Ordinary language is the *modus operandi*. In the natural attitude, the meaning of a word is taken principally to be what it references or stands for in the real world, following a correspondence theory of meaning. In this framework, the leading task of language is to convey accurate information. Viewed as a process of typification, however, words and categories are the constitutive building blocks of the social world. Typification through ordinary language use creates the sense among users that the life world is familiarly organized and substantial, simultaneously giving it shape and meaning. Individuals who interact with one another do so in an environment that is concurrently constructed and experienced in fundamentally the same terms by all parties, even

though mistakes may be made in its particular apprehensions. Taking for granted that we intersubjectively share the same reality, we assume further that we can understand each other in its terms. Intersubjectivity is thus a social accomplishment, a set of understandings sustained in and through the shared assumptions of interaction and recurrently sustained in processes of typification.

Ethnomethodological Formulations

Although indebted to Schutz, ethnomethodology is not a mere extension of his social phenomenological program. Ethnomethodology addresses the problem of order by combining a “phenomenological sensibility” (Maynard & Clayman, 1991) with a paramount concern for everyday social practice (Garfinkel, 1967). From an ethnomethodological standpoint, the social world’s facticity is accomplished by way of members’ constitutive interactional work, the mechanics of which produces and maintains the accountable circumstances of their lives.² In a manner of speaking, ethnomethodologists focus on how members actually “do” social life, aiming in particular to document the mechanisms by which they concretely construct and sustain social entities, such as gender, self, or family, for example.

Although Garfinkel’s studies were phenomenologically informed, his overall project responded more directly to his teacher Talcott Parsons’s theory of action (Heritage, 1984; Lynch, 1993). According to Parsons, social order was made possible through socially integrating systems of norms and values, a view that left little room for the everyday production of social order. Garfinkel sought an alternative to this approach, which in his judgment portrayed actors as “cultural dopes” who automatically put into place the effects of external social forces and internalized moral imperatives. Garfinkel’s (1952) response was a vision of social order built from the socially contingent, practical reasoning of ordinary members of society, which, contrastingly, foregrounded their cultural acuity. He viewed members as possessing ordinary linguistic and

interactional skills through which the accountable features of everyday life were produced. This approach deeply implicated members in the production of social order. Rather than more or less playing out moral directives, Garfinkel conceptualized members of society as actively using them, thus *working* to give their world a sense of orderliness. Indeed, ethnomethodology’s focus became members’ integral “methods” for accomplishing everyday reality.

The empirical investigation of members’ methods takes its point of departure from phenomenological bracketing. Adopting the parallel policy of “ethnomethodological indifference” (Garfinkel & Sacks, 1970), the investigator temporarily suspends all commitments to a priori or privileged versions of the social world, focusing instead on how members accomplish a sense of social order. Social realities such as crime or mental illness are not taken for granted; instead, belief in them is suspended temporarily in order to make visible how they become realities for those concerned. This brings into view the ordinary constitutive work that produces the locally unchallenged appearance of stable realities. This policy vigorously resists judgmental characterizations of the correctness of members’ activities. Contrary to the common sociological tendency to ironicize and criticize commonsense formulations from the standpoint of ostensibly correct sociological views, ethnomethodology takes members’ practical reasoning for what it is—circumstantially adequate ways of interpersonally orienting to and interpreting the world at hand. The abiding guideline is succinctly conveyed by Melvin Pollner (personal communication): “Don’t argue with the members!”

Ethnomethodologists have examined many facets of social order. One aim has been to document how recognizable structures of behavior, systems of motivation, or causal ties between motivations and social structures are evidenced in members’ practical reasoning (Zimmerman & Wieder, 1970). Whereas conventional sociology orients to rules, norms, and shared meanings as exogenous explanations for members’ actions, ethnomethodology turns this around to consider

how members themselves orient to and use rules, norms, and shared meanings to account for the regularity of their actions. Ethnomethodology sets aside the idea that actions are externally rule-governed or internally motivated in order to observe how members themselves establish and sustain social regularities. The appearance of action as being the consequence of a rule is treated as just that—the *appearance* of action as compliant or noncompliant. In “accounting” for their actions by prospectively invoking rules or retrospectively offering rule-motivated explanations for action, members convey a sense of structure and order, and, in the process, cast their actions as rational, coherent, precedented, and reproducible for all practical purposes (Zimmerman, 1970).

For example, a juror in the midst of deliberations may account for her opinion by saying that the judge’s instructions on how to consider the case in question compel her to think as she does. She actively uses the judge’s instructions to make sense of her opinion, thereby giving it the semblance of rationality, legality, and correctness because it was formed “according to the rule” invoked (Holstein, 1983). In contrast, another juror might account for his opinion by saying that it was serving the interests of justice, citing a value or moral principle in explanation (Maynard & Manzo, 1993). From an ethnomethodological standpoint, the rationality or correctness of these opinions and the reasoning involved is not at issue. Instead, the focus is on the *hows* involved—the use of instructions, values, moral principles, and other accounts to construct a sense of coherence in social action, in this case a shared understanding among jurors of what led them to form their opinions and reach a verdict.

The accountable display of social order forms ethnomethodology’s analytic horizon. Rather than assuming a priori that members share meanings and definitions of situations, ethnomethodologists consider how members achieve them by applying a native capacity to “artfully” account for their actions, rendering them orderly. Social order is not externally imposed by proverbial social forces, nor is it the expression of more

or less socialized members of society; instead, ethnomethodologists view it as locally produced by way of the practices of mundane reason (Pollner, 1987). If social order is accomplished in and through its practices, then social worlds and circumstances are self-generating. Members, as we put it earlier, are continually “doing” social life in the very actions they take to communicate and make sense of it. Their language games, to borrow from Ludwig Wittgenstein (1958), virtually constitute their everyday realities; in this sense, the games themselves are “forms of life.”

This implicates two properties of ordinary social action. First, all actions and objects are “indexical”; they depend upon (or “index”) context (see Holstein & Gubrium, 2004). Objects and events have equivocal or indeterminate meanings without a discernible context. It is through contextualization that practical meaning is derived. Second, the circumstances that provide meaningful contexts are themselves self-generating. Each reference to, or account for, an action—such as the juror’s comment that she is expressly following the judge’s directives—establishes a context (in this case, of procedural dutifulness) for evaluating the self-same and related actions of the juror herself and the actions of others. The account establishes a particular context, which in turn becomes a basis for making her own and others’ actions accountable. Having established this context, the juror can then virtually turn around and account for her actions by saying, for example, “That’s why I feel as I do,” in effect parlaying the context she has constructed for her actions into something recognizable and reasonable (accountable), if not ultimately acceptable. Practical reasoning, in other words, is simultaneously in and about the settings to which it orients and that it describes. Social order and its practical realities are thus “reflexive.” Accounts or descriptions of a setting constitute that setting, while they are simultaneously being shaped by the contexts they constitute.

Ethnomethodological research is keenly attuned to naturally occurring talk and social interaction, orienting to them as constitutive elements of the settings studied (see J. M. Atkinson

& Drew, 1979; Maynard, 1984, 1989; Mehan & Wood, 1975; Sacks, 1972). This has taken different empirical directions, in part depending on whether the interactive meanings or the structure of talk is emphasized. Ethnographic studies tend to focus on locally crafted meanings and the settings within which social interaction constitutes the practical realities in question. Such studies consider the situated content of talk in relation to local meaning-making (see Gubrium, 1992; Holstein, 1993; Lynch & Bögen, 1996; Miller, 1991; Pollner, 1987; Wieder, 1988). They combine attention to how social order is built up in everyday communication with detailed descriptions of place settings as those settings and their local understandings and perspectives mediate the meaning of what is said in the course of social interaction. The texts produced from such studies are highly descriptive of everyday life, with both conversational extracts from the settings and ethnographic accounts of interaction being used to convey the methodical production of the subject matter in question. To the extent the analysis of talk in relation to social interaction and setting is undertaken, this tends to take the form of (non-Foucauldian) discourse analysis, or DA, which more or less critically orients to how talk, conversation, and other communicative processes are used to make meaning (see Potter, 1996, 1997; Potter & Wetherell 1987; Wodak, 2004).

Studies that emphasize the structure of talk itself examine the conversational "machinery" through which meaning emerges. The focus here is on the sequential, utterance-by-utterance, socially structuring features of talk or "talk-in-interaction," the now familiar bailiwick of conversation analysis, or CA (see Heritage, 1984; Sacks, Schegloff, & Jefferson, 1974; Silverman, 1998; Zimmerman, 1988). The analyses produced from such studies are detailed explications of the communicative processes by which speakers methodically and sequentially construct their concerns in conversational practice. These analyses are often bereft of ethnographic detail except for brief lead-ins that describe place settings, and the analytic sense conveyed is that biographical and social

particulars can be understood as artifacts of the unfolding conversational machinery, although the analysis of what is called "institutional talk" or "talk at work" has struck a greater balance with place settings in this regard (see, for example, Drew & Heritage, 1992). Although some contend that CA's connection to ethnomethodology is tenuous because of this lack of concern with ethnographic detail (P. Atkinson, 1988; Lynch, 1993; Lynch & Bögen, 1994; for counterarguments see Maynard & Clayman, 1991, and ten Have, 1990), CA clearly shares ethnomethodology's interest in the local and methodical construction of social action (Maynard & Clayman, 1991).

John Heritage (1984) summarizes the fundamentals of conversation analysis in three premises. First, interaction is sequentially organized, and this may be observed in the regularities of ordinary conversation. All aspects of interaction can be found to exhibit stable and identifiable features, which are independent of speakers' individual characteristics. This sets the stage for the analysis of talk as structured in and through social interaction, not by internal sources such as motives or by external determinants such as social status. Second, social interaction is contextually oriented in that talk is simultaneously productive of, and reflects, the circumstances of its production. This premise highlights both the local conditioning and the local constructiveness of talk and interaction, exhibiting the dual properties of indexicality and reflexivity noted earlier. Third, these properties characterize all social interaction, so that no form of talk or interactive detail can be dismissed as irrelevant.

Conversation analysis has come under fire from ethnomethodologists who argue that the in situ details of everyday life are ignored at the risk of reducing social life to recorded talk and conversational sequencing. Michael Lynch, for example, has drawn a parallel between CA and molecular biology, which, proverbially speaking, tends to miss the forest for the trees, in this case the molecules. On one hand, this serves to underscore Lynch's claims about CA's basic formalism and scientism. On the other, it projects the image

of conversation as a relatively predictable set of socially structured techniques through which orderly social activities are assembled. Conversation analysts, according to Lynch, attempt to describe "a simple order of structural elements and rules for combining them, and thus they undertake a reductionist program not unlike molecular biology" (1993, p. 259), which attempts to deconstruct DNA for its molecular structures and rules of combination, glossing over the distinct forms of life in tow.

As a "molecular sociology" (Lynch, 1993), CA focuses on the normative, sequential "machinery" of conversation that constitutes social action. This machinery in many ways inverts conventional understandings of human agency, substituting the demands of a moral order of conversation for psychological and motivational imperatives. Although this does not strip participants of all agency, it does place them in the midst of a "liberal economy" of conversational rights and obligations (Lynch, 1993) that tests ethnomethodological tolerance for deterministic formulations.

In contrast to what Lynch and David Bogen (1994) have labeled the "enriched positivism" of CA, Garfinkel, Lynch, and others have elaborated what they refer to as a "postanalytic" ethnomethodology that is less inclined to universalistic generalizations regarding the enduring structures or machinery of social interaction (see Garfinkel, 1988; Lynch, 1993; Lynch & Bogen, 1996). This program of research centers on the highly localized competencies that constitute specific domains of everyday "work," especially the (bench)work of astronomers (Garfinkel, Lynch, & Livingston, 1981), biologists and neurologists (Lynch, 1985), and mathematicians (Livingston, 1986). The aim is to document the *haecceity*—the "just thisness"—of social practices within circumscribed domains of knowledge and activity (Lynch, 1993). The practical details of the real-time work of these activities are viewed as an *incarnate* feature of the knowledges they produce. It is impossible to separate the knowledges from the highly particularized occasions of their production. The approach is theoretically

minimalist in that it resists a priori conceptualization or categorization, especially historical time, while advocating detailed descriptive studies of the specific, local practices that manifest order and render it accountable (Bogen & Lynch, 1993).

Despite their success at displaying a panoply of social accomplishment practices, CA and postanalytic ethnomethodology in their separate ways tend to disregard an important balance in the conceptualizations of talk, setting, and social interaction that was evident in Garfinkel's early work and Harvey Sacks's (1992) pioneering lectures on conversational practice (see Silverman, 1998). Neither Garfinkel nor Sacks envisioned the machinery of conversation as productive of recognizable social forms in its own right. Attention to the constitutive *hows* of social realities were balanced with an eye to the meaningful *whats*. Settings, cultural understandings, and their everyday mediations were viewed as reflexively interwoven with talk and social interaction. Sacks, in particular, understood culture to be a matter of practice, something that served as a resource for discerning the possible linkages of utterances and exchanges. Whether they wrote of (Garfinkel's) "good organizational reasons" or (Sacks's) "membership categorization devices," both initially avoided the reduction of social practice to highly localized or momentary *haecceities* of any kind.

As such, some of the original promise of ethnomethodology has been short-circuited as CA and postanalytic ethnomethodology have increasingly restricted their investigations to the relation between social practices and the immediate accounts of those practices. If the entire goal of postanalytic and CA projects is describing the accounting practices by which descriptions are made intelligible in the immediate circumstances of their production, then constructionists would need to formulate a new project that retains ethnomethodology's interactional sensibilities while extending its scope to both the constitutive and constituted *whats* of everyday life. Michel Foucault, among others, is a valuable resource for such a project.

Foucauldian Discourse Analysis

Whereas ethnomethodology engages the accomplishment of everyday life at the interactional level, Foucault has undertaken a parallel project in a different empirical register. Appearing on the analytic stage during the early 1960s, at about the same time ethnomethodologists did, Foucault considers how historically and culturally located systems of power/knowledge construct subjects and their worlds. Foucauldians refer to these systems as “discourses,” emphasizing that they are not merely bodies of ideas, ideologies, or other symbolic formulations, but are also working attitudes, modes of address, terms of reference, and courses of action suffused into social practices. Foucault (1972, p. 48) himself explains that discourses are not “a mere intersection of things and words: an obscure web of things, and a manifest, visible, colored chain of words.” Rather, they are “practices that systematically form the objects [and subjects] of which they speak” (p. 49). Even the design of buildings such as prisons reveals the social logic that specifies ways of interpreting persons and the physical and social landscapes they occupy (Foucault, 1979).

Like the ethnomethodological perspective on social interaction, Foucault views discourse as socially reflexive, both constitutive and meaningfully descriptive of the world and its subjects. For Foucault, however, the accent is as much on the constructive *whats* that discourse constitutes as it is on the *hows* of discursive technology. Although this represents a swing in the analytic pendulum toward the culturally “natural,” Foucault’s treatment of discourse as social practice suggests, in particular, the importance of understanding the practices of subjectivity. If he offers a vision of subjects and objects constituted through discourse, he also allows for an unwittingly active subject who simultaneously shapes and puts discourse to work (Best & Kellner, 1991). As Foucault (1988) explains:

If now I am interested . . . in the way in which the subject constitutes himself in an active fashion, by the practices of the self, these practices are nevertheless not something that the individual invents

by himself. They are patterns that he finds in his culture and which are proposed, suggested and imposed on him by his culture, his society and his social group. (p. 11)

This parallels ethnomethodology’s interest in documenting the accomplishment of order in the everyday practice of talk and social interaction. Foucault is particularly concerned with social locations or institutional sites—the asylum, the hospital, and the prison, for example—that specify the practical operation of discourses, linking the discourse of particular subjectivities with the construction of lived experience. As in ethnomethodology, there is an interest in the constitutive quality of systems of discourse; it is an orientation to practice that views social worlds and their subjectivities as always already embedded and embodied in its discursive conventions.

Several commentators have pointed to the parallel between what Foucault (1988) refers to as systems of “power/knowledge” (or discourses) and ethnomethodology’s formulation of the constitutive power of language use (P. Atkinson, 1995; Gubrium & Holstein, 1997; Heritage, 1997; Miller, 1997b; Potter, 1996; Prior, 1997; Silverman, 1993). The correspondence suggests that what Foucault documents historically as “discourses-in-practice” in varied institutional or cultural sites may be likened to what ethnomethodology traces as “discursive practice” in varied forms of social interaction.⁴ We will continue to apply these terms—discourses-in-practice and discursive practice—throughout the chapter to emphasize the parallel, as well as the possibilities for critical awareness and social action that it suggests.

Although ethnomethodologists and Foucauldians draw upon different intellectual traditions and work in distinct empirical registers, we want to emphasize their respective concerns with social practice. They both attend to the reflexivity of discourse. Neither discursive practice nor discourse-in-practice is viewed as being caused or explained by external social forces or internal motives. Rather, they are taken to be the working mechanism of social life itself, as actually known or performed in time and place. For both, “power”

lies in the articulation of distinctive forms of social life as such, not in the application of particular resources by some to affect the lives of others. Although discourses-in-practice are represented by "regimens/regimes" or lived patterns of action that broadly (historically and institutionally) "discipline" or encompass their adherents' lives, and discursive practice is manifest in patterns of talk and interaction that constitute everyday life, the practices refer in common to the lived "doing," or ongoing accomplishment, of social worlds.

For Foucault, power operates in and through discourse as the other face of knowledge, thus the term "power/knowledge." Discourse not only puts words to work, it also gives them their meaning, constructs perceptions, and formulates understanding and ongoing courses of interaction. The "work" entailed simultaneously and reflexively constitutes the realities that words are taken otherwise to merely reference or specify. To deploy a particular discourse of subjectivity is not simply a matter of representing a subject; in practice, it simultaneously constitutes the kinds of subjects that are meaningfully embedded in the discourse itself. For example, to articulate the discourse of medicine in today's world automatically generates the roles of professional healer and patient, each of whose actions in turn articulate the application and reception of technologies of healing served by the dominance of scientific knowledge. The taken-for-grantedness of this socially encompassing discourse makes challenges to this way of "thinking" (or speaking) seem oddly misplaced. Even the weak "powerfully" participate in the discourse that defines them as weak. This is a kind of knowledge-in-practice, and it is powerful because it not only represents but also ineluctably puts into practice what is known and shared. Language is not just more or less correlated with what it represents, but is always already a "form of life," to again put it in Wittgenstein's (1958) terms. If ethnomethodologists tend to emphasize *how* members use everyday methods to account for their activities and their worlds, Foucault makes us aware of the related conditions of possibility for *what* the results are likely to be. For example,

in a Western postindustrial world, to seriously think of medicine and voodoo as equally viable paradigms for understanding sickness and healing would seem idiosyncratic, if not amusing or preposterous, in most conventional situations. The power of medical discourse partially lies in its ability to be "seen but unnoticed," in its ability to appear as *the* only possibility while other possibilities are outside the plausible realm.

Both ethnomethodology's and Foucault's approach to empirical material are "analytics," not theoretical frameworks in the traditional sense. Conventionally understood, theory purports to explain the state of the matters in question. It provides answers to *why* concerns, such as why the suicide rate is rising or why individuals are suffering depression. Ethnomethodology and the Foucauldian project, in contrast, aim to answer how it is that individual experience comes to be understood in particular terms such as these. They are pretheoretical in this sense, respectively seeking to arrive at an understanding of how the subject matter of theory comes into existence in the first place, and of what the subject of theory might possibly become. The parallel lies in the common goal of documenting the practiced bases of such realities.

Still, this remains a parallel. Because Foucault's project (and most Foucauldian projects) operates in a historical register, real-time talk and social interaction are understandably missing from chosen bodies of empirical material. Although Foucault himself points to sharp turns in the discursive formations that both form and inform the shifting realities of varied institutional spheres, contrasting extant social forms with the "birth" of new ones, he provides little or no sense of the *everyday* technology by which this is achieved (see P. Atkinson, 1995; Holstein & Gubrium, 2000). Certainly, he elaborates the broad birth of new technologies, such as the emergence of new regimes of surveillance in medicine and modern criminal justice systems (Foucault, 1965, 1979), but he doesn't provide us with a view of how these operate in social interaction. Neither do latter-day Foucauldians—such as Nikolas Rose (1990), who informatively documents the birth and rise of the

technical apparatus for “governing the soul” that forms a private self—offer much insight into the everyday processes through which such regimes are accomplished. These *hows*, in other words, are largely missing from their analyses.

Conversely, ethnomethodology’s commitment to documenting the real-time, interactive processes by which reality is built up into accountable structures precludes a broader perspective on constitutive resources, possibilities, and limitations. Such *whats*, so to speak, are largely absent in adherents’ work. It is one thing to show in interactive detail that our everyday encounters with reality are ongoing accomplishments, but is quite another matter to derive an understanding of what the general parameters of those everyday encounters might be. The machinery of talk-in-interaction tells us little about the massive resources that are taken up in, and that guide, the operation of conversation, or about the consequences of producing particular results and not others, each of which is an important ingredient of practice. Members speak their worlds and their subjectivities, but they also articulate particular forms of life as they do so. What Foucauldian considerations offer ethnomethodology in this regard is an analytic sensitivity to the discursive opportunities and possibilities at work in talk and social interaction, but without making it necessary to take these up as external templates for the everyday production of social order.

■ AN ANALYTICS OF INTERPRETIVE PRACTICE

The analytics of interpretive practice has benefited from drawing together ethnomethodological and Foucauldian sensibilities. This is not simply another attempt at bridging the so-called macro-micro divide. That debate usually centers on the question of how to conceptualize the relationship between preexisting larger and smaller social forms, the assumption being that these are categorically distinct and separately discernible. Issues raised in the debate perpetuate the distinction between, say, social systems, on one hand,

and social interaction, on the other. In contrast, those who consider ethnomethodology and Foucauldian analytics to be parallel operations focus their attention instead on the interactional, institutional, and cultural variabilities of socially constituting discursive practice or discourses-in-practice, as the case might be. They are concerned with how the social construction process is shaped across various domains of everyday life, not in how separate theories of macro and micro domains can be linked together for a fuller account of social organization. Doctrinaire accounts of Garfinkel, Sacks, Foucault, and others may continue to sustain a variety of distinct projects, but these projects are not likely to inform one another; nor will they lead to profitable “conversations” between dogmatic practitioners who insist on viewing themselves as speaking different analytic languages.⁴ In our view, what is required is a new, hybridized analytics of reality construction at the crossroads of institutions, culture, and social interaction—an analytics that “misreads” and co-opts useful insights from established traditions in order to appreciate the possible complementarity of analytic idioms, without losing sight of their distinctive utilities, limitations, and contributions.

■ BEYOND ETHNOMETHODOLOGY

Some conversation analysts have edged in this direction by analyzing the sequential machinery of talk-in-interaction as it is patterned by institutional context, bringing a greater concern for the *whats* of social life into the picture. Their studies of “talk at work” aim to specify how the “simplest systematics” of ordinary conversation (Sacks, Schegloff, & Jefferson, 1974) is shaped in various ways by the reflexively constructed speech environments of particular interactional regimes (see Boden & Zimmerman, 1991; Drew & Heritage, 1992). Ethnomethodologically oriented ethnographers approach the problem from another direction by asking how institutions and their respective representational cultures are brought into being, managed, and sustained in and through members’

social interaction (or "reality work") (see P. Atkinson, 1995; Dingwall, Eekelaar, & Murray, 1983; Emerson, 1969; Emerson & Messinger, 1977; Gubrium, 1992; Holstein, 1993; Mehan, 1979; Miller, 1991, 1997a). Self-consciously Foucauldian ethnographers, too, have drawn links between everyday discursive practice and discourses-in-practice to document in local detail how the formulation of everyday texts such as psychiatric case records or coroners' reports reproduce institutional discourses (see Prior, 1997).

In their own fashions, these efforts consider both the *hows* and the *whats* of reality construction. But this is analytically risky business. Asking *how* questions without having an integral way of getting an analytic handle on *what* questions makes concern with the *whats* arbitrary. Although talk-in-interaction is locally "artful," as Garfinkel (1967) puts it, not just anything goes. On the other hand, if we swing too far analytically in the direction of contextual or cultural imperatives, we end up with the cultural, institutional, or judgmental "dopes" that Garfinkel (1967) decried.

The admonition that "not just anything goes" has been taken seriously, but cautiously, by both ethnomethodologists and conversation analysts as they have sought to carefully document the practical contours of interaction in the varied circumstances in which it unfolds. Systematic attention to everyday reasoning and to the sequential organization of conversations have made it clear that outcomes are constructed in the interactional apparatuses within which their antecedents are made topical. But this is a very delimited approach to the constitutive *whats* of social construction, one that lacks a broad view of the institutional and cultural discourses that serve as resources for what is likely to be constructed, when, and where in everyday life.

To broaden and enrich ethnomethodology's analytic scope and repertoire, we have extended its reach into the institutional and cultural *whats* that come into play in social interaction. This needn't be a historical extension, as was Foucault's metier, although that certainly should not be ruled out. Rather, we appeal to a "cautious" (and self-conscious) naturalism that addresses the practical

and sized production of everyday life (Gubrium, 1993) and that, as will be seen, provides a integral basis for critically, not just descriptively, attending to ongoing talk and social interaction. The analytics of interpretive practice is such an effort. It centers on the interplay, not the synthesis, of discursive practice and discourses-in-practice, the tandem projects of ethnomethodology and Foucauldian discourse analysis. This analytics assiduously avoids theorizing social forms, lest the discursive practices associated with the construction of these forms be taken for granted. By the same token, it concertedly keeps institutional or cultural discourses in view, lest they be dissolved into localized displays of practical reasoning or forms of sequential organization for talk-in-interaction. First and foremost, an analytics of interpretive practice takes us, in real time, to the "going concerns" of everyday life, as Everett Hughes (1984) liked to call social institutions. There, we can focus on how members artfully put distinct discourses to work as they constitute their subjectivities and related social worlds.

The emphasis on the interplay between the *hows* and *whats* of interpretive practice is paramount. Interplay connotes a dynamic relationship. We assiduously avoid analytically privileging either discursive practice or discourses-in-practice. Putting it in ethnomethodological terms, the aim of an analytics of interpretive practice is to document the interplay between the practical reasoning and interactive machinery entailed in constructing a sense of everyday reality, on one hand, and the institutional conditions, resources, and related discourses that substantively nourish and interpretively mediate interaction, on the other. Putting it in Foucauldian terms, the goal is to describe the interplay between institutional discourses and the "dividing practices" that constitute local subjectivities and their worlds of experience (Foucault, 1965). The symmetry of real-world practice requires that we give equal treatment to both its articulative and its substantive engagements.

Qualitative researchers are increasingly focusing on these two sides of interpretive practice, looking to both the artful processes and the

substantive conditions of meaning-making and social order. Douglas Maynard (1989), for example, notes that most ethnographers traditionally have asked "How do participants see things?" whereas ethnomethodologically informed discourse studies have asked "How do participants do things?" Although his own work typically begins with the later question, Maynard cautions us not to ignore the former. He explains that, in the interest of studying how members *do* things, ethnomethodological studies have tended to de-emphasize factors that condition their actions. Recognizing that "external social structure is used as a resource for social interaction at the same time as it is constituted within it," Maynard suggests that ethnographic and discourse studies can be mutually informative, allowing researchers to better document the ways in which the "structure of interaction, while being a local production, simultaneously enacts matters whose origins are externally initiated" (1989, p. 139). "In addition to knowing how people 'see' their workaday worlds," writes Maynard (p. 144), researchers should try to understand how people "discover and exhibit features of these worlds so that they can be 'seen.'"

Expressing similar interests and concerns, Hugh Mehan has developed a discourse-oriented program of "constitutive ethnography" that puts "structure and structuring activities on an equal footing by showing *how* the social facts of the world emerge from structuring work to become external and constraining" (1979, p. 18, emphasis in the original). Mehan examines "contrastive" instances of interpretation in order to describe both the "distal" and the "proximate" features of the reality-constituting work people do "within institutional, cultural, and historical contexts" (1979, pp. 73 and 81).

Beginning from similar ethnomethodological and discourse analytic footings, David Silverman (1993) likewise attends to the institutional venues of talk and social construction (also see Silverman, 1985, 1997). Seeking a mode of qualitative inquiry that exhibits both constitutive and contextual sensibilities, he suggests that discourse studies that consider the varied institutional

contexts of talk bring a new perspective to qualitative inquiry. Working in the same vein, Gale Miller (1991, 1997b) has proposed "ethnographies of institutional discourse" that serve to document "the ways in which setting members use discursive resources in organizing their practical actions, and how members' actions are constrained by the resources available in the settings" (Miller, 1991, p. 280). This approach makes explicit overtures to both conversation analysis and Foucauldian discourse analysis.

Miller's (1997a) ethnography of the discourses characterizing a therapy agency is instructive, especially as it sheds light on the everyday production of the client in therapy. His 12-year ethnographic study of Northland Clinic, an internationally prominent center of "brief therapy," recounts a marked shift in client subjectivity that accompanied a conscious alteration of treatment philosophy. When Miller began his fieldwork, Northland employed "ecosystemic brief therapy," which emphasized the social contexts of clients' lives and problems. In this therapeutic environment, clients' subjectivity was linked with the systems of social relationships that were taken to form and fuel their problems. The approach required the staff to discern the state of these systems and to intervene so as to alter their dynamics and thereby effect change. Miller notes that this approach was informed by a "modern" discourse of the reality of the problems in question.

Several years into the fieldwork, Northland shifted to a more "postmodern" approach, articulating intervention in an everyday linguistic and constructivist discourse. Therapists began to apply what was called "solution-focused brief therapy," which meant viewing troubles as ways of talking about everyday life. This prompted the staff to orient to the therapy process as a set of language games, expressly appropriating Wittgenstein's sense of the term. The idea here was that troubles were as much constructions—ways of talking or forms of life—as they were real difficulties for the clients in question. This transformed clients' institutional subjectivity from being relatively passive agents of systems of personal troubles

and negative stories, to being active problem solvers with the potential to formulate positive stories about themselves and design helpful solutions. As an everyday language of solutions, not a discourse of problems, became the basis of intervention, the narrative identity of clients was transformed to reveal entirely different selves. Changes in the therapy agency were articulations of transformations of both the discourse-in-practice and related discursive practices. This resulted in the construction of distinctly different "clients" and "problems" (subsequently "solutions"). Emphasizing both the *hows* and *whats* of the agency's changing interpretive practices provides both the researcher and those researched an awareness of the alternative ways client troubles can be construed and the kinds of action that can be taken to deal with them in the process.

Dorothy Smith (1987, 1990) has been quite explicit in addressing a version of the interplay between the *whats* and *hows* of social life from a feminist point of view, pointing to the critical consciousness made possible by the perspective. Hers has been an analytics initially informed by ethnomethodological and, increasingly, Foucauldian sensibilities. Moving beyond ethnomethodology, she calls for what she refers to as a "dialectics of discourse and the everyday" (1990, p. 202). Stressing the "play and interplay" of discourse, Smith articulates her view of women's "active" placement in their worlds.

It is easy to misconstrue the discourse as having an overriding power to determine the values and interpretation of women's appearances in local settings, and see this power as essentially at the disposal of the fashion industry and media. But women are active, skilled, make choices, consider, are not fooled or foolish. Within discourse there is play and interplay. (p. 202)

Philosopher Calvin Schrag (1997) similarly emphasizes the advantage of the strategy of analytic interplay over theoretical integration. Schrag puts this in the context of the need to guard against reducing what we refer to as discursive practice to mere speech acts or talk-in-interaction, on one

hand, or supplanting the local artfulness of social interaction with its institutional discourses, on the other. Considering the self after postmodernity, Schrag echoes our own aim to keep both the constructive *whats* and *hows* in balance at the forefront of an analytics, lest the study of lived experience neglect or overemphasize one or the other.

We must stand guard to secure the space of discourse as temporalized event of speaking *between* the objectification of speech acts and language on the one hand and the abstractions and reifications in the structuralist designs of narratology on the other hand. The event of discourse as a saying of something by someone to someone is threatened from both "below" and "above"—from below in terms of a tendency toward an ontology of elementarism fixated on the isolable, constitutive elements of speech acts and linguistic units . . . and from above in the sense of a predilection toward an abstract holism of narratological structures that leave the event of discourse behind. Only by sticking to the terrain of the "between" will the subject as the who of discourse and the who of narrative remain visible. It is on this terrain, which we will later come to call the terrain of lived-experience, that we are able to observe the august event of a self understanding itself through the twin moments of discourse and narration. (pp. 22–23)

We echo Schrag's warning against integrating an analytics of discursive practice with an analytics of discourse-in-practice. To integrate one with the other is to reduce the empirical purview of a common enterprise. Reducing the analytics of discourse-in-practice into discursive practice risks losing the lessons of attending to institutional differences and cultural configurations as they mediate, and are not "just talked into being" through, social interaction. Conversely, figuring discursive practice as the mere residue of institutional discourse risks a totalized marginalization of local artfulness.

Analytic Bracketing

Rather than attempting synthesis or integration, we view an analytics of interpretive practice as more like a skilled juggling act, alternately

concentrating on the myriad *hows* and *whats* of everyday life. This requires a new form of bracketing to capture the interplay between discursive practice and discourses-in-practice. We've called this technique of oscillating indifference to the realities of everyday life "analytic bracketing" (see Gubrium & Holstein, 1997).

Recall that ethnomethodology's interest in the *hows* by which realities are constructed requires a studied, temporary indifference to those realities. Like phenomenologists, ethnomethodologists begin their analysis by setting aside belief in the real in order to bring into view the everyday practices by which subjects, objects, and events come to have a sense of being observable, rational, and orderly for those concerned. The ethnomethodological project moves forward from there, documenting how discursive practice constitutes social structures by identifying the particular mechanisms at play. As Wittgenstein (1958, p. 19) might put it, language is "taken off holiday" in order to make visible how language works to construct the objects it is otherwise viewed as principally describing.

Analytic bracketing works somewhat differently. It is employed throughout analysis, not just at the start. As analysis proceeds, the observer intermittently orients to everyday realities as both the *products* of members' reality-constructing procedures and as *resources* from which realities are constituted. At one moment, the analyst may be indifferent to the structures of everyday life in order to document their production through discursive practice. In the next analytic move, he or she brackets discursive practice in order to assess the local availability, distribution, and/or regulation of resources for reality construction. In Wittgensteinian terms, this translates into attending to both language-at-work and language-on-holiday, alternating considerations of how languages games, in particular institutional discourses, operate in everyday life and what games are likely to come into play at particular times and places. In Foucauldian terms, it leads to alternating considerations of discourses-in-practice, on one hand, and the locally fine-grained documentation of related discursive practices, on the other.

Analytic bracketing amounts to an orienting procedure for alternately focusing on the *whats*, then the *hows*, of interpretive practice (or vice versa) in order to assemble both a contextually scenic and a contextually constructive picture of everyday language-in-use. The objective is to move back and forth between discursive practice and discourses-in-practice, documenting each in turn, and making informative references to the other in the process. Either discursive machinery or available discourses becomes the provisional phenomenon, while interest in the other is temporarily deferred, but not forgotten. The constant interplay between the analysis of these two sides of interpretive practice mirrors the lived interplay between social interaction, its immediate surroundings, and its going concerns.

Because discursive practice and discourses-in-practice are mutually constitutive, one cannot argue that analysis should begin or end with either one, although there are predilections in this regard. As those who are ethnographically oriented are wont to do, Smith (1987, 1990), for example, advocates beginning "where people are": we take her to mean that this refers to where people are located in the institutional landscape of everyday life. Conversely, conversation analysts insist on beginning with discursive practice, even while a variety of unanalyzed *whats* typically informs their efforts.⁵

Wherever one starts, neither the cultural and institutional details of discourse nor its interpolations in social interaction predetermines the other. If we set aside the need for an indisputable resolution to the question of which comes first or last, or has priority, we can designate a suitable point of departure and proceed from there, so long as we keep firmly in mind that the interplay within interpretive practice requires that we move back and forth analytically between its facets. Because we don't want to reify the components, we continuously remind ourselves that the analytic task centers on the dialectics of two fields of play, not the reproduction of one by the other.

Although we advocate no rule for where to begin, we needn't fret that the overall task is impossible or logically incoherent. Maynard

(1998, p. 344), for example, compares analytic bracketing to "wanting to ride trains that are going in different directions, initially hopping on one and then somehow jumping to the other." He asks, "How do you jump from one train to another when they are going in different directions?" The question is, in fact, merely an elaboration of the issue of how one brackets in the first place, which is, of course, the basis for Maynard's and other ethnomethodologists' and conversation analysts' own projects. The answer is simple: Knowledge of the *principle* of bracketing (and unbracketing) makes it possible. Those who bracket the life world or treat it indifferently, as the case might be, readily set reality aside every time they get to work on their respective corpuses of empirical material. It becomes as routine as rising in the morning, having breakfast, and going to the workplace.⁶ On the other hand, the desire to operationalize bracketing of any kind, analytic bracketing included, into explicitly codified and sequenced procedural moves would turn bracketing into a set of recipe-like, analytic directives, something surely to be avoided. We would assume that no one, except the most recalcitrant operationalist, would want to substitute a recipe book for an analytics.⁷

Analytic bracketing, however, is far from undisciplined: It has distinct procedural implications. As we have noted, the primary directive is to alternately examine both sides of interpretive practice. Researchers engaging in analytic bracketing must constantly turn their attention in more than one direction. This has resulted in new methodological hybrids. Some analysts undertake a more content-oriented form of discourse analysis (see Potter, 1996; Potter & Wetherell, 1987). Others develop methods of "constitutive ethnography" (Mehan, 1979), the "ethnography of practice" (Gubrium, 1988), or other discursively sensitive ethnographic approaches (see Holstein, 1993; Miller, 1991, 1997a). The distinguishing feature of such studies is their disciplined focus on both discourse-in-practice and discursive practice.

The dual focus should remind us that, in describing the constitutive role of discourses-in-practice, we must take care not to appropriate these naively into our analysis. We must sustain

ethnomethodology's desire to distinguish between members' resources and our own. As a result, as we consider discourses-in-practice, we must attend to how they mediate, not determine, members' socially constructive activities. Analytic bracketing is always substantively temporary. It resists full-blown attention to discourses as systems of power/knowledge, separate from how they operate in lived experience. It also is enduringly empirical in that it does not take the everyday operation of discourses for granted as the truths of a setting *tout court*.⁸

Working Against Totalization

Centered at the crossroads of discursive practice and discourses-in-practice, an analytics of interpretive practice works against totalization. It offers breathing room for choice and action. It restrains the propensity of a Foucauldian analytics to view all interpretations as artifacts of particular regimes of power/knowledge. Writing in relation to the broad sweep of his "histories of the present," Foucault was inclined to overemphasize the predominance of discourses in constructing the horizons of meaning at particular times or places, conveying the sense that discourses fully detail the nuances of everyday life. A more interactionally sensitive analytics of discourse—one tied to discursive practice—resists this tendency.

Because interpretive practice is mediated by discourse through institutional functioning, we discern the operation of power/knowledge in the separate going concerns of everyday life. Yet, what one institutional site brings to bear is not necessarily what another puts into practice. Institutions constitute distinct, yet sometimes overlapping, realities. Whereas one may deploy a gaze that confers agency or subjectivity upon individuals, for example, another may constitute subjectivity along different lines, such as the family systems that are called into question as subjects and agents of troubles in family therapy (see Gubrium, 1992; Miller, 1997a).

Still, if interpretive practice is complex and fluid, it is not socially arbitrary. In the practice of everyday life, discourse is articulated in myriad

sites and is socially variegated; actors methodically build up their shared realities in diverse, locally nuanced, and biographically informed terms. Although this produces considerable slippage in how discourses do their work, it is far removed from the uniform hegemonic regimes of power/knowledge presented in some Foucauldian readings. Social organization nonetheless is evident in the going concerns referenced by participants, to which they hold their talk and interaction accountable.

An analytics of interpretive practice must deal with the perennial question of what realities and/or subjectivities are being constructed in the myriad sites of everyday life. In practice, diverse articulations of discourse intersect, collide, and work against the construction of common or uniform subjects, agents, and social realities. Interpretations shift in relation to the institutional and cultural markers they reference, which, in turn, fluctuate with respect to the varied settings in which social interaction unfolds. Discourses-in-practice refract one another as they are methodically adapted to practical exigencies, local discursive practice serving up variation and innovation in the process (see Abu-Lughod, 1991, 1993; Chase, 1995; Narayan & George, 2002).

From How and What to Why

Traditionally, qualitative inquiry has concerned itself with *what* and *how* questions. *Why* questions have been the hallmark of quantitative sociology, which seeks to explain and ostensibly predict behavior. Qualitative researchers typically approach *why* questions cautiously. Explanation is a tricky business, one that qualitative inquiry embraces discreetly in light of its appreciation for *interpretive elasticity*. It is one thing to describe what is going on and how things or events take shape, but the question of why things happen the way they do can lead to inferential leaps and empirical speculations that propel qualitative analysis far from its stock-in-trade. The challenge is to respond to *why* question in ways that are empirically and conceptually consonant with qualitative inquiry's traditional concerns.

Our approach to interpretive practice provides a limited basis for raising particular kinds of *why* questions in the context of qualitative inquiry. In order to pursue *why* questions, one needs to designate a domain of explanation for that which is to be explained. The familiar distinction in sociology between macrosociological and microsociological domains, for instance, specifies two kinds of explanatory footing. Most commonly, macrosociological variables are used as footing for explaining microsociological phenomena, for example, using the rural/urban or the traditional/modern distinction to explain qualities of face-to-face relationships. Parsons's (1951) social system framework was once a leading model of this kind of explanation, applying macro-level systemic variables as explanations for functioning and variation in individual lives and actions.

One way for qualitative inquiry to approach *why* questions without hazarding its traditional analytic interests is to proceed from the *whats* and *hows* of social life. Provisional explanatory footing can be found at the junction of concerns for what is going on in everyday life in relation to how that is constructed, centered in the space we have located interpretive practice. Bracketing the *whats*, footing for explaining the constructive nuances of social patterns can be found in discursive practice. Bracketing the *hows*, footing for explaining the delimited patterns of meaning consequent to social construction processes can be found in discourses-in-practice.

The interplay between discourses-in-practice and discursive practice is a source of two kinds of answer for why things are organized as they are in everyday life. One kind stems from the explanatory footings of discursive practice, directing us to the artful talk and interaction that designs and designates the local contours of our social worlds. From such footings, we learn why discourses are not templates for action. Their articulation is subject to the everyday contingencies of discursive practice. Discourses-in-practice are talked into action, so to speak; they do not dictate what is said and done from the outside or from the inside, as if they were separate and distinct sources of influence. To answer why social

structures are as circumstantially nuanced as they are, one can bracket the constitutive *whats* of the matter in order to reveal how recognizable activities and systems of meaning are constituted in particular domains of everyday life. Discursive practice, in other words, provides the footing for answering why recognizable constellations of social order take on locally distinctive shapes.

We may also answer limited *why* questions that are related to discursive practice, questions such as why discursive actions unfold in specific directions or why they have particular consequences. Answers emerge when we bracket the constitutive work that shapes who and what we are and what it is that we do. By itself, the machinery of conversation gives us few clues as to when, where, or what particular patterns of meaning or action will be artfully produced and managed. The machinery is like a galloping horse, but we have little or no sense of when it began to run, where it's headed, what indeed it is up to, and what might happen when it gets there. Is it racing, fleeing, playing polo, delivering the mail, or what? Each of these possibilities requires a discourse to set its course and to tell us what messages it might be conveying. This can inform us in delimited ways of why the machinery of speech environments is organized and propelled in the ways it is. Discourse-in-practice provides the footing for answering why discursive practice proceeds in the direction it does, toward what end, in pursuit of what goals, and in relation to what meanings.

