
- wound infections
- ...

The term sepsis

life-threatening organ dysfunction caused by a dysregulated host response to infection

Definition Sepsis-3, 2016

Sepsis, if not recognized and treated early, is the primary cause of death from infection

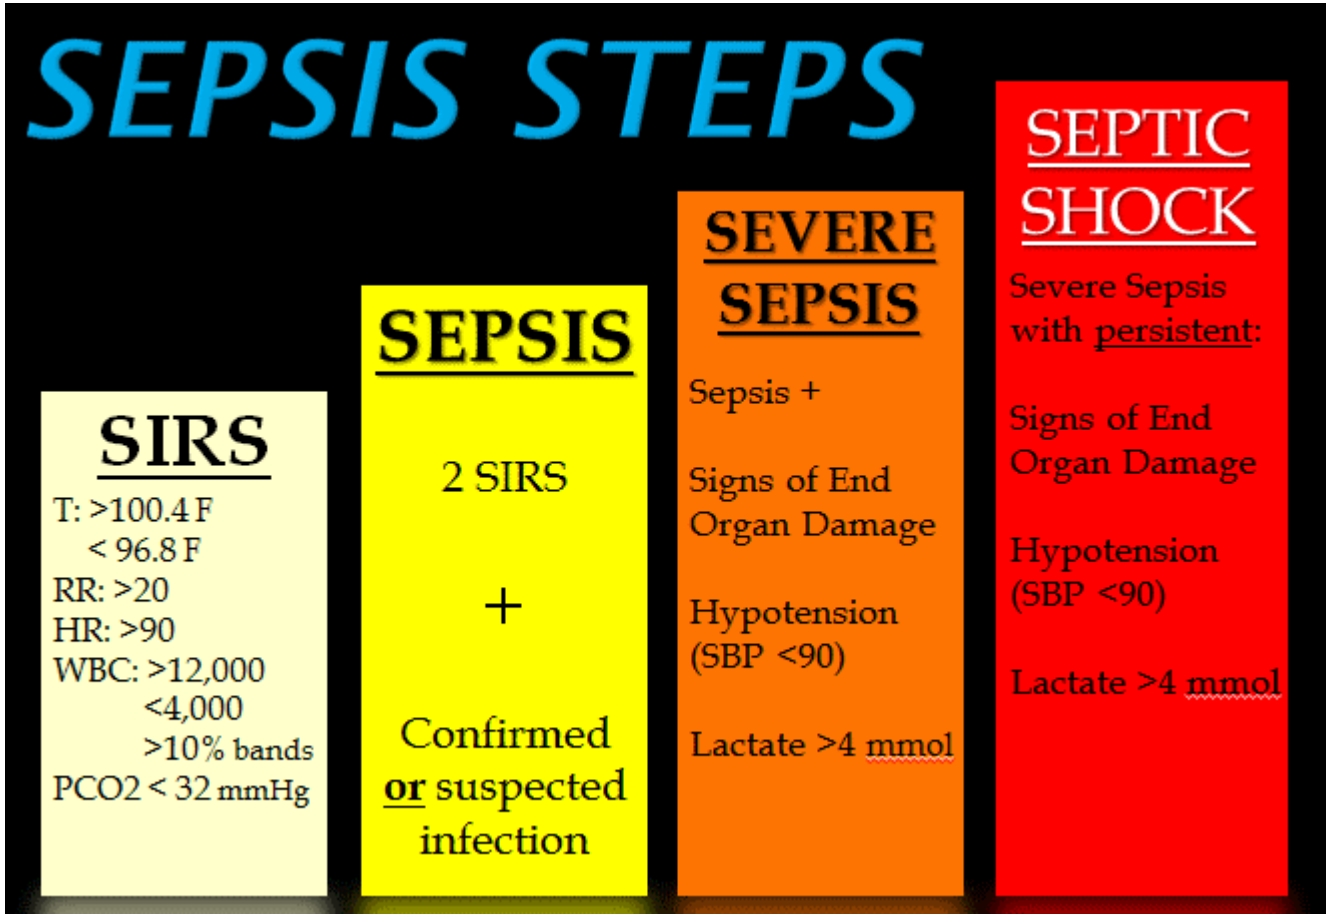
The term sepsis

Definition Sepsis-1, 1992
SIRS due to infection

Box 1. SIRS (Systemic Inflammatory Response Syndrome)