■ SUSTAINING A CRITICAL CONSCIOUSNESS

The interplay of discourse-in-practice and discursive practice sustains an integral critical consciousness for qualitative inquiry, which is a necessary basis for related social action. Each component of interpretive practice serves as *endogenous* grounds for raising serious questions relating to the empirical assumptions of ongoing inquiry. Critical consciousness is built into this framework; it is not external to it. Indeed, it's the other face of analytic bracketing. If, for purposes of broadening our knowledge of everyday life,

analytic bracketing provides a means of combining attention to constitutive *hows* with substantive *whats*, it simultaneously enjoins us to continuously pay attention to what we may be short-changing in the service of one of these questions or the other. The continuing enterprise of analytic bracketing doesn't keep us comfortably ensconced throughout the research process in a domain of indifference to the lived realities of experience, as *a priori* bracketing does. Nor does analytic bracketing keep us comfortably engaged in the unrepentant naturalism of documenting the world of everyday life the way it really is. Rather, it continuously jerks us out of the analytic lethargies of both endeavors.

When questions of discourse-in-practice take the stage, there are grounds for problematizing or politicizing the sum and substance of what otherwise can be too facilely viewed as arbitrarily or individualistically constructed, managed, and sustained. The persistent urgency of *what* questions cautions us not to assume that interpersonal agency, artfulness, or the machinery of social interaction is the whole story. The urgency prompts us to inquire into the broader sources of matters that are built up across time and circumstance in discursive practice, the contemporaneous conditions that inform and shape the construction process, and the personal and interpersonal consequences for those involved of having constituted their world in the way they have. Although the view toward interpretive practice doesn't orient naturalistically to the "real world," neither does it take everyday life as built from the ground up in talk-in-interaction on each and every conversational or narrative occasion. The political consequence of this is an analytic framework that turns to matters of social organization and control, implicating a reality that doesn't rest completely on the machinery of talk or the constructive quality of social interaction. It turns us to wider contexts in search of other sources of change or stability.

When discursive practice commands the spotlight, there is a basis for critically challenging the representational hegemony of taken-for-granted realities. The continual urgency of *how* questions

warns us not to assume that the world as it now is, is the world that must be (cf. Freire's [1970] strategy of *conscientização*). The warning prompts us to "unsettle" realities in search of their construction to reveal the constitutive processes that produce and sustain particular realities as the processes are engaged, not for time immemorial. Critically framed, the *how* concerns of interpretive practice caution us to remember that the everyday realities of our lives—whether they are being normal, abnormal, law abiding, criminal, male, female, young, or old—are realities we *do*. Having done them, they can be undone. We can move on to do realities, producing and reproducing, time and again, the world we inhabit. Politically, this presents the recognition that, in the world we live in, we could enact alternate possibilities or alternative directions, which the apparent organization of our lives might appear to make seem impossible. If we make visible the constructive fluidity and malleability of social forms, we also reveal a potential for change (see Gubrium & Holstein, 1990, 1994, 1995, 1997; Holstein & Gubrium, 2000).

The critical consciousness of this perspective deploys the continuous imperative to take issue with discourse or discursive practice when either one is foregrounded, thus turning the analytics on itself as it pursues its goals. Reflexively framed, the interplay of discourse and discursive practice transforms analytic bracketing into critical bracketing, offering a basis not only for documenting interpretive practice, but also for critically commenting on its own constructions, putting the analytic pendulum in motion in relation to itself.

Social Action

The critical consciousness that is endogenous to interpretive practice can be taken outside the context of research and analysis. Further attending to the substance of the social realities at stake in a realm of everyday life can specify the *whats* into *whens* and *wheres*. Further attending to what is at stake in the construction process can lead us to identify the times when and the places where

those concerned construct particular social forms in the ways they do. Knowing this provides interested parties, such as family members and troubled individuals, not just social researchers, with knowledge of the alternative constructions available to them for assembling themselves and their experiences in particular ways. They are provided distinct bases for action in the context of various discourses, as Foucauldians might put it, to construct their lives so that preferred solutions come into play. This works against totalization in the world of action.

For example, Gubrium's (1992) comparative field study of two family therapy programs focused on both the *hows* and the *whats* of the process by which therapists and family members constructed family troubles. His material shows how participants in both programs went about assembling the knowledge and approaches available to them into explicit pictures of domestic disorder and equally straightforward designs for turning disorder into orderly, or functional, family lives. The *hows*, or mechanisms of the process, were similar in the two programs, including cataloging and classifying particular experiences into reflexively constructed categories recognizable to all. The *whats*, however, were distinct. In one of the facilities, an outpatient program called "Westside House," family troubles were interpreted and clinically categorized as the dysfunctions of a hierarchical family system. In the other facility, an inpatient program located at what Gubrium called "Fairview Hospital," troubles took on an emotional cast, hierarchy being displaced by mutual disclosure and democratic communication centered on individual members' feelings. What was constructed in these two locations was distinct and had contrasting consequences for the family members' lives, even though the construction process was similar.

The social action consequences follow directly from the identification and documentation of constructed differences. Comparing what is constructed at Westside House with what is constructed at Fairview Hospital provides a modicum of choice for anyone seeking solutions—in this case, to family troubles. Westside House is a

discursive environment that privileges authority and downplays individual feelings, whereas Fairview Hospital is a discursive environment in which feelings and clear communication loom forth as a basis for healing familial wounds. Broadening the comparative perspective to include other discursive environments of family construction adds to the concrete choices for constructing both what these families are and solutions for what they could be (see Miller, 2001).

Taken into the world of everyday life, this provides those concerned—stakeholders such as troubled sons and daughters and distressed mothers and fathers—with evidence of the possible solutions available for understanding constructions of what troubles them as well as alternative ways of resolving those troubles. This moves beyond single solutions by providing evidence of the varied ways that troubles can be assembled into concrete realities. The *hows* and the *whats*, respectively, show that stakeholders have a choice in how their troubles will be construed as well as the options for construing them in particular ways. From related knowledge of when and where options present themselves, action can be organized toward preferred possibilities.

Although social researchers themselves aren't obliged to take a critical consciousness into the outside world, a critical consciousness does obligate them to document, publish, and make broadly available the possibilities for constructing everyday life. It is in this spirit, which stems in many ways from C. Wright Mills's (1959) call for a publicly oriented critical consciousness, that we have offered the framework of interpretive practice for public consumption and social action.

■ NOTES

1. Some self-proclaimed ethnomethodologists, however, would reject the notion that ethnomethodology is in any sense a "constructionist" or "constructivist" enterprise (see Lynch, 1993). Some reviews of the ethnomethodological canon also clearly imply that constructionism is anathema to the ethnomethodological project (see Maynard, 1998; Maynard & Clayman, 1991).

2. Although clearly reflecting Garfinkel's pioneering contributions, this characterization of the ethnomethodological project is perhaps closer to the version conveyed in the work of Melvin Pollner (1987, 1991) and D. Lawrence Wieder (1988) than to some of the more recent "postanalytic" or conversation analytic forms of ethnomethodology. Indeed, Garfinkel (1988), Lynch (1993), and others might object to how we ourselves portray ethnomethodology. We would contend, however, that there is much to be gained from a studied "misreading" of the ethnomethodological "classics," a practice that Garfinkel himself advocates for the sociological classics more generally (see Lynch, 1993). With the figurative "death of the author" (Barthes, 1977), those attached to doctrinaire readings of the canon should have little grounds for argument.

3. Other ethnomethodologists have drawn upon Foucault, but without necessarily endorsing these affinities or parallels. Lynch (1993), for example, writes that Foucault's studies can be relevant to ethnomethodological investigations in a "restricted and 'literal' way" (p. 131), and he resists the generalization of discursive regimes across highly occasioned "language games." See McHoul (1986) and Lynch and Bogen (1996) for exemplary ethnomethodological appropriations of Foucauldian insights.

4. There is still considerable doctrinaire sentiment for maintaining "hard-headed, rigorous investigation in one idiom" while recognizing its possible "incommensurability" with others (Maynard, 1998, p. 345). The benefit, according to Maynard (1998, p. 345), would be "strongly reliable understanding in a particular domain of social life, and it need not imply narrowness, fragmentation, limitation, or isolation." Our sense is that such conversations do produce fragmentation and isolation (see Hill and Crittenden [1968] for a vivid example of nonproductive conversation deriving from incompatible analytic idioms), resulting in the stale reproduction of knowledge and, of course, the equally stale representation of the empirical world. In our view, reliability has never been a strong enough incentive to ignore the potential validities of new analytic horizons.

5. The CA argument for this point of departure is that ostensibly distinct patterns of talk and interaction are constitutive of particular settings, and therefore must be the point of departure. This is tricky, though. CA's practitioners routinely designate and describe particular institutional contexts *before* the analysis of the conversations that those conversations are said to reveal. CA would have us believe that setting, as a

distinct context for talk and interaction, would be visibly (hearably) constituted in the *machinery of talk* itself (see Schegloff, 1991). This would mean that no scene-setting would be necessary (or even need to be provided) for the production of the discursive context to be apparent. One wonders if what is demonstrated in these studies could have been produced in the unlikely event that no prior knowledge of the setting had been available, or if prior knowledge were rigorously bracketed.

CA studies always admit to being about conversation in *some* context. Even the myriad studies of telephone interaction make that discursive context available to readers *before* the analysis begins. Indeed, titles of research reports literally announce institutional context at the start. For example, one of Heritage's (1985) chapters is titled "Analyzing News Interviews: Aspects of the Production of Talk for an 'Overhearing' Audience." Immediately, the reader knows and, in a manner of speaking, is prepared to get the gist of, what conversation is "doing" in what follows. In a word, the *productivity* of talk relies as much on this analytically underrecognized start as on what the analysis proper aims to show. In such studies, context inevitably sneaks in the front door, in titles and "incidental" stage setting. Apparently, analysts fail to recognize that some measure of discursive context is being imported to assist in the explanation of how context is indigenously constructed.

Strictly speaking, the researcher cannot hope to attribute institutional patterns completely to the machinery of conversation. Nor can she completely disattend to discourse-in-practice and meaning while describing the sequential flow of conversation. Analytically, one must at some point reappropriate institutions and external cultural understandings in order to know what is artfully and methodically going on in that talk and interaction. Centered as analytic bracketing is on both sides of interpretive practice, there is concerted warrant for the continual return of the analytic gaze to discourse-in-practice.

6. There are other useful metaphors for describing how analytic bracketing changes the focus from discourse-in-practice to discursive practice. One can liken the operation to shifting gears while driving a motor vehicle equipped with a manual transmission. One mode of analysis may prove quite productive, but eventually it will strain against the resistance engendered by its own temporary analytic orientation. When the analyst notes that the analytic "engine" is laboring under, or being constrained by, the restraints of what it is currently "geared" to accomplish, she can decide to

virtually "shift" analytic "gears" in order to gain further purchase on the aspects of interpretive interplay that were previously bracketed. Just as there can be no prescription for shifting gears while driving (i.e., one can never specify in advance at what speed one should shift up or down), changing analytic brackets always remains an artful enterprise, awaiting the empirical circumstances it encounters. Its timing cannot be pre-specified. Like shifts in gears while driving, changes are not arbitrary or undisciplined; rather, they respond to the analytic challenges at hand in a principled, if not predetermined, fashion.

7. This may be the very thing Lynch (1993) decries with respect to conversation analysts who attempt to formalize and professionalize CA as a "scientific" discipline.

8. Some critics (see Denzin, 1998) have worried that analytic bracketing represents a selective objectivism, a form of "ontological gerrymandering." These, of course, have become fighting words among constructionists. But we should soberly recall that Steve Woolgar and Dorothy Pawluch (1985) have suggested that carving out some sort of analytic footing may be a pervasive and unavoidable feature of any sociological commentary. Our own constant attention to the *interplay* between discourse-in-practice and discursive practice—as they are understood and used by members—continually reminds us of their reflexive relationship. Gerrymanderers stand their separate ground and unreflexively deconstruct; analytic bracketing, in contrast, encourages a continual and methodical deconstruction of empirical groundings themselves. This may produce a less-than-tidy picture, but it also is designed to keep reification at bay and ungrounded signification under control.

GROUNDING THEORY IN THE 21ST CENTURY

Applications for Advancing Social Justice Studies

Kathy Charmaz

Grounded theory methods of the 20th century offer rich possibilities for advancing qualitative research in the 21st century. Social justice inquiry is one area among many in which researchers can fruitfully apply grounded theory methods that Barney G. Glaser and Anselm L. Strauss (1967) created. In keeping with the theme for the current *Handbook* of advancing constructive social critique and change through qualitative research, this chapter opens discussion about applying grounded theory methods to the substantive area(s) of social justice. Inquiry in this area

assumes focusing on and furthering equitable distribution of resources, fairness, and eradication of oppression (Feagin, 1999).¹

The term "grounded theory" refers both to a method of inquiry and to the product of inquiry. However, researchers commonly use the term to mean a specific mode of analysis (see Charmaz, 2003a). Essentially, grounded theory methods are a set of flexible analytic guidelines that enable researchers to focus their data collection and to build inductive middle-range theories through successive levels of data analysis and conceptual development. A major strength of grounded

Author's Note. I thank Adele E. Clarke, Norman K. Denzin, Udo Kelle, Anne Marie McLanglin, and Janice Morse for their comments on an earlier version of this chapter. I also appreciate having the views of the following members of the Sonoma State University Faculty Writing Program: Karin Enstam, Scott Miller, Tom Rosin, Josephine Schallehn, and Thaine Stearns. I presented brief excerpts from earlier drafts in a keynote address, "Reclaiming Traditions and Re-forming Trends in Qualitative Research," at the Qualitative Research Conference, Carleton University, Ottawa, Canada, May 22, 2003, and in a presentation, "Suffering and the Self: Meanings of Loss in Chronic Illness," at the Sociology Department, University of California, Los Angeles, January 9, 2004.

theory methods is that they provide tools for analyzing processes, and these tools hold much potential for studying social justice issues. A grounded theory approach encourages researchers to remain close to their studied worlds and to develop an integrated set of theoretical concepts from their empirical materials that not only synthesize and interpret them but also show processual relationships.

Grounded theory methods consist of simultaneous data collection and analysis, with each informing and focusing the other throughout the research process.¹ As grounded theorists, we begin our analyses early to help us focus further data collection.² In turn, we use these focused data to refine our emerging analyses. Grounded theory entails developing increasingly abstract ideas about research participants' meanings, actions, and worlds and seeking specific data to fill out, refine, and check the emerging conceptual categories. Our work results in an analytic interpretation of participants' worlds and of the processes constituting how these worlds are constructed. Thus, we can use the processual emphasis in grounded theory to analyze relationships between human agency and social structure that pose theoretical and practical concerns in social justice studies. Grounded theorists portray their understandings of research participants' actions and meanings, offer abstract interpretations of empirical relationships, and create conditional statements about the implications of their analyses.

Applying grounded theory methods to the substantive area of social justice produces reciprocal benefits. The critical stance in social justice in combination with the analytic focus of grounded theory broadens and sharpens the scope of inquiry. Such efforts locate subjective and collective experience in larger structures and increase understanding of how these structures work (see also Clarke, 2003, 2005; Maines, 2001, 2003). Grounded theory can supply analytic tools to move social justice studies beyond description, while keeping them anchored in their respective empirical worlds.³ Not only are justice and injustice abstract concepts, but they are, moreover,

enacted processes, made real through actions performed again and again. Grounded theorists can offer integrated theoretical statements about the conditions under which injustice or justice develops, changes, or continues. How might we move in this direction? Which traditions provide starting points?

■ CONSTRUCTIVIST RE-VISIONS OF GROUNDED THEORY

To develop a grounded theory for the 21st century that advances social justice inquiry, we must build upon its constructionist elements rather than objectivist leanings. In the past, most major statements of grounded theory methods minimized what numerous critics (see, for example, Atkinson, Coffey, & Delamont, 2003; Bryant, 2002, 2003; Coffey, Holbrook, & Atkinson, 1996; Silverman, 2000) find lacking: interpretive, constructionist inquiry. Answering this criticism means building on the Chicago school roots in grounded theory consistent with my constructivist statement in the second edition of this handbook (Charmaz, 2000a).⁴ Currently, the Chicago school antecedents of grounded theory are growing faint and risk being lost. Contemporary grounded theorists may not realize how this tradition influences their work or may not act from its premises at all. Thus, we need to review, renew, and revitalize links to the Chicago school as grounded theory develops in the 21st century.

Building on the Chicago heritage supports the development of grounded theory in directions that can serve inquiry in the area of social justice. Both grounded theory methods and social justice inquiry fit pragmatist emphases on process, change, and probabilistic outcomes.⁵ The pragmatist conception of emergence recognizes that the reality of the present differs from the past from which it develops (Strauss, 1964). Novel aspects of experience give rise to new interpretations and actions. This view of emergence can sensitize social justice researchers to study change in new ways, and grounded theory methods can give them the tools for studying it. Thus,

we must revisit and reclaim Chicago school pragmatist and fieldwork traditions and develop their implications for social justice and democratic process.⁷ To do so, we must move further into a constructionist social science and make the positivist roots of grounded theory problematic.

For many researchers, grounded theory methods provided a template for doing qualitative research stamped with positivist approval. Glaser's (see, especially, Glaser, 1978, 1992) strong foundation in mid-20th-century positivism gave grounded theory its original objectivist cast with its emphases in logic, analytic procedures, comparative methods, and conceptual development and assumptions of an external but discernible world, unbiased observer, and discovered theory. Strauss's versions of grounded theory emphasized meaning, action, and process, consistent with his intellectual roots in pragmatism and symbolic interactionism. These roots seem shrunken in his methodological treatises with Juliet Corbin (Strauss & Corbin, 1990, 1998) but grow robust in other works (see, for example, Corbin & Strauss, 1988; Strauss, 1993). Like Glaser, Strauss and Corbin also advanced positivistic procedures, although different ones. They introduced new technical procedures and made verification an explicit goal, thus bringing grounded theory closer to positivist ideals.⁸ In divergent ways, Strauss and Corbin's works as well as Glaser's treatises draw upon objectivist assumptions founded in positivism.

Since then, a growing number of scholars have aimed to move grounded theory in new directions away from its positivist past. I share their goal and aim to build on the constructivist elements in grounded theory and to reaffirm its Chicago school antecedents. To date, scholars have questioned the epistemologies of both Glaser's and Strauss and Corbin's versions of grounded theory. We challenge earlier assumptions about objectivity, the world as an external reality, relations between the viewer and viewed, the nature of data, and authors' representations of research participants. Instead, we view positivist givens as social constructions to question and alter. Thus, when we adopt any positivist principle or procedure, we

attempt to do so knowingly and to make our rationales explicit. In the second edition of this handbook (Charmaz, 2000a), I argued for building on the pragmatist underpinnings in grounded theory and developing it as a social constructionist method. Clive Seale (1999) contends that we can retain grounded theory methods without adhering to a naïve realist epistemology. Antony Bryant (2002, 2003) calls for re-grounding grounded theory in an epistemology that takes recent methodological developments into account, and Adele E. Clarke (2003, 2005) aims to integrate postmodern sensibilities with grounded theory and to provide new analytic tools for discerning and conceptualizing subtle empirical relationships. These moves by grounded theorists reflect shifts in approaches to qualitative research.⁹

A constructivist grounded theory (Charmaz, 1990, 2000a, 2003b; Charmaz & Mitchell, 2001) adopts grounded theory guidelines as tools but does not subscribe to the objectivist, positivist assumptions in its earlier formulations. A constructivist approach emphasizes the studied phenomenon rather than the methods of studying it. Constructivist grounded theorists take a reflexive stance on modes of knowing and representing studied life. That means giving close attention to empirical realities and our collected renderings of them—and locating oneself in these realities. It does not assume that data simply await discovery in an external world or that methodological procedures will correct limited views of the studied world. Nor does it assume that impartial observers enter the research scene without an interpretive frame of reference. Instead, what observers see and hear depends upon their prior interpretive frames, biographies, and interests as well as the research context, their relationships with research participants, concrete field experiences, and modes of generating and recording empirical materials. No qualitative method rests on pure induction—the questions we ask of the empirical world frame what we know of it. In short, we share in constructing what we define as data. Similarly, our conceptual categories arise through our interpretations of data rather than emanating from them or from our methodological

practices (cf. Glaser, 2002). Thus, our theoretical analyses are interpretive renderings of a reality, not objective reportings of it.

Whether informed by Glaser (1978, 1992, 1998, 2002) or Strauss and Corbin (1990, 1998), many researchers adopted positivist grounded theory as a template. The constructivist position recasts this template by challenging its objectivist underpinnings. We can use a constructivist template to inform social justice research in the 21st century. Clearly, much research in the area of social justice is objectivist and flows from standard positivist methodologies. A constructivist grounded theory offers another alternative: a systematic approach to social justice inquiry that fosters integrating subjective experience with social conditions in our analyses.

An interest in social justice means attentiveness to ideas and actions concerning fairness, equity, equality, democratic process, status, hierarchy, and individual and collective rights and obligations. It signifies thinking about being human and about creating good societies and a better world. It prompts reassessment of our roles as national and world citizens. It means exploring tensions between complicity and consciousness, choice and constraint, indifference and compassion, inclusion and exclusion, poverty and privilege, and barriers and opportunities. It also means taking a critical stance toward actions, organizations, and social institutions. Social justice studies require looking at both realities and ideals. Thus, contested meanings of "shoulds" and "oughts" come into play. Unlike positivists of the past, social justice researchers openly bring their shoulds and oughts into the discourse of inquiry.

■ REEXAMINING GROUNDED THEORY OF THE PAST

In the 20th century, grounded theory methods offered guidelines and legitimacy for conducting research. Glaser and Strauss (1967) established qualitative research as valuable in its own right and argued that it proceeds from a different logic

than quantitative research. Although researchers did not always understand grounded theory methods and seldom followed them beyond a step or two, they widely cited and acclaimed these methods because they legitimized and codified a previously implicit process. Grounded theory methods offered explicit strategies, procedural rigor, and seeming objectivity. As Karen Locke (1996) notes, many researchers still use grounded theory methods for "a rhetoric of justification as opposed to a rhetoric of explication" (p. 244; see also Charmaz, 1983; Silverman, 2000).

All analyses come from particular standpoints, including those emerging in the research process. Grounded theory studies emerge from wrestling with data, making comparisons, developing categories, engaging in theoretical sampling, and integrating an analysis. But *how* we conduct all these activities does not occur in a social vacuum. Rather, the entire research process is interactive; in this sense, we bring past interactions and current interests into our research, and we interact with our empirical materials and emerging ideas as well as, perhaps, granting agencies, institutional review boards, and community agencies and groups, along with research participants and colleagues. Neither data nor ideas are mere objects that we passively observe and compile (see also Holstein & Gubrium, 1995).

Glaser (2002) treats data as something separate from the researcher and implies that they are untouched by the competent researcher's interpretations. If, perchance, researchers somehow interpret their data, then according to Glaser, these data are "rendered objective" by looking at many cases. Looking at many cases strengthens a researcher's grasp of the empirical world and helps in discerning variation in the studied phenomenon. However, researchers may elevate their own assumptions and interpretations to "objective" status if they do not make them explicit.

No analysis is neutral—despite research analysts' claims of neutrality. We do not come to our studies uninitiated (see also Denzin, 1994; Morse, 1999; Schwandt, 1994, 2000). What we know shapes, but does not necessarily determine, what we "find." Moreover, *each* stage of inquiry is

constructed through social processes. If we treat these processes as unproblematic, we may not recognize how they are constructed. Social justice researchers likely understand their starting assumptions; other researchers may not—including grounded theorists.¹⁰ As social scientists, we *define* what we record as data, yet how we define data outlines how we represent them in our works. Such definitional decisions—whether implicit or explicit—reflect moral choices that, in turn, spawn subsequent moral decisions and actions.¹¹

Rather than abandoning the traditional positivist quest for empirical detail, I argue that we advance it—*without the cloak of neutrality and passivity enshrouding mid-century positivism*. Gathering rich empirical materials is the first step. Recording these data systematically prompts us to pursue leads that we might otherwise ignore or not realize. Through making systematic recordings, we also gain comparative materials to pinpoint contextual conditions and to explore links between levels of analysis. By seeking empirical answers to emerging theoretical questions, we learn about the worlds we enter and can increase the cogency of our subsequent analyses. Hence, data need to be informed by our theoretical sensitivity. Data alone are insufficient; they must be telling and must answer theoretical questions.

Without theoretical scrutiny, direction, and development, data culminate in mundane descriptions (see also Silverman, 2000). The value of the product then becomes debatable, and critics treat earlier studies as reified representations of the limits of the method itself rather than how it was used (Charmaz, 2000a). Burawoy (1991) categorizes the products of grounded theory as empirical generalizations. Moreover, he claims that the method does not consider power in micro contexts and that “it represses the broader macro forces that both limit change and create domination in the micro sphere” (p. 282). I disagree. Simply because earlier authors did not address power or macro forces does not mean that grounded theory methods cannot. In contrast to Burawoy’s claims, I argue that we should use grounded theory methods in precisely these areas to gain fresh insights in social justice inquiry.

Critics of grounded theory commonly miss four crucial points: (a) theorizing is an activity; (b) grounded theory methods provide a way to proceed with this activity; (c) the research problem and the researcher’s unfolding interests shape the *content* of this activity, not the method; and (d) the products of theorizing reflect how researchers acted on these points. As Dan E. Miller (2000) argues, the ironic issue is that researchers have done so little grounded theory, despite their claims to use it. Its potential for developing theory remains untapped, as does its potential for studying power and inequality.

Social justice studies require data that diverse audiences agree represent the empirical world and that researchers have given a fair assessment. I do not mean that we reify, objectify, and universalize these data. Instead, I mean that we must start by gathering thorough empirical materials precisely because social justice research may provoke controversy and contested conclusions. Thus, we need to identify clear boundaries and limits of our data. Locating the data strengthens the foundation for making theoretical insights and for providing evidence for evaluative claims. Critics can then evaluate an author’s argument on its merits. The better they can see direct connections between the evidence and points in the argument, the more this argument will persuade them. The lingering hegemony of positivism still makes controversial research suspect, as Fine, Weis, Weseen, and Wong (2000) observe. Therefore, the data for such studies must be unassailable.

A strong empirical foundation is the first step in achieving credibility—for both social justice researchers and grounded theorists. Despite reliance on data-driven interpretations, the rush to “theorize”—or perhaps to publish—has led some grounded theorists to an unfortunate neglect of thorough data collection, which has persisted since Lofland and Lofland (1984) first noted it. Glaser (1992, 2002) discounts quests for accurate data and dismisses full description as distinguishing conventional qualitative data analysis from grounded theory. However, leading studies with implications for social justice and policy have had solid empirical foundations

(see, for example, Duneire, 1992; Glaser & Strauss, 1966; Goffman, 1961; Mitchell, 2002; Snow & Anderson, 1993). Grounded theory studies that lack empirical vitality cannot support a rationale for major social change—or even minor policy recommendations. The stronger the social justice arguments derived from a study, particularly controversial ones, the greater the need for a robust empirical foundation with compelling evidence.

■ USING GROUNDED THEORY TO STUDY SOCIAL JUSTICE ISSUES

Initial Reflections

Both the steps and the logic of grounded theory can advance social justice research. Grounded theorists insist that researchers define what is happening in the setting (Glaser, 1978; Glaser & Strauss, 1967). Sensitivity to social justice issues fosters defining latent processes as well as explicit actions. Grounded theory tools for studying action—collective as well as individual action—can make social justice analysis more precise and predictive. By focusing the data gathering, a researcher can seek new information to examine questions concerning equality, fairness, rights, and legitimacy.¹² The grounded theory openness to empirical leads spurs the researcher to pursue emergent questions and thus shifts the direction of inquiry.

A social justice researcher can use grounded theory to anchor agendas for future action, practice, and policies in the *analysis* by making explicit connections between the theorized antecedents, current conditions, and consequences of major processes. Social justice research, particularly participatory action research (Kemmis & McTaggart, 2000), proceeds from researchers' and participants' joint efforts and commitments to change practices. Because it arises in settings and situations in which people have taken a reflexive stance on their practices, they already have tools to conduct systematic research on their practices in relation to subjective experience, social actions, and social structures. Hence, adopting constructivist grounded theory

would foster their efforts to articulate clear links between practices and each level and, thus, to strengthen their arguments for change.

Other researchers need to weigh whether, when, how, and to what extent to bring research participants into the process. Although well intended, doing so may create a series of knotty problems in concrete situations.¹³ Janice Morse (1998) finds that the consequences of bringing participants into research decisions include keeping the analytic level low, overstating the views of participants who clamored for more space in the narrative, and compromising the analysis. Moreover, Morse (1998) notes that qualitative analyses differ from participants' descriptive accounts and may reveal paradoxes and processes of which participants are unaware.

Adopting grounded theory strategies in social justice research results in putting ideas and perspectives to empirical tests. Any extant concept must earn its way into the analysis (Glaser, 1978). Thus, we cannot import a set of concepts such as hegemony and domination and paste them on the realities in the field. Instead, we can treat them as sensitizing concepts, to be explored in the field settings (Blumer, 1969; van den Hoonaard, 1997). Then we can define if, when, how, to what extent, and under which conditions these concepts become relevant to the study (Charmaz, 2000b). We need to treat concepts as problematic and look for their characteristics as lived and understood, not as given in textbooks. Contemporary anthropologists, for example, remain alert to issues of cultural imperialism. Most sociologists attend to agency, power, status, and hierarchy.

Grounded theory studies can show how inequalities are played out at interactional and organizational levels. True, race, class, and gender—and age and disability—are everywhere. But how do members of various groups define them?¹⁴ How and when do these status variables affect action in the scene? Researchers must define how, when, and to what extent participants *construct* and *enact* power, privilege, and inequality. Robert Prus (1996) makes a similar point in his book *Symbolic Interaction and Ethnographic Research*. Race, class, gender, age, and disability are

social constructions with contested definitions that are continually reconstituted (see, for example, Olesen, Chapter 10, this volume). Using them as static variables, as though they have uncontested definitions that explain data and social processes *before* or *without* looking, undermines their potential power. Taking their meanings as given also undermines using grounded theory to develop fresh insights and ideas. Adopting my alternative tack involves juxtaposing participants' definitions against academic or sociological notions. In turn, researchers themselves must be reflexive about how they represent participants' constructions and enactments.

What new dimensions will social justice foci bring to research? Societal and global concerns are fundamental to a critical perspective. Thus, these studies situate the studied phenomenon in relation to larger units. How and where does it fit? For example, a study of sales interactions could look not only at the immediate interaction and how salespeople handle it but also at the organizational context and perhaps the corporate world, and its global reach, in which these interactions occur. Like many qualitative researchers, grounded theorists often separate the studied interactions from their situated contexts. Thus, a social justice focus brings in more structure and, in turn, a grounded theory treatment of that structure results in a dynamic, processual analysis of its enactment. Similarly, social justice research often takes into account the historical evolution of the current situation, and a grounded theory analysis of this evolution can yield new insights and, perhaps, alternative understandings. For that matter, researchers can develop grounded theories from analyses of pertinent historical materials in their realm of inquiry (see, for example, Clarke, 1998; Star, 1989).

Critical inquiry attends to contradictions between myths and realities, rhetoric and practice, and ends and means. Grounded theorists have the tools to discern and analyze contradictions revealed in the empirical world. We can examine what people *say* and compare it to what they *do* (Deutscher, Pestello, & Pestello, 1993). Focusing on words or deeds are ways of representing people;

however, observed contradictions between the two may indicate crucial priorities and practices. To date, grounded theorists have emphasized the *overt*—usually overt statements—more than the tacit, the liminal, and the implicit. With critical inquiry, we can put our data to new tests and create new connections in our theories.

■ SOCIAL JUSTICE EMPHASES: RESOURCES, HIERARCHIES, AND POLICIES AND PRACTICES

A social justice focus can sensitize us to look at both large collectivities and individual experiences in new ways. Several emphases stand out: *resources*, *hierarchies*, and *policies and practices*. First, present, partial, or absent resources—whether economic, social, or personal—influence interactions and outcomes. Such resources include information, control over meanings, access to networks, and determination of outcomes. Thus, information and power are crucial resources. As Martha Nussbaum (1999) argues, needs for resources vary among people, vary at different times, and vary according to capabilities. Elders with disabling conditions need more resources than other people do or than they themselves needed in earlier years. What are the resources in the empirical worlds we study? What do they mean to actors in the field? Which resources, if any, are taken for granted? By whom? Who controls the resources? Who needs them? According to which and whose criteria of need? To what extent do varied capabilities enter the discussion? Are resources available? If so, to whom? How, if at all, are resources shared, hoarded, concealed, or distributed? How did the current situation arise? What are the implications of having control over resources and of handling them, as observed in the setting(s)?

Second, any social entity has hierarchies—often several. What are they? How did they evolve? At what costs and benefits to involved actors? Which purported and actual purposes do these hierarchies serve? Who benefits from them? Under which conditions? How are the hierarchies

related to power and oppression? How, if at all, do definitions of race, class, gender, and age cluster in specific hierarchies and/or at particular hierarchical levels? Which moral justifications support the observed hierarchies? Who promulgates these justifications? How do they circulate? How do these hierarchies affect social actions at macro, meso, and micro social levels? How and when do the hierarchies change?

Third, the consequences of social policies and practices are made real in collective and individual life. Here we have the convergence of structure and process. What are the rules—both tacit and explicit? Who writes or enforces them? How? Whose interests do the rules reflect? From whose standpoint? Do the rules and routine practices negatively affect certain groups or categories of individuals? If so, are they aware of them? What are the implications of their relative awareness or lack of it? To what extent and when do various participants support the rules and the policies and practices that flow from them? When are they contested? When do they meet resistance? Who resists, and which risks might resistance pose?

By asking these questions, I aim to stimulate thinking and to suggest diverse ways that critical inquiry and grounded theory research may join. The potential of advancing such endeavors already has been indicated by symbolic interactionists who point the way to demonstrating micro consequences of structural inequalities (L. Anderson & Snow, 2000; Scheff, 2003; Schwalbe et al., 2000). Combining critical inquiry and grounded theory furthers these efforts.

■ WORKING WITH GROUNDED THEORY

Studying the Data

The following interview stories provide the backdrop for introducing how grounded theory guidelines can illuminate social justice concerns. My research is social psychological; however, grounded theory methods hold untapped potential for innovative studies at the organizational, societal, and global levels of analysis. The examples

below offer a glimpse of the kinds of initial comparisons I make.¹³ I began studying the experience of chronic illness with interests in meanings of self and time. Such social psychological topics can reveal hidden effects of inequality and difference on the self and social life that emerge in research participants' many stories of their experiences.

Both grounded theory and critical inquiry are inherently comparative methods. In earlier renderings, I treated the excerpt of Christine Danforth below as a story of suffering and Marty Gordon's initial tale as a shocking significant event that marked a turning point in her life. The first step of grounded theory analysis is to study the data. Grounded theorists ask: What is happening? and What are people doing? A fresh look at the accounts below can suggest new leads to pursue and raise new questions.

At the time of the following statement, Christine was a 43-year-old single woman who had systemic lupus erythematosus, Sjögren's syndrome, diabetes, and serious back injuries. I had first met her 7 years earlier, when her multiple disabilities were less visible, although intrusive and worrisome. Since then, her health had declined, and she had had several long stretches of living on meager disability payments. Christine described her recent episode:

I got the sores that are in my mouth, got in my throat and closed my throat up, so I couldn't eat or drink. And then my potassium dropped down to 2.0. I was on the verge of cardiac arrest. . . . That time when I went in they gave me 72 bottles of pure potassium, burned all my veins out.

I asked, "What does that mean, that it burned your veins out?"

She said, "It hurts really bad; it's just because it's so strong and they can't dilute it with anything. They said usually what they do is they dilute with something like a numbing effect, but because I was 2.0, which is right on cardiac arrest that they couldn't do it, they had to get it in fast."

I asked, "Did you realize that you were that sick?"

She said, "Well, I called the doctor several times saying, 'I can't swallow.' I had to walk around and drool on a rag. They finally made an appointment, and I got there and I waited about a half hour. The

lady said that there was an emergency and said that I'd have to come back tomorrow. And I said, 'I can't.' I said, 'As soon as I stand up, I'm going to pass out.' And she said, 'Well there's nothing we can do.' . . . And then this other nurse came in just as I got up and passed out, so then they took me to emergency. . . . And it took them 12 hours to—they knew when I went in there to admit me, but it took them 12 hours to get me into a room. I sat on a gurney. And they just kept fluid in me until they got me to a room.

Later in the interview, Christine explained,

[When the sores] go to my throat, it makes it really hard to eat or drink, which makes you dehydrated. After that first time . . . when I called her it had been 3 days since I'd ate or drank anything . . . and by the time I got an appointment, it was, I believe, six or seven days, without food or water.

Imagine Christine walking slowly and determinedly up the short sidewalk to my house. See her bent knees and lowered head, as she takes deliberate steps. Christine looks weary and sad, her face as laden with care as her body is burdened by pain and pounds. Always large, she is heavier than I have ever seen her, startlingly so.

Christine has a limited education; she can hardly read. Think of her trying to make her case for immediate treatment—without an advocate. Christine can voice righteous indignation, despite the fatigue and pain that saps her spirit and drains her energy. She can barely get through her stressful workday, yet she must work as many hours as possible because she earns so little. The low pay means that Christine suffers directly from cutbacks at the agency where she works. Her apartment provides respite, but few comforts. It has no heat—she cannot afford it. Christine does not eat well. Nutritious food is an unobtainable luxury; cooking is too strenuous, and cleanup is beyond imagination. She tells me that her apartment is filled with pictures and ceramic statues of cats as well as stacks of things to sort. Maneuverable space has shrunk to aisles cutting through the piles. Christine seldom cleans house—no energy for that. I've never been to her apartment; it embarrasses her too much to have visitors. Christine would love to adopt a kitten but cats are not permitted. Her eyes glaze with tears when my skittish cat allows her to pet him.

Christine has become more immobile and now uses a motorized scooter, which she says has saved

her from total disability. But since using the scooter and approaching midlife, she also has gained one hundred pounds and needs a better vehicle to transport the scooter. Christine has little social life by now; her friends from high school and her bowling days have busy family and work lives. When she first became ill, Christine had some nasty encounters with several of those friends who accused her of feigning illness. She feels her isolation keenly, although all she can handle after work is resting on the couch. Her relationship with her elderly mother has never been close; she disapproves of her brother, who has moved back in with their mother and is taking drugs. One continuing light in Christine's life is her recently married niece, who just had a baby.

The years have grown gray with hardships and troubles. Christine has few resources—economic, social, or personal. Yet she perseveres in her struggle to remain independent and employed. She believes that if she lost this job, she would never get another one. Her recent weight gain adds one more reason for the shame she feels about her body.

Christine suffers from chronic illness and its spiraling consequences. Her physical distress, her anger and frustration about her life, her sadness, shame, and uncertainty all cause her to suffer. Christine talks some about pain and much about how difficult disability and lack of money make her life. She has not mentioned the word "suffering." Like many other chronically ill people, Christine resists describing herself in a way that might undermine her worth and elicit moral judgments. Yet she has tales to tell of her turmoil and troubles. (Charmaz, 1999, pp. 362–363)

The following interview account of Marty Gordon's situation contrasts with Christine's story. Marty received care from the same health facility as Christine and also had a life-threatening condition that confounded ordinary treatment and management. However, Marty's relationship to staff there and the content and quality of her life differed dramatically from Christine's.

When I first met Marty Gordon in 1988, she was a 59-year-old woman with a diagnosis of rapidly progressing pulmonary fibrosis. A hospitalization for extensive tests led to the diagnosis of Marty's condition. She had moved to a new area

after her husband, Gary, retired as a school superintendent, and she herself retired early from her teaching and grant-writing post at a high school. Marty said that she and Gary were "very, very close." They had had no children, although Gary had a son by an earlier marriage and she, a beloved niece.

Pure retirement lasted about 3 months before they became bored. Subsequently, Marty became a part-time real estate agent and Gary worked in sales at a local winery. Not only did working bring new interests into their lives, but it also helped pay their hefty health insurance costs. They had not realized that their retirement benefits would not cover a health insurance plan. They both found much pleasure in their new lives and in their luxurious home high in the hills overlooking the city. Marty seemed to remain almost as busy as she was before retiring. While working full-time, she had entertained her husband's professional associates, had run a catering business, and had created special meals to keep Gary's diabetes and heart condition under control. She had taken much pride—and still did—in keeping up her perfectly appointed house and in keeping her weight down through regular exercise. For years, she had arisen at 5 each morning to swim an hour before going to work, then stopped at church afterward to say her rosaries.

When I first met Marty, she told the following tale about her first hospitalization:

The doctor came in to tell me, "Uh, it didn't look good and that this was a—could be a rapidly"—and it appeared that mine was really going rapidly and that it might be about six weeks. Whoa! That blew my mind. It really did. . . . Right after that—I'm a Catholic—right after that, a poor little volunteer lady came in and said, "Mrs. Gordon?" And the doctor had said, "Mrs. Gordon?" "Yeah, OK." And then he told me. She said, "I'm from St. Mary's Church." I said, "Jesus, Mary, and Joseph, they've got the funeral already." And it really just—then I began to see humor in it, but I was scared. . . .

This was the point when—[I decided]. "If this is going to happen OK, but I'm not going to let it happen." . . . And I think probably that was the turning point when I said I wouldn't accept it. You know,

I will not accept that uh, death sentence, or whatever you want to call it. (Charmaz, 1991, p. 215)

However, from that point on, Marty had Gary promise her that she would die first. She needed him to take care of her when she could no longer care for herself; moreover, she could not bear the thought of living without him. During the next 5 years, Marty made considerable gains, despite frequent pain, fatigue, and shortness of breath. One Sunday evening, when Gary came home from a wine-pouring and Marty saw his ashen face, she insisted, "We're going to emergency." He had had a second heart attack, followed by a quadruple bypass surgery. Marty said, "He sure is a lot better now. And, of course, *I was very angry with him*. I said to him, 'You can never leave me. *I tell you, I'll sue you!*' [She explained to me.] Because we've had a deal for a long time." When telling me about her own health, she recounted this conversation with her surgeon:

I come in for an appointment and I had just played 18 holes of golf, and so he said, "I think we misdiagnosed you." And I said, "Well, why do you think that?" And he said, "You're just going over, you're surpassing everything." So I said, "Well, that doesn't necessarily mean a diagnosis is wrong." I said, "Are you going to give me credit for anything?" And he said, "Well, what do you mean?" I said, "You have to have a medical answer, you can't have an answer that I worked very hard, on my whole body and my mind, to get, you know, the integral part of myself, and that maybe that might be helping? And the fact that I don't touch fats and I don't do this and I do exercise? *That's not helping, huh?*" So he said, "Well, I guess so." And I said, "Well, do you want to take out my lungs again and see?" I said, "You took them out [already]." So he acknowledged, he said, "Yeah, it's just that it's so unusual." And maybe not accepting something, you know, denial is one thing, but not *excepting* is another thing.

Marty strove to be the exception to her dismal prognosis—she insisted on being an exception. She made great efforts to keep herself and her husband alive, functioning, and enjoying life. By confronting her doctor and challenging his definition of her, Marty rejected his narrow,

medicalized definition of her. She implied that he was *denying her wellness*. Thus, she enacted a dramatic reversal of the conventional scenario of a doctor accusing the patient of denying her illness. Marty fought feelings of self-pity and sometimes talked about suffering and self-pity interchangeably. When she reflected on how she kept going, she said:

I do, do really think that, if you sit down, and I mean, literally sit down, because it's hard to get up, you do start feeling sorry for yourself. And I'm saying, "Oh, God if I could only get up without hurting." And I've begun to feel, once in a while, I get this little sorry for myself thing, that if I could have a day without pain, I wonder what I'd do? *Probably nothing*. Because I wouldn't push myself and I'd get less done.

I asked, "How so?"

Marty replied, "My whole thing is faith and attitude. You've just got to have it. I feel so sorry for people who give in. But maybe that's why . . . you've got to have some people die. [Otherwise they'd] be hanging around forever."

Marty had fortitude—and attitude. Marty intended to live—by will and grit. Dying? The prospect of dying undermined her belief in individual control and thus conflicted with her self-concept.

■ INTEGRATING GROUNDED THEORY WITH SOCIAL JUSTICE RESEARCH

What do these stories indicate? What might they suggest about social justice? How do grounded theory methods foster making sense of them? Both women have serious debilitating conditions with multiple harrowing episodes that make their lives uncertain. Both are courageous and forthright, are aware of their conditions, and aim to remain productive and autonomous.

Coding is the first step in taking an analytic stance toward the data. The initial coding phase in grounded theory forces the researcher to define the action in the data statement. In the figures illustrating coding (Figures 20.1–20.3), my codes

reflect standard grounded theory practice. The codes are active, immediate, and short. They focus on defining action, explicating implicit assumptions, and seeing processes. By engaging in line-by-line coding, the researcher makes a close study of the data and lays the foundation for synthesizing it.

Coding gives a researcher analytic scaffolding on which to build. Because researchers study their empirical materials closely, they can define both new leads from them and gaps in them. Each piece of data—whether an interview, a field note, a case study, a personal account, or a document—can inform earlier data. Thus, should a researcher discover a lead through developing a code in one interview, he or she can go back through earlier interviews and take a fresh look as to whether this code sheds light on earlier data. Researchers can give their data multiple readings and renderings. Interests in social justice, for example, would lead a researcher to note points of struggle and conflict and to look for how participants defined and acted in such moments.

Grounded theory is a comparative method in which the researcher compares data with data, data with categories, and category with category. Comparing these two women's lives illuminates their several similarities and striking contrasts between their personal, social, and material resources. I offer these comparisons here for heuristic purposes only, to clarify points of convergence and divergence. Both women shared a keen interest in retaining autonomy, and both were aware that illness and disability raised the specter of difference, disconnection, and degradation. Nonetheless, Marty Gordon enjoyed much greater economic security, choices, privileges, and opportunities throughout her life than did Christine Danforth. Marty's quick wit, articulate voice, organizational skills, and diligence constituted a strong set of capabilities that served her well in dealing with failing health.

Poverty and lack of skills had always constrained Christine's life and curtailed her choices. They also diminished her feelings of self-worth and moral status, that is, the extent of virtue or vice attributed to a person by others and self (Charmaz, in press). Then illness shrunk her

<p>Recognizing illness spiral Recounting symptom progression Approaching crisis</p>	<p>I got the sores that are in my mouth, got in my throat and closed my throat up, so I couldn't eat or drink. And then my potassium dropped down to 2.0. I was on the verge of cardiac arrest. . . . After that first time . . . when I called her it had been three days since I'd ate or drank anything . . . and by the time I got an appointment, it was, I believe, six or seven days, without food or water.</p>

Figure 20.1. Initial Coding—Christine Danforth

limited autonomy, and her moral status plummeted further. Christine lived under a cloud of nagging desperation. The anger she felt earlier about being disabled, deprived, and disconnected had dissipated into a lingering sadness and shame. Clearly, Christine has far fewer resources than Marty. She also has had fewer opportunities to develop capabilities throughout her life that could help her to manage her current situation.

Marty struggled periodically with daily routines, but she exerted control over her life and her world. Her struggles resided at another level; she fought against becoming inactive and sinking into self-pity. She treated both her body and her mind as objects to work on and to improve, as projects. Marty worked with physicians, if they agreed on her terms. Although she had grown weaker and had pronounced breathing problems, she believed living at all testified to her success.

Receiving bad news Facing death Suffering diagnostic shock Identifying religion Recounting the identifying moment Finding humor Feeling frightened	The doctor came in to tell me, "Uh, it didn't look good and that this was a—could be a rapidly"—and it appeared that mine was really going rapidly and that it might be about six weeks. Whoa! That blew my mind. It really did. . . . Right after that—I'm a Catholic—right after that, a poor little volunteer lady came in and said, "Mrs. Gordon?" And the doctor had said, "Mrs. Gordon?" "Yeah, OK." And then he told me. She said, "I'm from St. Mary's Church." I said, "Jesus, Mary, and Joseph, they've got the funeral already." And it really just—then I began to see humor in it, but I was scared. . . .
Accepting the present but not the prognosis Insisting on controlling the illness Turning point—Refusing the death sentence	This was the point when—[I decided], "If this is going to happen OK, but I'm not going to let it happen." . . . And I think probably that was the turning point when I said I wouldn't accept it. You know, I will not accept that uhm, death sentence, or whatever you want to call it.

Figure 20.2. Initial Coding—Marty Gordon

For long years, Marty kept her illness contained, or at least mostly out of view. Her proactive stance toward her body and her high level of involvements sustained her moral status. Whatever social diminishment of moral status she experienced derived more from age than from suffering.

The kinds of insights that grounded theory methods can net social justice research vary according to level, scope, and objectives of the study. Through comparing the stories above, we gain some sense of structural and organizational sources of suffering and their differential effects on individuals. The comparisons suggest how research participants' relative resources and capabilities became apparent through studying inductive data.

The comparisons also lead to ideas about structure. Most policy research emphasizes *access* to health care. Comparing these two interviews indicates differential treatment *within* a health care organization. In addition, the comparisons raise questions about rhetoric and realities of receiving care. Marty Gordon credited her "faith and attitude" for managing her illness; however, her lifestyle, income, supportive relationships, and quick wit also helped to buffer her losses. But

might not her attitude and advantages be dialectic and mutually reinforcing? Could not her advantages have also fostered her faith and attitude? Each person brings a past to the present. When invoking a similar logic, the residues of the past—limited family support, poor education, undiagnosed learning problems, and lack of skills—complicated and magnified Christine Danforth's troubles with chronic illness and in negotiating care. The structure of Christine's life led to her increasing isolation and decreasing moral status. Might not her anger and sadness have followed? From Marty and Christine's stories, we can discern hidden advantages of high social class status as well as hidden injuries of low status (Sennett & Cobb, 1973).

Last, coding practices can help us to see *our* assumptions, as well as those of our research participants. Rather than raising our codes to a level of objectivity, we can raise questions about how and why we developed certain codes.¹⁶ Another way to break open our assumptions is to ask colleagues and, perhaps, research participants themselves to engage in the coding. When they bring divergent experience to the coding, their responses to the data may call for scrutiny of our own.

	<i>Christine Danforth</i>	<i>Marty Gordon</i>
Awareness of illness	Predicting symptom intensification Recognizing illness spiral Lack of control over escalating symptoms Experiencing stigma	Learning and experimenting Becoming an expert Realizing the potential of stigma
Developing a stance toward illness	Remaining persistent Monitoring progression of symptoms Seeking help	Suffering initial diagnostic shock Feeling frightened Taking control Refusing death sentence Making deals Challenging physician's view Attacking physician's assumptions Discrediting physician's opinion Rejecting medical model Working on body and mind Following strict regimen Swaying physician's view Believing in her own perceptions Seeing self as an exception
Material resources	Fighting to keep the job Having a health plan Struggling to handle basic expenses Eking out a life—Juggling to pay the rent; Relying on an old car	Working part-time for extras Having a health plan Having solid retirement income Enjoying comfortable lifestyle with travel and amenities
Personal resources	Persevering despite multiple obstacles Defending self Recognizing injustice Abiding sense of shame about educational deficits and poverty Hating her appearance Trying to endure life Feeling excluded from organizational worlds	Preserving autonomy Forging partnerships with professionals Trusting herself Having a good education Assuming the right to control her life Believing in individual power Finding strength through faith Possessing a sense of entitlement Aiming to enjoy life Having decades of experience with organizations and professionals
Social resources	Living in a hostile world Taking delight in her niece Retreating from cruel accusations Suffering loneliness Realizing the fragility of her existence Foreseeing no future help	Taking refuge in a close marriage Having strong support, multiple involvements Maintaining powerful images of positive and negative role models Knowing she could obtain help, if needed
Strategies for managing life	Minimizing visibility of deficits Avoiding disclosure of illness Limiting activities	Obtaining husband's promise Avoiding disclosure of illness Controlling self-pity Remaining active Maintaining religious faith

Figure 20.3. Comparing Life Situations

■ RECLAIMING CHICAGO SCHOOL TRADITIONS

Marty Gordon and Christine Danforth's situations and statements above indicate the construction of their views and actions. Note that at certain points, they each struggle with obdurate social structures that take on tangible meaning in their stories of crucial interactions. To make further sense of situations and stories like these and to interpret the social justice issues with them, I have called for reclaiming Chicago school underpinnings in grounded theory. These underpinnings will move grounded theory more completely into constructionist social science. What are these underpinnings? What does reclaiming them entail? On which assumptions does Chicago school sociology rest? Why are they significant for both the development of grounded theory methods and social justice inquiry?

In brief, the Chicago school assumes human agency, attends to language and interpretation, views social processes as open-ended and emergent, studies action, and addresses temporality. This school emphasizes the significance of language for selfhood and social life and understands that human worlds consist of meaningful objects. In this view, subjective meanings emerge from experience, and they change as experience changes (Reynolds, 2003a). Thus, the Chicago school assumes dynamic, reciprocal relationships between interpretation and action, and it views social life as people fitting together diverse forms of conduct (Blumer, 1979, p. 22).¹⁷ Because social life is interactive and emergent, a certain amount of indeterminacy characterizes it (Strauss & Fisher, 1979a, 1979b). How might we use Chicago school sociology now to inform contemporary grounded theory studies and social justice inquiry? Where might it lead us? What moral direction might it give?

Both pragmatist philosophy and Chicago school ethnography foster openness to the world and curiosity about it. The Meadian concept of role-taking assumes empathetic understanding of research participants and their worlds. To achieve this understanding, we must know how people

define their situations and act on them. Social justice researchers can turn this point into a potent tool for discovering if, when, and to what extent people's meanings and actions contradict their economic or political interests—and whether and to what extent they are aware of such contradictions (see, for example, Kleinman, 1996). Thus, seeking these definitions and actions can make critical inquiry more complex and powerful. Knowing them can alert the researcher to points of actual or potential conflict and change—or compliance. Similarly, learning what things mean to people makes what they do with them comprehensible—at least from their worldview. Conversely, how people act toward things in their worlds indicates their relative significance. Such considerations prompt the researcher to construct an inductive analysis rather than, say, impose structural concepts on the scene.

Although Chicago school sociology has been viewed as microscopic, it also holds implications for the meso and macro levels that social justice researchers aim to engage. A refocused grounded theory would aid and refine connections with these levels. Horowitz (2001) shows how extending Mead's (1934) notion of "generalized other" takes his social psychology of the self to larger social entities and addresses expanding democratic participation of previously excluded groups. Her argument is two-pronged: (a) the development of a critical self is prerequisite for democracy and (b) groups that achieve self-regulation gain empowerment.

The naturalistic inquiry inherent in Chicago school tradition means studying what people in specific social worlds do over time and gaining intimate familiarity with the topic (Blumer, 1969; Lofland & Lofland, 1984, 1995). Hence, to reclaim the Chicago tradition, we must first: *Establish intimate familiarity with the setting(s) and the events occurring within it—as well as with the research participants.*¹⁸ This point may seem obvious; however, much qualitative research, including grounded theory studies, skate the surface rather than plumb the depths of studied life.

An emphasis on action and process leads to considerations of time. The pragmatist treatment

of social constructions of past, present, and future could direct social justice researchers to look at timing, pacing, and temporal rhythms. These concerns could alert us to new forms of control and organization. In addition, understanding timing and sequencing can shed light on the success or failure of collective action. Thus, attending to temporality affords us new knowledge of the worlds we study.

Chicago fieldwork traditions have long emphasized situated analyses embedded in social, economic, and occasionally political contexts, as evident in urban ethnographies (see, for example, E. Anderson, 2003; Horowitz, 1983; Suttles, 1968; Venkatesh, 2000). Numerous grounded theory studies have not taken account of the context in which the studied research problem or process exists. Combining Chicago intellectual traditions with social justice sensitivities would correct tendencies toward decontextualized—and, by extension, objectified—grounded theory analyses.

Looking at data with a Chicago school lens entails focusing on meaning and process at both the subjective and social levels. Like many other people with chronic illness, the women above are aware of the pejorative moral meanings of illness and suffering and sensed the diminished status of those who suffer. When I asked Marty Gordon how her condition affected her job, she said, “I never let it show there. Never. Never give cause for anybody either to be sorry for you or want to get rid of you.” Although Christine Danforth hated her job, she viewed it as her lifeline and feared losing it. After telling me about receiving written ultimatums from her supervisor, she said:

Nobody else is going to hire me. . . . An able body can't get one [job], how am I going to get one? So if I'm dyslexic, you know, those people don't even know what it is, let alone how to deal with it. I wouldn't be able to get a job as a receptionist because I can't read and write like most people, so I'm there for life.

Christine Danforth's employers knew the names of her medical diagnoses, but they did not understand her symptoms and their effects in

daily life. Christine's story took an ironic twist. She worked for an advocacy agency that served people with disabilities. Several staff members who challenged her work and worth had serious physical disabilities themselves. Christine also discovered that her supervisors had imposed rules on her that they allowed other staff to ignore. Thus, the situation forced Christine to deal with multiple moral contradictions. She suffered the consequences of presumably enlightened disability advocates reproducing negative societal judgments of her moral worth. Tales of such injustice inform stories of suffering.

These examples suggest the second step to reclaiming the Chicago tradition: *Focus on meanings and processes*. This step includes addressing subjective, situational, and social levels. By piecing together many research participants' statements, I developed a moral hierarchy of suffering. Suffering here is much more than pain; it defines self and situation—and ultimately does so in moral terms that support inequities. Suffering takes into account stigma and social definitions of human worth. Hence, suffering includes the lived experience of stigma, reduced autonomy, and loss of control of the defining images of self. As a result, suffering magnifies difference, forces social disconnection, elicits shame, and increases as inequalities mount.¹⁹

Meanings of suffering, however, vary and are processual. As researchers, we must find the range of meanings and learn how people form them. Figure 20.4 shows how suffering takes on moral status and assumes hierarchical form. In addition, it suggests how suffering intersects with institutional traditions and structural conditions that enforce difference. In keeping with a grounded theory perspective, any attributes taken as status variables must earn their way into the analysis rather than be assumed. Note that I added resources and capabilities as potential markers of difference as their significance became clear in the data.²⁰ Figure 20.4 implies how larger social justice issues can emerge in open-ended, inductive research. In this case, these issues concern access, equitable treatment, and inherent human worth in health care.

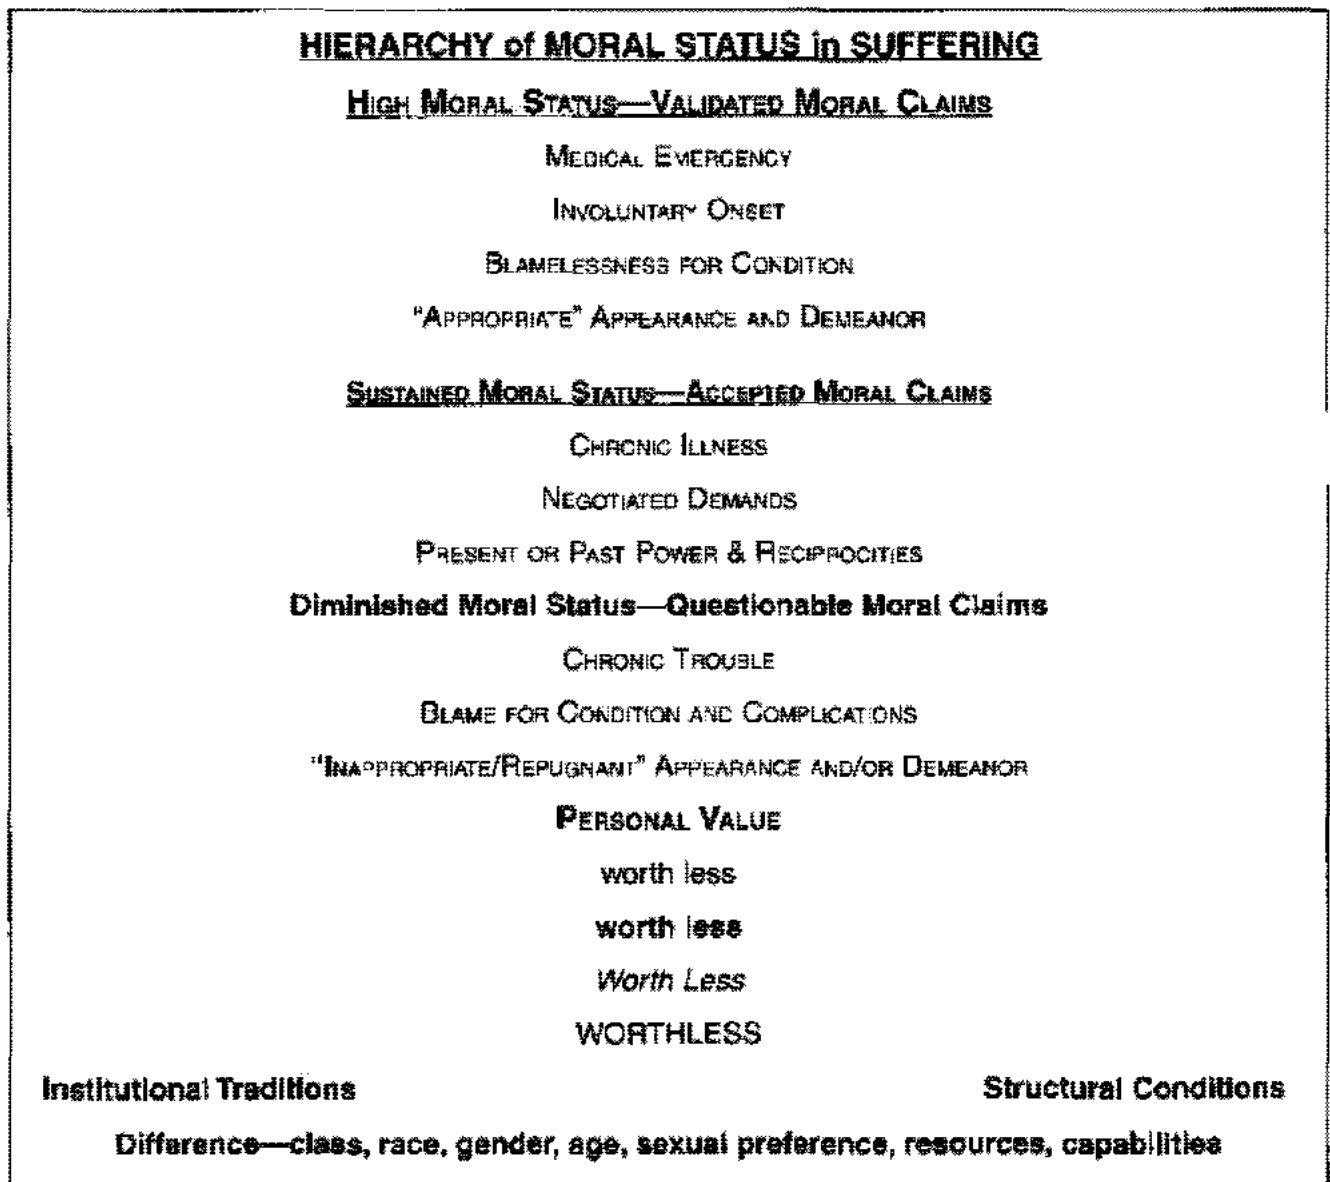

Figure 20.4. Hierarchy of Moral Status in Suffering

Source: Adapted and expanded from Charmaz (1999), "Stories of Suffering: Subjects' Stories and Research Narratives," *Qualitative Health Research*, 9, 362–382.

The figure reflects an abstract statement of how individual experience and social structure come together in emergent action. The figure derives from inductive and comparative analyses of meaning and action, consistent with Chicago school sociology. When we compare individual accounts, we can see that Marty Gordon and Christine Danforth develop their stance toward illness from different starting places and different experiences, yet they both are active in forming their definitions. The Chicago school concept of human nature has long contrasted with much of

structural social science. We not only assume human agency but also study it and its consequences. People are active, creative beings who *act*, not merely *behave*. They attempt to solve problems in their lives and worlds. As researchers, we need to learn how, when, and why participants act. Thus, the third step in reclaiming Chicago traditions follows: *Engage in a close study of action*. The Chicago emphasis on process becomes evident here. What do research participants see as routine? What do they define as problems? In Marty Gordon's case, the problems

disrupted her life and could kill her. She had good reason for wanting to oversee her care. At one point, she described her conversation with Monica, her lung specialist, about ending treatment with prednisone:

I've had a couple of setbacks. . . . The first time I went off it [prednisone], my breathing capacity cut right in half, so she said, "No." And I make deals with her. . . . So I'm going to Ireland and she said, "Okay, I want you to double it now, go back up while you're traveling, and then we'll talk about it. But no deals, and don't be stupid." So when I came back I said, "Let's try it again."

But when Marty came back from Ireland, she had complications. She described what happened while she was playing golf:

I wound up in emergency Easter Sunday because I thought . . . I pulled a muscle. . . . But they thought it was a pulmonary embolism. . . . They said, "Well, with your condition we have to take an X ray, a lung X ray." And he [physician] said, "Oh, I don't like what I see here." And I said, "Look, you're not the doctor that looks at that all the time, don't get nervous, it's been there." So he said, "No, there's a lot more scar tissue than your other X ray." And I said, "Yeah, well that's par for the course, from what I understand." And he said, "But there's a hole there I don't like to see." I said, "Look, it's a pulled muscle. Give me the Motrin." [At the time of this interview, Motrin was a prescription drug.] And finally he said, ". . . Maybe it is a pulled muscle." So she [Monica, her lung specialist] called me the next day and she said, "Okay, let's slow down on this going down on the prednisone, too many side things are happening, so we're going slower." And I think it will work. . . . I'm still playing golf and still working.

Marty Gordon's recounted conversations attest to her efforts to remain autonomous. She insisted on being the leading actor in her life and on shaping its quality. From the beginning, she had remained active in her care and unabashed in her willingness to challenge her physicians and to work with them—on her terms.

Agency does not occur in isolation; it always arises within a social context already shaped by

language, meaning, and modes of interaction. This point leads us to the next step in reclaiming the Chicago tradition: *Discover and detail the social context within which action occurs.* A dual focus on action and context can permit social justice researchers to make nuanced explanations of behavior. What people think, feel, and do must be analyzed within the relevant social contexts, which, in turn, people construct through action and interaction. Individuals take into account the actions of those around them as they themselves act. Interaction depends on fitting lines of action together, to use Herbert Blumer's term (Blumer, 1969, 1979). We sense how Marty Gordon and Monica fit lines of actions together to quell her symptoms. Marty crafted an enduring professional partnership with Monica that has eased her way through an increasingly less accessible health care organization for more than 10 years. Knowing that others are or will be involved shapes how people respond to their situations. The more participants create a shared focus and establish a joint goal, the more they will build a shared past and projected future. Marty and Monica shared the goal of keeping Marty alive and of reducing her symptoms while minimizing medication side effects. They built a history of more than a decade, and to this day they project a shared future.

The women in these two stories grapple with the issues that confront them and thus affect the social context in which they live. Marty had a voice and made herself heard; Christine tried but met resistance. She lacked advocates, social skills, and a shared professional discourse to enlist providers as allies, which commonly occurs when class and culture divide providers and patients. The construction of social context may be more discernible in Marty's statements than in other kinds of interviews. In Christine's attempt to obtain care, she related the sequence and timing of events. We see that she received care only because she became a medical emergency, and we learn how earlier refusals and delays increased her misery.

These interview statements contain words and phrases that tell and hint of meaning. Marty

Gordon talks about "making deals," "working hard," "not excepting," "wallowing," and "pushing myself." Christine Danforth contrasts herself with an "able body" and recounts how the sequence of events affected her actions. The fifth step in reclaiming the Chicago school tradition follows this dictum: *Pay attention to language*. Language shapes meaning and influences action. In turn, actions and experiences shape meanings. Marty's interview excerpts suggest how she uses words to make her meanings real and tries to make her meanings stick in interaction. Chicago school sociology assumes reciprocal and dynamic relations between interpretation and action. We interpret what happens around and to us and shape our actions accordingly, particularly when something interrupts our routines and causes us to rethink our situations.

In addition to the points outlined above, Chicago school scholars have generated other concepts that can fruitfully inform initial directions in social justice research and can sensitize the researcher's empirical observations. Among these concepts are Glaser and Strauss's (1965) concept of awareness contexts, Scott and Lyman's (1968) idea of accounts, Mills's (1990) notion of vocabularies of motive, Goffman's (1959) metaphor of the theater, and Hochschild's (1983) depiction of emotion work and feeling rules. Establishing who knows what, and when they know it, can provide a crucial focus for studying interaction in social justice research. Both the powerful and the powerless may be forced to give accounts that justify or excuse their actions. People describe their motives in vocabularies in situated social, cultural, historical, and economic contexts. Viewing life as theater can alert social justice researchers to main actors, minor characters and audiences, acts and scenes, roles and scripts, and front-stage impressions and back-stage realities. Different kinds of emotion work and feeling rules reflect the settings in which they arise. Expressed emotions and stifled feelings stem from rules and enacted hierarchies of power and advantage that less privileged actors may unwittingly support and reproduce (see, for example, Lively, 2001).

■ RETHINKING OUR LANGUAGE

Just as we must attend to how our research participants' language shapes meaning, we must attend to our own language and make it problematic. I mention a few key terms that we qualitative researchers assume and adopt. These terms have served as guiding metaphors or, more comprehensively, as organizing concepts for entire studies. Perhaps ironically, Chicago school sociologists and their followers have promulgated most of these terms. Researchers have made them part of their taken-for-granted lexicon and, I believe, imposed them too readily on our studied phenomena. The logic of both the earlier Chicago school and grounded theory means developing our concepts *from* our analyses of empirical realities, rather than applying concepts *to* them. If we adopt extant concepts, they must earn their way into the analysis through their usefulness (Glaser, 1978). Then we can extend and strengthen them (see, for example, Mamo, 1999; Timmermans, 1994).

Two major concepts carry images of tactical manipulations by a calculating social actor: strategies and negotiations. Despite what we social scientists say, much of human behavior does not reflect explicit *strategies*. Subsuming ordinary actions under the rubric of "strategies" implies explicit tactical schemes when, in fact, an actor's intentions may not have been so clear to him or her, much less to this actor's audience. Rather than strategies, much of what people do reflects their taken-for-granted habitual actions. These actions become routine and scarcely recognized unless disrupted by change or challenge. Note that in the long lists of codes comparing Christine Danforth's and Marty Gordon's situations, I list many actions but few strategies.

When looking for taken-for-granted actions in our research, John Dewey's (1922) central ideas about habit, if not the term itself, can prove helpful to attend to participants' assumptions and taken-for-granted practices, which may not always be in their own interests. Like Snow's (2001) point that much of life is routine and proceeds without explicit interpretation, Dewey (1922) views habits as patterned predispositions

that enable individuals to respond to their situations with economy of thought and action: People can act while focusing attention elsewhere (see also Clark, 2000; Cutchin, 2000). Thus, habits include those taken-for-granted modes of thinking, feeling, and acting that people invoke without reflection (Dewey, 1922; Hewitt, 1994). The habits of a lifetime enabled Marty Gordon to maintain hope and to manage her illness. Christine's habits let her eke by but also increased her isolation and physical problems.

Like the concept of strategies, negotiation also imparts a strategic character to interaction. Negotiation is an apt term to describe Marty Gordon's "deals" and disputes with her practitioners. At least from her view, contests did emerge, and bargaining could bring them to effective closure. Then interaction could proceed from the negotiated agreement. Marty brought not only her resolve to her negotiations, but also years of skills and fearlessness in dealing with professionals, a partnership with her primary physician, a network of supportive others, and the ability to pay for nutritious food, conveniences, and a good health plan. Little negotiation may proceed when a person has few such resources and great suffering, as Christine Danforth's story suggests.

Although the concept of negotiations may apply in Marty Gordon's case, we have stretched its applicability, as if it reflected most interactions. It does not. Much of social life proceeds as people either unconsciously adapt their response to another person or interpret what the other person says, means, or does and then they subsequently respond to it (Blumer, 1979). Interaction can alter views, temper emotions, modify intentions, and change actions—all without negotiation. The strategic quality of negotiation may be limited or absent during much sociability. People can be persuasive without attempting to negotiate. Negotiation assumes actors who are explicitly aware of the content and structure of the ensuing interaction. Negotiation also assumes that participants' interactional goals conflict or need realignment if future mutual endeavors are to occur. For that matter, the term assumes that all

participants have sufficient power to make their voices heard, if not also to affect outcomes. Judith Howard (2003) states, "The term 'negotiation' implies that the interacting parties have equal opportunities to control the social identities presented, that they come to the bargaining table with equal resources and together develop a joint definition of the situation" (p. 10). Nonetheless, much negotiation ensues when the parties involved do not have equal resources, and much foment may occur about enforcing definitions of social identities, despite unequal positions. For negotiations to occur, each party must be involved with the other to complete joint actions that matter to both, likely for different reasons.

The problems of applying these concepts and of importing their meanings and metaphors on our data extend beyond the concepts above. These problems also occur with applying the concepts of "career," "work," or "trajectory," which we could examine with the same logic. However, the current social scientific emphasis on stories merits scrutiny here.

■ METAPHORS OF STORIES AND MEANINGS OF SILENCES

The term "story" might once have been a metaphor for varied qualitative data such as interview statements, field note descriptions, or documents. However, we cease to use the term "story" as metaphor and have come view it as concrete reality, rather than a construction we place on these data. With several exceptions (e.g., Charmaz, 2002, *in press*; Frank, 1997), social scientists have treated the notion of "story" as unproblematic. We have questioned whose story we tell, how we tell it, and how we represent those who tell us their stories, but not the idea of a story itself or whether our materials fit the term "story." The reliance on qualitative interviews in grounded theory studies (Creswell, 1997), as well as in other qualitative approaches, such as narrative analysis, furthered this focus on stories. In addition, the topics themselves of intensive interviews foster producing a story.

Limiting data collection to interviews, as is common in grounded theory research, delimits the theory we can develop. In social justice studies, we must be cautious about which narrative frame we impose on our research, and when and how we do it. The frame itself can prove consequential. The story frame assumes a linear logic and boundaries of temporality that we might over- or underdraw.²¹

Part of my argument about stories concerns silences. In earlier works (Charmaz, 2002, in press), I have emphasized silences at the individual level of analysis; they are also significant at the organizational, social worlds, and societal levels. Clarke (2003, 2005) provides a new grounded theory tool, situational mapping, for showing action and inaction, voices and silences, at varied levels of analysis. She observes that silences reveal absent organizational alignments. Thus, mapping those silences, in their relation to active alignments, can render invisible social structure visible. Invisible aspects of social structure and process are precisely what critical inquiry needs to tackle.²²

Silences pose significant meanings and telling data in any research that deals with moral choices, ethical dilemmas, and just social policies. Silence signifies absence and sometimes reflects a lack of awareness or inability to express thoughts and feelings. However, silence speaks to power arrangements. It also can mean attempts to control information, to avoid redirecting actions, and, at times, to impart tacit messages. The "right" to speak may mirror hierarchies of power: *Only those who have power dare to speak*. All others are silenced (see, for example, Freire, 1970). Then, too, the powerless may retreat into silence as a last refuge. At one point, Christine Danforth felt that her life was out of control. She described being silenced by devastating events and by an aggressive psychiatrist, and she stopped talking. In all these ways, silence is part of language, meaning, and action.

Making stories problematic and attending to silences offers new possibilities for understanding social life for both social justice and grounded theory research. What people in power do not say

is often more telling than what they do say. We must note those who choose to remain silent, as well as those who have been silenced. Treating both stories and silences with a critical eye and comparing them with actions and inaction provides empirical underpinnings for any emerging grounded theory. Subsequently, the constructed theory will gain usefulness in its explanatory and predictive power.

■ ESTABLISHING EVALUATION CRITERIA

Using grounded theory for social justice studies requires revisiting the criteria for evaluating them. Glaser and Strauss's (1967; Glaser, 1978) criteria for assessing grounded theory studies include fit, workability, relevance, and modifiability. Thus, the theory must fit the empirical world it purports to analyze, provide a workable understanding and explanation of this world, address problems and processes in it, and allow for variation and change that make the core theory useful over time. The criterion of modifiability allows for refinements of the theory that simultaneously make it more precise and enduring.

Providing cogent explanations stating how the study meets high standards will advance social justice inquiry and reduce unmerited dismissals of it. However, few grounded theorists provide a model. They seldom offer explicit discussions about how their studies *meet* the above or other criteria, although they often provide statements on the logic of their decisions (cf. S. J. Miller & Fredericks, 1999). In the past, some grounded theorists have claimed achieving a theoretical grounding with limited empirical material. Increasingly, researchers justify the type, relative depth, and extent of their data collection and analysis on *one* criterion: saturation of categories. They issue a claim of saturation and end their data collection (Flick, 1998; Morse, 1995; Silverman, 2000). But what does saturation mean? To whom? Janice Morse (1995), who initiated the critique of saturation, accepts defining it as "data adequacy" and adds that it is "operationalized as collecting data until no new information is

obtained" (p. 147). Often, researchers invoke the criterion of saturation to justify small samples—very small samples with thin data. Such justifications diminish the credibility of grounded theory. Any social justice study that makes questionable claims of saturation risks being seen as suspect.

Claims of saturation often reflect rationalization more than reason, and these claims raise questions. What stands as a category?²⁵ Is it conceptual? Is it useful? Developed? By whose criteria? All these questions add up to the big question: *What stands as adequate research?* Expanded criteria that include the Chicago school's rigorous study of context and action makes any grounded theory study more credible and advances the claims of social justice researchers. Then we can augment our criteria by going beyond "saturation" and ask if our empirical detail also achieves Christians's (2000) and Denzin's (1989) criterion of "interpretive sufficiency," which takes into account cultural complexity and multiple interpretations of life.

To reopen explicit discussion of criteria for grounded theory studies, and particularly those in social justice research, I offer the following criteria.

Criteria for Grounded Theory Studies in Social Justice Inquiry

Credibility

- Has the researcher achieved intimate familiarity with the setting or topic?
- Are the data sufficient to merit the researcher's claims? Consider the range, number, and depth of observations contained in the data.
- Has the researcher made systematic comparisons between observations and between categories?
- Do the categories cover a wide range of empirical observations?
- Are there strong logical links between the gathered data and the researcher's argument and analysis?
- Has the researcher provided enough evidence for his or her claims to allow the reader to form an independent assessment—and agree with the researcher's claims?

Originality

- Are the categories fresh? Do they offer new insights?
- Does the analysis provide a new conceptual rendering of the data?
- What is the social and theoretical significance of the work?
- How does the work challenge, extend, or refine current ideas, concepts, and practices?

Resonance

- Do the categories portray the fullness of the studied experience?
- Has the researcher revealed liminal and taken-for-granted meanings?
- Has the researcher drawn links between larger collectivities and individual lives, when the data so indicate?
- Do the analytic interpretations make sense to members and offer them deeper insights about their lives and worlds?

Usefulness

- Does the analysis offer interpretations that people can use in their everyday worlds?
- Do the analytic categories speak to generic processes?
- Have these generic processes been examined for hidden social justice implications?
- Can the analysis spark further research in other substantive areas?
- How does the work contribute to making a better society?

A strong combination of originality and credibility increases resonance, usefulness, and the subsequent value of the contribution. The criteria above account for the empirical study and development of the theory. They say little about how the researcher writes the narrative or what makes it compelling. Other criteria speak to the aesthetics of the writing. Our written works derive from aesthetic principles and rhetorical devices—in addition to theoretical statements and scientific rationales. The act of writing is intuitive, inventive, and interpretive, not merely a reporting of acts and facts, or, in the case of grounded theory,

causes, conditions, categories, and consequences. Writing leads to further discoveries and deeper insights; it furthers inquiry. Rather than claiming silent authorship hidden behind a scientific facade, grounded theorists—as well as proponents of social justice—should claim audible voices in their writings (see Charmaz & Mitchell, 1996; Mitchell & Charmaz, 1996). For grounded theorists, an audible voice brings the writer's self into the words while illuminating intersubjective worlds. Such evocative writing sparks the reader's imagined involvement in the scenes portrayed and those beyond. In this sense, Laurel Richardson's (2000) criteria for the evocative texts of "creative analytic practice ethnography" also apply here. These criteria consist of the narrative's substantive contribution, aesthetic merit, reflexivity, impact, and expression of a reality (p. 937).

A grounded theory born from reasoned reflections and principled convictions that conveys a reality makes a substantive contribution. Add aesthetic merit and analytic impact, and then its influence may spread to larger audiences. Through reclaiming Chicago traditions, conducting inquiry to make a difference in the world, and creating evocative narratives, we will not be silenced. We will have stories to tell and theories to proclaim.

■ SUMMARY AND CONCLUSIONS

A turn toward qualitative social justice studies promotes combining critical inquiry and grounded theory in novel and productive ways. An interpretive, constructivist ground theory supports this turn by building on its Chicago school antecedents. Grounded theory can sharpen the analytic edge of social justice studies. Simultaneously, the critical inquiry inherent in social justice research can enlarge the focus and deepen the significance of grounded theory analyses. Combining the two approaches enhances the power of each.

A grounded theory informed by critical inquiry demands going deeper into the phenomenon itself and its situated location in the world than perhaps most grounded theory studies have

in the past. This approach does not mean departing from grounded theory guidelines. It does not mean investigative reporting. Grounded theory details process and context—and goes into the social world and setting far beyond one investigative story. Grounded theory contains tools to study how processes become institutionalized practices. Such attention to the processes that constitute structure can keep grounded theory from dissolving into fragmented small studies.

With the exception of those studies that rely on historical documents, grounded theory studies typically give little scrutiny to the past and sometimes blur inequalities with other experiences or overlook them entirely. Studying social justice issues means paying greater attention to inequality and its social and historical contexts. Too much of qualitative research today minimizes current *social* context, much less historical evolution. Relying on interview studies on focused topics may preclude attention to context—particularly when our research participants take the context of their lives for granted and do not speak of it. Hence, the mode of inquiry itself limits what researchers may learn. Clearly, interviewing is the method of choice for certain topics, but empirical qualitative research suffers if it becomes synonymous with interview studies.

Like snapshots, interviews provide a picture taken during a moment in time. Interviewers gain a view of research participants' concerns as they present them, rather than as events unfold. Multiple visits over time combined with the intimacy of intensive interviewing do provide a deeper view of life than one-shot structured or informational interviews can provide. However, anyone's retelling of events may differ markedly from an ethnographer's recording of them. In addition, as noted above, what people say may not be what they do (Deutscher et al., 1993). At that, what an interviewer asks and hears or an ethnographer records depends in part on the overall context, the immediate situation, and his or her training and theoretical proclivities.

At its best, grounded theory provides methods to explicate an empirical process in ways that prompt seeing beyond it. By sticking closely to

the leads and explicating the relevant process, the researcher can go deeper into meaning and action than given in words. Thus, the focused inquiry of grounded theory, with its progressive inductive analysis, moves the work theoretically and covers more empirical observations than other approaches. In this way, a focused grounded theory portrays a picture of the whole.

■ NOTES

1. Such emphases often start with pressing social problems, collective concerns, and impassioned voices. In contrast, Rawls's (1971) emphasis on fairness begins from a distanced position of theorizing individual rights and risks from the standpoint of the rational actor under hypothetical conditions. Conceptions of social justice must take into account both collective goods and individual rights and must recognize that definitions both of rationality and of "rational" actors are situated in time, space, and culture—and both can change. To foster justice, Nussbaum (2000, p. 234) argues that promoting a collective good must not subordinate the ends of some individuals over others. She observes that women suffer when a collective good is promoted without taking into account the internal power and opportunity hierarchies within a group.

2. For descriptions of grounded theory guidelines, see Charmaz (2000a, 2003b), Glaser (1978, 1992), and Strauss and Corbin (1990, 1998).

3. I use the term "data" throughout for two reasons: It symbolizes (a) a fund of empirical materials that we systematically collect and assemble to acquire knowledge about a topic and (b) an acknowledgment that qualitative resources hold equal significance for studying empirical reality as quantitative measures, although they differ in kind.

4. In this way, integrating a critical stance offers a corrective to narrow and limited studies conducted as grounded theory studies. Neither a narrow focus nor limited empirical material is part of the method itself. We cannot blur how earlier researchers have used grounded theory with the guidelines in the method. Although social justice inquiry suggests substantive fields, it also assumes questions and concerns about power, privilege, and hierarchy that some grounded theorists may not yet have entertained.

5. Chicago school sociology shaped an enduring tradition of qualitative research in sociology, of which grounded theory remains a part. What stands as "the"

Chicago school varies depending on who defines it (Abbott, 1999; L. H. Lofland 1980). In my view, the Chicago school theoretical heritage goes back to the early years of the 20th century, in the works, for example, of Charles Horton Cooley (1902), John Dewey (1922), George Herbert Mead (1932, 1934), and Charles S. Peirce (Hartshorne & Weiss, 1931–1935). In research practice, the Chicago school sparked study of the city and spawned urban ethnographies (see, for example, Park & Burgess, 1925; Shaw, 1930; Thomas & Znaniecki, 1927; Thrasher, 1927). Chicago sociologists often held naïve and partial views but many sensed the injustices arising in the social problems of the city, and Abbott (1999) notes that Albion Small attacked capitalism. Nonetheless, some Chicago school sociologists reinforced inequities in their own bailiwicks (Deegan, 1995). Mid-century ethnographers and qualitative researchers built on their Chicago school intellectual heritage and created what scholars have called a second Chicago school (G. A. Fine, 1995). For recent renderings of the Chicago school, see Abbott (1999), G. A. Fine (1995), Musolf (2003), and Reynolds (2003a, 2003b). Chicago school sociology emphasizes the contextual backdrop of observed scenes and their situated nature in time, place, and relationships. Despite the partial emergence of grounded theory from both theoretical and methodological Chicago school roots, Glaser (2002) disavows the pragmatist, constructionist elements in grounded theory.

6. Symbolic interactionism provides an open-ended theoretical perspective from which grounded theory researchers can start. This perspective is neither inherently prescriptive nor microsociological. Barbara Ballis Lal (2001) not only suggests the contemporary usefulness of early Chicago school symbolic interactionist ideas for studying race and ethnicity but also notes their implications for current political action and social policy. David Maines (2001) demonstrates that symbolic interactionist emphases on agency, action, and negotiated order have long had macrosociological import. He shows that the discipline of sociology has incorrectly—and ironically—compartmentalized symbolic interactionism while increasingly becoming more interactionist in its assumptions and directions.

7. In particular, the Chicago school provides antecedents for attending to social reform, as in Jane Addams's (1919) work at Hull-House and Mead and Dewey's interests in democratic process. The field research founded in Chicago school sociology has been called into question at various historical junctures

from Marxist and postmodernist perspectives (see, for example, Burawoy, Blom, et al., 1991; Burawoy, Gamson, et al., 2002; Clough, 1992; Denzin, 1992; Wacquant, 2002). Criticisms of Chicago school sociology have suggested that grounded theory represents the most codified and realist statement of Chicago school methodology (Van Maanen, 1988).

8. Strauss and Corbin's (1990, 1998) emphasis on technical procedures has been met with chagrin by a number of researchers (Glaser, 1992; Melia, 1996; Stern, 1994). In his 1987 handbook *Qualitative Analysis for Social Scientists*, Strauss mentions axial coding and verification, which depart from earlier versions of grounded theory, and he and Juliet Corbin (1990, 1998) develop them in their coauthored texts.