Two or more of:

- Temperature >38°C or <36°C
- Heart rate >90/min
- Respiratory rate >20/min or $PaCO_2$ <32 mm Hg (4.3 kPa)
- White blood cell count >12 000/mm^3 or <4000/mm^3 or >10% immature bands



The term sepsis

Definition Sepsis-2, 2003

supplemented by a list of diagnostic criteria

including alteration of consciousness, oedema, positive fluid balance, hyperglycaemia, etc.

Infection[a]

Documented or suspected *and* some of the following[b]:

General parameters

Fever (core temperature >38.3°C)
Hypothermia (core temperature <36°C
Heart rate >90 bpm or >2 SD above the normal value for age
Tachypnea: >30 bpm
Altered mental status
Significant edema or positive fluid balance (>20 ml/kg over 24 h)
Hyperglycemia (plasma glucose >110 mg/dl or 7.7 mM/l) in the absence of diabetes

Inflammatory parameters

Leukocytosis (white blood cell count >12,000/µl)
Leukopenia (white blood cell count <4,000/µl)
Normal white blood cell count with >10% immature forms
Plasma C reactive protein >2 SD above the normal value
Plasma procalcitonin >2 SD above the normal value

Hemodynamic parameters

Arterial hypotension[b] (systolic blood pressure <90 mmHg, mean arterial pressure <70, or a systolic blood pressure decrease >40 mmHg in adults or <2 SD below normal for age)
Mixed venous oxygen saturation >70%[b]
Cardiac index >3.5 l min^{-1} m^{-2}[c,d]
Organ dysfunction parameters
Arterial hypoxemia ($PaO_2/FIO2$ <300)
Acute oliguria (urine output <0.5 ml kg^{-1} h^{-1} or 45 mM/l for at least 2 h)
Creatinine increase ≥0.5 mg/dl
Coagulation abnormalities (international normalized ratio >1.5 or activated partial thromboplastin time >60 s)
Ileus (absent bowel sounds)
Thrombocytopenia (platelet count <100,000/µl)
Hyperbilirubinemia (plasma total bilirubin >4 mg/dl or 70 mmol/l)

Tissue perfusion parameters

Hyperlactatemia (>3 mmol/l)
Decreased capillary refill or mottling

The term sepsis

life-threatening **organ dysfunction** caused by a **dysregulated host response** to infection

today's sepsis (sepsis-3) corresponds to severe sepsis (sepsis-1),
i.e. distinguishes sepsis from uncomplicated BSI

Clinical criteria: SOFA (sequential organ failure assessment)

Table 1. Sequential [Sepsis-Related] Organ Failure Assessment Score[a]

	Score				
System	0	1	2	3	4
Respiration					
Pao_2/Fio_2, mm Hg (kPa)	≥400 (53.3)	<400 (53.3)	<300 (40)	<200 (26.7) with respiratory support	<100 (13.3) with respiratory support
Coagulation					
Platelets, $\times 10^3/\mu L$	≥150	<150	<100	<50	<20
Liver					
Bilirubin, mg/dL (μmol/L)	<1.2 (20)	1.2-1.9 (20-32)	2.0-5.9 (33-101)	6.0-11.9 (102-204)	>12.0 (204)
Cardiovascular	MAP ≥70 mm Hg	MAP <70 mm Hg	Dopamine <5 or dobutamine (any dose)[b]	Dopamine 5.1-15 or epinephrine ≤0.1 or norepinephrine ≤0.1[b]	Dopamine >15 or epinephrine >0.1 or norepinephrine >0.1[b]
Central nervous system					
Glasgow Coma Scale score[c]	15	13-14	10-12	6-9	<6
Renal					
Creatinine, mg/dL (μmol/L)	<1.2 (110)	1.2-1.9 (110-170)	2.0-3.4 (171-299)	3.5-4.9 (300-440)	>5.0 (440)
Urine output, mL/d				<500	<200