9. My critique mirrors a much larger trend. Lincoln and Guba (2000) find that the movement away from positivism pervades the social sciences. They state that the turn toward interpretive, postmodern, and critical theorizing makes most studies vulnerable to criticism (p. 163).

10. Grounded theory provides tools that researchers can—and do—use from any philosophical perspective—or political agenda. Studies of worker involvement, for example, may start from addressing employees' concerns or management's aim to increase corporate profits.

11. Tedlock (2000) states, "Ethnographers' lives are embedded within their field experiences in such a way that all their interactions involve moral choices" (p. 455). Ethnography may represent one end of a continuum. Nevertheless, does not grounded theory research also involve moral choices?

12. Feminist research suggests ways to proceed. DeVault (1999) and Olsen (2000) provide excellent overviews of and debates in feminist research.

13. Issues of exploitation arise when participants work without pay or recognition. Feminist researchers often recommend having participants read drafts of materials, yet even reading drafts may be too much when research participants are struggling with losses, although they may have requested to see the researcher's writings in progress. When research participants express interest, I share early drafts, but I try to reduce participants' potential feelings of obligation to finish reading them. Morse (1998) agrees with sharing results but not the conduct of inquiry.

14. Schwalbe et al. (2000) and Harris (2001) make important moves in this analytic direction.

15. The first two interview excerpts appear in earlier published accounts. I include them so that readers interested in seeing how I used them in social

psychological accounts may obtain them. Subsequent interview statements have not been published. The data are part of an evolving study of 170 interviews of chronically ill persons. A subset of research participants that includes these two women have been interviewed multiple times.

16. Further specifics of grounded theory guidelines are available in Charmaz (2000a, 2003b, Charmaz & Mitchell, 2001), Glaser (1978, 1992, 2001), Strauss, (1987), and Strauss and Corbin (1990, 1998).

17. I realize that presenting the Chicago school as a unified perspective is something of a historical gloss because differences are discernible between the early pragmatists as well as among the sociologists who followed them. Furthermore, a strong quantitative tradition developed at the University of Chicago (see Bolmer, 1984).

18. See Lofland and Lofland (1984, 1995) for an emphasis on describing the research setting. Lincoln and Guba (1985) offer a sound rationale for naturalistic inquiry as well as good ideas for conducting it. When the data consist of extant texts such as documents, films, or texts, then the researcher may need to seek multiple empirical sources.

19. See Scheff (2003) for a discussion of relationships between shame and society.

20. Grounded theory methods can inform traditional quantitative research, although these approaches seldom have been used together. Hypotheses can be drawn from Figure 20.4, such as that the greater the definitions of an individual's difference, the more rapid his or her tumble down the moral hierarchy of suffering. Quantitative researchers could pursue such hypotheses.

21. And as I have pointed out with individual accounts (Charmaz, 2002), raw experience may fit neither narrative logic nor the comprehensible content of a story.

22. Clarke's (2003, 2004) concept of implicated actors can be particularly useful to analyze voices and silences in social justice discourses.

23. See Dey (1999) for an extensive discussion on constructing categories in the early grounded theory works.

CRITICAL ETHNOGRAPHY AS STREET PERFORMANCE

Reflections of Home, Race, Murder, and Justice

D. Soyini Madison

What does it mean to be at home? How does leaving home affect home and being-at-home?

Home is here, not a particular place that one simply inhabits, but more than one place: there are too many homes to allow place to secure the roots or routes of one's destination. It is not simply that the subject does not belong anywhere. The journey between homes provides the subject with the contours of a space of belonging, but a space that expresses the very logic of an interval, the passing through of the subject between apparently fixed moments of departure and arrival. (Ahmed 2000, p. 76)

■ THE AIRPORT: DEPARTING HOME/ARRIVING HOME

When my plane was about to land at Kotoka International Airport in Ghana, West Africa, in March of 2000, I had been away from Africa for nearly a month. I had gone home to the United States to

see my son and my daughter after more than 2 years of fieldwork in Ghana. I was leaving home to come home. For the last 2 years, airports on both sides of the Atlantic marked physical and symbolic junctures of the departure and arrival of home (Ahmed, 2000). Airports had become rhizomes of perennial beginnings and endings, of a marked liminality that delineated what it meant to depart one life and arrive in another. Airports became the synecdoche for a black Diaspora citizenship and for a politics of mobility.

During 14 hours of travel, I departed home in order to arrive home, and, in the sentiment of Alice Walker, to do the work my soul must do (Walker, 1974), in Ghana, by doing the work of performance and by making a performance that, hopefully, mattered. As I gathered my belongings to leave the plane, I realized it was my last year in Africa. I was in the final stage of my fieldwork—the culminating stage. This was the year I would stage the performance, thereby making my fieldwork public and its purpose known.

It was upon entering the airport and waiting for my friend and fellow Fulbright sister, Lisa Aubrey, to pick me up that I began to feel the full weight of this final arrival. This was it. There was no turning back. It was time to transform 2 years of fieldwork data on poverty and indigenous human rights activism into a public performance, a public performance for the purpose of advocacy and change. The performance would depict a debate raging within a community of Ghanaians, one side representing the human rights of women and girls, and the other side representing the preservation of traditional religious practices. The former believed that traditional religion must be changed for the freedom and development of their people, while the latter believed that traditional religion must be preserved for the sustenance and protection of their people. The performance would represent these opposing claims, but it would do more—it would implicate the corporate, capitalist economy and the consequences of poverty on human rights abuses in the global South.

1. Performance of Possibility

As I walked through the airport, thoughts of the performance and its purpose took hold. This performance was going to be about the work of Ghanaian human rights activists and the work they were doing in their own country, and it had to be powerful and true and absolutely urgent because bodies were on the line. These people were changing the lives of women and girls by re-imagining the discourse of rights, by mobilizing their communities, and by changing the law. Moreover, Ghanaians did this for themselves under the forces of wretched poverty and global inequity. The performance had to unveil the labor of these activists working in their local communities, AND it had to unveil the devastation of global forces that impeded and burdened their victories. This performance aimed to expose the hidden, clarify the oblique, and articulate the possible. It would be a performance of possibility (Madison, 1998) that aimed to create and contribute to a discursive space where unjust systems and processes

are identified and interrogated. Social critic Anna Marie Smith (1998) states:

Dissemination of democratic discourse to new and needed areas of the social is the first step toward change. . . . One becomes radicalized when one finds a compelling discourse to speak. (p. 8)

I hoped the performance would provide such a discourse through the descriptions and narratives of those Ghanaian rights activists who told me their stories. Staging their struggles for human rights and the mandate for economic justice through the illuminating frame of performance promised this dissemination of democratic discourse. I hoped the performance would offer its audience another way to speak of rights and the origins of poverty that would then un-nestle another possibility of informed and strategic action. In other words, the significance of the performance for the subjects of my fieldwork is for those who bear witness to their stories to interrogate actively and purposefully those processes that limit their health and freedom. I do not mean to imply that one performance can bring down a revolution, but one performance can be revolutionary in enlightening citizens to the possibilities that grate against injustice. One performance may or may not change someone's world, but, as James Scott reminds us, acts of resistance amass, rather like snowflakes on a steep mountainside, and can set off an avalanche. Everyday forms of resistance give way to collective defiance (Scott, 1990, p. 192). In the performance of possibilities, the expectation is for the performers and spectators to appropriate the rhetorical currency they need, from the inner space of the performance to the outer domain of the social world, to make a material difference (Madison, 1998).

Performance scholar Diana Taylor reminds us that when confronted with certain "truths," theater has the power to illuminate not only what we see and how we see it, but how we can reject the reality of what we see and know to be true (Taylor, 1997). I believe more and more that a performance of possibility is always a harbinger of and a confrontation with the truth.

II. The Unexpected in the Present Tense: The Murder of Amadou Diallo

I see Lisa at the baggage claim. How on Earth did she actually get inside the airport! Those hard-core guards don't let anyone come inside the airport unless they're traveling. This woman is a wonder, with her combination of striking beauty, unabashed willfulness, irreverence for rules, and extraordinary intellect. She always averts the expected, the predictable, the required. I won't even ask her how she might have charmed the guards to get through this blockade of an airport, while throngs of others are waiting outside to greet friends and relations.

"Lisa!" I shout, so happy to see my friend.

"Soyiiiiineeee!" she calls out with excitement in her Louisiana accent. "How was the flight?"

"The flight was fine. I have just been so worried about getting this performance ready. This is all on top of the fatigue of not sleeping for 2 days trying to get back here."

"Oh. Soyini, girrrrl, the performance will be wonderful and you will be fine. Besides, you don't have time to be tired."

"Why?" I asked curiously. "What's happening?"

"We must organize a protest march on the American embassy for Amadou!"

"Lisa, it is all so awful and so redundant."

Lisa's voice tightens. "Does a blackman's life, a poor blackman's life, mean anything in the U.S.?"

The march was Lisa's idea, and I knew that she would be stalwart in mobilizing people of conscience to stand up and speak out against the murder of Amadou Diallo and the miscarriage of justice that followed. Still, I was so exhausted I could hardly speak.

"Lisa, are we meeting tonight?"

"Yes, we're all meeting at Flavors Pub in Osu tonight. This will be our second meeting. I need you there to help organize. We don't have much time. We need to mount the protest for next week!"

I'm stunned. "Next week?"

"Yes, next week. We need to get the letters and petitions to Washington within 2 weeks for a retrial. Are you too tired, Soyini? Can you make it, because we may be up all night."

I take a deep, uneasy breath, not so much from fatigue but from the contradiction. I am in the home of my heart, Africa, reflecting back on a 400-year-old rage for the home of my birth, the United States. The ideology of liberal democracy in the United States is, for some, a model for the world, yet its democratic principles partner with racial injustice with flagrant consistency. Racism in America is no moribund phenomenon; whatever or however its forms of disguise, it is alive and still hurting people. I will protest here, in my African home, for what was done there, in my American home, to a blackman born on this continent. I say to Lisa, "Let's go."

■ ■ ■

[African] Americans organizing protest activities in Ghana against the United States government posed interesting political and social contractual questions regarding citizen's rights, state responsibility, and democracy in an international context. For instance, in what ways can citizens lawfully exercise their constitutional rights to hold institutions of government accountable for their actions when these citizens reside outside of the country of their birth and citizenship? Additionally, how do we ensure that protests comply to laws of both the land of citizenship and the land of residence? Furthermore, how can we operate within the confines of both sets of laws and still maintain the passion, outrage and fervor of our demands? (Aubrey, 2001, p. 1)

Africanist and political science professor Lisa Aubrey wrote these words for *In Salute of Hero Amadou Diallo: African Americans Organize Amadou Diallo Protest Activities in Accra, Ghana in 2000: Lesson for Democracy in the United States and in Ghana*.

■ THE STREET PERFORMANCE: BLACKNESS AND OUTSIDE BELONGING

There are more people here at the march than we expected. We've worked very hard, and we've pulled it off. The teach-ins, the awareness sessions,

the petitions, the letter writing campaign, and the international solidarity day for Mumia Abu Jamal each were essential and dynamic projects in our organizing efforts for this march, the Amadou Diallo march. Each of these activities was a success, now culminating in this day. I look at all these people gathered here: They are a blend of races and ethnicities, expatriates from Europe, Asia, Africa, and the Americas living in Ghana from all over the world and coming to voice their indignation over the death of a young, innocent black man in New York City who was murdered by four plainclothes police officers as he was entering his residence in the Bronx. The police officers fired 41 bullets at Amadou Diallo; 19 of those bullets entered his body after he had fallen to the ground. The police were looking for a criminal, a young black man they thought was Amadou. They asked him if they could have a word with him. Amadou reached for his wallet to show his identification; then, the bullets came, and they kept coming. He did not have a weapon. The officers were brought to trial. A jury of eight white men and four black women acquitted the four white police officers. I wonder, if all the officers had been black, would Amadou's life have been spared? It is a troubling thought, but I don't think it would have made a difference. Blackness is a universal signifier of fear, danger, and threat across color lines; the meanings play out in the destruction of too many black men in American cities by those powerful and powerless with guns.

Here we all stand, together, on this day, March 8, 2000, remembering Amadou and demanding justice. And here I stand, African American, between two homes—one majority white, the other majority black. I stand here thinking about this thing called race that wrestles between Africa and America and that is complicated by the category "African American."

Performance scholar Joni Jones writes:

Just what is an African American? In Africa? My inability to answer this question uprooted a heretofore, fundamental aspect of my identity, a part of the self I took for granted in the United States as a part

of my cultural identity. In my mind, my dreadlocks, West African inspired clothing, and blackness of tongue meant something powerful in the United States, while for the Yoruba, these artifacts of identity elicited puzzlement, amusement, and sometimes disdain. I did not feel that my self, the self I had constructed on the U.S. soil, was visible. Indeed, I felt out of my self. (1996, p. 133)

I Remember: A Digression

I remember, during my first days in Ghana, I went to visit Lisa. I was looking for her flat; I couldn't figure out which apartment was hers. A Ghanaian, living on the first floor of her building saw that I was lost. He knew that I was looking for Lisa, so referring to her, he asked, "Are you looking for the white girl upstairs?"

I was taken aback by his description. Lisa is honey brown, with natural hair and West African-inspired clothing and blackness of tongue. How could he mistake Lisa for a white woman?

"No," I said, unsettled and insulted. "I am not looking for a white girl. I am looking for Lisa Aubrey and we are both African Americans."

The man pointed to her apartment and then just shook his head and chuckled under his breath, "Abruni."

I trembled. He had just called me a foreigner, a white person.

Black people are dying and catching hell in the United States, and that man called me Abruni! I belong to blackness as much as this man! I am reminded of cultural critic Elspeth Probyn: "If you have to think about belonging, perhaps you are already outside. Instead of presuming a common locus, I want to consider the ways in which the very longing to belong embarrasses its taken-for-granted nature" (1996, pp. 8–9).

For many black Americans, at profound moments, belonging requires a fixed political ground. Understanding that ultimately we belong in different categories and to different communities and that our belonging may be annunciated at different stages of political and social progressions (or regressions), beyond all this, "African American" as signifier and as signified is nonetheless a relatively stable reality of belonging to blackness in the

United States, however complicated that belonging may be. I experience belonging within the racialization of blackness in the United States not as a longing from an outside identity to enter into an inside identity. I am always already inside. Even when I'm not thinking about it, am I ever not a black person? Granted, I experience black belonging on American soil as a space of flux and ambiguity constituting multiple identities; however, this belonging remains a discursive and material association with specific bodies based on historical, social, and political arrangements that are regulated through law, culture, and the everyday. As this belonging is discursively instituted and materially experienced, my black body is further evidence that I am not white and that I belong to the category of blackness.

Black people can or cannot and will or will not choose to be slippery and equivocal about their racial identity and belonging. But for many black people in the United States, embracing this belonging, however it is articulated or whatever the level of its consistency, becomes a matter of saving one's life and one's sanity. This kind of belonging falls beyond intellectual or philosophical pondering; it is psychological and physical protection.

I never questioned the fact of my blackness. It is as much a part of me as my skin, my nose, my mouth, my hair, and my speech, all the while with an understanding that it is beyond appearances. When Anna Julia Cooper said, "When and where I enter, my race enters with me," she was acknowledging the ubiquity of race as it is internally felt and externally constructed (Giddings, 1996). The ever-present fact of race looms within the multi-layered realms of blackness in the United States and within a web of projections both colored and white, both hostile and admiring, where race/blackness often precedes being. In Ghana, West Africa, the words "white girl upstairs" disrupted my reality of belonging (that I've always known) to its very core. I was reminded that geography might be one of the greatest determiners of them all. Perhaps geography is destiny after all.

My personhood, for Lisa's neighbor, was outside blackness. I was outside belonging (Probyn, 1996). I represented something else to him. At that

moment, it was representation that eclipsed any notion of belonging. I was not a black woman, but the representation of a white one, the representation of a white, advanced country. The neighbor certainly understood that I was not white like Julia Roberts is white. I was not white by phenotype, but by country. Although he may have understood that I was of African descent, it did not matter. Nation and global order took primacy over racial identification. In that instant, I represented an individual of American descent, not African descent. I live in an advanced country; he lives in the developing world. This fact of economy eclipsed blackness within the U.S. context or any unity around Diaspora blackness that I might fantasize.

Belonging may be the effect of identity, but representation became a framework for meaning in the white girl upstairs (Hall, 1997). And if representation embodies meaning, my meaning was now constructed as not black, as not belonging. And if one of the things that culture is based on is the production and exchange of meanings, and if one of the ways we give things meaning is by how we produce them and how we represent them or how they appear to us, in that moment the white girl upstairs became the classic encounter between cultural insider and cultural outsider. At that moment, insider/outsider was deeply inscribed and poignantly reversed. I was the outsider, and belonging was reversed. That race is socially made became an understatement at the sound of "white girl." We are reminded repeatedly (and for good reason) that race is constructed, reconstructed, and deconstructed depending on locale, history, and power, but immediate experience sometimes penetrates deeper. Would he have called Lisa white if she had been a man and if I had been a man? Would he have said, "the white boy upstairs"? If I had been a white American woman, would he have referred to race at all? Would he have said, "you mean the lady upstairs?"

I personalize my experiences in the field to engage ironically with a vulnerability toward universal questions and human unease. Race as personally experienced in the ethnographic then, when I became subject and object of the Other's

gaze, brings me to the ethnographic now, writing. I theorize from the starting point of the personal and from my own racial dislocation between, within, and outside belonging in Africa. Race, in the moment—"white girl upstairs"—meant that this (re)construction of who I am is tied to where I live and where I travel, as well as politicized perspectives on wealth, opportunity, and technology, specifically as they are perceived by those in the global South, the developing world. That blackness is contingent—relative to African Americans, NOT on being of African descent but on being American citizens—is for many Africans taken for granted, while for many black Americans it is disheartening. Blackness is tied to slavery, terror, and discrimination, as it is also tied to a culture and past that are generative, free, and prosperous. However, in that ethnographic then, all these layers were displaced in recognition of my American citizenship that is complicated because I am of African descent.

III. Street Performance and Diaspora Identity

We are marching down the streets of Accra. This is less a protest march and more a street performance, or is it more a protest march because it is a street performance?

We had all planned to meet at the Labonne Coffee Shop in town and then march in silence to the American embassy; upon reaching the embassy, we would begin our program of speeches and testimonies. But the silence has surrendered to the sheer energy of our collective will. We are all caught in the drama and the urgency of our indignation, which cannot be stilled by silence, not here on this continent of drums, poetry, and dance, always dance, because this coming together has evolved into a precious praise song nightly strung together by the antiquity of dark-skinned motion. The march is a performance of movement made into a variance of sounds, symbolic rhythms, and lyrical incantations of mourning and politics. The onlookers in our path join our chorus of steps. They sing and chant with us. They see the black and white T-shirts we are

wearing, the word "Diallo" written in black letters across the front and the numbers "19 of 41" written across our backs. We pick up more and more people on our way. This march is becoming a carnival of contestation of the highest order, of purposeful action (Conquergood, 2002). We are all together, absorbed spontaneously in the *communitas* and flow of this assemblage of movement and this alchemy of collective will. There is no white girl upstairs here; there is only, in this heightened moment, communal energy. On this path of street performance and protest, for this brief moment in time, all of us belong to each other for performance and because of it, and some of us, for justice and because of it. More and more come to join the march. We are stepping and singing; we are meeting new friends; we are learning about the particularity of a lost life; we are enacting our urgency for justice. Reggae singer Shasha Marley raises his voice and calls. We respond. He calls again, and we respond again in the reverie of Ghanaian high life.

Anthropologist Victor Turner (1982) writes:

Is there any of us who has not known this moment when the mood, style, or fit of spontaneous *communitas* is upon us, we place a high value on personal honesty, openness, and lack of pretensions or pretentiousness. We feel that it is important to relate directly to another person as he presents himself in the here and now, free from the culturally defined encumbrances of his role, status, reputation, class, caste, sex, or other structural niche. Individuals who interact with one another in the mode of spontaneous *communitas* become totally absorbed into a single synchronized, fluid event. It has something magical about it. (pp. 47–48)

The magic of our inspired oneness summoned by the dramatic sounds and motions of street performance displaced "white girl upstairs," at least today and with a possibility for tomorrow, into a Diaspora consciousness, a black Atlantic identity, that would demand that African peoples on the continent and in the United States understand Amadou's death as an allegory for political action on both sides of the ocean. Describing that day, I turn again to Lisa's article and her words:

African American individuals in Ghana who took the initiative of organizing protest activities were supported by many Pan-African and other humanitarian communities that believe in justice, fairness, equality, and democracy. Individuals, community organizations, non-governmental organizations (NGOs), businesses, especially private radio stations, offered untiring support for the Diallo protest activities. Among the supporters were the African American Association of Ghana, One-Africa, the Brotherhood, members of the Ghana legal profession and the Ghana Bar Association, other concerned Ghanaians, Liberian refugees in Ghana, the W.E.B. Dubois Center, the Embassy of Guinea, the Commission on Human Rights and Administrative Justice (CHRA), a quasi governmental organization of Ghana, the Student and Workers Solidarity Committee, Musicians of Ghana (MUSIGA) and Ghanaian and American students from the University of Ghana, Legon. (Aubrey, 2001, pp. 1-2)

Now, the march has grown to even greater numbers. Amadou Diallo's memory is reaching out like a hand gesturing for another to hold and to remember. Manifest through performance, the gesture is exquisite, evolving into a celebratory embrace.

We finally reach the American embassy. We form a large circle in front of the building. As the circle forms, we begin lighting our candles. Lisa begins the ceremony by recounting the night of Amadou's death. She concludes her presentation by speaking eloquently on the nature of democracy and descent. Her words are a call to action for free speech, for collective action, and for the U.S. Department of Justice to intervene and bring federal civil rights charges against the acquitted police officers.

After Lisa ends her presentation, I begin to speak. I am speaking of the power of mourning: mourning the hope of Amadou Diallo, who was so like so many immigrants, who strive most of their lives to come to the land of opportunity, wealth, and happiness, and discover that when they finally arrive, they must confront the ominous inequality and violence of race in America. I close by recovering what it means to mourn, not only as loss but also as evocation. Our mourning evokes

social activism. I am reminded of rights activists who have fought across national borders and their urgent cry: "Don't mourn, organize!"

The ceremony is drawing to an end. The written statement we crafted, demanding a retrial and that civil charges be brought against the four police officers, is given to the director of the embassy. She receives the statement with the promise that the embassy would look into the matter and take action, as its officers also believe in justice.

■ NOVEMBER 15, 2002,
NORTH CAROLINA, U.S.A.

And the Hate Goes On
La, La, La, La, La

A retrial was not ordered. The acquittal of the four police officers was granted without further interference by the justice system. When I first began preparing this chapter, 2 years after our protest march, I went to the Internet to search for new developments relating to the Diallo case. I discovered that there was an Amadou Diallo Web site. I opened the site and, to my surprise, although the murder of Diallo was on February 4, 1999, nearly 3 years prior, there was a posting for that very day, November 15, 2002. What follows are samples of the most recent exchange over a 3-day period from when I first discovered the site. These verbatim exchanges (including spelling and grammar) represent the sentiment of most of the entries sent to the Amadou Diallo home page. I have chosen to include only three that were the least offensive.

Name: Nigger God Killer

Date: Tuesday, November 12, 2002, at 20:44:06

Comments: Phuck you Nigger God you stupid fucking worthless faggot ass nigger! Someone should kill your worthless cocksucking faggot nigger ass! Kill all niggers! White Power!

Name: Aryan

Date: Thursday, November 12, 2002, at 20:47:22

Comments: Amadou Diallo is a worthless nigger; the cops should have blown this nigger brains out. The only good nigger is a dead nigger. Heil Hitler! Deutschland Uher Alles! Ein Reich, Ein Volk, Ein Fuhrer! Saig heil!

Name: All niggers and niggerlovers must die!

Date: Friday, November 15, 2002, at 01:44:51

Comments: I totally agree with you Aryan. The cops should have not only blown Amadou Diallo's brains out, but have also blown out his whole family's brains, allus true white people (excluding kikes, wiggers, and faggots, because they're niggerloving white race traitors) should blow every nigger on this earth's brains out. If niggerkilling and niggerloverkilling was legalized I'd be killing tons and tons of niggers and niggerloving white race traitor kikes, wiggers, and faggots everyday.

And the hate goes on, even after death. We are in an era when many still relegate such racism to bygone days. The messages from the Internet notwithstanding, and given that the murder of Amadou Diallo met no justice, what good did our street protest do? People still hate, and more people of color have died since 1999 at the hands of murderous authority. What is the value of such performances when what we aim for is not achieved? What effect did our performance march have in the light of these despicable and violent words?

IV. Conclusion

Just like a bell cannot be unring, our street performance cannot be undone. It is remembered, and it has produced friends, allies, and comrades, as it has also inspired imagination. The promise of a performance of possibility is that it not only creates alliances while it names and marks injustice, but it also enacts a force beyond ideology; it enacts and imagines the vast possibilities of collective hopes and dreams coming into fruition, of actually being lived. In the words of performance scholar Janelle Reinelt, "performance can overrun ideology's containment" (1996, p. 3). Why, then, did our street performance matter?

The performance made public international injustice committed on an American city street. It brought that injustice beyond its particular location by extending the arena of public viewing and awareness across national boundaries to invoke and materialize a transborder participatory call for justice, generating a street performance that embodied a dialogue with authority (Gunner, 1994). Therefore, in this more expanded performative participation, a re-visioning of ingrained social arrangements relating to authority and violence, class and power, as well as freedom of speech and social change, were called into question by the voices and action of those situated within the context of globalization from below (Brecher, Costello, & Smith, 2002; Cohen-Cruz, 1998).

The march evolved into a street performance that made spirited actors out of passive observers. Engaged action motivated by performative intervention, a performance of possibility was required for the call and the response, for the testimonies, the dialogue, and the demand upon the American embassy. Moreover, it is the emotionally charged animation drawn from the body in motion, within the heightened moments of performative intervention, that unleashes a palpable defiance that dissolves apathy (Conquergood, 2002; Denzin, 2003; Madison, 1999). The performance evoked spontaneous *communitas* that offers the alchemy of human connection, conjoinment, and intersubjectivity to the power and ubiquity of memory. We remember how this communion felt for us and for each other, together. It was made even more powerfully human because it was publicly performed. I echo the sentiment of social activist Ernesto J. Cortes, Jr., that there is a dimension of our humanity that emerges only when we engage in public discourse.

The street performance, empowered by *communitas* and the humanizing dynamics of public discourse, provided us with the gift of remembering (Pollock, 1999). The street performance became a method and a means for the dissemination of discourse relative to rights, justice, and change, and, moreover, for transborder participatory democracy (Brecher et al., 2002). The march

was a local and a dramatic point of interrogation of U.S. foreign policy relative to democracy assistance programs that demand that other nations in the world to make their state institutions accountable and fair (Aubrey, 2001, p. 2). Lisa Aubrey states: "By organizing the protest activities, African Americans were forcing the U.S. to look into the mirror for the very transparency and probity it aims to cultivate and extract from other governments" (p. 2). The street performance honored the local in speaking truth to power (Marable, 1996) and became a communicative instrument in the public interrogation of injustice that resulted in the enactment of collective memory and mourning.

Finally, the street performance opens the possibility for another strategy for globalization from below. Globalization from above is making poor people poorer and rich people richer. Brecher, Costello, and Smith, in their powerfully concise book *Globalization From Below*, state:

The ultimate source of power is not the command of those at the top, but the acquiescence of those at the bottom. . . . In response to globalization from above, movements are emerging all over the world in social locations that are marginal to the dominant power centers. These are linking up by means of networks that cut across national borders. They are beginning to develop a sense of solidarity, a common belief system, and a common program. They are utilizing these networks to impose new norms on corporations, governments, and international institutions. (pp. 23, 26)

The street performance is another illustration of the communicative function and political effectiveness of performance in mobilizing communities for change. It serves as an added example of the potential of street performance as a platform for subaltern voices and cross-border access and networks.

Several years have passed since our march on the American embassy in Ghana, and I still relive in my memory the words and chants from several of our Ghanaian friends who were responsible for

turning a protest march into a street performance: Shasha chanted "We are One Love"; Akosua kept repeating "We prove today that we are sisters"; Helen asserted "We are all African people"; and, as the march came to an end, Kweku said, "An ocean cannot divide our blood."

I remember the resounding force of the drummers and how our steps marked the rhythms of the drums along the road to the embassy under the hot sun, the blazing heat, and the many accented voices filled with song, chant, banter, and laughter. In Shasha's words and in the words of many other Ghanaians who performed that day, we were living in the *communitas* of one love.

But after the march, and beyond the path of the marchers, Lisa and I still remain the white girls upstairs. However, on that particular day, the magic of performance evoked a politics that was lived in the flesh and on the ground and that demanded social justice, a politics that is now remembered and recurred for the possibilities of another way of being.

TESTIMONIO, SUBALTERNITY, AND NARRATIVE AUTHORITY

John Beverley

In a justly famous essay, Richard Rorty (1985) distinguishes between what he calls the "desire for solidarity" and the "desire for objectivity" as cognitive modes:

There are two principal ways in which reflective human beings try, by placing their lives in a larger context, to give sense to those lives. The first is by telling the story of their contribution to a community. This community may be the actual historical one in which they live, or another actual one, distant in time or place, or a quite imaginary one, consisting perhaps of a dozen heroes and heroines selected from history or fiction or both. The second way is to describe themselves as standing in an immediate relation to a nonhuman reality. This relation is immediate in the sense that it does not derive from a relation between such a reality and their tribe, or their nation, or their imagined band of comrades. I shall say that stories of the former kind exemplify the desire for solidarity, and that stories of the latter kind exemplify the desire for objectivity. (p. 3)¹

The question of *testimonio*—testimonial narrative—has come prominently onto the agenda of the human and social sciences in recent years

in part because *testimonio* intertwines the "desire for objectivity" and "the desire for solidarity" in its very situation of production, circulation, and reception.

Testimonio is by nature a demotic and heterogeneous form, so any formal definition of it is bound to be too limiting.² But the following might serve provisionally: A *testimonio* is a novel or novella-length narrative, produced in the form of a printed text, told in the first person by a narrator who is also the real protagonist or witness of the events she or he recounts. Its unit of narration is usually a "life" or a significant life experience. Because in many cases the direct narrator is someone who is either functionally illiterate or, if literate, not a professional writer, the production of a *testimonio* generally involves the tape recording and then the transcription and editing of an oral account by an interlocutor who is a journalist, ethnographer, or literary author.

Although one of the antecedents of *testimonio* is undoubtedly the ethnographic life history of the *Children of Sánchez* sort, *testimonio* is not exactly commensurable with the category of life history (or oral history). In the life history, it is the intention of the interlocutor-recorder (the ethnographer

or journalist) that is paramount; in *testimonio*, by contrast, it is the intention of the direct narrator, who *uses* (in a pragmatic sense) the possibility the ethnographic interlocutor offers to bring his or her situation to the attention of an audience—the bourgeois public sphere—to which he or she would normally not have access because of the very conditions of subalternity to which the *testimonio* bears witness.³ *Testimonio* is not intended, in other words, as a reenactment of the anthropological function of the native informant. In René Jara's (1986, p. 3) phrase, it is rather a *narración de urgencia*—an “emergency” narrative—involving a problem of repression, poverty, marginality, exploitation, or simply survival that is implicated in the act of narration itself. In general, *testimonio* could be said to coincide with the feminist slogan “The personal is the political.” The contemporary appeal of *testimonio* for educated, middle-class, transnational publics is perhaps related to the importance given in various forms of 1960s counterculture to oral testimony as a form of personal and/or collective catharsis and liberation in (for example) the consciousness-raising sessions of the early women's movement, the practice of “speaking bitterness” in the Chinese Cultural Revolution, or psychotherapeutic encounter groups.

The predominant formal aspect of the *testimonio* is the voice that speaks to the reader through the text in the form of an “I” that demands to be recognized, that wants or needs to stake a claim on our attention. Eliana Rivero (1984–1985) notes that “the act of speaking faithfully recorded on the tape, transcribed and then ‘written,’ remains in the *testimonio* punctuated by a repeated series of interlocutive and conversational markers . . . which constantly put the reader on the alert, so to speak: True? Are you following me? OK? So?” (pp. 220–221, my translation). The result, she argues, is a “snaillike” discourse (*discurso encaramolado*) that keeps turning in on itself and that in the process invokes the complicity of the reader through the medium of his or her counterpart in the text, the direct interlocutor. This presence of the voice, which the reader is meant to experience as the voice of a *real*

rather than a fictional person, is the mark of a desire not to be silenced or defeated, to impose oneself on an institution of power and privilege from the position of the excluded, the marginal, the subaltern—hence the insistence on the importance of personal name or identity evident sometimes in titles of *testimonios*, such as *I, Rigoberta Menchú* (even more strongly in the Spanish: *Me llamo Rigoberta Menchú y así me nació la conciencia*), *I'm a Juvenile Delinquent* (*Soy un delincuente*), and *Let Me Speak* (*Si me permiten hablar*).

This insistence suggests an affinity between testimony and autobiography (and related forms, such as the autobiographical *bildungsroman*, the memoir, and the diary). Like autobiography, *testimonio* is an affirmation of the authority of personal experience, but, unlike autobiography, it cannot affirm a self-identity that is separate from the subaltern group or class situation that it narrates. *Testimonio* involves an erasure of the function and thus also of the textual presence of the “author” that is so powerfully present in all major forms of Western literary and academic writing.⁴ By contrast, in autobiography or the autobiographical *bildungsroman*, the very possibility of “writing one's life” implies necessarily that the narrator is no longer in the situation of marginality and subalternity that his or her narrative describes, but now has attained precisely the cultural status of an author (and, generally speaking, middle- or upper-class economic status). Put another way, the transition from storyteller to author implies a parallel transition from *gemeinschaft* to *gesellschaft*, from a culture of primary and secondary orality to writing, from a traditional group identity to the privatized, modern identity that forms the subject of liberal political and economic theory.

The metonymic character of testimonial discourse—the sense that the voice that is addressing us is a part that stands for a larger whole—is a crucial aspect of what literary critics would call the convention of the form: the narrative contract with the reader it establishes. Because it does not require or establish a hierarchy of narrative authority, *testimonio* is a fundamentally democratic

and egalitarian narrative form. It implies that any life so narrated can have a symbolic and cognitive value. Each individual *testimonio* evokes an absent polyphony of other voices, other possible lives and experiences (one common formal variation on the first-person singular *testimonio* is the polyphonic *testimonio* made up of accounts by different participants in the same event).

If the novel is a closed form, in the sense that both the story and the characters it involves end with the end of the text, in *testimonio*, by contrast, the distinctions between text and history, representation and real life, public and private spheres, objectivity and solidarity (to recall Rorty's alternatives) are transgressed. It is, to borrow Umberto Eco's expression, an "open work." The narrator in *testimonio* is an actual person who continues living and acting in an actual social space and time, which also continue. *Testimonio* can never create the illusion—fundamental to formalist methods of textual analysis—of the text as autonomous, set against and above the practical domain of everyday life and struggle. The emergence of *testimonios*, for the form to have become more and more popular in recent years, means that there are experiences in the world today (there always have been) that cannot be expressed adequately in the dominant forms of historical, ethnographic, or literary representation, that would be betrayed or misrepresented by these forms.

Because of its reliance on voice, *testimonio* implies in particular a challenge to the loss of the authority of orality in the context of processes of cultural modernization that privilege literacy and literature as a norm of expression. The inequalities and contradictions of gender, class, race, ethnicity, nationality, and cultural authority that determine the "urgent" situation of the testimonial narrator may also reproduce themselves in the relation of the narrator to the interlocutor, especially when (as is generally the case) that narrator requires to produce the *testimonio* a "lettered" interlocutor from a different ethnic and/or class background in order first to elicit and record the narrative, and then to transform it into a printed text and see to its publication and circulation as such. But it is equally important to understand

that the testimonial narrator is not the subaltern as such either; rather, she or he functions as an organic intellectual (in Antonio Gramsci's sense of this term) of the subaltern, who speaks to the hegemony by means of a metonymy of self in the name and in the place of the subaltern.

By the same token, the presence of subaltern voice in the *testimonio* is in part a literary illusion—something akin to what the Russian formalists called *skaz*: the textual simulacrum of direct oral expression. We are dealing here, in other words, not with reality itself but with what semioticians call a "reality effect" that has been produced by both the testimonial narrator—using popular speech and the devices of oral storytelling—and the interlocutor-compiler, who, according to hegemonic norms of narrative form and expression, transcribes, edits, and makes a story out of the narrator's discourse. Elzbieta Skłodowska (1982) cautions in this regard that it would be naïve to assume a direct homology between text and history (in *testimonio*).

The discourse of a witness cannot be a reflection of his or her experience, but rather a refraction determined by the vicissitudes of memory, intention, ideology. The intention and the ideology of the author-editor further superimposes the original text, creating more ambiguities, silences, and absences in the process of selecting and editing the material in a way consonant with norms of literary form. Thus, although the *testimonio* uses a series of devices to gain a sense of veracity and authenticity—among them the point of view of the first-person witness-narrator—the play between fiction and history reappears inexorably as a problem. (p. 379, my translation; see also Skłodowska, 1996)

The point is well taken, but perhaps overstated. Like the identification of *testimonio* with life history (which Skłodowska shares), it concedes agency to the interlocutor-editor of the testimonial text rather than to its direct narrator. It would be better to say that what is at stake in *testimonio* is the particular nature of the reality effect it produces. Because of its character as a narrative told in the first person to an actual interlocutor, *testimonio* interpellates the reader in a way

that literary fiction or third-person journalism or ethnographic writing does not. The word *testimonio* carries the connotation in Spanish of the act of testifying or bearing witness in a legal or religious sense. Conversely, the situation of the reader of *testimonio* is akin to that of a jury member in a courtroom. *Something* is asked of us by *testimonio*, in other words. In this sense, *testimonio* might be seen as a kind of speech act that sets up special ethical and epistemological demands. (When we are addressed directly by an actual person, in such a way as to make a demand on our attention and capacity for judgment, we are under an obligation to respond in some way or other; we can act or not on that obligation, but we cannot ignore it.)

What *testimonio* asks of its readers is in effect what Rorty means by solidarity—that is, the capacity to identify their own identities, expectations, and values with those of another. To understand how this happens is to understand how *testimonio* works ideologically as discourse, rather than what it is.

In one of the most powerful sections of her famous *testimonio* I, *Rigoberta Menchú* (Menchú, 1984), which has come to be something like a paradigm of the genre, Menchú describes the torture and execution of her brother Petrocinio by elements of the Guatemalan army in the plaza of a small highland town called Chajul, which is the site of an annual pilgrimage by worshippers of the local saint. Here is part of that account:

After he'd finished talking the officer ordered the squad to take away those who'd been "punished," naked and swollen as they were. They dragged them along, they could no longer walk. Dragged them to this place, where they lined them up all together within sight of everyone. The officer called to the worst of the criminals—the *Kaibiles*, who wear different clothes from other soldiers. They're the ones with the most training, the most power. Well, he called the *Kaibiles* and they poured petrol over each of the tortured. The captain said, "This isn't the last of their punishments, there's another one yet. This is what we've done with all the subversives we catch, because they have to die by violence. And if this doesn't teach you a lesson, this is what'll happen to you too. The problem is that the Indians

let themselves be led by the communists. Since no-one's told the Indians anything, they go along with the communists." He was trying to convince the people but at the same time he was insulting them by what he said. Anyway, they [the soldiers] lined up the tortured and poured petrol on them; and then the soldiers set fire to each one of them. Many of them begged for mercy. Some of them screamed, many of them leapt but uttered no sound—of course, that was because their breathing was cut off. But—and to me this was incredible—many of the people had weapons with them, the ones who'd been on their way to work had machetes, others had nothing in their hands, but when they saw the army setting fire to the victims, everyone wanted to strike back, to risk their lives doing it, despite all the soldiers' arms. . . . Faced with its own cowardice, the army itself realized that the whole people were prepared to fight. You could see that even the children were enraged; but they didn't know how to express their rage. (pp. 178–179)

This passage is undoubtedly compelling and powerful. It invites the reader into the situation it describes through the medium of the eyewitness narrator, and it is the sharing of the experience through the medium of Menchú's account that constitutes the possibility of solidarity. But "what if much of Rigoberta's story is not true?" anthropologist David Stoll (1999, p. viii) asks. On the basis of interviews in the area where the massacre was supposed to have occurred, Stoll concludes that the killing of Menchú's brother did not happen in exactly this way, that Menchú could not have been a direct witness to the event as her account suggests, and that therefore this account, along with other details of her *testimonio*, amounts to, in Stoll's words, a "mythic inflation" (pp. 63–70, 232). It would be more accurate to say that what Stoll is able to show is that *some* rather than "much" of Menchú's story is not true. He does not contest the fact of the murder of Menchú's brother by the army, and he stipulates that "there is no doubt about the most important points [in her story]: that a dictatorship massacred thousands of indigenous peasants, that the victims included half of Rigoberta's immediate family, that she fled to Mexico to save her life, and

that she joined a revolutionary movement to liberate her country" (p. vili). But he does argue that the inaccuracies or omissions in her narrative make her less than a reliable spokesperson for the interests and beliefs of the people for whom she claims to speak. In response to Stoll, Menchú herself has publicly conceded that she grafted elements of other people's experiences and stories onto her own account. In particular, she has admitted that she was not herself present at the massacre of her brother and his companions in Chajul, and that the account of the event quoted in part above came instead from her mother, who (Menchú claims) was there. She says that this and similar interpolations were a way of making her story a collective one, rather than a personal autobiography. But the point remains: If the epistemological and ethical authority of testimonial narratives depends on the assumption that they are based on personal experience and direct witness, then it might appear that, as Stoll puts it, "*I, Rigoberta Menchú* does not belong in the genre of which it is the most famous example, because it is not the eyewitness account it purports to be" (p. 242).

In a way, however, the argument between Menchú and Stoll is not so much about what really happened as it is about who has the authority to narrate. (Stoll's quarrel with Menchú and *testimonio* is a political quarrel that masquerades as an epistemological one.) That question, rather than the question of "what really happened," is crucial to an understanding of how *testimonio* works. What seems to bother Stoll above all is that Menchú has an agenda. He wants her to be in effect a native informant who will lend herself to his purposes (of ethnographic information gathering and evaluation), but she is instead functioning in her narrative as an organic intellectual, concerned with producing a text of local history—that is, with elaborating hegemony.

The basic idea of Gayatri Spivak's famous, but notoriously difficult, essay "Can the Subaltern Speak?" (1988) might be reformulated in this way: If the subaltern could speak—that is, speak in a way that really *matters* to us, that we would feel compelled to listen to—then it would not be

subaltern. Spivak is trying to show that behind the gesture of the ethnographer or solidarity activist committed to the cause of the subaltern in allowing or enabling the subaltern to speak is the trace of the construction of an other who is available to speak to us (with whom we *can* speak or with whom we would feel comfortable speaking), thus neutralizing the force of the reality of difference and antagonism to which our own relatively privileged position in the global system might give rise. She is saying that one of the things being subaltern means is not mattering, not being worth listening to, or not being understood when one is "heard."

By contrast, Stoll's argument with Rigoberta Menchú is precisely with how her *testimonio* comes to matter. He is bothered by the way it was used by academics and solidarity activists to mobilize international support for the Guatemalan armed struggle in the 1980s, long after (in Stoll's view) that movement had lost whatever support it may have initially enjoyed among the indigenous peasants for whom Menchú claims to speak. That issue—"how outsiders were using Rigoberta's story to justify continuing a war at the expense of peasants who did not support it" (Stoll, 1999, p. 241)—is the main problem for Stoll, rather than the inaccuracies or omissions themselves. From Stoll's viewpoint, by making Menchú's story seem (in her own words) "the story of all poor Guatemalans"—that is, by its participating in the very metonymic logic of *testimonio*—*I, Rigoberta Menchú* misrepresents a more complex and ideologically contradictory situation among the indigenous peasants. It reflects back to the reader not the subaltern as such, but a narcissistic image of what the subaltern *should be*:

Books like *I, Rigoberta Menchú* will be exalted because they tell academics what they want to hear. . . . What makes *I, Rigoberta Menchú* so attractive in universities is what makes it misleading about the struggle for survival in Guatemala. We think we are getting closer to understanding Guatemalan peasants when actually we are being borne away by the mystifications wrapped up in an iconic figure. (Stoll, 1999, p. 227)

In one sense, of course, there is a coincidence between Spivak's concern with the production in metropolitan ethnographic and literary discourse of what she calls a "domesticated Other" and Stoll's concern with the conversion of Menchú into an icon of academic political correctness. But Stoll's argument is also explicitly *with* Spivak, as a representative of the very kind of "postmodern scholarship" that would privilege a text like *I, Rigoberta Menchú*, even to the extent of wanting to deconstruct its metaphysics of presence. Thus, Stoll states, for example:

Following the thinking of literary theorists such as Edward Said and Gayatri Spivak, anthropologists have become very interested in problems of narrative, voice, and representation, especially the problem of how we misrepresent voices other than our own. In reaction, some anthropologists argue that the resulting fascination with texts threatens the claim of anthropology to be a science, by replacing hypothesis, evidence, and generalization with stylish forms of introspection. (p. 247)

Or this: "Under the influence of postmodernism (which has undermined confidence in a single set of facts) and identity politics (which demands acceptance of claims to victimhood), scholars are increasingly hesitant to challenge certain kinds of rhetoric" (p. 244). Or "With postmodern critiques of representation and authority, many scholars are tempted to abandon the task of verification, especially when they construe the narrator as a victim worthy of their support" (p. 274).

Where Spivak is concerned with the way in which hegemonic literary or scientific representation effaces the effective presence and agency of the subaltern, Stoll's case against Menchú is precisely that; a way of, so to speak, *resubalternizing* a narrative that aspired to (and to some extent achieved) cultural authority. In the process of constructing her narrative and articulating herself as a political icon around its circulation, Menchú is becoming not-subaltern, in the sense that she is functioning as what Spivak calls a subject of history. Her *testimonio* is a *performative* rather than simply descriptive or denotative

discourse. Her narrative choices, and silences and evasions, entail that there are versions of "what really happened" that she does not or cannot represent without relativizing the authority of her own account.

It goes without saying that in any social situation, indeed even within a given class or group identity, it is always possible to find a variety of points of view or ways of telling that reflect contradictory, or simply differing, agendas and interests. "Obviously," Stoll (1999) observes:

Rigoberta is a legitimate Mayan voice. So are all the young Mayas who want to move to Los Angeles or Houston. So is the man with a large family who owns three worn-out acres and wants me to buy him a chain saw so he can cut down the last forest more quickly. Any of these people can be picked to make misleading generalizations about Mayas. (p. 247)

The presence of these other voices makes Guatemalan indigenous communities—indeed even Menchú's own immediate family—seem irremediably driven by internal rivalries, contradictions, and disagreements.

But to insist on this is, in a way, to deny the possibility of subaltern agency as such, because a hegemonic project by definition points to a possibility of collective will and action that depends precisely on the transformation of the conditions of cultural and political disenfranchisement, alienation, and oppression that underlie these rivalries and contradictions. The appeal to diversity ("any of these people") leaves intact the authority of the outside observer (the ethnographer or social scientist) who is alone in the position of being able to both hear and sort through all the various conflicting testimonies.

The concern about the connection between *testimonio* and identity politics that Stoll evinces is predicated on the fact that multicultural rights claims carry with them what Canadian philosopher Charles Taylor (1994) has called a "presumption of equal worth" (and *I, Rigoberta Menchú* is, among other things, a strong argument for seeing the nature of American societies as irrevocably multicultural and ethnically heterogeneous). That

presumption in turn implies an epistemological relativism that coincides with the postmodernist critique of the Enlightenment paradigm of scientific objectivity. If there is no one universal standard for truth, then claims about truth are contextual. They have to do with how people construct different understandings of the world and historical memory from the same sets of facts in situations of gender, ethnic, and class inequality, exploitation, and repression. The truth claims for a testimonial narrative like *I, Rigoberta Menchú* depend on conferring on the form a special kind of epistemological authority as embodying subaltern voice and experience. Against the authority of that voice—and, in particular, against the assumption that it can represent adequately a collective subject (“all poor Guatemalans”)—Stoll wants to affirm the authority of the fact-gathering and -testing procedures of anthropology and journalism, in which accounts like Menchú’s will be treated simply as ethnographic data that must be processed by more objective techniques of assessment, which, by definition, are not available to the direct narrator. In the final analysis, what Stoll is able to present as evidence against the validity of Menchú’s account are, precisely, *other testimonios*: other voices, narratives, points of view, in which, it will come as no surprise, he can find something *he* wants to hear.

We know something about the nature of this problem. There is not, outside the realm of human discourse itself, a level of facticity that can guarantee the truth of this or that representation, given that society itself is not an essence prior to representation, but rather the consequence of struggles to represent and over-representation. That is the deeper meaning of Walter Benjamin’s aphorism “Even the dead are not safe”: Even the historical memory of the past is conjectural, relative, perishable. *Testimonio* is both an art and a strategy of subaltern memory.

We would create yet another version of the native informant of classical anthropology if we were to grant testimonial narrators like Rigoberta Menchú only the possibility of being witnesses, and not the power to create their own narrative authority and negotiate its conditions of truth

and representativity. This would amount to saying that the subaltern can of course speak, but only through *us*, through our institutionally sanctioned authority and pretended objectivity as intellectuals, which give us the power to decide what counts in the narrator’s raw material. But it is precisely that institutionally sanctioned authority and objectivity that, in a less benevolent form, but still claiming to speak from the place of truth, the subaltern must confront every day in the forms of war, economic exploitation, development schemes, obligatory acculturation, police and military repression, destruction of habitat, forced sterilization, and the like.⁵

There is a question of agency here. What *testimonio* obliges us to confront is not only the subaltern as a (self-)represented victim, but also as the agent—in that very act of representation—of a transformative project that aspires to become hegemonic in its own right. In terms of this project, which is not our own in any immediate sense and which may in fact imply structurally a contradiction with our own position of relative privilege and authority in the global system, the testimonial text is a *means* rather than an end in itself. Menchú and the persons who collaborated with her in the creation of *I, Rigoberta Menchú* certainly were aware that the text would be an important tool in human rights and solidarity work that might have a positive effect on the genocidal conditions the text itself describes. But *her* interest in the text is not to have it become an object for us, our means of getting the “whole truth”—*toda la realidad*—of her experience. It is rather to act tactically in a way she hopes and expects will advance the interests of the community and social groups and classes her *testimonio* represents: “poor” (in her own description) Guatemalans. That is as it should be, however, because it is not only *our* desires and purposes that count in relation to *testimonio*.

This seems obvious enough, but it is a hard lesson to absorb fully, because it forces us to, in Spivak’s phrase, “unlearn privilege.” Unlearning privilege means recognizing that it is not the intention of subaltern cultural practice simply to signify its subalternity to us. If that is what *testimonio*

does, then critics like Sklodowska are right in seeing it as a form of the status quo, a kind of postmodernist *costumbrismo*. The force of a *testimonio* such as *I, Rigoberta Menchú* is to displace the centrality of intellectuals and what they recognize as culture—including history, literature, journalism, and ethnographic writing. Like any testimonial narrator (like anybody), Menchú is of course also an intellectual, but in a sense she is clearly different from what Gramsci meant by a traditional intellectual—that is, someone who meets the standards and carries the authority of humanistic and/or scientific high culture. The concern with the question of subaltern agency and authority in *testimonio* depends, rather, on the suspicion that intellectuals and writing practices are themselves complicit in maintaining relations of domination and subalternity.

The question is relevant to the claim made by Dinesh D'Souza (1991) in the debate over the Stanford Western Culture undergraduate requirement (which centered on the adoption of *I, Rigoberta Menchú* as a text in one of the course sections) that *I, Rigoberta Menchú* is not good or great literature. D'Souza writes, "To celebrate the works of the oppressed, apart from the standard of merit by which other art and history and literature is judged, is to romanticize their suffering, to pretend that it is naturally creative, and to give it an aesthetic status that is not shared or appreciated by those who actually endure the oppression" (p. 87). It could be argued that *I, Rigoberta Menchú* is one of the most powerful works of literature produced in Latin America in the past several decades, but there is also some point in seeing it as a provocation in the academy, as D'Souza feels it to be. The subaltern, by definition, is a social position that is not, and cannot be, adequately represented in the human sciences or the university, if only because the human sciences and the university are among the institutional constellations of power/knowledge that create and sustain subalternity. This is not, however, to draw a line between the world of the academy and the subaltern, because the point of *testimonio* is, in the first place, to intervene in that world—that

is, in a place where the subaltern is not. In its very situation of enunciation, which juxtaposes radically the subject positions of the narrator and interlocutor, *testimonio* is involved in and constructed out of the opposing terms of a master/slave dialectic: metropolis/periphery, nation/region, European/indigenous, creole/mestizo, elite/popular, urban/rural, intellectual/manual, male/female, "lettered"/illiterate or semiliterate. *Testimonio* is no more capable of transcending these oppositions than are more purely literary or scientific forms of writing or narrative; that would require something like a cultural revolution that would abolish or invert the conditions that produce relations of subordination, exploitation, and inequality in the first place. But *testimonio* does involve a new way of articulating these oppositions and a new, collaborative model for the relationship between the intelligentsia and the popular classes.

To return to Korten's point about the "desire for solidarity," a good part of the appeal of *testimonio* must lie in the fact that it both represents symbolically and enacts in its production and reception a relation of solidarity between ourselves—as members of the professional middle class and practitioners of the human sciences—and subaltern social subjects. *Testimonio* gives voice to a previously anonymous and voiceless popular-democratic subject, but in such a way that the intellectual or professional is interpellated, in his or her function as interlocutor/reader of the testimonial account, as being in alliance with (and to some extent dependent on) this subject, without at the same time losing his or her identity as an intellectual.

If first-generation *testimonios* such as *I, Rigoberta Menchú* effaced textually in the manner of the ethnographic life story (except in their introductory presentations) the presence of the interlocutor, it is becoming increasingly common in what is sometimes called the "new ethnography" to put the interlocutor into the account, to make the dynamic of interaction and negotiation between interlocutor and narrator part of what *testimonio* testifies to. Ruth Behar's *Translated Woman: Crossing the Border with Esperanza's Story* (1993), for example, is often mentioned as a

model for the sort of ethnographic text in which the authority (and identity) of the ethnographer is counterpointed against the voice and authority of the subject whose life history the ethnographer is concerned with eliciting. In a similar vein, Philippe Bourgois's innovative ethnography of Puerto Rican crack dealers in East Harlem, *In Search of Respect* (1995), often pits the values of the investigator—Bourgois—against those of the dealers he befriends and whose stories and conversations he transcribes and reproduces in his text. In *Event, Metaphor, Memory: Chauri Chaura, 1922–1992* (1995), the subaltern studies historian Shahid Amin is concerned with retrieving the “local memory” of an uprising in 1922 in a small town in northern India in the course of which peasants surrounded and burned down a police station, leading to the deaths of 23 policemen. But he is also concerned with finding ways to incorporate formally the narratives that embody that memory into his own history of the event, thus abandoning the usual stance of the historian as omniscient narrator and making the heterogeneous voices of the community itself the historian(s).

These ways of constructing testimonial material (obviously, the examples could be multiplied many times over) make visible that what happens in *testimonio* is not only the textual staging of a “domesticated Other,” to recall Spivak's telling objection, but the confrontation through the text of one person (the reader and/or immediate interlocutor) with another (the direct narrator or narrators) at the level of a possible solidarity. In this sense, *testimonio* also embodies a new possibility of political agency (it is essentially that possibility to which Stoll objects). But that possibility—a postmodernist form of Popular Front-style alliance politics, if you will—is necessarily built on the recognition of and respect for the radical incommensurability of the situation of the parties involved. More than empathic liberal guilt or political correctness, what *testimonio* seeks to elicit is *coalition*. As Doris Sommer (1996) puts it succinctly, *testimonio* “is an invitation to a tête-à-tête, not to a heart to heart” (p. 143).

■ BIBLIOGRAPHIC NOTE

Margaret Randall, who has organized testimonial workshops in Cuba and Nicaragua (and who has herself edited a number of *testimonios* on the roles of women in the Cuban and Nicaraguan revolutions), is the author of a very good, albeit hard to find, handbook on how to prepare a *testimonio* titled *Testimonios: A Guide to Oral History* (1985). The first significant academic discussion of *testimonio* that I am aware of was published in the 1986 collection *Testimonio y literatura*, edited by René Jara and Hernán Vidal at the University of Minnesota's Institute for the Study of Ideologies and Literature. The most comprehensive representation of the debate around *testimonio* in the literary humanities in the ensuing decade or so is the collection edited by Georg Gugelberger titled *The Real Thing: Testimonial Discourse and Latin America* (1996), which incorporates two earlier collections: one by Gugelberger and Michael Kearney for a special issue of *Latin American Perspectives* (vols. 18–19, 1991), and the other by myself and Hugo Achugar titled *La voz del otro: Testimonio, subalternidad, y verdad narrativa*, which appeared as a special issue of *Revista de Crítica Literaria Latinoamericana* (1992). The initial literary “manifesto” of *testimonio* was the essay by the Cuban novelist-ethnographer Miguel Barnet (apropos his own *Biography of a Runaway Slave*), “La novela-testimonio: Socioliteratura” (1986), originally published in the late 1960s in the Cuban journal *Unión*. On the academic incorporation of *testimonio* and its consequences for pedagogy, see Carey-Webb and Benz (1996). Jara and Vidal's (1986) collection happened to coincide with the famous collection on ethnographic authority and writing practices edited by James Clifford and George Marcus, *Writing Culture* (1986), which exercised a wide influence in the fields of anthropology and history. One should note also in this respect the pertinence of the work of the South Asian Subaltern Studies Group (see, e.g., Guha, 1997; Guha & Spivak, 1988) and of the Latin American Subaltern Studies Group (see Rabasa, Sanjinés, & Carr, 1994/1996). For both

social scientists and literary critics, a touchstone for conceptualizing *testimonio* should be Walter Benjamin's great essays, "The Storyteller" and "Theses on the Philosophy of History" (see Benjamin, 1969).

■ NOTES

1. Rorty's (1985) distinction may recall for some readers Marvin Harris's well-known distinction between *emic* and *etic* accounts (where the former are personal or collective "stories" and the latter are representations given by a supposedly objective observer based on empirical evidence).

2. Widely different sorts of narrative texts could in given circumstances function as *testimonios*: confession, court testimony, oral history, memoir, autobiography, autobiographical novel, chronicle, confession, life story, *novela-testimonio*, "nonfiction novel" (Truman Capote), or "literature of fact" (Roque Dalton).

3. Mary Louise Pratt (1986) describes the *testimonio* usefully in this respect as "autoethnography."

4. In Miguel Barner's (1986) phrase, the author has been replaced in *testimonio* by the function of a "compiler" (*compilador*) or "activator" (*gestante*), somewhat on the model of the film producer.

5. Lacan (1977, pp. 310–311) writes:

Any statement of authority has no other guarantee than its very enunciation, and it is pointless for it to seek another signifier, which could not appear outside this locus in any way. Which is what I mean when I say that no metalanguage can be spoken, or, more aphoristically, that there is no Other of the Other. And when the Legislator (he who claims to lay down the Law) presents himself to fill the gap, he does so as an impostor.

PARTICIPATORY ACTION RESEARCH

Communicative Action and the Public Sphere

Stephen Kemmis and Robin McTaggart

Participatory action research has an extensive history in many fields of social practice. Our aim in this chapter is to develop the view of participatory action research that has shaped our own theory and practice during recent years. We begin with a short overview of the evolution of our own thinking and the influence of several generations of action research. In our chapter on "Participatory Action Research" for the second edition of this *Handbook*, we identified several key approaches to action research, the sites and settings where they are most frequently used, several criticisms that have been advanced for each, and key sources to explore them (Kemmis & McTaggart, 2000). The approaches identified were a somewhat eclectic mix—participatory research, classroom action research, action learning, action science, soft systems approaches, and industrial action research. We summarize those approaches again here but do not reiterate our views of them in this chapter. We acknowledge the influence of each approach on

the field and as stimulus to reflection on our own ideas and practices.

For our current purposes, we proceed to develop a comprehensive view of social practice and reflect on aspects of our own work that we term "myths, misinterpretations, and mistakes" to move toward reconceptualizing research itself as a social practice. Thinking about research as a social practice leads us to an exploration of Habermas's notion of the public sphere as a way of extending the theory and practice of action research. We hope that this argument shows more clearly how participatory action research differs from other forms of social inquiry, integrating more clearly its political and methodological intentions. We anticipate that this argument will provide direction for a new generation of participatory action research, and we trust that it will strengthen the theory and practice of participatory action research in the many fields and settings that draw on its intellectually and morally rich traditions, ideas, and challenges.

■ THE FAMILY OF ACTION RESEARCH

Action research began with an idea attributed to social psychologist Kurt Lewin. It first found expression in the work of the Tavistock Institute of Human Relations in the United Kingdom (Rapaport, 1970), where Lewin had visited in 1933 and 1936 and had maintained contact for many years. Lewin's (1946, 1952) own earliest publications on action research related to community action programs in the United States during the 1940s. However, it is worth noting that Altrichter and Gstettner (1997) argued that there were earlier, more "actionist" approaches to action research in community development practiced by H. G. Moreno, for example, working with prostitutes in Vienna at the turn of the 20th century. Nevertheless, it was Lewin's work and reputation that gave impetus to the action research movements in many different disciplines. Stephen Corey initiated action research in education in the United States soon after Lewin's work was published (Corey, 1949, 1953). However, efforts to reinterpret and justify action research in terms of the prevailing positivistic ideology in the United States led to a temporary decline in its development there (Kemmis, 1981).

A second generation of action research, building on a British tradition of action research in organizational development championed by researchers at the Tavistock Institute (Rapaport, 1970), began in Britain with the Ford Teaching Project directed by John Elliott and Clem Adelman (Elliott & Adelman, 1973). Recognition in Australia of the "practical" character of the British initiative led to calls for more explicitly "critical" and "emancipatory" action research (Carr & Kemmis, 1986). The critical impulse in Australian action research was paralleled by similar advocacies in Europe (Brock-Utne, 1980). These advocacies and efforts for their realization were called the third generation of action research. A fourth generation of action research emerged in the connection between critical emancipatory action research and participatory action research that had developed in the context of social movements in the developing world, championed by people such as Paulo Freire, Orlando Fals Borda, Rajesh

Tandon, Anisur Rahman, and Marja-Liisa Swantz as well as by North American and British workers in adult education and literacy, community development, and development studies such as Budd Hall, Myles Horton, Robert Chambers, and John Gaventa. Two key themes were (a) the development of theoretical arguments for more "actionist" approaches to action research and (b) the need for participatory action researchers to make links with broad social movements.

Participatory Research

Participatory research is an alternative philosophy of social research (and social life [*vivência*]) often associated with social transformation in the Third World. It has roots in liberation theology and neo-Marxist approaches to community development (e.g., in Latin America) but also has rather liberal origins in human rights activism (e.g., in Asia). Three particular attributes are often used to distinguish participatory research from conventional research: shared ownership of research projects, community-based analysis of social problems, and an orientation toward community action. Given its commitment to social, economic, and political development responsive to the needs and opinions of ordinary people, proponents of participatory research have highlighted the politics of conventional social research, arguing that orthodox social science, despite its claim to value neutrality, normally serves the ideological function of justifying the position and interests of the wealthy and powerful (Fals Borda & Rahman, 1991; Forester, Pitt, & Welsh, 1993; Freire, 1982; Greenwood & Levin, 2000, 2001; Hall, Gillette, & Tandon, 1982; Horton, Kohl, & Kohl, 1990; McGuire, 1987; McTaggart, 1997; Oliveira & Darcy, 1975; Park, Brydon-Miller, Hall, & Jackson, 1993).

Critical Action Research

Critical action research expresses a commitment to bring together broad social analysis—the self-reflective collective self-study of practice, the way in which language is used, organization and power in a local situation, and action to improve things.

Critical action research is strongly represented in the literatures of educational action research, and there it emerges from dissatisfactions with classroom action research that typically does not take a broad view of the role of the relationship between education and social change. It has a strong commitment to participation as well as to the social analyses in the critical social science tradition that reveal the disempowerment and injustice created in industrialized societies. During recent times, critical action research has also attempted to take account of disadvantage attributable to gender and ethnicity as well as to social class, its initial point of reference (Carr & Kemmis, 1986; Fay, 1987; Henry, 1991; Kemmis, 1991; Marika, Ngurruwutthun, & White, 1992; McTaggart, 1991a, 1991b, 1997; Zuber-Skerritt, 1996).

Classroom Action Research

Classroom action research typically involves the use of qualitative interpretive modes of inquiry and data collection by teachers (often with help from academics) with a view to teachers making judgments about how to improve their own practices. The practice of classroom action research has a long tradition but has swung in and out of favor, principally because the theoretical work that justified it lagged behind the progressive educational movements that breathed life into it at certain historical moments (McTaggart, 1991a; Noffke, 1990, 1997). Primacy is given to teachers' self-understandings and judgments. The emphasis is "practical," that is, on the interpretations that teachers and students are making and acting on in the situation. In other words, classroom action research is not just practical idealistically, in a utopian way, or just about how interpretations might be different "in theory"; it is also practical in Aristotle's sense of practical reasoning about how to act rightly and properly in a situation with which one is confronted. If university researchers are involved, their role is a service role to the teachers. Such university researchers are often advocates for "teachers' knowledge" and may disavow or seek to diminish the relevance of more theoretical discourses such as critical

theory (Dadds, 1995; Elliott, 1976-1977; Sagor, 1992; Stenhouse, 1975; Weiner, 1989).

Action Learning

Action learning has its origins in the work of advocate Reg Revans, who saw traditional approaches to management inquiry as unhelpful in solving the problems of organizations. Revans's early work with colliery managers attempting to improve workplace safety marks a significant turning point for the role of professors, engaging them directly in management problems in organizations.

The fundamental idea of action learning is to bring people together to learn from each other's experiences. There is emphasis on studying one's own situation, clarifying what the organization is trying to achieve, and working to remove obstacles. Key aspirations are organizational efficacy and efficiency, although advocates of action learning affirm the moral purpose and content of their own work and of the managers they seek to engage in the process (Clark, 1972; Pedler, 1991; Revans, 1980, 1982).

Action Science

Action science emphasizes the study of practice in organizational settings as a source of new understandings and improved practice. The field of action science systematically builds the relationship between academic organizational psychology and practical problems as they are experienced in organizations. It identifies two aspects of professional knowledge: (a) the formal knowledge that all competent members of the profession are thought to share and into which professionals are inducted during their initial training and (b) the professional knowledge of interpretation and enactment. A distinction is also made between the professional's "espoused theory" and "theories in use," and "gaps" between these are used as points of reference for change. A key factor in analyzing these gaps between theory and practice is helping the professional to unmask the "cover-ups" that are put in place, especially when participants are feeling anxious or threatened. The approach aspires to the development of

the "reflective practitioner" (Argyris, 1990; Argyris & Schön, 1974, 1978; Argyris, Putnam, & McLain Smith, 1985; Reason, 1988; Schön, 1983, 1987, 1991).

Soft Systems Approaches

Soft systems approaches have their origins in organizations that use so-called "hard systems" of engineering, especially for industrial production. Soft systems methodology is the human "systems" analogy for systems engineering that has developed as the science of product and information flow. It is defined as oppositional to positivistic science with its emphasis on hypothesis testing. The researcher (typically an outside consultant) assumes a role as discussion partner or trainer in a real problem situation. The researcher works with participants to generate some (systems) models of the situation and uses the models to question the situation and to suggest a revised course of action (Checkland, 1981; Checkland & Scholes, 1990; Davies & Ledington, 1991; Flood & Jackson, 1991; Jackson, 1991; Kolb, 1984).

Industrial Action Research

Industrial action research has an extended history, dating back to the post-Lewinian influence in organizational psychology and organizational development in the Tavistock Institute of Human Relations in Britain and the Research Center for Group Dynamics in the United States. It is typically consultant driven, with very strong advocacies for collaboration between social scientists and members of different levels of the organization. The work is often couched in the language of workplace democratization, but more recent explorations have aspired more explicitly to the democratization of the research act itself, following the theory and practice of the participatory research movement. Especially in its more recent manifestations, industrial action research is differentiated from action science and its emphasis on cognition taking a preferred focus on reflection and the need for broader organizational and social change. Some advocacies have

used critical theory as a resource to express aspirations for more participatory forms of work and evaluation, but more typically the style is somewhat humanistic and individualistic rather than critical. Emphases on social systems in organizations, such as improving organizational effectiveness and employee relations, are common. Also, the Lewinian aspiration to learn from trying to bring about change is a strong theme (Bravette, 1996; Elden, 1983; Emery & Thorsrud, 1976; Emery, Thorsrud, & Trist, 1969; Foster, 1972; Levin, 1985; Pasmore & Friedlander, 1982; Sandkull, 1980; Torbert, 1991; Warmington, 1980; Whyte, 1989, 1991).

■ THE EMERGENCE OF CRITICAL PARTICIPATORY ACTION RESEARCH

Until the late 1990s, the hallmark of the action research field was eclecticism. Although the Lewinian idea was often used as a first point of legitimation, quite different rationales and practices had emerged in different disciplines. The sequestering of much literature under disciplinary rubrics meant that there was little dialogue between groups of different practitioners and advocates. Increases in visibility and popularity of the approaches rapidly changed this. There were large increases in scale and attendance at the world congresses on participatory action research as well as burgeoning interest at international sociological conferences. Action research reemerged as an influential approach in the United States (Greenwood & Levin, 2000, 2001). New associations between researchers and a vast literature of critique of modernity and its insinuation of capitalist, neocapitalist, and postcapitalist state and social systems into social life created both the impetus for and the possibility of dialogue. The historical and geographical distribution of action research approaches around the world and their interrelationships were better understood.

Critical participatory action research emerged as part of this dialogue. It aimed to provide a frame of reference for comprehension and critique of itself and its predecessors and to offer a

way of working that addressed rampant individualism, disenchantment, and the dominance of instrumental reason—the key features of the “malaise of modernity” (Taylor, 1991). Critical participatory action research, as we now understand it, also creates a way of reinterpreting our own views of action research as they develop practically, theoretically, and pedagogically over time (e.g., Carr & Kemmis, 1986; Kemmis & McTaggart, 1988a, 1988b, 2000; McTaggart, 1991a). Before we revisit some of the myths, misinterpretations, and mistakes associated with our work over three decades, we present a summary of what we have regarded as the key features of participatory action research. We do this to identify some key principles as markers of progress, but we then look back at our own experience to develop what might potentially be seen as the rationale for a new generation of critical participatory action research.

Key Features of Participatory Action Research

Although the process of participatory action research is only poorly described in terms of a mechanical sequence of steps, it is generally thought to involve a spiral of self-reflective cycles of the following:

- *Planning a change*
- *Acting and observing the process and consequences of the change*
- *Reflecting on these processes and consequences*
- *Replanning*
- *Acting and observing again*
- *Reflecting again, and so on . . .*

Figure 23.1 presents this spiral of self-reflection in diagrammatic form. In reality, the process might not be as neat as this spiral of self-contained cycles of planning, acting and observing, and reflecting suggests. The stages overlap, and initial plans quickly become obsolete in the light of learning from experience. In reality, the process is likely to be more fluid, open, and responsive. The criterion of success is not whether participants have followed the steps faithfully but

rather whether they have a strong and authentic sense of development and evolution in their *practices*, their *understandings* of their practices, and the *situations* in which they practice.

Each of the steps outlined in the spiral of self-reflection is best undertaken collaboratively by coparticipants in the participatory action research process. Not all theorists of action research place this emphasis on collaboration; they argue that action research is frequently a solitary process of systematic self-reflection. We concede that it is often so; nevertheless, we hold that participatory action research is best conceptualized in collaborative terms. Participatory action research is itself a social—and educational—process. The “subjects” of participatory action research undertake their research as a social practice. Moreover, the “object” of participatory action research is social; participatory action research is directed toward studying, reframing, and reconstructing social practices. *If practices are constituted in social interaction between people, changing practices is a social process.* To be sure, one person may change so that others are obliged to react or respond differently to that individual’s changed behavior, but the willing and committed involvement of those whose interactions constitute the practice is necessary, in the end, to secure and legitimate the change. Participatory action research offers an opportunity to create forums in which people can join one another as coparticipants in the struggle to remake the practices in which they interact—forums in which rationality and democracy can be pursued together without an artificial separation ultimately hostile to both. In his book *Between Facts and Norms*, Jürgen Habermas described this process in terms of “opening communicative space” (Habermas, 1996), a theme to which we return later.

At its best, then, participatory action research is a social process of collaborative learning realized by groups of people who join together in changing the practices through which they interact in a shared social world in which, for better or worse, we live with the consequences of one another’s actions.

It should also be stressed that participatory action research involves the investigation of

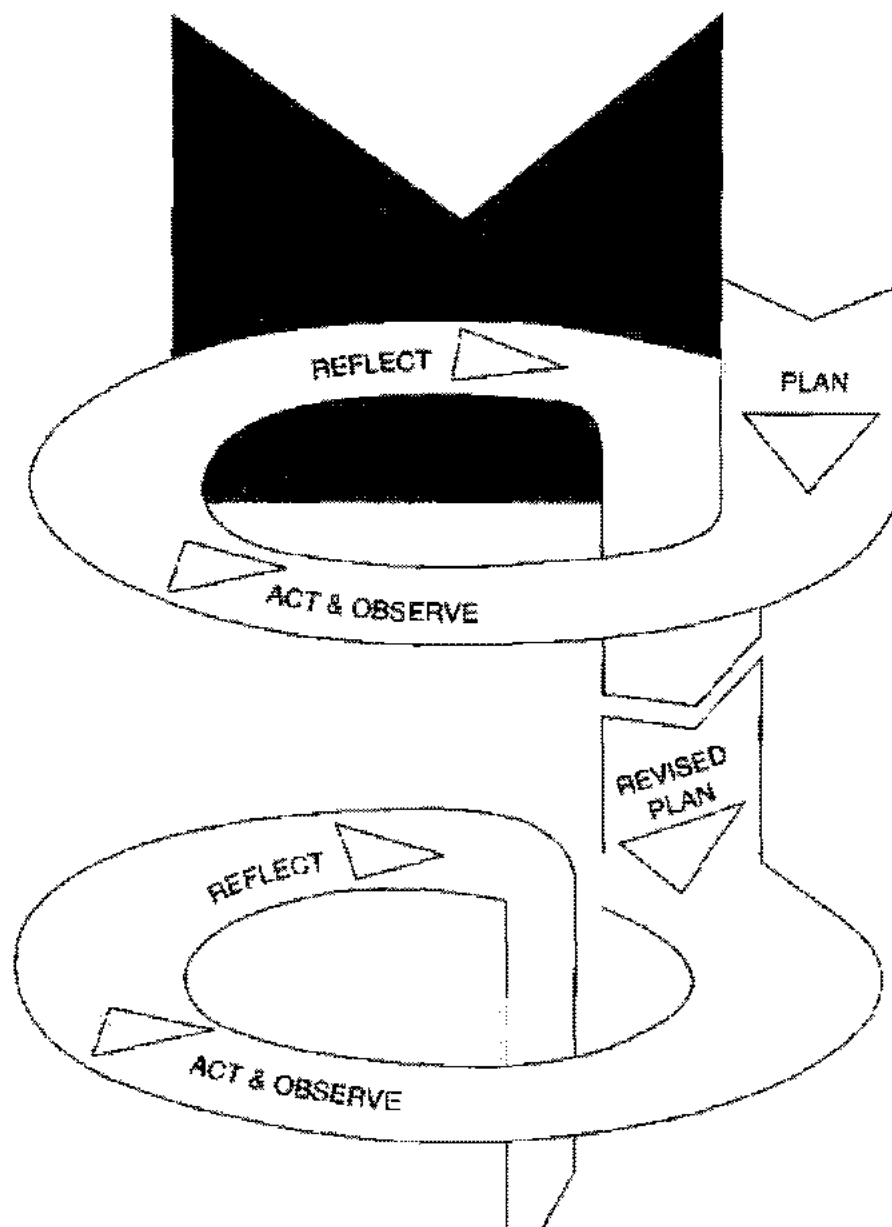

Figure 23.1. The Action Research Spiral

actual practices and not *abstract* practices. It involves learning about the real, material, concrete, and particular practices of particular people in particular places. Although, of course, it is not possible to suspend the inevitable abstraction that occurs whenever we use language to name, describe, interpret, and evaluate things, participatory action research differs from other forms of research in being more obstinate about its focus on changing particular practitioners' particular practices. Participatory action researchers may be interested in practices in general or in the abstract, but their principal concern is in changing practices in "the here

and now." In our view, participatory action researchers do not need to apologize for seeing their work as mundane and mired in history; on the contrary, by doing so, they may avoid some of the philosophical and practical dangers of the idealism that suggests that a more abstract view of practice might make it possible to transcend or rise above history and to avoid the delusions of the view that it is possible to find a safe haven in abstract propositions that construe but do not themselves constitute practice. Participatory action research is a learning process whose fruits are the real and material changes in the following:

- What people do
- How people interact with the world and with others
- What people mean and what they value
- The discourses in which people understand and interpret their world

Through participatory action research, people can come to understand that—and how—their social and educational practices are located in, and are the product of, particular material, social, and historical circumstances that *produced* them and by which they are *reproduced* in everyday social interaction in a particular setting. By understanding their practices as the product of particular circumstances, participatory action researchers become alert to clues about how it may be possible to *transform* the practices they are producing and reproducing through their current ways of working. If their current practices are the product of one particular set of intentions, conditions, and circumstances, other (or transformed) practices may be produced and reproduced under other (or transformed) intentions, conditions, and circumstances.

Focusing on practices in a concrete and specific way makes them accessible for reflection, discussion, and reconstruction as products of past circumstances that are capable of being modified in and for present and future circumstances. While recognizing that the real space-time realization of every practice is transient and evanescent, and that it can be conceptualized only in the inevitably abstract (but comfortingly imprecise) terms that language provides, participatory action researchers aim to understand their own particular practices as they emerge in their own particular circumstances without reducing them to the ghostly status of the general, the abstract, or the ideal—or, perhaps one should say, the unreal.

If participatory action research is understood in such terms, then through their investigations, participatory action researchers may want to become especially sensitive to the ways in which their particular practices are *social practices* of material, symbolic, and social

- communication,
- production, and
- social organization,

which shape and are shaped by *social structures* in

- the cultural/symbolic realm,
- the economic realm, and
- the sociopolitical realm,

which shape and are shaped by the *social media* of

- language/discourses,
- work, and
- power,

which largely shape, but also can be shaped by, participants' *knowledge* expressed in their

- understandings,
- skills, and
- values,

which, in turn, shape and are shaped by their *social practices* of material, symbolic, and social

- communication,
- production, and
- social organization, and so on.

These relationships are represented diagrammatically in Figure 23.2.

Participatory action researchers might consider, for example, how their acts of communication, production, and social organization are intertwined and interrelated in the real and particular practices that connect them to others in the real situations in which they find themselves (e.g., communities, neighborhoods, families, schools, hospitals, other workplaces). They consider how, by collaboratively changing the ways in which they participate with others in these practices, they can change the *practices* themselves, their *understandings* of these practices, and the *situations* in which they live and work.

For many people, the image of the spiral of cycles of self-reflection (planning, acting and observing, reflecting, replanning, etc.) has become the dominant feature of action research as an

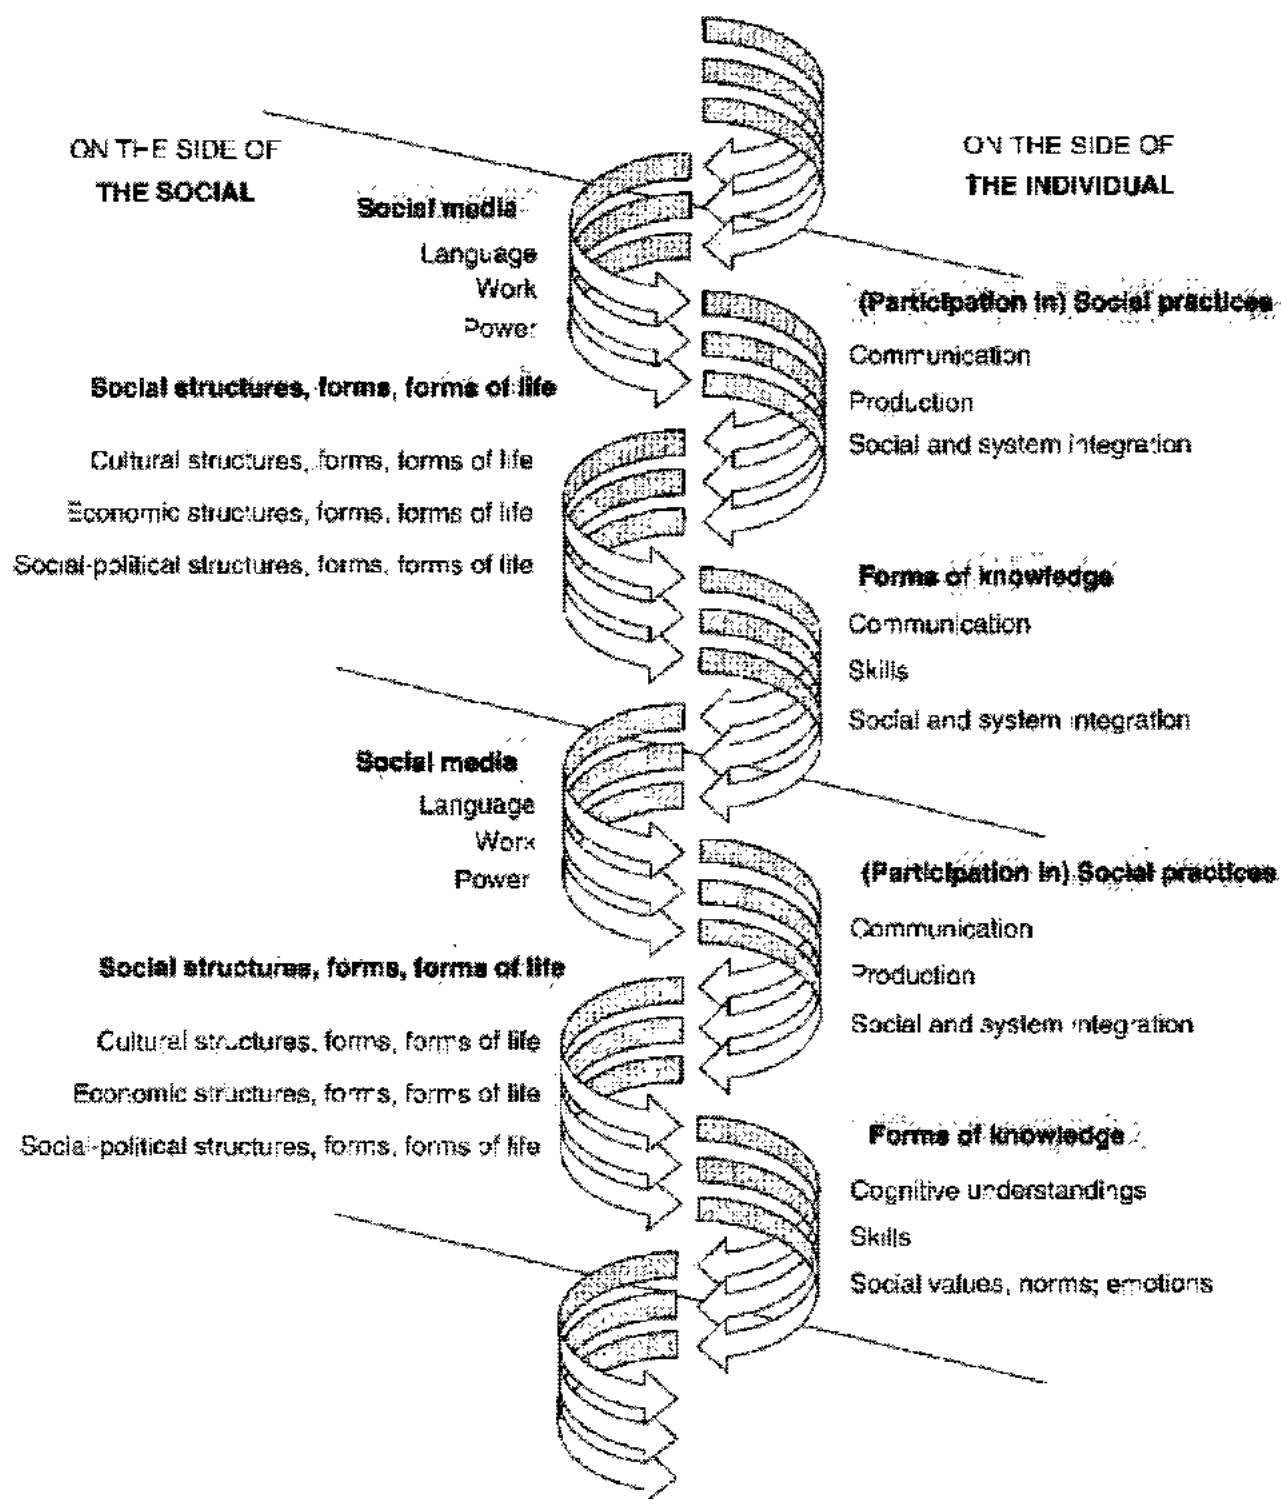

Figure 23.2. Recursive Relationships of Social Mediation That Action Research Aims to Transform

approach. In our view, participatory action research has seven other key features that are at least as important as the self-reflective spiral.

1. *Participatory action research is a social process.* Participatory action research deliberately explores the relationship between the realms of the individual

and the social. It recognizes that “no individuation is possible without socialization, and no socialization is possible without individuation” (Habermas, 1992b, p. 26), and that the processes of individuation and socialization continue to shape individuals and social relationships in all of the settings in which we find ourselves.

Participatory action research is a process followed in research in settings such as those of education and community development, when people—individually and collectively—try to understand how they are formed and reformed as individuals, and in relation to one another in a variety of settings, for example, when teachers work together (or with students) to improve processes of teaching and learning in the classroom.

2. *Participatory action research is participatory.* Participatory action research engages people in examining their *knowledge* (understandings, skills, and values) and interpretive categories (the ways in which they interpret themselves and their action in the social and material world). It is a process in which all individuals in a group try to get a handle on the ways in which their knowledge shapes their sense of identity and agency and to reflect critically on how their current knowledge frames and constrains their action. It is also participatory in the sense that people can only do action research “on” themselves, either individually or collectively. It is *not* research done “on” others.

3. *Participatory action research is practical and collaborative.* Participatory action research engages people in examining the *social practices* that link them with others in social interaction. It is a process in which people explore their practices of communication, production, and social organization and try to explore how to improve their interactions by changing the acts that constitute them, that is, to reduce the extent to which participants experience these interactions (and their longer-term consequences) as irrational, unproductive (or inefficient), unjust, and/or unsatisfying (alienating). Participatory researchers aim to work together in reconstructing their social interactions by reconstructing the acts that constitute them.

4. *Participatory action research is emancipatory.* Participatory action research aims to help people recover, and release themselves from, the constraints of irrational, unproductive, unjust, and unsatisfying *social structures* that limit their self-development and self-determination. It is a process

in which people explore the ways in which their practices are shaped and constrained by wider social (cultural, economic, and political) structures and consider whether they can intervene to release themselves from these constraints—or, if they cannot, how best to work within and around them to minimize the extent to which they contribute to irrationality, lack of productivity (inefficiency), injustice, and dissatisfactions (alienation) as people whose work and lives contribute to the structuring of a shared social life.