no standardised diagnostic test for sepsis is available

Microbiological diagnostics

Blood culture

Molecular diagnostics

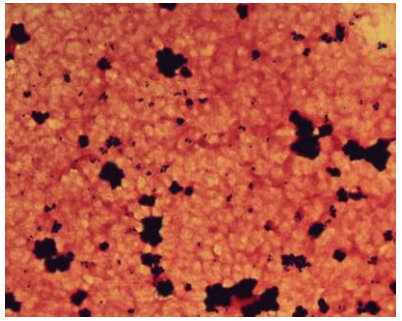
Blood culture

1- 3 days

positive

negative

5 days



Gram staining

culture on solid media

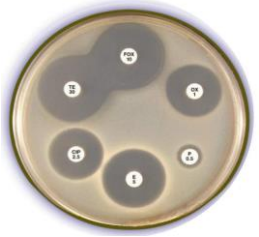
2 hours

preliminary identification

1 day

identification and AST

1 day



What characteristics should the ideal dg. test have:

	Blood culture:
• cheap	yes
• reliable	sensitivity 50% only
• rapid (ultra-rapid)	takes dozens of hours
• unaffected by antibiotic treatment	certainly affected (x resins)
• distinguishing the finding of a pathogen from contamination	not straightforward
• with information on appropriate ATB treatment	upon AST

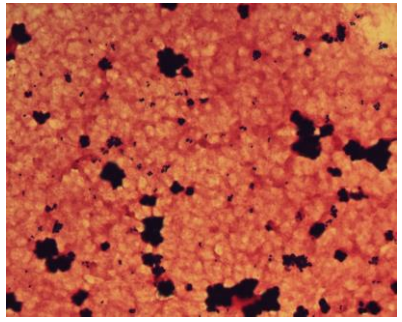
Blood culture

1- 3 days

positive

negative

5 days



Gram staining

2 hours

preliminary identification

1 den

culture on solid media

identification and AST

1 day

1 hour

identification and several AMR genes

43 targets

Tabulka 2. Analyty detekované testem BioFire BCID2 Panel

Grampozitivní bakterie					
Enterococcus faecalis	*Staphylococcus* spp.		*Streptococcus* spp.		
Enterococcus faecium		*Staphylococcus aureus*		*Streptococcus agalactiae* (skupina B)	
Listeria monocytogenes		*Staphylococcus epidermidis*		*Streptococcus pneumoniae*	
		Staphylococcus lugdunensis		*Streptococcus pyogenes* (skupina A)	

Gramnegativní bakterie					
Komplex *Acinetobacter calcoaceticus-baumannii*			*Enterobacterales*		
Bacteroides fragilis				Komplex *Enterobacter cloacae*	
Haemophilus influenzae				*Escherichia coli*	
Neisseria meningitidis (opouzdřená)				*Klebsiella aerogenes*	
Pseudomonas aeruginosa				*Klebsiella oxytoca*	
Stenotrophomonas maltophilia				Skupina *Klebsiella pneumoniae*	
				Proteus spp.	
				Salmonella spp.	
				Serratia marcescens	

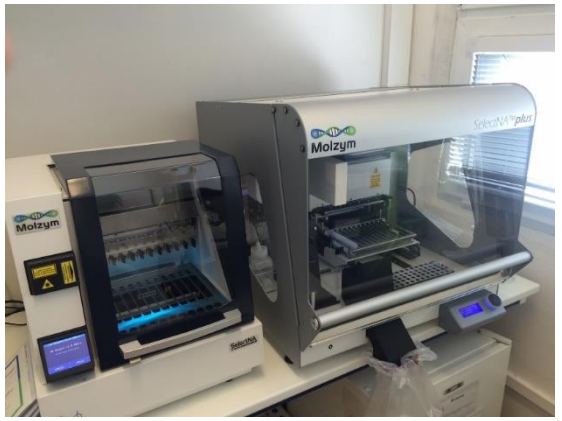
Kvasinky		
Candida albicans	*Candida krusei*	*Cryptococcus neoformans/gattii*
Candida auris	*Candida parapsilosis*	
Candida glabrata	*Candida tropicalis*	