5. *Participatory action research is critical.* Participatory action research aims to help people recover, and release themselves from, the constraints embedded in the *social media* through which they interact—their language (discourses), their modes of work, and the social relationships of power (in which they experience affiliation and difference, inclusion and exclusion—relationships in which, grammatically speaking, they interact with others in the third, second, or first person). It is a process in which people deliberately set out to contest and reconstitute irrational, unproductive (or inefficient), unjust, and/or unsatisfying (alienating) ways of interpreting and describing their world (e.g., language, discourses), ways of working (work), and ways of relating to others (power).

6. *Participatory action research is reflexive* (e.g., recursive, dialectical). Participatory action research aims to help people to investigate reality in order to change it (Fals Borda, 1979) and (we might add) to change reality in order to investigate it. In particular, it is a deliberate process through which people aim to transform their practices through a spiral of cycles of critical and self-critical action and reflection. As Figure 23.2 (presented earlier) aims to show, it is a deliberate social process designed to help collaborating groups of people to transform their world so as to learn more about the nature of the recursive relationships among the following:

- Their (individual and social) *practices* (the work)
- Their *knowledge of their practices* (the workers)

- The *social structures* that shape and constrain their practices (the workplace)
- The *social media* in which their practices are expressed (the discourses in which their work is represented and misrepresented)

In our view, this is what theorizing practice means. Participatory action research does not, however, take an armchair view of theorizing; rather, it is a process of learning, with others, by doing—changing the ways in which we interact in a shared social world.

7. *Participatory action research aims to transform both theory and practice.* Participatory action research does not regard either theory or practice as preeminent in the relationship between theory and practice; rather, it aims to articulate and develop each in relation to the other through critical reasoning about both theory and practice and their consequences. It does not aim to develop forms of theory that can stand above and beyond practice, as if practice could be controlled and determined without regard to the particulars of the practical situations that confront practitioners in their ordinary lives and work. Nor does it aim to develop forms of practice that might be regarded as self-justifying, as if practice could be judged in the absence of theoretical frameworks that give them their value and significance and that provide substantive criteria for exploring the extent to which practices and their consequences turn out to be irrational, unjust, alienating, or unsatisfying for the people involved in and affected by them. Thus, participatory action research involves “reaching out” from the specifics of particular situations, as understood by the people within them, to explore the potential of different perspectives, theories, and discourses that might help to illuminate particular practices and practical settings as a basis for developing critical insights and ideas about how things might be transformed. Equally, it involves “reaching in” from the standpoints provided by different perspectives, theories, and discourses to explore the extent to which they provide practitioners themselves with a critical grasp of the problems and issues they actually confront in specific local

situations. Thus, participatory action research aims to transform *both* practitioners’ theories and practices *and* the theories and practices of others whose perspectives and practices may help to shape the conditions of life and work in particular local settings. In this way, participatory action research aims to connect the local and the global and to live out the slogan: that the personal is political.

These seven features summarize some of the principal features of participatory action research as we see it. It is a particular partisan view. There are writers on action research who prefer to move immediately from a general description of the action research process (especially the self-reflective spiral) to questions of methodology and research technique—a discussion of the ways and means of collecting data in different social and educational settings. This is a somewhat methodologically driven view of action research; it suggests that research methods are what makes action research “research.” This is not to argue that participatory action researchers should not be capable of conducting sound research; rather, it is to emphasize that sound research must respect much more than the canons of method.

■ MYTHS, MISINTERPRETATIONS, AND MISTAKES IN CRITICAL PARTICIPATORY ACTION RESEARCH

The critical view of participatory action research that we developed over the more than two decades since 1981 emerged in a practice that involved some successes; however, from the perspective of our current understandings, it also engendered some failures. Sometimes we, as well as some of our colleagues, mythologized or overstated the power of action research as an agent of individual and social change. Sometimes we misinterpreted our own experience and the ways in which substantive and methodological literatures might be useful pedagogically. Sometimes others misinterpreted our views, occasionally even despite our stout disavowal. The repeated reference to the

action research spiral as "*the method of action research*" continues to frustrate us. We also made some mistakes. These myths, misinterpretations, and mistakes clustered around four key foci:

- Exaggerated assumptions about how *empowerment* might be achieved through action research
- Confusions about the role of those helping others to learn how to conduct action research, the problem of *facilitation*, and the illusion of neutrality
- The falsity of a supposed *research-activism dualism*, with research seen as dispassionate, informed, and rational and with activism seen as passionate, intuitive, and weakly theorized
- Understatement of the role of the collective and how it might be conceptualized in conducting the research and in formulating action in the "project" and in its engagement with the "public sphere" in all facets of institutional and social life

We present these reflections on our practices here and return to them later from a different theoretical perspective.

Empowerment

In our earliest work on action research, we argued that self-reflection on efforts to bring about change that was disciplined by group planning and reflection of observations would give participants a greater sense of control of their work. Sometimes we overstated our claims; we were victims of our own enthusiasm and persuasion. This was not always unconscious. We faced the dilemma of the advocate; that is, rhetoric can help lead to changes in reality. Our aspirations were often picked up by others, and the result left action research advocates vulnerable to charges of hyperbole or naïveté in real settings where individual and collective change often proved to be extremely difficult to effect.

It is true that an increased understanding of social situations through action materially changes individual power, authority, and control over people's work. However, it is equally true that

such change is often technical and constrained, invoking concepts such as "efficiency." Authentic change, and the empowerment that drives it and derives from it, requires political sustenance by some kind of collective, too easily construed as an "action group" that defined itself by opposition to, and distinctiveness from, a wider social or public realm. Nevertheless, it was a mistake not to emphasize sufficiently that power comes from collective commitment and a methodology that invites the democratization of the objectification of experience and the disciplining of subjectivity. A question remains as to whether this was an adequate conceptualization of "empowerment," the way in which to achieve it, or indeed who or what empowerment was for.

The Role of the Facilitator of Action Research

We were troubled by the concept of "facilitation" as early as 1981 at the Australian National Seminar on Action Research (Brown, Henry, Henry, & McTaggart, 1988). Too often the facilitator lapsed into the role of "process consultant" with pretensions or aspirations to expertise about a "method" of action research, a role quite inconsistent with the commitment to participate in the personal and social changes in practice that had brought participants together. Despite efforts to contain the concept then, and to disavow its utility and outline its dangers later, it was a mistake to perpetuate the use of a term that already carried connotations of neutrality. Although the role of university researchers in action research is always somewhat problematic and an important object of critique, conceptualizing facilitation as a neutral or merely technical activity denies the social responsibility of the facilitator in making or assisting social change (McTaggart, 2002). The emphasis on techniques of facilitation also overplayed the importance of academic researchers and implicitly differentiated the work of theoreticians and practitioners, academics and workers, and community developers and peasant workers. Preoccupation with neutrality sustained the positivistic myth of the researcher as detached

secretary to the universe and focused attention on the social practices (and research practices) of "the other." This in turn helped to make action research look like research for amateurs.

University professors often play an active role in action research. In the education field, for example, they are often teacher educators as well as researchers. Teacher education is just one "sub-practice" of education as a social practice and, of course, is not practiced exclusively by university professors. In education, there are also curriculum practices, policy and administration practices, and research and evaluation practices. There is also a variety of student learning practices and community and parent participation practices that help to constitute the practice of education. Similarly, in action research for community development in some parts of the world, outside researchers have often been indispensable advocates and *animateurs* of change and not just technical advisers. It is clear to us that some of these *animateurs* have been heroes in social transformation, and we must acknowledge that many have lost their lives because of their work with dispossessed and disempowered people and communities, struggling with them for justice and democracy against repressive social and economic conditions.

Apart from these moral and political reasons against seeing facilitation as a merely technical role, there are reasons of epistemology. Emphasis on facilitation as a neutral role blinds one to the manifoldness of practice, that is, to the constitution of practice through the knowledge of individuals and a range of extraindividual features, including its social, discursive, moral, and political aspects as well as its historical formation such as the way in which it is shaped and reshaped in traditions of practice (Kemmis, 2004). Seeing facilitation in neutral terms also blinds one to the way in which practice is constituted as a "multiple reality" that is perceived differently by different participants in and observers of practice (e.g., professionals, clients, clients' families and friends, interested observers). Thus, seeing the role of facilitation as a neutral role obscures key aspects of practices and impedes critique of the way in

which practices may sustain and daily reconstitute social realities whose character and consequences can be unjust, irrational, unproductive, and unsatisfactory for some of the people involved in or affected by them.

This leads us to the nub of a problem. What is the shared conceptual space that allows the intrication of these subpractices of broad social practices, such as education, health, agriculture, and transportation, to become the object of critique and the subject of enhancement? To understand how these subpractices are constitutive of lived social realities requires what Freire called *conscientization*, that is, the development of an informed critical perspective on social life among ordinary people or, to put it another way, the development of a critical theory of social life by the people who participate in it.

The Research–Activism Dualism

We find significant understatement of the role of theory and theory building in the literature of action research. The causes of this are complex. On the one hand, they include the difficulties associated with group members introducing theoretical concepts and experience of similar cases that are too difficult or confronting for other participants (McTaggart & Garbutcheon-Singh, 1986). On the other hand, they include the difficulties of ignoring or oversimplifying pertinent theoretical resources without which participants may be obliged to construe their own problems or concerns as if in a vacuum, isolating them from useful intellectual and discursive resources and sometimes leaving them vulnerable to charges of mere navel gazing. This is compounded by thinking in terms of a theory–action (thinking–activism) dualism. Thinking about unsatisfactory conditions is less confronting than actually changing them, and some take refuge in the view that political action is somehow less rational than thinking or talking about change. We reject this dualism; on the contrary, our experience suggests that there should be both more theory and more action in action research. Political activism should be theoretically informed just like any other social

practice. Although action research is often incremental in the sense that it encourages growth and development in participants' expertise, support, commitment, confidence, knowledge of the situation, and understanding of what is prudent (i.e., changed thinking), it also encourages growth and development in participants' capacity for action, including direct and substantial collective action that is well justified by the demands of local conditions, circumstances, and consequences.

The Role of the Collective

The idea of the action research group is typically credited to Lewin immediately after World War II, although it may be that Moreno pioneered the practice a generation earlier (Altrichter & Gsetzner, 1997). It was Lewin who argued the potency of "group commitment" in bringing about changes in social practices. In more recent views of action research, the "collective" is seen as supporting three important functions. First, it is seen as an expression of the democratization of scientific practice. Instead of deferring to the pronouncements of professional experts, a local scientific community is established to use principles of scientific inquiry to enhance and create richer local understandings. We have referred to this process as the "objectification of experience." Two further roles of the collective are expressed in the idea of the "disciplining of subjectivity," where subjectivity refers to an *affective* aspect, the emotional reactions of participants, and an aspect of political agency. In the affective aspect of subjectivity, the action research process creates opportunities for feelings to be made accessible and explored. At the same time, it creates opportunities for the way in which people feel about their situations to be examined for deeper causes and meanings and for participants to differentiate serious and abiding concerns from transient or peripheral reactions to immediate difficulties. Again, this work is not simply the preserve of the scientific or professional specialist group therapist or facilitator; on the contrary, in participatory action research, it must be part of a social process of transformation (of selves as well as situations)

that is comprehensible to participants. Participants play a supportive role, but the collective has a disciplining function, helping to clarify thinking and providing a context where affect as well as cognitive questions can be justified. People come to realize that some feelings are superficial, misdirected, unfair, and overreactions. Other feelings are focused, strengthened, and nurtured as they are revealed, articulated, thought through, and reflected on. This is introspective in part, but its aim is refined action.

Political agency is a corollary of heightened understanding and motivation. As affect becomes mobilized and organized, and as experience is more clearly objectified and understood, both knowledge and feeling become articulated and disciplined by the collective toward prudent action. Individual action is increasingly informed and planned with the support and wisdom of others directly participating in related action in a situation. The collective provides critical support for the development of personal political agency and critical mass for a commitment to change. Through these interactions, new forms of practical consciousness emerge. In other words, both the action and research aspects of action research *require* participation as well as the disciplining effect of a collective.

The extension of action research collectives to include "critical friends," to build alliances with broader social movements, and to extend membership across institutional hierarchies has been a way of enhancing the understanding and political efficacy of individuals and groups. However, the problem of how to create the conditions of learning for participants persists. People not only are hemmed in by material institutional conditions, they frequently are trapped in institutional discourses that channel, deter, or muffle critique. How do we create (or re-create) new possibilities for what Fals Borda (1988) called *vivencia*, through the revitalization of the public sphere, and also promote decolonization of lifeworlds that have become saturated with the bureaucratic discourses, routinized practices, and institutionalized forms of social relationships characteristic of social systems that see the world only through the

prism of organization and not the human and humane living of social lives? This is an issue that we have now come to interpret through the notion of public discourse in public spheres and the idea of research as a social practice.

■ PARTICIPATORY ACTION RESEARCH AND THE STUDY OF PRACTICE

In our chapter on participatory action research for the second edition of this *Handbook*, we outlined five traditions in the study of practice. We argued that *research on practice* is itself a practice and that the practice of research on practice has historically taken, and continues to take, different forms. Different practitioners of research on practice see it more from the perspective of the *individual* and/or the *social* and more from an “objective” perspective and/or a “subjective” perspective. They use different research methods and techniques that reflect these epistemological and ontological choices, that is, choices about what it means to know a practice (the epistemological choice) and about what a practice is and thus how it manifests itself in reality (the ontological choice). If research on practice is *methodologically defined*, however, researchers may obscure, even from themselves, the epistemological and ontological choices that underpin their choices of methods. As ways of “seeing” practice, research methods both illuminate and obscure what the research and the researcher can see. As Ludwig Wittgenstein noticed, this may involve a “conjuring trick” that obscures the very thing we hoped to see:

How does the philosophical problem about mental processes and states and about behaviourism arise? The first step is the one that altogether escapes notice. We talk of processes and states and leave their nature undecided. Sometime perhaps we shall know more about them—we think. But that is just what commits us to a particular way of looking at the matter. For we have a definite concept of what it means to learn to know a process better. (The decisive movement in the conjuring trick has been made, and it was the very one that we thought quite innocent.) And now the analogy which was to make us understand

our thoughts falls to pieces. So we have to deny the yet uncomprehended process in the yet unexplored medium. And now it looks as if we had denied mental processes. And naturally we don't want to deny them. (Wittgenstein, 1958, p. 103)

We conclude, therefore, that it is risky to proceed in a discussion of research on practice principally from research methods and techniques—risky because the methods we choose may inadvertently have “committed us to a particular way of seeing the matter.”

In our chapter in the second edition of this *Handbook*, we depicted the relationships among five broad traditions in the study of practice. Table 23.1 summarizes these traditions.

We argued that these different approaches to the study of practice involved different kinds of relationships between *the researcher* and *the researched*. Essentially, we argued that “objective” approaches tended to see practice from the perspective of an outsider in the *third person*; that “subjective” approaches tended to see practice from the perspective of an insider in the *second person*; and that the reflexive dialectical perspective of critical social science tended to see practice from the perspective of the insider group, whose members’ interconnected activities constitute and reconstitute their own social practices, in the *first person* (plural). This last perspective on practice is the one taken by participant-researchers in participatory action research.

In terms of these five aspects of practice and the five traditions in the study of practice, it seems to us that a methodologically driven view of participatory action research finds itself mired in the assumptions about practice to which one or another of the different traditions of research on practice is committed. Depending on which of these sets of presuppositions it adopts, it may find itself unable to approach (the study of) practice in a sufficiently rich and multifaceted way, that is, in terms that recognize different aspects of practice and do justice to its social, historical, and discursive construction.

If participatory action research is to explore practice in terms of each of the five aspects

Table 23.1. Relationships Among Different Traditions in the Study of Practice

<i>Perspective</i>	<i>The Individual</i>	<i>The Social</i>	<i>Both: Reflexive–dialectical view of individual–social relations and connections</i>
Objective	(1) Practice as individual behavior, seen in terms of performances, events, and effects: Behaviorist and most cognitivist approaches in psychology	(2) Practice as social interaction (e.g., ritual, system-structured): Structure-functionalist and social systems approaches	
Subjective	(3) Practice as intentional action, shaped by meaning and values: Psychological <i>verstehen</i> (empathetic understanding) and most constructivist approaches	(4) Practice as socially structured, shaped by discourses, tradition: Interpretive, aesthetic-historical <i>verstehen</i> (empathetic understanding), and poststructuralist approaches	
Both: Reflexive–dialectical view of subjective–objective relations and connections			(5) Practice as socially and historically constituted and as reconstituted by human agency and social action: Critical methods; dialectical analysis (multiple methods)

outlined in our chapter in the second edition of this *Handbook*, it will need to consider how different traditions in the study of practice, and different research methods and techniques, can provide *multiple* resources for the task. It must also avoid accepting the assumptions and limitations of particular methods and techniques. For example, the participatory action researcher may legitimately eschew the narrow empiricism of those approaches that attempt to construe practice entirely “objectively,” as if it were possible to exclude consideration of participants’ subjective intentions, meanings, values, and interpretive categories from an understanding of practice or as if it were possible to exclude consideration of the frameworks of language, discourse, and tradition by which people in different groups construe their practices. It does not follow from this that quantitative approaches are never relevant in participatory

action research; on the contrary, they may be—but without the constraints of empiricism and objectivism that many quantitative researchers put on these methods and techniques. Indeed, when quantitative researchers use questionnaires to convert participants’ views into numerical data, they tacitly concede that practice cannot be understood without taking participants’ views into account. Participatory researchers will differ from one-sidedly quantitative researchers in the ways in which they collect and use such data because participatory action researchers will regard them as crude approximations of the ways in which participants understand themselves and not (as empiricistic, objectivistic, quantitative researchers may assert) as more rigorous (e.g., valid, reliable) because they are scaled.

On the other hand, the participatory action researcher will differ from the one-sidedly

qualitative approach that asserts that action can be understood only from a qualitative perspective, for example, through close clinical or phenomenological analysis of an individual's views or close analysis of the discourses and traditions that shape the way in which a particular practice is understood by participants. The participatory action researcher will also want to explore how changing "objective" circumstances (e.g., performances, events, effects, patterns of interaction, rules, roles, system functioning) shape and are shaped by the "subjective" conditions of participants' perspectives.

In our view, questions of research methods should not be regarded as unimportant, but (in contrast with the methodologically driven view) we would want to assert that what makes participatory action research "research" is not the machinery of research techniques but rather an abiding concern with the relationships between social and educational theory and practice. In our view, before questions about what kinds of research methods are appropriate can be decided, it is necessary to decide what kinds of things "practice" and "theory" are, for only then can we decide what kinds of data or evidence might be relevant in describing practice and what kinds of analyses might be relevant in interpreting and evaluating people's real practices in the real situations in which they work. On this view of participatory action research, a central question is how practices are to be understood "in the field," as it were, so that they become available for more systematic theorizing. Having arrived at a general view of what it means to understand (theorize) practice in the field, it becomes possible to work out what kinds of evidence, and hence what kinds of research methods and techniques, might be appropriate for advancing our understanding of practice at any particular time.

The theoretical scheme depicted in Figure 23.2 takes a view of what theorizing a practice might be like—locating practice within frameworks of participants' knowledge, in relation to social structures, and in terms of social media. By adopting a more encompassing view of practice like the one outlined in Table 23.1, we may be able to

understand and theorize it more richly, and in more complex ways, so that powerful social dynamics (e.g., the tensions and interconnections between system and lifeworld [Habermas 1984, 1987b]) can be construed and reconstituted through a critical social practice such as participatory action research.

The participants in participatory action research understand practice from *both* its individual and its social aspects and understand it *both* objectively and subjectively. They view practice as constructed and reconstructed *historically* both in terms of the *discourses* in which practices are described and understood and in terms of socially and historically constructed *actions and their consequences*. Moreover, they view practice as constituted and reconstituted in *human and social action* that projects a living past through the lived present into a future where the people involved and affected will live with the consequences of actions taken.

This view of practice as *projected through history by action* applies not only to the "first-level" practices that are the object and subject of participants' interests (e.g., the practices of economic life in a village aiming at community development) but also to the practice of research itself. Participants in participatory action research understand their research practices as *meta-practices* that help to construct and reconstruct the first-level practices they are investigating. For example, participants in a participatory action research project on practices of community development (the first-level practices) understand their research practices as among the meta-practices that shape their practices of community development. Practices of management, administration, and social integration are also meta-practices shaping their practices of community development. However, unlike those other meta-practices, the meta-practice of participatory action research is deliberately and systematically reflexive. It is both outwardly directed and inwardly (self-) directed. It aims to change community development practitioners, community development practices, and the practice situations of community

development through practices of research that are also malleable and developmental and that, through collaborative processes of communication and learning, change the practitioners, practices, and practice situations of the research. Like other practices, the practices of participatory action research are projected through history by action. They are meta-practices that aim to transform the world so that other first-level transformations become possible, that is, transformations in people's ways of thinking and talking, ways of doing things, and ways of relating to one another.

This view of *research practices* as specifically located in time (history) and social space has implications that are explored later in this chapter. In the process of participatory action research, the same people are involved in two parallel, reflexively related sets of practices. On the one hand, they are the practitioners of community development (to use our earlier example); on the other hand, they are the practitioners of the meta-practice of participatory action research. They are *both practitioners and researchers* in, say, community development, the development of primary health care, or school–community relations. They understand their research as “engaged research” (Bourdieu & Wacquant, 1992) through which they, as researchers, aim to *transform* practices of community development, primary health care, or school–community relations. But they also understand their research practices as constructed and open to reconstruction. They do not regard the research process as the application of fixed and preformed research techniques to the particular “applied” problem with which they are concerned. On the contrary, they regard their research practices as a matter of borrowing, constructing, and reconstructing research methods and techniques to throw light on the nature, processes, and consequences of the particular object they are studying (whether community development practices, primary health care practices, or practices of school–community relations). And this means that participatory action researchers are embarked on a process of transforming themselves as researchers, transforming their research

practices, and transforming the practice settings of their research.

In our chapter in the second edition of this *Handbook*, we also argued for a view of research that we termed “symposium research,” that is, research drawing on the multiple disciplinary perspectives of different traditions in social science theorizing and multiple research methods that illuminate different aspects of practices. We believe that this approach will increasingly come to characterize participatory action research inquiries. That is, we expect that as participatory action research becomes more sophisticated in its scope and intentions, it will draw on transdisciplinary theoretical resources (e.g., relevant psychological and sociological theories) and multiple research methods and techniques that will allow participant-researchers to gain insight into the formation and transformation of their practices in context. For example, we expect to see more participatory action research using research techniques characteristic of all five of the traditions depicted in Table 23.1. These methods and techniques are presented in Table 23.2.

In the current edition of the *Handbook*, we argue that the nature of the social relationships involved in participatory action research—and the proper politics of participatory action research—can be more clearly understood from the perspective of Habermas's (1984, 1987a) *theory of communicative action* and, in particular, his later commentary on the nature of the *public sphere*, as outlined in *Between Facts and Norms* (Habermas, 1996, chap. 8).

■ THE POLITICS OF PARTICIPATORY ACTION RESEARCH: COMMUNICATIVE ACTION AND THE PUBLIC SPHERE

In his book *Theory of Communicative Action*, and especially the second volume, Habermas (1984, 1987b) described communicative action as what people do when they engage in communication of a particular—and widespread—kind, with three particular features. It is communication in which people consciously and deliberately aim

Table 23.2. Methods and Techniques Characteristic of Different Approaches to the Study of Practice

<i>Perspective</i>	<i>The Individual</i>	<i>The Social</i>	<i>Both: Reflexive–dialectical view of individual–social relations and connections</i>
Objective	(1) Practice as individual behavior: Quantitative and correlational–experimental methods; psychometric and observational techniques, tests, and interaction schedules	(2) Practice as social and systems behavior: Quantitative and correlational–experimental methods; observational techniques, sociometrics, systems analysis, and social ecology	
Subjective	(3) Practice as intentional action: Qualitative and interpretive methods; clinical analysis, interview, questionnaire, diaries, journals, self-report, and introspection	(4) Practice as socially structured, shaped by discourses and tradition: Qualitative, interpretive, and historical methods; discourse analysis and document analysis	
Both: Reflexive–dialectical view of subjective–objective relations and connections			(5) Practice as socially and historically constituted and as reconstituted by human agency and social action: Critical methods; dialectical analysis (multiple methods)

1. to reach *intersubjective agreement* as a basis for
2. *mutual understanding* so as to
3. reach an *unforced consensus about what to do* in the particular practical situation in which they find themselves.

Communicative action is the kind of action that people take when they interrupt what they are doing (Kemmis, 1998) to ask four particular kinds of questions (the four validity claims):

- Whether their understandings of what they are doing *make sense* to them and to others (are *comprehensible*)
- Whether these understandings are *true* (in the sense of being *accurate* in accordance with what else is known)
- Whether these understandings are *sincerely held and stated* (authentic)

- Whether these understandings are *morally right and appropriate* under the circumstances in which they find themselves

In *Between Facts and Norms*, Habermas (1995) added a fourth feature to the original list of three features of communicative action. He noticed something obvious that previously had been overlooked, namely that communicative action also *opens communicative space* between people. He gave this fourth feature of communicative action special attention because he considered that opening space for communicative action produces two particular and simultaneous effects. First, it builds *solidarity* between the people who open their understandings to one another in this kind of communication. Second, it underwrites the understandings and decisions that people reach with *legitimacy*. In a world where communications

are frequently cynical, and where people feel alienated from public decisions and even from the political processes of their world, legitimacy is hard-won. More important for our purposes here, however, Habermas's argument is that *legitimacy is guaranteed only through communicative action*, that is, when people are free to choose—authentically and for themselves, individually and in the context of mutual participation—to decide *for themselves* the following:

- What is comprehensible to *them* (whether in fact they understand what others are saying)
- What is true in the light of *their own* knowledge (both their individual knowledge and the shared knowledge represented in the discourse used by members)
- What participants *themselves* regard as sincerely and truthfully stated (individually and in terms of their joint commitment to understanding)
- What participants *themselves* regard as morally right and appropriate in terms of their individual and mutual judgment about what it is right, proper, and prudent to do under the circumstances in which they find themselves

What is projected here is not an ideal against which actual communications and utterances are to be judged; rather, it is something that Habermas believes we normally take for granted about utterances—unless they are deliberately distorted or challenged. In ordinary speech, we may or may not regard any particular utterance as suspect on the grounds of any or all of the four validity claims; whether any particular utterance will be regarded as suspect or needing closer critical examination will depend on “who is saying what about what to whom in what context.” On the other hand, when we move into the mode of *communicative action*, we acknowledge at the outset that we must strive for intersubjective agreement, mutual understanding, and unforced consensus about what to do in this particular situation because we already know that one or all four of the validity claims must be regarded as problematic—by *us* here and now, for our situation, and in relation to what to do in practice about the matter at hand. That is, the validity

claims do not function merely as *procedural* ideals for critiquing speech; they also function as bases for, or underpinnings of, the *substantive* claims we need to explore to reach mutual agreement, understanding, and consensus about what to do in the *particular* concrete situation in which a particular group of people in a shared socially, discursively, and historically structured specific communicative space are deliberating together.

What we notice here, to reiterate, is that the process of recovering and critiquing validity claims is not merely an abstract ideal or principle but also an invocation of critique and critical self-awareness in *concrete* and *practical* decision making. In a situation where we are genuinely acting collaboratively with others, and where practical reason is genuinely called for, we are obliged, as it were, to “retreat” to a meta-level of critique—communicative action—because it is *not* self-evident what should be done. Perhaps we simply do not comprehend what is being talked about or we are not sure that we understand it correctly. Perhaps we are unsure of the truth or accuracy of the facts on which our decisions might be based. Perhaps we fear that deliberate deception or accidental self-deception may lead us astray. Perhaps we are not sure what it is morally right and appropriate to do in this practical situation in which our actions will, as always, be judged by their historical consequences (and their differential consequences for different people and groups). In any of these cases, we need to consider how to approach the practical decision before us, and we must gather our shared understandings to do so. In such cases, we interrupt what we are doing to move into the mode of communicative action. In some such cases, we may also move into the slower, more concretely practical, and more concretely critical mode of participatory action research, aiming deliberately and collaboratively to investigate the world in order to transform it, as Fals Borda observed, and to transform the world in order to investigate it. We take a problematic view of our own action in history and use our action in history as a “probe” with which to investigate reflexively our own action and its place as cause and effect in the unfolding history of our world.

Participatory Action Research and Communicative Space

In our view, *participatory action research opens communicative space* between participants. The process of participatory action research is one of *mutual inquiry* aimed at reaching intersubjective agreement, mutual understanding of a situation, unforced consensus about what to do, and a sense that what people achieve together will be *legitimate* not only for themselves but also for every reasonable person (a universal claim). Participatory action research aims to create circumstances in which people can search together collaboratively for more comprehensible, true, authentic, and morally right and appropriate ways of understanding and acting in the world. It aims to create circumstances in which *collaborative social action* in history is not justified by appeal to authority (and still less to coercive force); rather, as Habermas put it, it is justified by the force of better argument.

To make these points is to notice three things about the social relations engendered through the process of action research. First, it is to notice that certain relationships are appropriate in the *research* element of the term “participatory action research.” It is to notice that the social practice of this kind of research is a *practice directed deliberately toward discovering, investigating, and attaining* intersubjective agreement, mutual understanding, and unforced consensus about what to do. It is aimed at testing, developing, and retesting agreements, understandings, and decisions against the criteria of mutual comprehensibility, truth, truthfulness (e.g., sincerity, authenticity), and moral rightness and appropriateness. In our view, *participatory action research projects communicative action into the field of action and the making of history*. It does so in a deliberately critical and reflexive way; that is, it aims to change both our unfolding history and ourselves as makers of our unfolding history. As science, participatory action research is *not* to be understood as the kind of science that gathers knowledge as a precursor to and resource for controlling the unfolding of events (the technical knowledge-constitutive

interest characteristic of positivistic social science [Habermas, 1972]). Nor is it to be understood as the kind of science directed toward educating the person to be a wiser and more prudent actor in as yet unspecified situations and circumstances (the practical knowledge-constitutive interest characteristic of hermeneutics and interpretive social science [Habermas, 1972]). Participatory action research is to be understood as a collaborative practice of critique, performed in and through a collaborative practice of research that aims to change the researchers themselves as well as the social world they inhabit (the emancipatory knowledge-constitutive interest characteristic of critical social science [Carr & Kemmis, 1986; Habermas, 1972]).

Second, it is to notice that similar relationships are appropriate in the *action* element of participatory action research. It is to notice that the decisions on which action is based must first have withstood the tests of the research element and must then withstand the tests of wisdom and prudence—that people are willing to, and indeed can, reasonably live with the consequences of the decisions they make, and the actions they take, and the actions that follow from these decisions. This is to notice that participatory action research generates not only a collaborative sense of agency but also a collaborative sense of the *legitimacy* of the decisions people make, and the actions they take, together.

Third, it is to notice that participatory action research involves relationships of *participation* as a central and defining feature and not as a kind of instrumental or contingent value tacked on to the term. In many views of action research, including some of our earliest advocacies for it, the idea of “participation” was thought to refer to an action research group whose members had reached an agreement to research and act together on some shared topic or problem. This view caused us to think in terms of “insiders” and “outsiders” to the group and to the action research process. Such a view carries resonances of discussions of the role of the avant-garde in making the revolution. It suggests that the action research group constitutes itself *against* established authorities or ways of

working, as if it were the role of the group to show how things can and should be done better despite the constraints and exigencies of taken-for-granted ways of doing things.

The idea of participation as central to participatory action research is not so easily enclosed and encapsulated. The notion of *inclusion* evoked in participatory action research should not, in our view, be regarded as static or fixed. Participatory action research should, in principle, create circumstances in which all of those involved in and affected by the processes of research and action (all of those involved in thought and action as well as theory and practice) about the topic have a right to speak and act in transforming things for the better. It is to say that, in the case of, for example, a participatory action research project about education, it is not only teachers who have the task of improving the social practices of schooling but also students and many others (e.g., parents, school communities, employers of graduates). It is to say that, in projects concerned with community development, not only lobby groups of concerned citizens but also local government agencies and many others will have a share in the consequences of actions taken and, thus, a right to be heard in the formation of programs of action.

In reality, of course, not all involved and affected people will participate in any particular participatory action research project. Some may resist involvement, some might not be interested because their commitments are elsewhere, and some might not have the means to join and contribute to the project as it unfolds. The point is that a participatory action research project that aims to transform existing ways of understanding, existing social practices, and existing situations must also transform other people and agencies who might not "naturally" be participants in the processes of doing the research and taking action. *In principle*, participatory action research issues an invitation to previously or naturally uninvolved people, as well as a self-constituted action research group, to participate in a common process of *communicative action for transformation*. Not all will accept the invitation, but it is incumbent

on those who do participate to take into account those others' understandings, perspectives, and interests—even if the decision is to oppose them in the service of a broader public interest.

Participatory Action Research and the Critique of the "Social Macro-Subject"

As these comments suggest, participatory action research does not—or need not—valorize a particular group as the carrier of legitimate political action. In his critique of the "social macro-subject" in *The Philosophical Discourse of Modernity* and *Between Facts and Norms*, Habermas (1987a, 1996) argued that political theory has frequently been led astray by the notion that a state or an organization can be autonomous and self-regulating in any clear sense. The circumstances of late modernity are such, he argued, that it is simplistic and mistaken to imagine that the machinery of government or management is unified and capable of self-regulation in any simple sense of "self." Governments and the machinery of government, and managements and the machinery of contemporary organizations, are nowadays so complex, multifaceted, and (often) internally contradictory as "systems" that they do not operate in any autonomous way, let alone in any way that could be regarded as self-regulating in relation to the publics they aim to govern or manage. They are not unified systems but rather complex sets of subsystems having transactions of various kinds with one another economically (in the steering medium of money) and administratively (in the steering medium of power). *Between Facts and Norms* is a critique of contemporary theories of law and government that are based on concrete, historically outmoded notions of governmentality that presume a single, more or less unified body politic that is regulated by law and a constitution. Such theories presume that governments can encapsulate and impose order on a social body as a unified whole across many dimensions of social, political, cultural, and individual life or lives. Many of those who inhabit the competing subsystems of contemporary government and management in fact acknowledge

that no such simple steering is possible; on the contrary, steering takes place—to the extent that it can happen at all—through an indeterminate array of established practices, structures, systems of influence, bargaining, and coercive powers.

The same is true of participatory action research groups. When they conceive of themselves as closed and self-regulating, they may lose contact with social reality. In fact, participatory action research groups are internally diverse; they generally have no unified “center” or core from which their power and authority can emanate, and they frequently have little capacity to achieve their own ends if they must contend with the will of other powers and orders. Moreover, participatory action research groups connect and interact with various kinds of external people, groups, and agencies. In terms of thought and action, and of theory and practice, they arise and act out of, and back into, the wider social reality that they aim to transform.

The most morally, practically, and politically compelling view of participatory action research is one that sees participatory action research as a practice through which people can create networks of communication, that is, sites for the practice of communicative action. It offers the prospect of opening communicative space in public spheres of the kind that Habermas described. Based on such a view, participatory action research aims to engender practical critiques of existing states of affairs, the development of critical perspectives, and the shared formation of emancipatory commitments, that is, commitments to overcome distorted ways of understanding the world, distorted practices, and distorted social arrangements and situations. (By “distorted” here, we mean understandings, practices, and situations whose consequences are unsatisfying, ineffective, or unjust for some or all of those involved and affected.)

Communicative Action and Exploratory Action

Participatory action research creates a communicative space in which communicative action is fostered among participants and in which

problems and issues can be thematized for critical exploration aimed at overcoming felt dissatisfactions (Fay, 1987), irrationality, and injustice. It also fosters a kind of “playfulness” about action—what to do. At its best, it creates opportunities for participants to adopt a thoughtful but highly exploratory view of what to do, knowing that their practice can and will be “corrected” in the light of what they learn from their careful observation of the processes and consequences of their action as it unfolds. This seems to us to involve a new kind of understanding of the notion of communicative action. It is not just “reflection” or “reflective practice” (e.g., as advocated by Schön, 1983, 1987, 1991) but also action taken with the principal purpose of learning from experience by careful observation of its processes and consequences. It is deliberately designed as an *exploration* of ways of doing things in this particular situation at this particular historical moment. It is designed to be *exploratory action*.

Participatory action research is scientific and reflective in the sense in which John Dewey described “scientific method.” Writing in *Democracy and Education*, Dewey (1916) described the essentials of reflection—and scientific method—as follows:

They are, first, that the pupil has a genuine situation of experience—that there be a continuous activity in which he is interested for its own sake; secondly, that a genuine problem develop within this situation as a stimulus to thought; third, that he possess the information and make the observations needed to deal with it; fourth, that suggested solutions occur to him which he shall be responsible for developing in an orderly way; fifth, that he shall have the opportunity and occasion to test his ideas by application, to make their meaning clear, and to discover for himself their validity. (p. 192)

For Dewey, experience and intelligent action were linked in a cycle. Education, like science, was to aim not just at filling the minds of students but also at helping them to take their place in a democratic society ceaselessly reconstructing and transforming the world through action. Intelligent action was always experimental and exploratory.

conducted with an eye to learning and as an opportunity to learn from unfolding experience.

In our view, participatory action research is an elaboration of this idea. It is exploratory action that parallels and builds on the notion of communicative action. It does more than conduct its reflection in the rear-view mirror, as it were, looking backward at what has happened to learn from it. It also generates and conducts action in an exploratory and experimental manner, with actions themselves standing as practical hypotheses or speculations to be tested as their consequences emerge and unfold.

■ CONSTITUTING PUBLIC SPHERES FOR COMMUNICATIVE ACTION THROUGH PARTICIPATORY ACTION RESEARCH

Baynes (1995), writing on Habermas and democracy, quoted Habermas on the *public sphere*:

[Deliberative politics] is bound to the demanding communicative presuppositions of political arenas that do not coincide with the institutionalized will-formation in parliamentary bodies but extend equally to the political public sphere and to its cultural context and social basis. A deliberative practice of self-determination can develop only in the interplay between, on the one hand, the parliamentary will-formation institutionalized in legal procedures and programmed to reach decisions and, on the other, political opinion-building in informal circles of political communication. (p. 316).¹

Baynes (1995) described Habermas's conceptualization of the "strong publics" of parliamentary and legal subsystems and the "weak publics" of the "public sphere ranging from private associations to the mass media located in 'civil society' . . . [which] assume responsibility for identifying and interpreting social problems" (pp. 216–217). Baynes added that, in this connection, Habermas "also describes the task of an opinion-forming public sphere as that of laying siege to the formally organized political system by encircling it with reasons without, however, attempting to overthrow or replace it" (p. 217).

In practice, this has been the kind of task that many action researchers, and especially participatory action researchers, have set for themselves—surrounding established institutions, laws, policies, and administrative arrangements (e.g., government departments) with *reasons* that, on the one hand, respond to contemporary crises or problems experienced "in the field" (in civil society) and, on the other, provide a rationale for changing current structures, policies, practices, procedures, or other arrangements that are implicit in causing or maintaining these crises or problems. In response to crises or problems experienced in particular places, participatory action researchers are frequently involved in community development projects and initiatives of various kinds, including community education, community economic development, raising political consciousness, and responding to "green" issues. In one sense, they see themselves as oppositional, that is, as protesting current structures and functions of economic and administrative systems. In another sense, although sometimes they are confrontational in their tactics, they frequently aim not to *overthrow* established authority or structures but rather to get them to *transform* their ways of working so that problems and crises can be overcome. As Baynes observed, their aim is to besiege authorities with *reasons* and not to destroy them. We might also say, however, that some of the reasons that participatory action researchers employ are the fruits of their practical experience in making change. They create *concrete contradictions* between established or current ways of doing things, on the one hand, and alternative ways that are developed through their investigations. They read and contrast the nature and consequences of existing ways of doing things with these alternative ways, aiming to show that irrationalities, injustices, and dissatisfactions associated with the former can be overcome *in practice* by the latter.

As we indicated earlier, the approach that participatory action researchers take to identified problems or crises is to *conduct research* as a basis for informing themselves and others about the problems or crises and to explore ways in which

the problems or crises might be overcome. Their stock in trade is communicative action both internally, by opening dialogue within the group of researcher-participants, and externally, by opening dialogue with the powers-that-be about the nature of the problems or crises that participants experience in their own lives and about ways of changing social structures and practices to ease or overcome these problems or crises. Sometimes advocates of participatory action research (including ourselves) have misstated the nature of this oppositional role—seeing themselves as simply opposed to established *authorities* rather than as opposed to particular *structures* or established *practices*. We recognize that in our own earlier advocacies, the language of “emancipation” was always ambiguous, permitting or encouraging the idea that the emancipation we sought was from the structures and systems of the state itself rather than, or as much as, emancipation from the real objects of our critique—self-deception, ideology, irrationality, and/or injustice (as our more judicious formulations described it).

Habermas’s critique of the social macro-subject suggests that our formulation of the action group as a kind of avant-garde was always too wooden and rigid. It encouraged the notion that there were “insiders” and “outsiders” and that the insiders could be not only self-regulating and relatively autonomous but also effective in confronting a more or less unitary, self-regulating, and autonomous state or existing authority. That is, it seemed to presume an integrated (unconflicted) “core” and an integrated (unconflicted) political object to be changed as a consequence of the investigations undertaken by the action group. In reality, we saw action groups characterized by contradictions, contests, and conflicts within that were interacting with contradictory, contested, and conflict-ridden social structures without. Alliances shifted and changed both inside action groups and in the relations of members with structures and authorities in the wider social context of which they were a part. Indeed, many participatory action research projects came into existence *because* established structures and authorities wanted to explore possibilities for change in

existing ways of doing things, even though the new ways would be in a contradictory relationship with the usual ways of operating.

This way of understanding participatory action research groups is more open-textured and fluid than our earlier advocacies suggested. In those advocacies, we imagined action groups as more tightly knotted, better integrated, and more “solid” than the way in which we see them now. Now we recognize the more open and fluid connections between “members” of action groups and between members and others in the wider social context in which their investigations take place.

Public Spheres

In *Between Facts and Norms*, Habermas (1996, chap. 8) outlined the kinds of conditions under which people can engage in communicative action in the contexts of social action and social movements. He set out to describe the nature of what he called *public spheres*. (Note that he did not refer solely to “the public sphere,” which is an abstraction; rather, he referred to “public spheres,” which are concrete and practical contexts for communication.) The public spheres that Habermas had in mind are *not* the kinds of communicative spaces of most of our social and political communication. Communication in very many political contexts (especially in the sense of *realpolitik*) is frequently distorted and disfigured by interest-based bargaining, that is, by people speaking and acting in ways that are guided by their own (self-) interests (even if they are shared political interests) in the service of their own (shared) particular goals and ends. We return to this in our discussion of participatory action research and communicative space later.

From Habermas’s (1996, chap. 8) discussion in *Between Facts and Norms*, we identified 10 key features of public spheres as he defined them. In what follows, drawing on other recent work (Kemmis, 2004; Kemmis & Brennan Kemmis, 2003), we describe each of these features and then briefly indicate how critical participatory action research projects might exemplify each feature. From Kemmis and Brennan Kemmis (2003), we

also present comments indicating how two kinds of social action projects displayed some of the characteristics of public discourses in public spheres, that is, how participatory action research work can create more open and fluid relationships than can the closed and somewhat mechanical notions sometimes associated with action research groups and methodologically driven characterizations of their work. To use this illustration, it is necessary to give a brief introduction to these examples. The first is an example of a participatory action research project in Yirrkala, Australia, during the late 1980s and 1990s. The second is an example of a large educational congress held in the Argentine Republic in 2003.

Example 1: The Yirrkala Ganma Education Project. During the late 1980s and 1990s, in the far north of Australia in the community of Yirrkala, North East Arnhem Land, Northern Territory, the Yolngu indigenous people wanted to change their schools.² They wanted to make their schools more appropriate for Yolngu children. Mandawuy Yunupingu, then deputy principal at the school and later lead singer of the pop group Yothu Yindi, wrote about the problem this way:

Yolngu children have difficulties in learning areas of Balanda [white man's] knowledge. This is not because Yolngu cannot think, it is because the curriculum in the schools is not relevant for Yolngu children, and often these curriculum documents are developed by Balanda who are ethnocentric in their values. The way that Balanda people have institutionalised their way of living is through maintaining the social reproduction process where children are sent to school and they are taught to do things in a particular way. Often the things that they learn favour [the interests of] the rich and powerful, because when they leave school [and go to work] the control of the workforce is in the hands of the middle class and the upper class.

An appropriate curriculum for Yolngu is one that is located in the Aboriginal world which can enable the children to cross over into the Balanda world. [It allows] for identification of bits of Balanda knowledge that are consistent with the Yolngu way of learning. (Yunupingu, 1991, p. 102)

The Yolngu teachers, together with other teachers and with the help of their community, began a journey of participatory action research. Working together, they changed the white man's world of schooling. Of course, sometimes there were conflicts and disagreements, but they worked through them in the Yolngu way—toward consensus. They had help but no money to conduct their research.

Their research was not research about schools and schooling *in general*; rather, their participatory action research was about how schooling was done in *their* schools. As Yunupingu (1991) put it,

So here is a fundamental difference compared with traditional research about Yolngu education: We start with Yolngu knowledge and work out what comes from Yolngu minds as of central importance, not the other way [a]round. (pp. 102–103)

Throughout the process, the teachers were guided by their own collaborative research into their problems and practices. They gathered stories from the old people. They gathered information about how the school worked and did not work for them. They made changes and watched what happened. They thought carefully about the consequences of the changes they made, and then they made still further changes on the basis of the evidence they had gathered.

Through their shared journey of participatory action research, the school and the community discovered how to limit the culturally corrosive effects of the white man's way of schooling, and they learned to respect *both* Yolngu ways and the white man's ways. At first, the teachers called the new form of schooling "both ways education." Later, drawing on a sacred story from their own tradition, they called it "Ganma education."

Writing about his hopes for the Ganma research that the community conducted to develop the ideas and practices of Ganma education, Yunupingu (1991) observed,

I am hoping the Ganma research will become critical educational research, that it will empower Yolngu, that it will emphasize emancipatory aspects, and that it will take a side—just as the

Balanda research has always taken a side but never revealed this, always claiming to be neutral and objective. My aim in Ganma is to help, to change, to shift the balance of power.

Ganma research is also critical in the processes we use. Our critical community of action researchers working together, reflecting, sharing, and thinking includes important Yolngu elders, the Yolngu action group [teachers in the school], Balanda teachers, and a Balanda researcher to help with the process. Of course, she is involved too; she cares about our problems, [and] she has a stake in finding solutions—this too is different from the traditional role of a researcher. (p. 103) . . .

It is, I must stress, important to locate Ganma in our broader development plans . . . in the overall context of Aboriginalisation and control into which Ganma must fit. (p. 104)

Together, the teachers and the community found new ways in which to think about schools and schooling, that is, new ways in which to think about the work of teaching and learning and about their community and its future. Their collaborative participatory action research changed not only the school but also the people themselves.

We give a little more information about the communicative relationships established in the project as we describe 10 features of public spheres as discussed by Habermas.

Example 2: The Córdoba Educational Congress. In October 2003, some 8,000 teachers gathered in Córdoba, Argentina, for the Congreso Internacional de Educación (Congreso V Nacional y III Internacional).⁵ We want to show that the congress opened a shared communicative space to explore the nature, conditions, and possibilities for change in the social realities of education in Latin America. When participants opened this communicative space, they created open-eyed and open-minded social relationships in which participants were jointly committed to gaining a critical and self-critical grasp on their social realities and the possibilities for changing the educational practices of their schools and universities and for overcoming the injustice, inequity, irrationality, and suffering endemic in the societies in which they live. Although we are not claiming that

the case perfectly realizes the ideal type of the public sphere, it seems to us that the participants in the Córdoba congress created the kind of social arena that is appropriately described as a public sphere. Moreover, the congress is also to be understood as one of many key moments in a broad social and educational movement at which participants reported on particular projects of different kinds (many of them participatory action research projects), seeing these particular projects as contributions to the historical, social, and political process of transforming education in various countries in South America.

The 10 features of public spheres we mentioned earlier are as follows:

1. Public spheres are *constituted as actual networks of communication among actual participants*. We should not think of public spheres as entirely abstract, that is, as if there were just one public sphere. In reality, *there are many public spheres*.

Understood in this way, participatory action research groups and projects might be seen as open-textured networks established for communication and exploration of social problems or issues and as having relationships with other networks and organizations in which members also participate.

The Yirrkala Ganma project involved a particular group of people in and around the schools and community at that time. It was a somewhat fluid group that was focused on a group of indigenous teachers at the school together with community elders and other community members—parents and others—and students at the schools. It also involved nonindigenous teachers and coresearchers who acted as critical friends to the project. The network of actual communications among these people constituted the project as a public sphere.

The Córdoba congress brought together some 8,000 teachers, students, education officials, and invited experts in various fields. For the 3 days of the congress, they constituted an overlapping set of networks of communication that could be regarded as a large but highly interconnected

and thematized set of conversations about contemporary educational conditions and educational practices in Latin America. They were exploring the question of how current educational practices and institutions continued to contribute to and reproduce inequitable social relations in those countries and how transformed educational practices and institutions might contribute to transforming those inequitable social conditions.

2. Public spheres are *self-constituted*. They are formed by people who get together *voluntarily*. They are also *relatively autonomous*; that is, they are outside formal systems such as the administrative systems of the state. They are also outside the formal systems of influence that mediate between civil society and the state such as the organizations that represent particular interests (e.g., a farmers' lobby). They are composed of people who want to explore particular problems or issues, that is, around particular themes for discussion. Communicative spaces or communication networks organized as part of the communicative apparatus of the economic or administrative subsystems of government or business would *not* normally qualify as public spheres.

Participatory action research groups come into existence around themes or topics that participants want to investigate, and they make a shared commitment to collaborating in action and research in the interests of transformation. They constitute themselves as a group or project for the purpose of mutual critical inquiry aimed at practical transformation of existing ways of doing things (practices/work), existing understandings (which guide them as practitioners/workers), and existing situations (practice settings/workplaces).

The Yirrkala Ganma project was formed by people who wanted to get together to work on changing the schools in their community. They participated voluntarily. They were relatively autonomous in the sense that their activities were based in the schools but were not "owned" by the schools, and their activities were based in the community but were not "owned" by any community organization. The project was held together

by a common commitment to communication and exploration of the possibilities for changing the schools to enact the Ganma (both ways) vision of Yolngu schooling for Yolngu students and communities.

People attended the Córdoba congress voluntarily. Despite the usual complex arrangements for people to fund their attendance and sponsorship of students and others who could not afford to attend (approximately 800 of the 8,000 attendees received scholarships to subsidize their attendance), the congress remained autonomous of particular schools, education systems, and states. The administrative apparatus of the congress was not "owned" by any organization or state, although its core administrative staff members were based at the Dr. Alejandro Carbó Normal School. The congress was coordinated by a committee of educators based in Córdoba and was advised by an academic committee composed of people from many significant Argentinean education organizations (e.g., the Provincial Teachers' Union, universities, the National Academy of Sciences based in Córdoba). Arguably, however, the structuring of the congress as a self-financing economic enterprise (as distinct from its connection with a broader social and educational movement) jeopardized the extent to which it might properly be described as a public sphere.

3. Public spheres frequently come into existence in response to *legitimation deficits*; that is, they frequently come into existence because potential participants do not feel that existing laws, policies, practices, or situations are legitimate. In such cases, participants do not feel that they would necessarily have come to the decision to do things the ways they are now being done. Their communication is aimed at exploring ways in which to overcome these legitimation deficits by finding alternative ways of doing things that will attract their informed consent and commitment.

Participatory action research groups and projects frequently come into existence because existing ways of working are regarded as lacking legitimacy in the sense that they do not (or no longer) command respect or because they cannot

be regarded as authentic for participants, either individually or collectively.

The Yirrkala Ganma project came into existence because of prolonged and profound dissatisfaction with the nature and consequences of the white man's way of schooling for Yolngu students, including the sense that current ways of doing schooling were culturally corrosive for Yolngu students and communities. As indicated earlier, Yolngu teachers and community members wanted to find alternative ways of schooling that would be more inclusive, engaging, and enabling for Yolngu students and that would help to develop the community under Yolngu control.

The people attending the Córdoba congress generally shared the view that current forms of education in Latin America serve the interests of a kind of society that does not meet the needs of most citizens, that is, that current forms of schooling are not legitimate in terms of the interests of the majority of students and their families. They wanted to explore alternative ways of doing education that might better serve the interests of the people of Latin America (hence the theme for the congress, "Education: A Commitment With the Nation").

4. Public spheres are constituted for *communicative action* and for *public discourse*. Usually they involve face-to-face communication, but they could be constituted in other ways (e.g., via e-mail, via the World Wide Web). Public discourse in public spheres has a similar orientation to communicative action, in that it is oriented toward intersubjective agreement, mutual understanding, and unforced consensus about what to do. Thus, communicative spaces organized for essentially instrumental or functional purposes—to command, to influence, to exercise control over things—would *not* ordinarily qualify as public spheres.

Participatory action research projects and groups constitute themselves for communication oriented toward intersubjective agreement, mutual understanding, and unforced consensus about what to do. They create communication networks aimed at achieving communicative

action and at projecting communicative action into practical inquiries aimed at transformation of social practices, practitioners' understandings of their practices, and the situations and circumstances in which they practice.

The Yirrkala Ganma project was created with the principal aim of creating a shared communicative space in which people could think, talk, and act together openly and with a commitment to making a difference in the way in which schooling was enacted in their community. Communications in the project were mostly face-to-face, but there was also much written communication as people worked on various ideas and subprojects within the overall framework of the Ganma project. They spent many hours in reaching intersubjective agreement on the ideas that framed their thinking about education, in reaching mutual understanding about the conceptual framework in which their current situation was to be understood and about the Ganma conceptual framework that would help to guide their thinking as they developed new forms of schooling, and in determining ways in which to move forward based on unforced consensus about how to proceed. Although it might appear that they had an instrumental approach and a clear goal in mind—the development of an improved form of schooling—it should be emphasized that their task was not merely instrumental. It was not instrumental because they had no clear idea at the beginning about what form this new kind of schooling would take; both their goal and the means to achieve it needed to be critically developed through their communicative action and public discourse.

In the Córdoba congress, people came together to explore ways of conceptualizing a reconstructed view of schooling and education for Latin America at this critical moment in the history of many of its nations. The point of the congress was to share ideas about how the current situation should be understood and how it was formed and to consider ideas, issues, obstacles, and possible ways in which to move forward toward forms of education and schooling that might, on the one hand, overcome some of the problems of the past and, on the

other, help to shape forms of education and schooling that would be more appropriate to the changed world of the present and future. Participants at the congress presented and debated ideas; they explored social, cultural, political, educational, and economic problems and issues; they considered the achievements of programs and approaches that offered alternative "solutions" to these problems and issues; and they aimed to reach critically informed views about how education and schooling might be transformed to overcome the problems and address the issues they identified in the sense that they aimed to reach practical decisions about what might be done in their own settings when participants returned home from the congress.

5. Public spheres aim to be *inclusive*. To the extent that communication among participants is *exclusive*, doubt may arise as to whether a sphere is in fact a "public" sphere. Public spheres are attempts to create communicative spaces that include not only the parties most obviously interested in and affected by decisions but also people and groups peripheral to (or routinely excluded from) discussions in relation to the topics around which they form. Thus, essentially private or privileged groups, organizations, and communicative networks do *not* qualify as public spheres.

Participatory action research projects and groups aim to include not only practitioners (e.g., teachers, community development workers) but also others involved in and affected by their practices (e.g., students, families, clients).

The Yirrkala Ganna project aimed to include as many of the people who were (and are) involved in and affected by schooling in the community as was possible. It reached out from the school to involve the community and community elders; it included nonindigenous teachers as well as indigenous teachers, and it involved students and their families as well as teachers in the school. It was not exclusive in the sense that its assertion of Yolngu control excluded Balanda (nonindigenous) people; still, it invited Balanda teachers, advisers, and others to join the common

commitment of Yolngu people in their search for improved forms of education and schooling that would meet the needs and aspirations of Yolngu people and their communities more genuinely.

The Córdoba congress aimed to be broadly inclusive. It was a congress that was described by its coordinator, María Nieves Díaz Carballo, as "by teachers for teachers"; nevertheless, it included many others involved in and affected by education and schooling in Latin America—students, education officials, invited experts, representatives of a range of government and nongovernment organizations, and others. It aimed to include all of these different kinds of people as friends and contributors to a common cause—creating new forms of education and schooling better suited to the needs of the present and future in Latin America and the world.

6. As part of their inclusive character, public spheres tend to involve communication in *ordinary language*. In public spheres, people deliberately seek to break down the barriers and hierarchies formed by the use of specialist discourses and the modes of address characteristic of bureaucracies that presume a ranking of the importance of speakers and what they say in terms of their positional authority (or lack thereof). Public spheres also tend to have only the weakest of distinctions between insiders and outsiders (they have relatively permeable boundaries and changing "memberships") and between people who are relatively disinterested and those whose (self-)interests are significantly affected by the topics under discussion. Thus, the communicative apparatuses of many government and business organizations, and of organizations that rely on the specialist expertise of some participants for their operations, do *not* ordinarily qualify as public spheres.

While drawing on the resources and discourses of theory and policy in their investigations, participatory action researchers aim to achieve mutual comprehension and create discourse communities that allow all participants to have a voice and play a part in reaching consensus about what to do. By necessity, they use language that all can use rather

than relying on the specialist discourses of social science that might exclude some from the shared task of understanding and transforming shared everyday lives and a shared lifeworld.

In the Yirrkala Ganma project, much of the communication about the project not only was in ordinary language but was also conducted in the language of the community, that is, *Yolngu-matha*. This not only was a deliberate shift from the language in which Balanda schooling was usually discussed in the community (English and some specialist educational discourse) but also was a shift to engage and use the conceptual frameworks of the community and Yolngu culture. On the other hand, the modes of address of the Yolngu culture require respect for elders and specialist forms of language for "inside" matters (secret/sacred, for the initiated) versus "outside" matters (secular, for the uninitiated), so many discussions of the Ganma conceptual framework required participants to respect these distinctions and the levels of initiation of speakers and hearers.

At the Córdoba congress, many speakers used specialist educational (and other) discourses to discuss their work or ideas, but much of the discussion took place in language that was deliberately intended to be inclusive and engaging for participants, that is, to share ideas and open up participants for debate without assuming that hearers were fluent in specialist discourses for understanding either the sociopolitical context of education in Latin America or the technical aspects of contemporary education in Latin American countries. More particularly, the languages used at the congress, including translations from English and Portuguese, were inclusive because they were directed specifically toward fostering the shared commitment of participants about the need for change and the obstacles and possibilities ahead if participants wanted to join the shared project of reconstructing education in Argentina and elsewhere. Specialist discourses were used to deal with specific topics (e.g., in philosophy, in social theory, in curriculum), but the conversations about those topics soon shifted register to ensure that ideas were accessible to any interested participants.

7. Public spheres presuppose *communicative freedom*. In public spheres, participants are free to occupy (or not occupy) the particular discursive roles of speaker, listener, and observer, and they are free to withdraw from the communicative space of the discussion. Participation and non-participation are voluntary. Thus, communicative spaces and networks generally characterized by obligations or duties to lead, follow, direct, obey, remain silent, or remain outside the group could not be characterized as public spheres.

Participatory action research projects and groups constitute themselves to "open communicative space" among participants. They constitute themselves to give participants the right and opportunity to speak and be heard, to listen, or to walk away from the project or group. Contrary to some of our earlier views, they are not closed and self-referential groups in which participants are (or can be) bound to some "party line" in the sense of a "correct" way of seeing things. Moreover, they constitute themselves deliberately for *critical* and *self-critical* conversation and decision making that aims to open up existing ways of saying and seeing things, that is, to play with the relationships between the actual and the possible.

In the Yirrkala Ganma project, participants were free to occupy the different roles of speaker, listener, and observer or to withdraw from discussions. In any particular discussion, some may have occupied one or another of these roles to a greater extent, but over the life of the project, people generally occupied the range of these roles at one time or another. As indicated earlier, some people continued to occupy privileged positions as speakers (e.g., on matters of inside knowledge), but they also occupied roles as listeners in many other situations, responding with their specialist knowledge whenever and wherever it was appropriate to do so. In general, however, the prolonged discussions and debates about giving form to the idea of the Ganma (both ways) curriculum was conducted in ways that enabled participants to gather a shared sense of what it was and could be and how it might be realized in practice. The discussions were consistently open and critical in the sense that all participants wanted to reach shared

understandings and agreements about the limitations of Balanda education for Yolngu children and communities and about the possibilities for realizing a different and improved form of education for Yolngu children and their community.

The Córdoba congress engendered conditions of communicative freedom. Although the congress program and timetable privileged particular participants as speakers at particular times, the vast conversation of the congress, within and outside its formal sessions and in both formal and informal communication, presupposed the freedom of participants to speak in, listen to, observe, and withdraw from particular discussions. Conversations were open and critical, inviting participants to explore ideas and possibilities for change together.

8. The communicative networks of public spheres generate *communicative power*; that is, the positions and viewpoints developed through discussion will command the respect of participants not by virtue of obligation but rather by the power of mutual understanding and consensus. Thus, communication in public spheres creates legitimacy in the strongest sense, that is, the shared belief among participants that they freely and authentically consent to the decisions they reach. Thus, systems of command or influence, where decisions are formed on the basis of obedience or self-interests, would *not* ordinarily qualify as public spheres.

Participatory action research projects and groups allow participants to develop understandings of, reasons for, and shared commitment to transformed ways of doing things. They encourage exploration and investigation of social practices, understandings, and situations. By the very act of doing so, they generate more authentic understandings among participants and a shared sense of the legitimacy of the decisions they make.

Over the life of the Yirrkala Ganma project, and in the continuing work arising from it, participants developed the strongest sense that the new way of thinking about education and schooling that they were developing was timely, appropriate,

true to their circumstances, and generative for Yolngu children and their community. They were clearly conscious that their shared viewpoint, as well as their conceptual framework, contrasted markedly with taken-for-granted assumptions and presuppositions about schooling in Australia, including many taken-for-granted (Balanda) ideas about indigenous education. The communicative power developed through the project sustained participants in their commitment to these new ways of schooling despite the occasional resistances they experienced when the Northern Territory education authorities found that community proposals were counter to, or exceptions to, usual ways of operating in the system. (It is a tribute to many nonindigenous people in the Northern Territory who worked with Yirrkala Community Schools and the associated Homelands Centre Schools that they generally took a constructive and supportive view of the community's proposals even when the proposals fell outside established practice. The obvious and deep commitment of the Yolngu teachers and community to the tasks of the project, the support of credible external coresearchers, and the long-term nature of the project encouraged many nonindigenous system staff members to give the project "the benefit of the doubt" as an educational project that had the possibility to succeed in indigenous education where many previous proposals and plans developed by nonindigenous people had failed.)

The Córdoba congress was infused by a growing sense of shared conviction and shared commitment about the need and possibilities for change in education in Argentina and elsewhere in Latin America. On the other hand, the impetus and momentum of the developing sense of shared conviction may have been more fragile and transitory because the congress was just a few days long (although building on the momentum from previous congresses and other work that participants were doing toward the same transformative ends). Seen against the broader sweep of education and educational change in education in Latin America, however, it is clear that the congress was drawing on, refreshing, and redirecting long-standing

reserves of critical educational progressivism in the hearts, minds, and work of many people who attended.

The shared conviction that new ways of working in education are necessary generated a powerful and nearly tangible sense of *solidarity* among participants in the congress—a powerful and lasting shared commitment to pursuing the directions suggested by the discussions and debates in which they had participated. It also generated an enduring sense of the *legitimacy* of decisions made by participants in the light of shared exploration of their situations, shared deliberation, and shared decision making.

9. Public spheres do not affect social systems (e.g., government, administration) *directly*; their impact on systems is *indirect*. In public spheres, participants aim to change the climate of debate, the ways in which things are thought about and how situations are understood. They aim to generate a sense that alternative ways of doing things are possible and feasible and to show that some of these alternative ways actually work or that the new ways do indeed resolve problems, overcome dissatisfactions, or address issues. Groups organized primarily to pursue the particular interests of particular groups by direct intervention with government or administrative systems would not ordinarily qualify as public spheres. Similarly, groups organized in ways that usually serve the particular interests of particular groups, even though this may happen in a concealed or “accidental” way (as frequently happens with news media), do not ordinarily qualify as public spheres.

Participatory action research projects and groups rarely have the power to legislate or compel change, even among their own members. It is only by the force of better argument, transmitted to authorities who must decide for themselves what to do, that they influence existing structures and procedures. They frequently establish themselves, and are permitted to establish themselves, at the margins of those structures and procedures, that is, in spaces constituted for exploration and investigation and for trying out alternative ways of doing things. They are

frequently listened to because they have been deliberately allowed to explore this marginal space, with the tacit understanding that what they learn may be of benefit to others and to existing systems and structures. Although they may understand themselves as oppositional or even “outlaw” (in a metaphorical sense), they are frequently acting with the knowledge and encouragement of institutional authorities who recognize that changes might be needed.

As already indicated, the Yirrkala Ganma project was based in the schools but was not an official project of the school system or education system, and it was based in the community but was not an official project of any community organization. The schools and the Northern Territory education system, as well as various community organizations, knew of the existence of the project and were generally supportive. The work of the project was not an improvement or development project undertaken by any of these organizations, nor did the project “speak” directly to these organizations from within the functions and operations of the systems as systems. On the contrary, the project aimed to change the way in which these systems and organizations thought about and organized education in the community. In particular, it aimed to change the conceptual frameworks and discourses in which Yolngu education was understood and the activities that constituted it. In a sense, the transformations produced by the project were initially “tolerated” by these systems and organizations as exceptions to usual ways of operating. Over time, through the indirect influence of showing that alternative ways of doing things could work, the systems began to accept them—even though the alternative ways were at odds with practice elsewhere. The project changed the climate of discussion and the nature of the discourse about what constitutes good education for Yolngu children and communities. Because similar experiments were going on elsewhere around Australia (e.g., with the involvement of staff members from Deakin University, the University of Melbourne, and Batchelor College), there was a sense within education systems that the new experiment should be

permitted to proceed in the hope (increasingly fulfilled) that the new ways of working might prove to be more effective in indigenous schools in indigenous communities where education had frequently produced less satisfactory outcomes than in nonindigenous schools and for non-indigenous students and communities. In a variety of small but significant ways, education systems began to accept the discourses of "both ways" education (realized differently in different places) and to encourage different practices of "both ways" education in indigenous communities and schools with large enrollments of indigenous students.

The Córdoba congress operated outside the functional frameworks of education and state systems and aimed to change the ways in which education and schooling were understood and practiced indirectly rather than directly. No state agency sponsor controlled the congress; as indicated earlier, it is a congress created and maintained by its organizers "by teachers for teachers." On the other hand, state officials (e.g., the minister of education for the Province of Córdoba [Amelia López], the Argentinean federal minister of education [Daniel Filmus]) addressed the congress and encouraged participants in their efforts to think freshly about the educational problems and issues being confronted in schools and in Argentina. The size, success, and generativity of previous congresses was well known (the 2003 congress was the fifth national congress and third international congress held in Córdoba), and it is reasonable to assume that representatives of the state would want to endorse the congress even if some of the ideas and practices being debated and developed by participants were at the periphery of, or even contrary to, state initiatives in education and schooling. Of course it is also true that many of the ideas and practices discussed at the congress, such as those concerned with social justice in education, were generally in the spirit of state initiatives, although most congress participants appeared to take an actively and constructively critical view of the forms and consequences of contemporary state initiatives in schooling.

10. Public spheres frequently arise in practice through, or in relation to, the communication networks associated with *social movements*, that is, where voluntary groupings of participants arise in response to a legitimation deficit or a shared sense that a social problem has arisen and needs to be addressed. Nevertheless, the public spheres created by some organizations (e.g., Amnesty International) can be long-standing and well organized and can involve notions of (paid) membership and shared objectives. On the other hand, many organizations (e.g., political parties, private interest groups) do *not* ordinarily qualify as public spheres for reasons already outlined in relation to other items on this list and also because they are part of the social order rather than social movements.

Participatory action research groups and projects often arise in relation to broad social movements such as the women's movement, the green movement, peace movements, the civil rights movement, and other movements for social transformation. They frequently arise to explore alternative ways of doing things in settings where the impact of those movements is otherwise unclear or uncertain (e.g., in the conduct of teaching and learning in schools, in the conduct of social welfare by family and social welfare agencies, in the conduct of catchment management by groups of landholders). They draw on the resources of those social movements and feed back into the broader movements, both in terms of the general political potency of the movements and in terms of understanding how the objectives and methods of those movements play out in the particular kinds of situations and settings (e.g., village life, schooling, welfare practice) being investigated.

As some of the statements of Yunupingu (1991) quoted earlier suggest, the Yirrkala Ganma project was an expression of several important contemporary indigenous social movements in Australia, particularly the land rights movement, the movement for Aboriginal self-determination and control, and (for Australians generally) the movement for reconciliation between indigenous and nonindigenous Australians. Arguably, some of the ideas developed in the Ganma project have

had a far wider currency than might have been expected, for example, through the songs and music of Yunupingu's pop group, Yothu Yindi, which have resolutely and consistently advocated mutual recognition and respect between indigenous and nonindigenous Australians and have educated and encouraged nonindigenous Australians to understand and respect indigenous people, knowledge, communities, and cultures. The Ganma project was a manifestation of these indigenous rights movements at the local level and in the particular setting of schools and was also a powerful intellectual contribution to shaping the wider movements. On the one hand, the project named and explained ways in which schooling was culturally corrosive for indigenous peoples; on the other hand, it showed that it was possible to create and give rational justifications of alternative, culturally supportive ways of doing schooling and education for indigenous people and in indigenous communities.

In the Córdoba congress, there was a strong sense of connection to a broad social movement for change in Latin American education and societies. Endemic corruption, ill-considered economic adventures, antidemocratic practices, the denial of human rights, and entrenched social inequity in a number of Latin American countries were opposed and critiqued by many progressive people, including many teachers and education professionals, and there was (and is) a hunger for alternative forms of education that might prevent the tragic inheritance of previous regimes (e.g., escalating national debt, fiscal crises, impoverishment, the collapse of services) from being passed on to rising generations of students and citizens. The negative/critical and positive/constructive aspects of the education movement represented in and by the congress are connected to a wider social movement for change, but they are also a particular and specific source of intellectual, cultural, social, political, and economic ideas and practices that make a distinctive contribution to the shape and dynamics of the wider movement. The congress itself is now something of a rallying point for progressive and critical teachers and education professionals, but it remains determinedly and politely independent of the state and

commercial sponsors that might seek to exercise control over or through it. Its organizers are convinced that their best chance to change the climate of thinking about education and society is to remain independent of the state machinery of social order and to strive only for an indirect role in change by having a diffuse role in changing things "by the force of better argument" rather than striving to create change through the administrative power available through the machinery of the state or (worse) through any kind of coercive force. The congress also expressed, not only in its written materials but also in its climate and culture, a profound sense of passion, hope, and joy; participants clearly regard it as an opportunity to celebrate possibilities and achievements in creating new forms of education aimed at making (and speaking and writing into existence) a better future.

These 10 features of public spheres describe a space for social interaction in which people strive for intersubjective agreement, mutual understanding, and unforced consensus about what to do and in which legitimacy arises. These are the conditions under which participants regard decisions, perspectives, and points of view reached in open discussion as compelling for—and even binding on—themselves. Such conditions are very different from many other forms of communication, for example, the kind of functional communication characteristic of social systems (which aims to achieve particular ends by the most efficient means) and most interest-based bargaining (which aims to maximize or optimize self-interests rather than to make the best and most appropriate decision for all concerned).

These conditions are ones under which practical reasoning and exploratory action by a community of practice are possible—theorizing, research, and collective action aimed at changing practices, understandings of practices, and the settings and situations in which practice occurs. They are conditions under which a loose affiliation of people can gather to address a common theme based on contemporary problems or issues, aiming to inform themselves about the core practical question of "what is to be done?" in relation to the formation and transformation of

practice, practitioners, and the settings in which practice occurs at particular times and in particular places.

As already suggested, such communities of practice sometimes come into existence when advocacy groups believe that problems or issues arise in relation to a program, policy, or practice and that change is needed. An example would be the kind of collaboration that occurs when a group of mental health service clients meet with mental health service providers and professionals to explore ways in which to improve mental health service delivery at a particular site. Another example would be the project work of groups of teachers and students who conduct participatory action research investigations into problems and issues in schooling. Another would be the kind of citizens' action campaign that sometimes emerges in relation to issues of community well-being and development or environmental or public health issues. This approach to the transformation of practice understands that changing practices is not just a matter of changing the ideas of practitioners alone; it also is a matter of changing the social, cultural, discursive, and material conditions under which the practice occurs, including changing the ideas and actions of those who are the clients of professional practices and the ideas and actions of the wider community involved in and affected by the practice. This approach to changing practice, through fostering public discourse in public spheres, is also the approach to evaluation advocated by Niemi and Kemmis (1999) under the rubric of "communicative evaluation" (see also Ryan, 2003).

■ MYTHS, MISINTERPRETATIONS, AND MISTAKES REVISITED

In the light of the Habermasian notions of *system* and *lifeworld* (explored in our chapter in the second edition of this *Handbook*), the critique of the *social macro-subject*, and the notion of *public spheres* developed in *Between Facts and Norms*, we can throw new light on the myths, misinterpretations, and mistakes about critical participatory action research identified earlier in this chapter. The

following comments present a necessarily brief summary of some of the ways in which our understandings of these topics have evolved during recent years.

Empowerment

In the light of the Habermasian theory of system and lifeworld, we came to understand the notion of empowerment neither solely in lifeworld terms (in terms of the lifeworld processes of cultural, social, and personal reproduction and transformation and their effects) nor solely in systems terms (in terms of changing systems structures or functioning or through effects produced by the steering media of money and administrative power of organizations and institutions). Exploring practices, our understandings of them, and the settings in which we worked from *both* lifeworld and system perspectives gave us richer critical insight into how processes of social formation and transformation occur in the contexts of particular projects. Increasingly, we came to understand empowerment not only as a lifeworld process of cultural, social, and personal development and transformation but also as implying that protagonists experienced themselves as working both in and against system structures and functions to produce effects intended to be read in changed systems structures and functioning. From this stereoscopic view, system structures and functions are not only sources of constraint but also sources of possibility, and lifeworld processes of cultural, social, and personal reproduction and transformation are not only sources of possibility but also sources of constraint on change. Thus, in real-world settings inevitably constructed by both, the notion of empowerment plays across the conceptual boundary between lifeworld and system, and it now seems likely that one would say that empowerment had occurred only when transformations were evident in both lifeworld and system aspects of a situation.

In the light of Habermas's critique of the social macro-subject, we increasingly recognized that the notion of empowerment is not to be understood solely in terms of closed organizations achieving

self-regulation (by analogy with the sovereignty of states) as a process of achieving autonomy and self-determination, whether at the level of individual selves or at the level of some collective (understood as a macro-"self"). It turns out that neither individual actors nor states can be entirely and coherently autonomous and self-regulating. Their parts do not form unified and coherent wholes but rather must be understood in terms of notions such as difference, contradiction, and conflict as much as unity, coherence, and independence. In the face of internal and external differentiation, perhaps ideas such as dialogue, interdependence and complementarity are the positives for which one might hope. Despite its rhetorical power and its apparent political necessity, the concept of empowerment does not in reality produce autonomous and independent self-regulation; rather, it produces only a capacity for individuals, groups, and states to interact more coherently with one another in the ceaseless processes of social reproduction and transformation. At its best, it names a process in which people, groups, and states engage one another more authentically and with greater recognition and respect for difference in making decisions that they will regard as legitimate because they have participated in them openly and freely, more genuinely committed to mutual understanding, intersubjective agreement, and consensus about what to do.

In the light of Habermas's commentary on the public sphere, the basis for empowerment is not to be understood in terms of activism justified by ideological position taking; rather, the basis for empowerment is the communicative power developed in public spheres through communicative action and public discourse. On this view, the aim of empowerment is rational and just decisions and actions that will be regarded as legitimate by those involved and affected.

The Role of the Facilitator

In the light of the Habermasian theory of system and lifeworld, we came to understand that facilitation is not to be understood solely in

system terms as a specialized role with specialized functions, nor is it to be understood solely in lifeworld terms as a process of promoting the reproduction and transformation of cultures, social relationships, and identities. Instead, it is to be understood as a process to be critically explored from both perspectives. The question of facilitation usually arises when there is an asymmetrical relationship of knowledge or power between a person expecting or expected to do "facilitation" and people expecting or expected to be "facilitated" in the process of doing a project. It is naïve to believe that such asymmetries will disappear; sometimes help is needed. At the same time, it must be recognized that those asymmetries can be troublesome and that there is little solace in the idea that they can be made "safe" because the facilitator aims to be "neutral." On the other hand, it is naïve to believe that the person who is asked for help, or to be a facilitator, will be an entirely "equal" coparticipant along with others, as if the difference were invisible. Indeed, the facilitator *can* be a coparticipant, but one with some special expertise that may be helpful to the group in its endeavors. The theory of system and lifeworld allows us to see the doubleness of the role in terms of a specialist role and functions in critical tension with processes of cultural, social, and personal reproduction and transformation that aspire to achieving self-expression, self-realization, and self-determination (recognizing that the individual or collective self in each case is not a unified, coherent, autonomous, responsible, and independent whole entirely capable of self-regulation). The stereoscopic view afforded by the theory of system and lifeworld provides conceptual resources for critical enactment and evaluation of the role of the facilitator in practice.

In the light of Habermas's critique of the social macro-subject, we no longer understand the people involved in collaborative participatory action research projects as a closed group with a fixed membership; rather, we understand them as an open and inclusive network in which the facilitator can be a contributing coparticipant, albeit with particular knowledge or expertise that can be of help to the group. Moreover, at different times,

different participants in some groups can and do take the facilitator role in relation to different parts of the action being undertaken and in relation to the participatory action research process.

In the light of Habermas's commentary on the public sphere, the facilitator should not be understood as an external agent offering technical guidance to members of an action group but rather should be understood as someone aiming to establish or support a collaborative enterprise in which people can engage in exploratory action as participants in a public sphere constituted for communicative action and public discourse in response to legitimation deficits.

The Research-Action Dualism

In the light of the Habermasian theory of system and lifeworld, action in participatory action research should not be understood as separated from research in a technical division of labor mirrored in a social division of labor between participants and researchers. Instead, research and action converge in communicative action aimed at practical and critical decisions about what to do in the extended form of exploratory action, that is, practices of action and research jointly projected through history by action. Equally, however, we do not understand the research and action elements of participatory action research as the "natural" realization of the lifeworld processes of cultural, social, and personal reproduction and transformation. In participatory action research, systems categories of structure, functions, goals, roles, and rules are relevant when a group works on a "project" (implying some measure of rational-purposive or strategic action). Here again, participatory action research crosses and recrosses the conceptual boundaries between system and lifeworld aspects of the life of the project, and the stereoscopic view afforded by the theory of system and lifeworld offers critical resources for exploring and evaluating the extent to which the project might become nothing but a rational-purposive project and the extent to which it risks dissolving into the

lifeworld processes of the group conducting it. Both the research element and the action element of the project have system and lifeworld aspects, and both elements are candidates for critical exploration and evaluation from the perspectives of system and lifeworld. Indeed, we might now conclude that it is the commitment to conducting this critique, in relation to the action, the research, and the relationship between them, that is the hallmark of critical participatory action research.

In the light of Habermas's critique of the social macro-subject, research and action are to be understood not in terms of steering functions for an individual or for a closed group (e.g., to steer the group by exercising administrative power) but rather as mutually constitutive processes that *create* affiliations and collaborative action among people involved in and affected by particular kinds of decisions and actions.

In the light of Habermas's commentary on the public sphere, research and action are to be understood not as separate functions but rather as different moments in a unified process of struggle characteristic of social movements—struggles against irrationality, injustice, and unsatisfying social conditions and ways of life (a unification of research for action that recalls the insight that all social movements are also educational movements). In the light of Habermas's (1996, chap. 8) description of the public sphere in *Between Facts and Norms*, we now conclude that the impulse to undertake participatory action research is an impulse to subject practice—social action—to deliberate and continuing critique by making action deliberately exploratory and arranging things so that it will be possible to learn from what happens and to make the process of learning a collective process to be pursued through public discourse in a public sphere constituted for that purpose.

The Role of the Collective

In the light of the Habermasian theory of system and lifeworld, the collective is not to be understood either solely in systems terms, as an organization or institution, or solely in lifeworld

terms, as a social group constituted in face-to-face social relationships. Instead, it must be critically explored from *both* perspectives and as constituted by processes associated with each (on the systems side: steering media; on the lifeworld side: cultural reproduction and transformation, social reproduction and transformation, and the formation and transformation of individual identities and capabilities).

In the light of Habermas's critique of the social macro-subject, the collective should be understood not as a closed group with fixed membership—a coherent, unified, autonomous, independent, and self-regulating whole—but rather as internally diverse, differentiated, and sometimes inconsistent and contradictory. Nor does a participatory action research group stand in the position of an avant-garde in relation to other people and groups in the setting in which the research occurs, but it retains its connections with those others, just as it retains responsibility for the consequences of its actions as they are experienced in those wider communities in which they take place.

In the light of Habermas's commentary on the public sphere, the collective formed by a participatory action research project should be understood not as a closed and exclusive group constituted to perform the particular organizational roles and functions associated with a project but rather as an open and inclusive space constituted to create conditions of communicative freedom and, thus, to create communicative action and public discourse aimed at addressing problems and issues of irrationality, injustice, and dissatisfaction experienced by particular groups at particular times. In our view, some of the most interesting participatory action research projects are those directly connected with wider social movements (e.g., green issues; issues of peace, race, or gender), but it should not go unnoticed that many participatory action research projects constitute themselves in ways that are very like social movements in relation to local issues, although often with wider ramifications, for example, by addressing issues about the effects of hyperrationalization of practices in local settings

that frequently have much more widespread relevance. For example, around the world there are hundreds—probably thousands—of different kinds of action research projects being conducted by teachers to explore the potential and limitations of various innovative forms of teaching and learning that address the alienating effects of state regulation of curriculum, teaching, and assessment at every level of schooling. The multiplication of such projects suggests that there is a social movement under way aimed at recovering or revitalizing education in the face of the very widespread colonization of the lifeworld of teaching and learning by the imperatives of increasingly muscular and intrusive administrative systems regulating and controlling the processes of schooling. These projects in education are paralleled by similar action research projects in welfare, health, community development, and other fields. Taken together, despite their differences, they make an eloquent statement of refusal and reconstruction in the face of a version of corporate and public administration that places the imperative of institutional control above the moral and substantive imperatives and virtues traditionally associated with the practice of these professions.

■ REIMAGINING CRITICAL PARTICIPATORY ACTION RESEARCH

The view of critical participatory action research we have advanced in this chapter is somewhat different from the view of it that we held in the past. Two decades ago, our primary aim was to envisage and enact a well-justified form of research to be conducted by teachers and other professional practitioners into their own practices, their understandings of their practices, and the situations in which they practiced. Despite our critique of established ways of thinking about social and educational research, certain remnant elements of conventional perceptions of research continued to survive in the forms of research we advocated, for example, ideas about theory, knowledge, and the centrality of the researcher in the advancement of knowledge.

Two decades ago, we hoped for advances in theory through action research that would somehow be similar to the kinds of theory conventionally produced or extended in the social and educational research of that time. We expected that practitioners would also develop and extend their own theories of education, but we were perhaps less clear about what the nature and form of those theories would be. We had admired Lawrence Stenhouse's definition of research as "systematic enquiry made public" (Stenhouse, 1975) but had given less thought to how those theories might emerge in a literature of practitioner research. Now we have a clearer idea that sometimes the theories that motivate, guide, and inform practitioners' action are frequently in the form of *collective understandings* that elude easy codification in the forms conventionally used in learned journals and books. They accumulate in conversations, archives of evidence, and the shared knowledge of *communities of practice*.

Two decades ago, although we had regarded "knowledge" as a problematic category and had distinguished between the private knowledge of individuals and the collective knowledge of research fields and traditions, we probably valued the knowledge outcomes of research over the practical outcomes of participant research—the effects of participant research in changing social and educational practices, understandings of those practices, and the situations and settings of practice. Now we have a clearer idea that the outcomes of participatory action research are written in histories—the histories of practitioners, communities, the people with whom they interact, and (again) communities of practice. And we see that the outcomes of participatory action research are to be read in terms of historical consequences for participants and others involved and affected by the action people have taken, judged not only against the criterion of truth but also against the criteria of wisdom and prudence, that is, whether people were better off in terms of the consequences they experienced. We can ask whether their understandings of their situations are less irrational (or ideologically skewed) than before, whether their action is less unproductive and

unsatisfying for those involved, or whether the social relations between people in the situation are less inequitable or unjust than before. The product of participatory action research is not just knowledge but also different histories than might have existed if participants had not intervened to transform their practices, understandings, and situations and, thus, transformed the histories that otherwise seemed likely to come into being. We look for the products of participatory action research in *collective action* and the making and remaking of *collective histories*.

Two decades ago, we were excited by participatory research that connected with social movements and made changes in particular kinds of professional practices (e.g., nursing, education, community development, welfare), but we were less aware than we are now that this kind of engagement with social movements is a two-way street. Social movements can be expressed and realized in the settings of professional practice (e.g., the powerful connections made between the women's movement and health or education or between green issues and education or community development), but social movements also take strength and direction from participatory studies that explore and critically investigate issues in the particular contexts of different kinds of social practices. Social movements set agendas around the broad themes that are their focus, but studies of particular practices and local settings also show how differently those broad themes must be understood in terms of issues identified in in-depth local investigations. Now we have a clearer understanding not only that participatory action research expresses the spirit of its time in terms of giving life to social movements in local settings or in relation to particular themes (e.g., gender, indigenous rights) but also that local investigations into locally felt dissatisfactions, disquiets, or concerns also open up themes of broader interest, sometimes linking to existing social movements but also bringing into existence new movements for transformation in professional fields and in the civil life of communities. Now, in judging the long-term success of participatory action research projects, we are more likely

to ask about the extent to which they have fed *collective capacities for transformation* locally and in the widening sphere of social life locally, regionally, nationally, and even internationally, as has happened in the history of participatory action research as it has contributed to the development of *people's collective communicative power*.

Most particularly, two decades ago we valorized the researcher. According to conventional views of research, researchers were the people at the center of the research act—heroes in the quiet adventures of building knowledge and theory. We encouraged participant research that would make “ordinary” practitioners local heroes of knowledge building and theory building and collaborative research that would make heroic teams of researching practitioners who produced new understandings in their communities and communities of practice. Increasingly, in those days, we saw research “collectives” as key activist groups that would make and change history. We continue to advocate this view of participatory research as making history by making exploratory changes. Now, however, our critiques of the research–action dualism, and our changing views of the facilitator and the research collective, encourage us to believe that critical participatory action research needs *animateurs* but that it also thrives in *public spheres* in which people can take a variety of roles as researchers, questioners, interlocutors, and interested observers. And if we reject the heroic view of history as being “made” by individuals—great men or great women—then we must see the real transformations of history as transformations made by ordinary people working together in the light of emerging themes, issues, and problems (e.g., via social movements). We now see a central task of participatory action research as including widening groups of people in the task of making their own history, often in the face of established ways of doing things and often to overcome problems caused by living with the consequences of the histories others make for us—often the consequences of new ways of doing things that were intended to improve things but that turned out to have unexpected, unanticipated, and untoward

consequences for those whom the new ways were intended to help. As we hope we have shown, Habermas’s description of public discourse in public spheres gives us another way in which to think about who can do “research” and what research might be like if it is conceptualized as exploratory action aimed at nurturing and feeding public discourse in public spheres. Now we are less inclined to think in terms of heroes of knowledge building or even of heroes of history making; we are more inclined to think in terms of people working together to develop a greater collective capacity to change the circumstances of their own lives in terms of *collective capacity building*.