Geny antimikrobiální rezistence				
CTX-M	KPC	*mecA/C*	NDM	*vanA/B*
IMP	*mcr-1*[a]	*mecA/C* a MREJ (MRSA)	OXA-48-like	VIM

Molecular diagnostics

10 hours (intensive)

broad-range PCR (16S rRNA gene)
+ Sanger sequencing



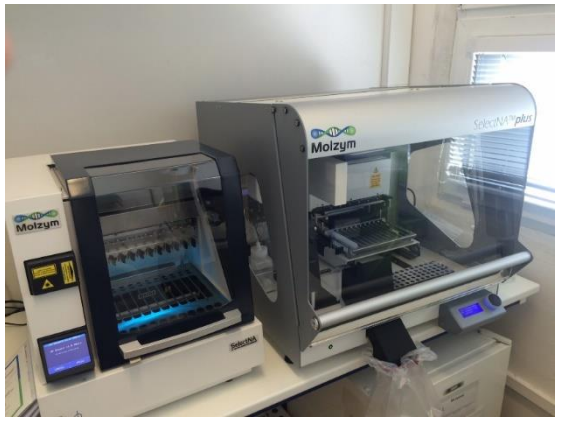
Use of 16S on various materials

	Heart valves	Joint aspirates	Blood ICU
Samples total	**75**	**230**	**476**
Samples positive	55	135	186
Samples positive by both culture and 16S PCR	11	73	87
Samples positive by 16S PCR only	**44**	**59**	**73**
Samples positive by culture only	0	3	26
Added values of 16S PCR (% from all samples)	**56 %**	**19 %**	**7 %**
False negativity of 16S PCR (% from all samples)	0 %	2 %	7 %

Molecular diagnostics

10 hours (intensive)

broad-range PCR (16S rRNA gene)
+ Sanger sequencing



3.5 hours

multiplex PCR and T2MR

T2MR and „ESCAPE“

- a group of six virulent and resistant bacteria (in the T2MR list, *E. coli* replaces *Enterobacter*)
- health care-associated infections
- may escape conventional ATB therapy due to their MDR phenotype

Escherichia coli	E (Ec)
Staphylococcus aureus	S
Klebsiella pneumoniae	K
Acinetobacter baumannii	A
Pseudomonas aeruginosa	P
Enterococcus faecium	E

Back to blood culture

Blood culture

Gold standard of microbiological diagnostics of sepsis (BSI)

To collect	Traditional approach	Novel approach
Which material	blood	blood
When	when the temperature rises	on suspicion of BSI
How	„paired blood cultures" **2x to 3x twin bottles**	Single sampling **1x four to six bottles**

one blood culture ≠ one bottle
one blood culture = a set of bottles taken at a given time, or all bottles taken during a single septic episode (24 hours)

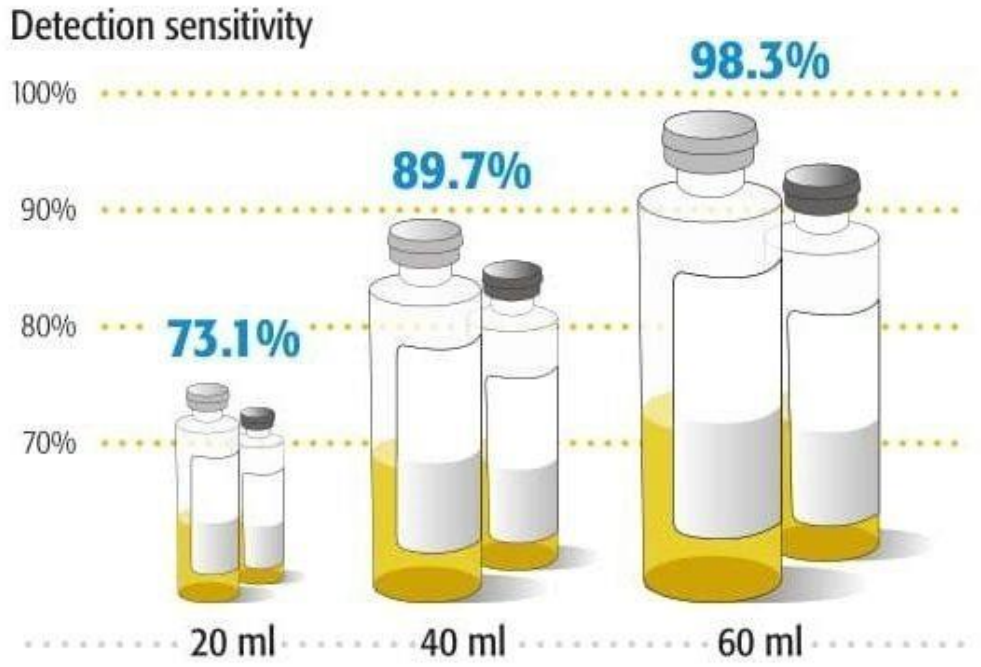
Collection of a sufficient amount of blood

- essential to increase the sensitivity

only 1 to 10 bacterial cells in 1 mL of blood

Desired blood volume: 40 to 60 mL

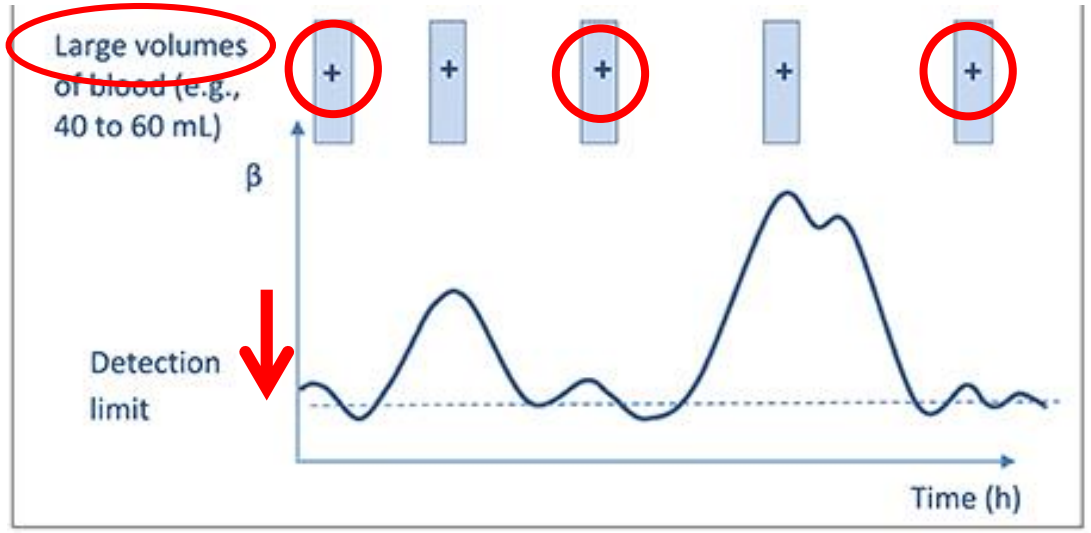
Taking just one single bottle is useless



Lee et al. Detection of bloodstream infections in adults: how many blood cultures are needed? 2007.

Collection of a sufficient amount of blood

- essential to increase the sensitivity

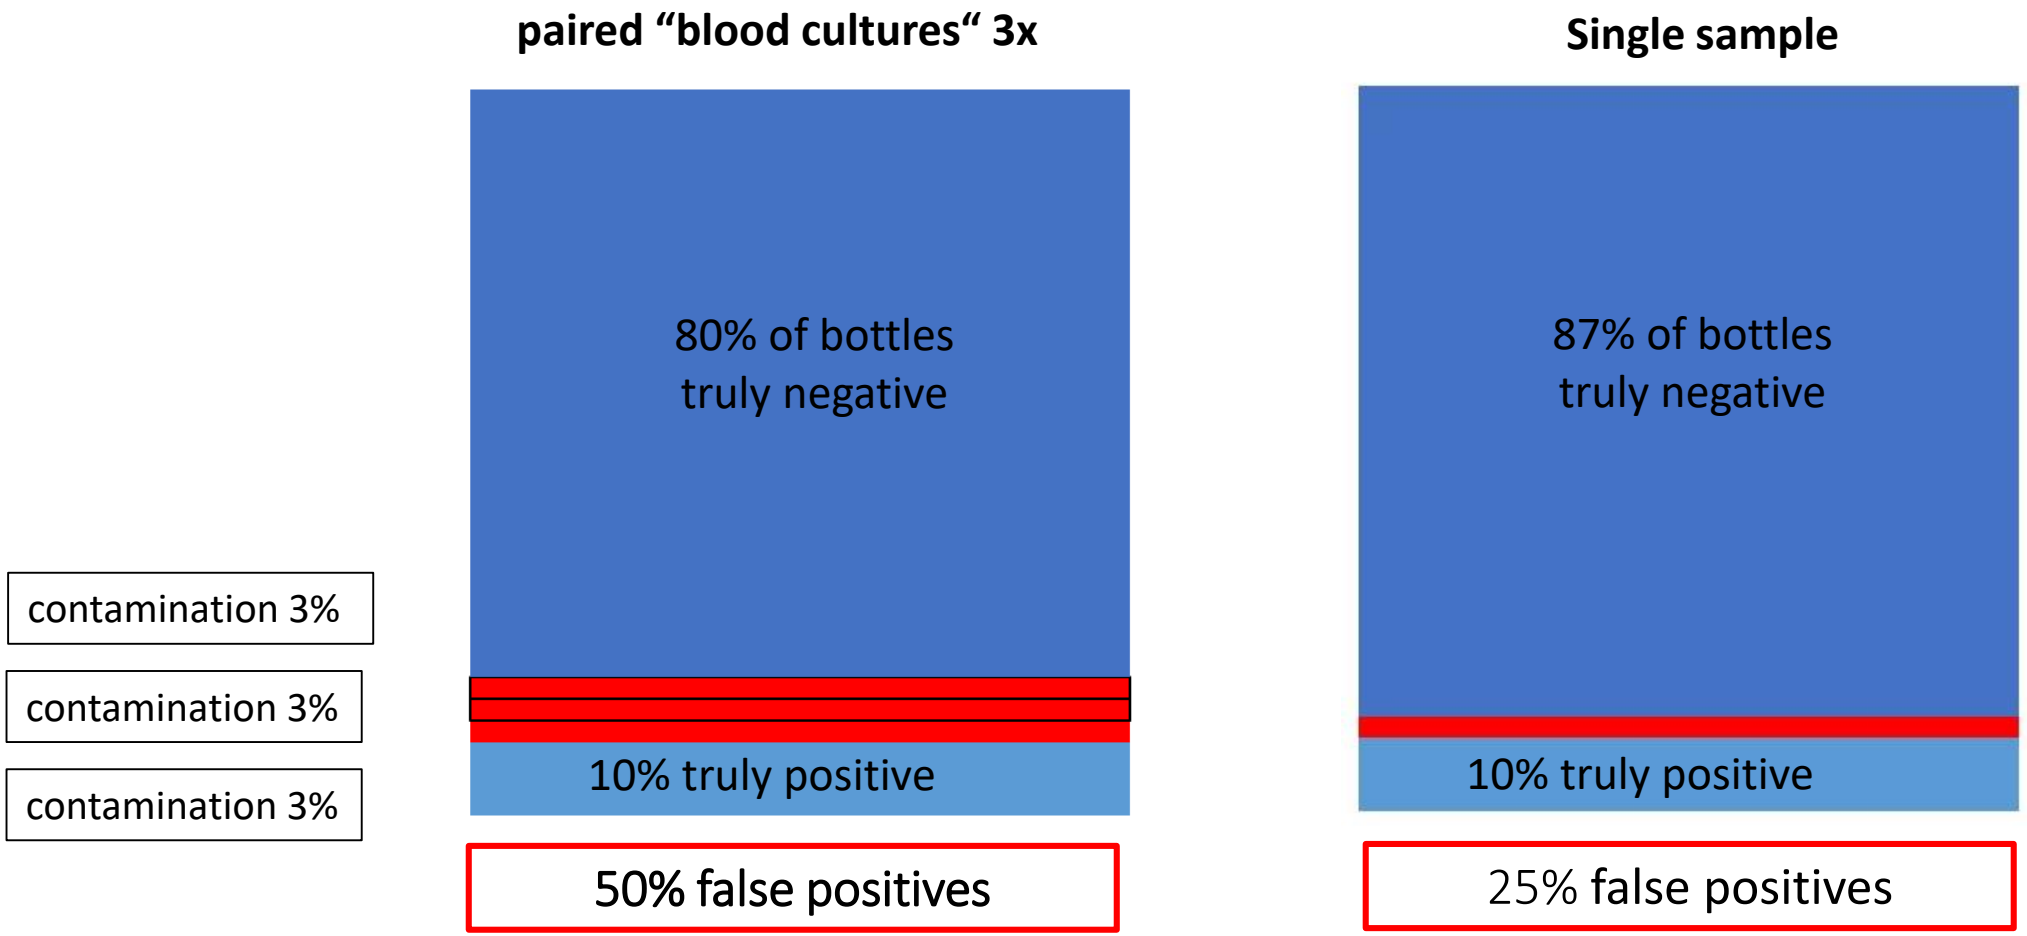


Intermittent bacteraemia for less than 24 hours is exceptional

Single sample

- essential to increase the specificity

Common contaminants: coagulase negative staphylococci, *Corynebacterium* spp., *Micrococcus* spp., *Bacillus* spp., *Cutibacterium acnes*.



Practical aspects of blood culture collection

- Sufficient amount of blood, **40 to 60 ml** = 4 to 6 bottles (10 mL each)
  Fill the bottles completely (orientation according to the scale on the side of the bottle)
- Aerobic and anaerobic bottles in ratio **1 : 1**; to fill **aerobic bottles as the first in order**
- Mycotic bottle can be added to the basic set

- collection from the periphery
- start automatic blood incubation as early as possible

Management of sepsis (from microbiologcal perspective)

- broad-spectrum AB therapy timely (within one hour of occurrence):

  beta-lactam (carbapenem or piperacilin/tazobactam or cefepim)

  + aminoglycoside (amikacin or gentamicin)

  potentially + clindamycin (or linezolid) if production of toxin is suspected

- blood cutlure

  + sometimes molecular diagnostics

Infective endocarditis

- predisposing factors: valve replacement, pacemaker, iv. addicts, rheumatic fever

Causing agents:

S. aureus, viridans streptococci (oral), *S. gallolyticus*, enterococci, HACEK, non culturable (*bartonella, coxiella*), candida

HACEK: *Haemophilus aphrophilus* (today *Aggregatibacter*), *Aggregatibacter actinomycetemcomitans*, *Cardiobacterium hominis*, *Eikenella corrodens*, *Kingella kingae*

Infective endocarditis

Diagnosis is based on clinical findings, microbiology and imaging (oesophageal echo)

Duke criteria:

Major criteria	Minor criteria
1. Two positive blood cultures with typical microorganisms collected at least 12 h apart (or one positive culture for *Coxiella burnetii*) 2. Evidence of endocardial involvement (new murmur, echocardiographic evidence of cardiac mass, abscess, valve dehiscence)	1. Fever > 38°C 2. Vascular phenomenon (systemic emboli, Janeway lesions) 3. Immunologic phenomenon (Osler nodes, Roth spots) 4. Predisposition to infective endocarditis (previous infective endocarditis or intravenous drug abuse) 5. Microbiologic evidence that does not meet major criteria

2	+	0
1	+	3
0	+	5

repeated sampling of haemocultures:

→ need to catch microbes repeatedly
→ 3x2 vials in total within 24 hours

Thank you for your attention