Now, more so than two decades ago, we are excited by notions of collective understanding, collective research, communicative power, and collective capacity. We are interested in describing and identifying conditions under which people can investigate their own professional fields or community circumstances to develop communicative power and strengthen their collective capacity. In “projects” and movements aimed at collective capacity building, we see people securing new ways of working on the basis of *collective commitment*. We see them achieving new ways of working and new ways of being that have *legitimacy* because their decisions are made in conditions like those we described in the last section—the conditions of public discourse in public spheres. Now, more so than two decades ago, we see participatory action research as a process of sustained *collective deliberation* coupled with sustained *collective investigation* of a topic, a problem, an issue, a concern, or a theme that allows people to explore possibilities in action, judging them by their consequences in history and moving with a measure of tentativeness and prudence (in some cases with great courage in the face of violence and coercion) but also with the support that comes with *solidarity*.

This account of what we now value as outcomes and consequences of participatory action research—well-justified and agreed-on collective action that reduces the world’s stock of irrationality,

injustice, inequity, dissatisfaction, and unproductive ways of doing things—may seem a far cry from the kind of justification for much social and educational research. Perhaps more modestly, that research makes few claims to changing history for the better and promises only improved knowledge and theories that *may* contribute to clearer understanding and improved policy and practice. That is not necessarily the way it is used, of course; sometimes “scientific” theories or findings are used to justify social programs, policies, and practices of breathtaking foolhardiness. Our advocacy of critical participatory research is intended partly as an antidote to such foolhardiness but also to insist, in an age of hyperrationality and the technologization of everything, that people can still, gaps and miscues notwithstanding, have a hope of knowing what they are doing and doing what they think is right and, more particularly, doing less of what they think will have untoward consequences for themselves and others. Perhaps this is to take too “activist” a view of participatory action research and to give up on the conventional understanding that people should wait for experts and theorists to tell them what will work best—what will be best for them.

In 1957, in the *Journal of Educational Sociology*, Harold Hodgkinson presented a critique of action research that he regarded as “a symptom of the times in which we live” (Hodgkinson, 1957, p. 152). Against Arthur Foshay, whom he quoted as saying, “Cooperative action research is an approach to making what we do consistent with what we believe” (which we would argue fails to acknowledge the power of action research to put our ideas to the test and correct what we believe), Hodgkinson retorted,

This is simply not so. Action research merely focuses attention on the doing and eliminates most of the necessity for believing. We are living in a “doing” age, and action research allows people the privilege of “doing” something. This method could easily become an end in itself. (p. 153)

Hodgkinson (1957) believed that action research would produce “teachers who spend much of their time measuring and figuring, playing

with what Dylan Thomas would call ‘easy hobby games for little engineers’” (p. 153). He held out for the great scientific generalizations, based on sound empirical and statistical methods that would provide a secure scientific basis for what teachers could or should do.

Those other approaches to research have produced some justifications for improved ways of working in education, social work, community development, and other spheres of social action. They will continue to do so. But they will always create a problem of putting the scientist as “expert” in the position of mediator, that is, mediating between the knowledge and action and the theory and practice of practitioners and ordinary people. They will always create disjunctions between what scientific communities and policymakers believe to be prudent courses of action and the courses of action that people would (and will) choose for themselves, knowing the consequences of their actions and practices for the people with whom they work. For two decades, we have insisted that *practitioners’* interpretive categories (not just how they think about their work but also how they think about their world) must be taken into account in deciding what, when, whether, and how research should be conducted into professional practice and community life. Critical participatory action research is an expression of this impulse, and it has proved, in hundreds of studies, to be a means by which people have transformed their worlds. Sometimes, perhaps, things have *not* turned out for the better, but many times people have concluded that their participatory action research work has changed their circumstances for the better and avoided untoward consequences that they otherwise would have had to endure. This has been true in rebuilding education in South Africa, in literacy campaigns in Nicaragua, in developments in nursing practice in Australia, in improving classroom teaching in the United Kingdom, in community development in The Philippines, in farms in Sri Lanka, in community governance in India, in improving water supplies in Bangladesh, and in hundreds of other settings around the world. These are not “easy hobby games for little engineers,” as

Hodgkinson might have it, but rather matters of great human and social significance. These people might not have changed the world, but they have changed their worlds. Is that not the same thing? They might not have changed everything everywhere, but they have improved things for particular people in particular places and in many other places where their stories have traveled. We do not think that it is too immodest an aspiration to judge participatory action research in terms of historical consequences. Indeed, perhaps we judge too much social and educational science against too low a bar. We are used to expecting too little help from it, and our expectations have been met. Under such circumstances, we believe, people would be wise to conduct their own research into their own practices and situations. Under such circumstances, there continues to be a need for critical participatory action research.

CLINICAL RESEARCH

William L. Miller and Benjamin F. Crabtree

Under a sky the color of pea soup she is looking at her work growing away there actively, thickly like grapevines or polo beans as things grow in the real world, slowly enough.

—Opening stanza of Marge Piercy's "The Seven of Pentacles"

A tornado approaches the fields of our dreams. How well has our clinical research prepared the ground for the coming whirlwind? Jocelyn arrives to consult with her primary care clinician. For 3 years, the 50-year-old Jocelyn notices some burning pain "around my heart" shortly after meals and when she lies down for extended periods. This pain is frequently associated with a "sour taste in my mouth." On the morning of her visit, shortly after her fourth cup of coffee, she stands by the grill at work nearly doubled over by the pain. She can tolerate the suffering no longer. By nearly everyone's account, the clinical encounter that follows is a success. Her doctor quickly diagnoses gastroesophageal reflux disease (GERD) and prescribes Nexium, the "purple pill." The whole visit takes only 6 minutes and helps the doctor to meet his productivity quota. Jocelyn, knowing about the pill from television commercials, is worried about the diagnosis but pleased with the simple solution. AstraZeneca, which produces Nexium, is

delighted. The office staff and practice group manager are happy, and Jocelyn's employer at the fast-food restaurant is glad that Jocelyn has very little time lost from work. Clinical researchers, proud of their randomized controlled trials demonstrating the effectiveness of esomeprazole (the generic name for Nexium), feel vindicated. So, where's the tornado? If you are a clinical researcher, are you worrying about the standardized simplicity of this story?

GERD is the disease label affixed to a symptom complex associated with the experience of heartburn. GERD is related to the reflux of gastric acid (important for immunity and digestion) into the esophagus because of the inappropriate relaxation or leakage of the lower esophageal sphincter (LES) that separates the stomach from the esophagus. The healthy stomach has a protective coating of mucous shielding it from acid, whereas the esophagus does not and often produces alerting symptoms such as heartburn in the presence of acid. Proton pump inhibitors (PPIs) such as

Nexium block the cellular pumps that produce normal acid in the stomach and, by nearly eliminating the acid, prevent heartburn (but not the reflux of acid-free stomach juices). Reflux results from multiple factors that weaken the LES, relax it inappropriately, or create excessive pressure on it. These factors include overeating, bedtime snacking, wearing tight clothing or tight clip-on earrings, rapid eating, being obese (especially with large abdominal girth), experiencing emotional stress, and using several common drugs, caffeine, tobacco, and/or alcohol—in summary, an acquisitive, materialistic consumer lifestyle. These factors are named and chided in a PPI commercial where a patient celebrates being liberated from the agony of lifestyle change simply by taking the right pill. She is now free to continue whatever lifestyle she wishes and no longer needs to wonder what else her body is trying to communicate through the symptom of heartburn. She is learning to ignore the questions that emerge from her own experiences and to pay more attention to consumer-oriented answers and corporation-generated questions. These are questions of instrumental rationality that are eagerly and extravagantly funded by government-sponsored research institutions and the medical technology and pharmaceutical industries and that are most commonly addressed by current clinical research.

One by one, islands of rock, with a solitary person standing on each, loom into view as the surf pounds below. Each voice urgently proclaims, "I didn't know!" As the hidden camera fades back, the islands merge together, each person appearing securely confident—protected by the purple pill—and the erosive raging of the sea below now controlled. The war against the terrorism of stomach acid pouring across its boundary into the esophagus has been won. Millions of television viewers, including Jocelyn, watch this AstraZeneca commercial about its newest PPI, Nexium. What didn't they know? The veiled threat is that GERD could lead to Barrett's esophagus and then to adenocarcinoma, even though this connection is rare and uncertain and there is no evidence that taking PPIs prevents it (Conio et al., 2003). Thousands of physicians, fed by AstraZeneca

representatives, have their offices cluttered with tablets, pens, and trinkets labeled "Nexium" and have their drug cabinets stocked with Nexium samples. How well has our clinical research prepared Jocelyn and her clinician, as well as everyone else, for this global corporate tornado? On their desks or computer screens appear article reprints of clinical research exclaiming the effectiveness of esomeprazole (Nexium) in controlling the symptoms of heartburn (Johnson et al., 2001; Talley et al., 2002) but none about what it means.

Sickness pervades the landscape. Suburban sprawl contributes to obesity and the epidemic of diabetes (Perdue, Stone, & Gostin, 2003). Millions of socioeconomically impoverished people are dying or dead from AIDS, tuberculosis, and malaria because economically colonized countries lack access to care and the necessary medicines despite supporting the profits of global pharmaceutical corporations (Farmer, 2001; Kim, Millen, Irwin, & Gershman, 2000). Sustainable ways of living across our globe are disrupted and replaced by capitalist market economies. People who were once self-sufficient are now bound to wage labor and assured the freedom to choose soft drinks. Greatly reduced is their freedom to choose a local vocation and way of life (Coote, 1996; Douthwaite, 1999). Water, air, forests, soil, and the ecologies of which they are a part are deteriorating (Gardner, 2003). The acid of Western civilization's quest for domination is pouring across its boundaries, scorching the land, and consuming the earth's diversity. The proposed solutions are even more technology and business as usual, a global purple pill for global GERD. Part of what is going on here is the complex interactions of an expectant and frightened public, the myopic arrogance of military and economic power, and many (often well-intentioned) individuals trapped in their own and the dominant culture's webs of denial (Jensen, 2002). Welcome to the clinical research space.

Meanwhile, amid a Middle Atlantic landscape of small farms, sprawling suburbs, crowded urban streets, and rigid walls of private property, Jocelyn is taking the purple pill every day. She is confused and worried. Although free of heartburn

symptoms, nothing else has changed in her life. The heartburn began about 1 year after her daughter's infant child died in an auto accident and 6 months after starting a new job in a fast-food restaurant. Over that year, Jocelyn resumed smoking, gained 30 pounds, and was drinking more coffee. The heartburn was getting worse despite taking many over-the-counter medicines. During this same time, she worried about her son serving in the U.S. Army in Iraq and about the threat of terrorism. Is it possible that parts of this story are related to her symptoms? To the global issues noted? What does the new diagnosis of GERD mean to Jocelyn? What and whose questions were addressed in her encounter? What and whose questions were missing? Poor, frightened, and 50 years old, she knows that something is wrong. Where is the meaning in her embodied embedded lived experiences? Her life, composed of memories, children, career, lovers, and anticipated hopes, appears shredded; she fears that no one is listening. Now she is noticing some low back pain. Her doctors hide their fears and lose their empathy behind the latest tests and the newest drugs and clinical trial protocols. Working for "HamsterCare," they are exhausted turning their wheels of productivity (Morrison, 2000). They feel tired, overregulated, angry at the continued emphasis on cost cutting and efficiency and on the threat of malpractice, and inadequate in the face of death, but they conceal their emotions behind a wall of professional "objectivity." The clinicians also struggle to mediate guidelines, multiple languages of specialization, ambiguities of new technological visions of the body, their own clinical knowledge and experience, and patient values and idiosyncrasies. Meanwhile, marketing researchers for AstraZeneca are conducting focus groups to learn more effective ways of convincing adults and physicians of Nexium's value. But these are stories rarely known by the "public." These stories are hidden, if known at all, by conscious concealment and by the forces of unconscious cultural preference. The story told is that GERD is dangerous to you and that Nexium is the safe and effective product fix. The ecological, social, and spiritual consequences are invisible.

This is a typical tale in clinical medical research. *Suffering and normality are standardized, commoditized, and marketed.* The suffering related to heartburn is framed as a threat, that is, a universal need for some marketable product that restores control. The story is framed as a "restitution" narrative (Frank, 1995). Everyone has something wrong with him or her; normal now means inadequate in moral and standardized ways such as the recent guidelines creating the new disease of prehypertension (Chobanian et al., 2003) and the guidelines on obesity that make most U.S. adults overweight or obese (National Heart, Lung, and Blood Institute, 1998). The complexities, multiplicities, and individualities of suffering and normality are subsumed within this technological and commercial frame. This is the tornado! Important voices, questions, and evidence are missing. Knowing the efficacy of the drug—the internal validity—is sufficient to approve using all means necessary to convince all people to "choose" the pill as a requirement for a safe and healthy life. It is assumed that there is a real material world that is, in principle, knowable through scientific methodology, especially the randomized controlled trial, and nothing should stand in the way of pursuing this truth. Outside the swirl of this neorealist tornado, there is so much silence. Jocelyn's experience of taking a daily pill that labels her self and body as endangered is missing. The voices of her family members are missing. Relationships and moral discourse are missing. The place and role of power are missing. Feeling, spirituality, and ecology are missing. Depth and context are reduced, simplified, or eliminated, and relationships are isolated and alienated. What hope is there after the tornado passes?

This is the clinical research space we have witnessed above ground—clinical research too often working on behalf of the dominant cultural tornado of global corporate capitalism. There are alternatives! The stories of interest and hope for clinical researchers are in what is missing and how the stories are framed. We imagine clinical research spaces where Jocelyn and the many communities of patients and neighbors, clinicians,

and researchers meet together and seek transformation. The suffering related to heartburn is framed as broken-ness calling for reconnection, generosity, and love. The story is framed as a movement from "chaos" to "quest" narrative (Frank, 1995). We imagine at least two different and deeply connected research spaces. One is at ground level, visible, helpful, and growing and healing within the dominant culture, at the places where the questions of embodied and embedded lived experience meet clinical reality and current institutional structures and processes. Here, using a more participatory and mixed methods approach guided by the questions of lived experience, the ground is tended and weeded and opportunities for planting seeds and nurturing healthier plants are identified and enacted. This is the quest toward transformation that assumes that even the oppressors are oppressed. We do not believe that this will be enough. The tornado already creates wastelands based on ethnicity, color, class, gender, and sexuality, and it ravishes the life-sustaining soul of our one earth—the soil, water, air, and intricate web of interdependent species. The tornado often leaves us in chaos, with no clear storyline apparent; there is only the hope of each other. We propose a second space below ground—out of reach of the tornado. Within the burrows and entanglements of garden soil, clinician/patient, qualitative/quantitative, academy/practice, very different ways, cultures, and technologies of knowing can meet, converse, and create a "solidarity" clinical research for the future that serves nascent institutional forms. This chapter explores both of these spaces and conversations.

This *Handbook* celebrates the qualitative research community's conversations—the internal discourse about our identity, what we do, and the faith and hope for our own growth and transformation that is sustained there. The opportunity to translate this conversation into both an expanded and a new alternative clinical research space was never better or more urgent. Historical calls for a shift away from a strictly positivist position and for seeking greater methodological diversity, including the use of qualitative research

methods (e.g., Freymann, 1989; McWhinney, 1986, 1989; Waitzkin, 1991), are being answered. Qualitative clinical research is finding its way into funding agency agendas, especially in primary health and medical care and nursing. Patients' and clinicians are increasingly invited into research conversations. Methods are also evolving; they are beginning to separate from their parent traditions (e.g., ethnography, phenomenology, grounded theory) and generating new hybrids in the clinical research space. Unfortunately, this success is also leading to powerful efforts from within the dominant paradigm to co-opt qualitative methods despite a small and articulate resistance (Morse, Swanson, & Kuzel, 2001). This is most evident in the development of checklists for ensuring validity of qualitative studies (Barbour, 2001). Versions of this chapter in earlier editions of this *Handbook* were solely about continuing and accelerating this successful flow, that is, the exploration and conversations at ground level. We no longer believe this to be sufficient. Our own recent experiences at working within the toxic embrace of the dominant paradigm and its forces of elite corporate globalization alert us to the additional need for work below ground preparing for after the tornado passes.

The understandings of clinical research presented here are grounded in the authors' own stories. Our rhizomes are deeply embedded within the nexus of applied anthropology and the practice of primary health care, particularly family medicine. Both authors have appointments in departments of family medicine and are trained in anthropology. Our social science roots were fed by the development of clinically applied anthropology during the 1970s (Chrisman, 1977; Chrisman & Maretzki, 1982; Fabrega, 1976, 1979; Foster, 1974; Foster & Anderson, 1978; Polgar, 1962) and were nurtured by the later work of Kleinman (1988, 1992, 1995; see also Kleinman, Eisenberg, & Good, 1978), the Goods (Good, 1994; Good & Good, 1981), Lock (1982, 1986, 1993), the Peltos (Pelto & Pelto, 1978, 1990), and Young (1982a, 1982b). These roots are currently challenged by the poststructuralist debate (Burawoy et al., 1991; Clifford & Marcus, 1986; Haraway,

1993; Jackson, 1989) and critical theory (Baer, 1993; Morsy, 1996; Singer, 1995). One of the authors (W.L.M.) has a busy urban family medicine practice, oversees a residency program, and chairs a clinical department within a large academic community hospital. The other author (B.E.C.) directs a family medicine research division and is a national research consultant. Both authors actively participate in the politics and discourse of academic biomedicine and academic social science and have experience in international health settings. The biomedical influence, with its perceived therapeutic imperative, steers toward pragmatic interventions and the desire for explicitness and coherence in information gathering and decision making and highlights the appeal of neorealist postpositivism and technology. The actual relationships that emerge within patient care reveal the uncertainty and particularity (McWhinney, 1989) of clinical praxis and turn one toward storytelling, relationship, and interpretation. The realities of power and dominant cultural hegemony are exposed in our efforts to help uninsured patients receive appropriate care, to protect the health of local habitats, to change international health policy, to get grants funded, to publish storied knowledge in biomedical journals, and to guide our departments through budget challenges and our institutions toward profitability. Growing and dying within the multiplicities of our soils, we have come to realize the relativity of all knowledge. The challenges are not epistemological but rather practical and moral. We are privileged white men holding positions of power within the belly of the beast; we are also tricksters. The conversations that we recommend for clinical research reflect these two stances.

■ CLINICAL RESEARCH AT GROUND LEVEL

Fight persistently as the creeper that brings down the tree. Spread like the squash plant that overruns the garden. Crawl in the dark and use the sun to make sugar. Weave real connections, create real

nodes, build real houses. Live a life you can endure: make love that is loving.

—Continuation of Marge Piercy's
"The Seven of Pentacles"

Our guiding premise is that the questions emerging from the embodied, embedded, and mindfully lived clinical experience frame conversation and determine research design (Brewer & Hunter, 1989; Diers, 1979; Miller & Crabtree, 1999b). Clinical researchers have at least six discernible research styles available: (a) experimental, (b) survey, (c) documentary-historical, (d) field (qualitative), (e) philosophical, and (f) action/participatory (Lather, 1991; see also Madison, chap. 21, this volume). The clinical research space above ground needs to be open to all of these possible sources and types of knowledge. They all contribute to the two primary aims of clinical research at ground level. The first is to *deepen and contextualize the practical and ethical questions, concerns, and emerging understandings* for healers and their patients and policymakers. A second aim is to *trouble the waters and seek change* within the clinical research world itself. This section is organized around the following three goals: (a) *creating a space* for research that opens and celebrates qualitative and multiparadigmatic approaches to the clinical world, (b) *providing the tools and translations* necessary for discovering and witnessing clinical stories and knowledge within this space, and (c) *identifying and describing the means for telling the stories and sharing the knowledge*.

The emphasis is on the clinical text of Western biomedicine and the particular subtext of primary health care because of the authors' location in that place. Fortunately, the discussion is easily transferred to other clinical contexts such as nursing care, education, organizational management, community organizing, and international activism (see also Berg & Smith, 1988; Bogdan & Biklen, 1992; Morse & Field, 1997; Moyer, MacAllister, & Soifer, 2001; Roseland, 1998; Sapsford & Abbott, 1992; Schein, 1987; Symon & Cassell, 1998). In all of these arenas, qualitative methods are more accepted, yet the noise from

policymakers is for being more evidence based and outcomes driven with generalizability and randomized designs prioritized. (See the recent “No Child Left Behind” act for an example of this in educational policy [www.ed.gov/nclb/landing.jhtml].) In education, for example, a recent “consensus” report sought to define scientific research in education and, like this chapter, argued that the methods must fit the question. Unlike this chapter, the report prioritized the value of randomized studies and expressed doubts about participatory models. The report voiced no concerns about the goal of evidence-based education (Shavelson & Towne, 2002). We offer an alternative viewpoint.

Creating a Space

The dominant biomedical world and the smaller qualitative research community both tend to maintain methodological and academic rigidity. Creating a clinical research space requires bringing both groups into the garden and developing common language. *The clinical questions are the common ground* (Taylor, 1993) for creating this space. These questions call us to rediscover the missing evidence (the people, experiences, ecology, power, and contexts) and the richness and depth of what “effectiveness” means. The clinical questions invite us to explore the human implications of rationing and cost issues, biotechnology, and genetic engineering and to enter the conflicted landscape of alternative and conventional medicine—the world between the “garden” and the “machine” (Beinfeld & Korngold, 1991). The questions beg us to locate, own, aim, and share the powers inherent in clinical situations (Brody, 1992). The vulnerability exposed by the fully embedded and embodied clinical experiences that give rise to these questions also reveals the inadequacies of a neorealist epistemology (for more details, see Perakyla, chap. 34, this volume). Three core strategies for creating and entering this common ground and transforming clinical research are described. These consist of stepping carefully and strategically into the biomedical world, expanding the evidence-based medicine (EBM) space, and democratizing knowledge.

Three additional strategies—using theory more explicitly, expanding cross-disciplinary collaborations, and applying the principles of critical multiplism—are also mentioned briefly. These strategies assume that change is more experience based than it is rational and that clinical participants must actively try methods if they are to adopt them. Thus, there is an emphasis on clinical participants, including patients, answering their own questions using methods appropriate for those questions.

Entering Biomedicine

Walking and working within the walls of technocratic biomedicine is exciting and daunting, and it frequently challenges intellectual and personal integrity. Thriving in this world requires understanding the biomedical cultural context while also clearly articulating a model that highlights the clinical implications of qualitative clinical research. This knowledge, if also joined by patients and other community participants, facilitates bargaining, mediation, and the formation of common language that makes possible the creation of a new research space at ground level. This is where, in languages understandable by the existing clinical world and patients, a space for more expansive imagination is created, the tools for listening and seeing are shared, and the seeds for transforming stories are sown.

The dominant biomedical paradigm is rooted in a patriarchal positivism; *control through rationality and separation is the overriding theme*. The biomedical model is typified by the following 10 basic premises: (a) scientific *rationality*, (b) an emphasis on *individual autonomy* rather than on family or community, (c) the *body as machine* with an emphasis on physicochemical data and on objective numerical measurement, (d) *mind-body separation* and dualism, (e) *diseases as entities*, (f) the *patient as object* and the resultant alienation of physician from patient, (g) an emphasis on the *visual*, (h) diagnosis and treatment from the *outside*, (i) *reductionism* and the seeking of *universals* (Davis-Floyd & St. John, 1998; Gordon, 1988), and (j) *separation from*

nature. The everyday characteristics of the clinical medical world that follow from this model include (a) male centeredness, (b) physician centeredness, (c) specialist orientation, (d) an emphasis on credentials, (e) high value placed on memory, (f) a process orientation: accentuating ritual with supervaluation on "science" and technology, (g) therapeutic activism with an emphasis on short-term results, (h) death seen as defeat, (i) division of the clinical space into "front" (receptionists, billing clerks, and office managers) and "back" (doctors, nurses, and phlebotomists), (j) the definition, importance, and sanctity of "medical time," (k) an emphasis on patient satisfaction, (l) profit-driven system, (m) reverence for the privacy of the doctor-patient relationship, (n) disregard of ecological and international impacts, and (o) intolerance of other modalities (Davis-Floyd & St. John, 1998; Helman, 2000; Pfifferling, 1981; Stein, 1990). These are the common (and often tacit) assumptions, values, and beliefs that characterize the dominant voice of the medical clinic and that currently define the preferred boundaries of clinical research.

Biomedical culture is reinforced and sustained by its comfortable fit within the prevailing cultural norms of the United States and an elite globalizing corporate economy. These "normalizing ideologies" include control over the environment, rational determinism, future orientation, life as an ordered and continuous whole, and individualism with an emphasis on productivity, perseverance, self-determination, and self-reliance. They surface in public discourse as four "market myths," namely, that (a) growth benefits all, (b) freedom is market freedom, (c) we are *homo economicus, consumens, et dominans*, and (d) corporate and finance driven globalization is inevitable (Moe-Lobeda, 2002). The normalizing ideologies are also manifest in daily discourses about family, self, gender identity, and aging. Both patients and physicians refer to these ideologies and their associated discourses to help them restore order and normality to the disruptions of sickness (Becker, 1997).

This reigning voice of biomedicine has now been successfully corporatized in the United States, and its apparent goals, aside from amassing

profits, are the elimination of pain, suffering, disease, and even death. The research tends to be product focused, hospital based, and disease oriented. In many ways, the current situation represents the triumph of commoditization and universalism with an emphasis on cost, customers, products, outcomes, effectiveness, standardization, and evidence. The reasons for focusing on outcomes are to inform choices (market approach), to provide accountability (regulatory approach), and to improve care (management approach). Despite the superficial appearance of hegemony and coherence, the voice of medicine, when enacted and witnessed, reveals many "hidden" multiplicities (Mol, 2002). Fortunately for qualitative researchers, these voices and actions are waiting to be heard and seen. If these voices are entered into the conversation as evidence, the clinical research space is expanded, dominant paradigms are challenged, and hope is reimagined.

Successfully entering the biomedical world as a qualitative clinical researcher requires a many-eyed *model of mediation*. Enter as eye jugglers (Frey, 1994) with multiple perspectives. This qualitative clinical model of mediation features the following 10 premises:

1. Center yourself in the *clinical world*, that is, in the eye of the storm.
2. Focus on the *questions* that dawn there.
3. Assume *both/and*. Acknowledge what is of value in biomedicine and highlight what is missing---what is silent, invisible, or ignored. Expand on the already existent tension between care and competence (Good & Good, 1993). Hold quantitative objectivisms in one hand and qualitative revelations in the other.
4. Follow a *natural history* path that characterized the early history of Western medicine and that is still an important aspect of primary health care (Harris, 1989).
5. Be *participatory*. Include patients and clinicians in your inquiry work.
6. Preserve and celebrate *anomaly*, that is, the discoveries and data that do not fit. Anomalies are levers for transformation.

7. Allow "truth" to be *emergent* and not preconceived, defensive, or forceful.
8. Respect the plea for *clinical action* and the perceived need for coherence voiced by nearly all participants in the clinical world.
9. Practice *humility, generosity, and patience*. This will enable everything else.
10. Refuse *silence* when oppression is evident or exposed. Practice testimony (Frank, 1995).

Qualitative clinical researchers bring several powerful perspectives to the clinical encounter that help surface the unseen and unheard and also add depth to what is already present. These include understanding disease as a cultural construction (Berger & Luckmann, 1967); possessing knowledge of additional medical models such as the biopsychosocial and humanistic models (Engels, 1977; Smith, 1996), the holistic model (Gordon, 1996; Weil, 1988), homeopathy (Swayne, 1998), and non-Western models that include traditional Chinese (Beinfeld & Korngold, 1991), Ayurvedic (Sharma & Clark, 1998), and shamanism (Drury, 1996); and recognizing the face and importance of spirituality in human life. Qualitative researchers also perceive that the therapeutic or healing process occurs not only in the clinical moment but also in everyday life between clinical events. Thus, the study of everyday life offers additional perspectives, that is, additional voices to the research space being created at ground level. Carrying the staff of your many-eyed model of mediation, you are ready to enter the clinic.

The clinic² is a public sanctuary for the voicing of trouble and the dispensing of relief. Each clinic participant crafts meaning out of the "facts" and "feelings" inherent in each clinical encounter and seeks to weave a comforting cloth of *support*. Jocelyn and her family come and meet their clinician and his staff at the clinic. All of these participants' past ghosts—the emotional, physical, conceptual, sociocultural, and spiritual contingencies—and the competing demands of their presents and the hopes and fears for their futures are brought into the clinic. This is the real world of

clinical practice involving intentions, meanings, intersubjectivity, values, personal knowledge, power, and ethics. Yet most published clinical research still consists of observational epidemiology (Feinstein, 1985; Kelsey, Thompson, & Evans, 1986; Sackett, 1991; Stevens, Abrams, Brazier, Fitzpatrick, & Lilford, 2001) and clinical trial designs (Meinert, 1986; Pocock, 1983). These studies involve separating the variables of interest from their local everyday milieu, entering them into a controlled research environment, and then trying to fit the results back into the original context. For example, Jocelyn's clinician is aware of randomized controlled trials demonstrating clinical efficacy for short-term bed rest in patients with back pain (Deyo, Diehl, & Rosenthal, 1986; Wiesel et al., 1980). But the practitioner encounters difficulty in applying this information to the particular back pain and disability experienced by Jocelyn. The pieces of evidence needed to inform this encounter are many. Ideally, the clinical participants will study themselves and, thus, challenge their own situated knowledges and empower their own transformations. This requires bringing qualitative methods to the clinical experience. Let us expand the EBM research space.

Expanding Evidence-Based Medicine

EBM is the new wonder child in clinical care and clinical research. The premise is that individual clinical expertise must be integrated "with the best research evidence . . . and patient values" (Sackett, Straus, Richardson, Rosenberg, & Haynes, 2000, p. 1). Randomized clinical trials (RCTs) and meta-analyses (systematic reviews of multiple RCTs) are considered the best external evidence when asking questions about therapeutic interventions. An international group of clinicians, methodologists, and consumers has formed the Cochrane Collaboration as a means of facilitating the collection, implementation, and dissemination of such systematic reviews (Fullerton-Smith, 1995). The group has created a Cochrane Library that is available on CD, on the Internet, and in secondary publications through

the *British Medical Journal*. Major initiatives are under way to ensure that all physicians, especially at the primary care level, use this evidence to guide their clinical decision making (Shaughnessy, Slawson, & Bennett, 1994; Slawson, Shaughnessy, & Bennett, 1994). The proliferation of clinical practice guidelines is one result of these initiatives. Another result is the relative reduced value of qualitative studies. But EBM actually offers qualitative clinical investigators multiple opportunities for entering, expanding, challenging, and adding variety and honesty to this space. There is so much *missing evidence*!

The double-blind (closed) RCT has high internal validity but dubious external validity and very little information about *context* or *ecological consequences* (Glasgow, Lichtenstein, & Marcus, 2003). Read any RCT report, and the only voice you hear is the cold sound of the intervention and faint echoes of the investigator's biases. The cacophonous music of patients, clinicians, insurance companies, lawyers, government regulatory bodies, consumer interest groups, animals and habitats, community agencies, office staff, corporate interests, and family turmoil is mute. Local politics and contradictory demands become the sound of thin hush. There is also little research about the *individual clinical expertise* side of the EBM equation and about the associated areas of relationship dynamics, communication, and patient preference. There is much to be learned about how patients and clinicians actually implement "best evidence." How is the evidence incorporated into patients' and communities' life stories? In addition, there are many gray zones of clinical practice where the evidence about competing clinical options is incomplete or contradictory (Naylor, 1995). What constitutes evidence, anyway (Morse et al., 2001)? Who creates it, defines it, and judges it? Trouble the waters of EBM certainty. Here are openings for clinical researchers. We can enter the EBM and RCT space and expand and challenge its vision.

We recommend replacing the metaphor of "gold standard" with a metaphor of "ancient forest standard" that needs to include qualitative methods along with the RCT. In addition to those areas

already noted, qualitative methods can help to formalize the learning curve, test theory, inform hypothesis testing and future work, and enhance the transferability of the clinical trial into clinical practice. "Gold standard" suggests a singular, immutable, and universal truth, whereas "ancient forest standard" suggests diversity, dynamic complexity, and contingent multiple perspectives. We propose conceptualizing a multimethod RCT as a double-stranded helix of DNA—a *double helix trial design* (Miller, Crabtree, Duffy, Epstein, & Stange, 2003). On one strand are qualitative methods addressing issues of context, meaning, power, and complexity, and on the other strand are quantitative methods providing measurement and a focused anchor. The two strands are connected by the research questions. The qualitative and quantitative strands twist and spiral around the questions in an ongoing interaction, creating codes of understanding that get expressed in better clinical care. If the qualitative strand maintains methodological integrity and interpretive relativism and stays connected to the experiences informing the research questions, the double helix and its bonds might even experience breakage and mutation and transformation beyond postpositivism.

We hope that clinical researchers will seek out those doing clinical trials on symptom management, treatments, clinical process, and community interventions and will advocate for adding the qualitative strand. For example, if a gastroenterologist at your local hospital or academic medical center is planning or conducting an RCT concerning a new treatment option for GERD, you could offer to meet and propose adding a qualitative arm to the study with the intent of exploring any of several possible questions. How do patients understand and incorporate the diagnosis into their life stories? How do they experience the treatment? What is the impact on their quality of life, their work, their sexual activity, their family and social relations, their involvement in civic affairs, their sense of self, and their fears and desires? How does the study affect the researchers? This work will help to identify new outcomes that transpose the emphasis on

individual cure and elimination of pain and disease toward care, growth, quality of life, healthier relationships, and more sustainable communities and ecosystems. Nonetheless, a double helix trial design is not adequate for assessing ecological consequences of interventions; this requires more longitudinal, mixed method, and case study designs.

Examples showing the way toward double helix trial designs already exist. Jolly, Bradley, Sharp, Smith, and Mant (1998), using RCT technology, tested a nurse-led intervention to help patients surviving heart attacks maintain a rehabilitation program and improve health habits. The quantitative RCT strand yielded statistically insignificant results; fortunately, Wiles (1998) had also conducted a qualitative depth interview study with 25 of the participants at 2 weeks and 5 months during the trial and uncovered several clinically valuable findings. At 2 weeks, most of the patients trusted the official accounts of what had happened and what needed to be done to prevent future problems. By 5 months, most of the patients had lost that trust because the official accounts had not adequately addressed the experienced random nature of heart attacks, the severity, and the level of recovery. Many of the patients perceived survival to mean that their heart attacks were mild, and because the doctors had reassured them that everything would be normal in 6 weeks, the patients assumed that they could return to their original "normal" lifestyles by that time. Another example of the double helix design for RCTs concerns smoking cessation interventions and is found in the work of Willms and Wilson at McMaster University. They learned that the meanings that patients attributed to their cigarettes were more influential in stopping smoking than were counseling and the use of nicotine gum (Willms, 1991; Willms et al., 1990; Wilson et al., 1988). Let us also join in opening the imagination inside the genome with qualitative questions and approaches (Finkler, 2000).

What are the clinically grounded questions that serve as windows for opening imagination at ground level? Clinicians and patients seeking *support* in the health care setting confront four

fundamental questions of clinical praxis. First, what is going on with our *bodies*? Second, what is happening with our *lives*? Third, who has what *power*? Fourth, what are the complex *relationships* among our bodies, our lives, our ecological context, and power? These four questions also mirror the methods of numeracy, literacy, policy, and "ecolacy" (i.e., thinking ecologically) (Hardin, 1985). Each of these questions has *emotional, physical/behavioral, conceptual/attributional, cultural/social/historical, and spiritual/energetic* ramifications. From the story of Jocelyn, there are body questions about support. What are the emotions of living with a fear of the long-term consequences of GERD? Is Nexium more effective than lifestyle change at preventing those consequences? How will either impact family and social bodies? What is the lived experience and meaning of GERD for patients and clinicians? What is happening in the office practice as a body that helps or hinders Jocelyn's care? There are questions concerning the support of one's life or biography. Do explanatory models of GERD relate to the experience and outcome of risk? How does one's self-concept relate to GERD and response to Nexium? What are patients' and clinicians' hopes, despairs, fears, and insecurities concerning GERD? How does past experience connect to the immediate experience of GERD or participation in a clinical trial? There are questions of power about how people are supported. What is happening when patients with GERD present to clinicians in different organizational contexts of care? How is emotional distress surfaced or suppressed? What patterns exist in these different settings? Who influences whom? How is the power of the patient or clinician undermined or enhanced (Fahy & Smith, 1999)? What are the local politics? There are questions about the support of relationships. What actions in the clinical encounter enhance family relationships? How do the individuals, the families, and the clinic function as complex adaptive systems? How do the illness and its care relate to the local ecology? Many of these questions are addressed adequately only if qualitative methods enter into the clinical research space and we look toward an ancient forest standard.

This is the evidence needed! We can apply these four question categories to the critically important issues of the next decade such as the globalization of biomedicine, rationing and cost, biotechnology and genetic products, and the often conflicted landscape where alternative medicine and biomedicine meet. How does rationing affect our bodies? What are the emotional, physical, conceptual, social, and spiritual consequences? The same questions can be asked of the many new (and old) products of biotechnology. What is the impact on our lives? Where is the power, and how is it used and resisted? What are the relationships and complex systems that are affected and through which the technology is deployed? What are the unanticipated consequences? How do patients decide about therapies? How do they juggle seeing their bodies as both garden and machine? What other metaphors are used, and when and how do they change outcomes? The questions are infinite and challenging. Primary care, at its core, is a context-dependent craft. EBM lacks context in its current form; it cries out for qualitative methods and alternative paradigms. Let us get to work!

Democratizing Knowledge

Entering biomedicine and working to expand and change the EBM space also holds great risk for qualitative clinical researchers being co-opted by the dominant paradigm that they seek to transform; thus, there is a need for democratizing knowledge. The assumption is that the more everyone and everything potentially affected by any given knowledge and its associated technologies and actions has decision-making influence and involvement in the production of that knowledge, the less likely the research will be co-opted by any single power. Participatory research approaches, supported by using a participatory wheel of inquiry and its four ways of knowing, valuing variation and improvisation, applying the precautionary principle, and pursuing slow knowledge, are proposed keys to democratizing knowledge and opening the clinical research space above ground to transformational hope.

Participatory research approaches all share the characteristics of collaboration between the researcher and the researched, a reciprocal process whereby each party educates the other, and the intent to create local knowledge for improving the conditions and quality of life (Macaulay et al., 1998; Small, 1995; Thesen & Kuzel, 1999). Participatory research promotes the voices of communities in identifying health issues and helps to ensure that social, cultural, economic, and ecological conditions are included (Jason, Keys, Suarez-Balcazar, Taylor, & Davis, 2004). It also provides another entry into challenging and transforming the research space and brings us around, full circle, to the research questions. We propose that clinical researchers investigate questions emerging from the clinical experience with the clinical participants, pay attention to and reveal any underlying values and assumptions, and direct the results toward clinical participants and policymakers. This refocuses the gaze of clinical research onto the clinical experience and redefines its boundaries as the answer to three questions, namely "Whose question is it?" "Are hidden assumptions of the clinical world revealed?" and "For whom are the research results intended?" (i.e., who are the stakeholders or audiences?). Clinical researchers share ownership of the research with clinical participants, thereby undermining the patriarchal bias of the dominant paradigm and opening its assumptions to investigation. This is the situated knowledge, the "somewhere in particular" (Haraway, 1991, p. 196), where space is created to find a larger and more inclusive vision of clinical research. The opportunity is created to redefine the meaning of and responsibilities for health, to value indigenous practices and knowledge systems, to demystify science and technology, and to expand the research capacity of communities (Tandon, 1996). Patients and clinicians are invited to explore personal and/or each other's questions and concerns with whatever methods and paradigms are necessary.

Participatory approaches bring a diverse group of people and ideas and ways of knowing into a common space that challenges the traditional

boundaries of science. Figure 24.1, a *participatory wheel of inquiry* derived from the work of Wilber (1996) and Schumacher (1977), represents a map for understanding and working with this diversity of traditions, experiences, and associated methods (Stange, Miller, & McWhinney, 2001), and the six research styles noted earlier. This integrative framework represents human knowledge about the natural world in four quadrants, with the horizontal axis representing inner and outer reality and the vertical axis representing individual and collective knowledge. The right-hand quadrants are the world as seen by materialist science—the view from outside. This is the domain of third-person “It” and “Its” knowledge based on detached, objective observation. The left-hand quadrants are the inner or subjective aspects of reality—the domain of “I” and “We” knowledge. The left is concerned with meaning, that is, with beauty and goodness. The right is concerned with physical laws. The multiple ways of knowing and associated traditions and methods may be classified within this grid (for a similar model, see Kemmis & McLaughlin, 2003). For example, both of the right-hand quadrants, knowledge of external physical and social reality, are studied using experimental and social science and epidemiological survey methods and are based primarily on the traditional biomedical paradigm and associated reductionist assumptions of materialist inquiry.

For the domains of knowledge needed for personalized, prioritized, and integrated clinical care, a more participatory and “subjective” way of knowing based on intimate involvement with self and other is required. The interior-focused quadrants on the left represent such complementary knowledge based on reflective participation. The left upper quadrant, “I” knowledge, refers to wisdom gained through the individual accumulation of particular experiences—reflection on clinical practice, diaries and journals, and philosophical methods. The left lower quadrant, “We” knowledge, is exemplified by the theoretical work of Lucy Candib. Candib (1995) demonstrated the connections among the developing feminist literature on ways of knowing, the general

practice traditions, and the emerging literature on qualitative research and the narrative mode of thought. She argued effectively for the importance of a “connected knowing” based on personal experiences and relationships that seek to discover how the other perceives the world. Connected knowing is rooted in empathy and believability and is interested in context, relationship, and time. This way of knowing usually uses qualitative (“field” style) and participatory research strategies.

At the intersection of the four quadrants is the clinical craft or practice being informed by the multiple modes of inquiry being enacted within a participatory framework. As a means of keeping the wheel of inquiry turning and the participatory space open, it is helpful to emphasize and value *variation* and *improvisation* over standardization. Emerging understandings from complexity science and ecological science strongly suggest that “nature” and life thrive on variation and improvisation (Capra, 1996, 2002). The conventional metaphor of the “body as machine” reflects the dangers inherent in standardization. Too many voices are silenced. The participatory wheel turns within a sphere of interpretive relativism (see Perakyla, chap. 34, this volume). A more robust metaphor, one that embraces all four quadrants of human knowledge and values variation, is the “body as organism in ecological context.” This metaphor contains the seeds from which a democratized knowledge and clinical practice can grow. They will not grow, however, unless the ground is fertile and not poisoned by the privatized knowledge and products of global corporations.

Much current clinical research is the hand inside the glove of corporate interests and operates on a “first act until harm proven” principle, where proven usually means establishing a direct cause-and-effect relationship. The result is the continued spread of chemical toxins, greenhouse gases, and cigarettes until such nearly impossible proof appears and convinces everyone. Older wisdom recommended “first do no harm.” A current form of this wisdom, the *precautionary principle* (Raffensperger, Tickner, & Jackson, 1999), offers guidance consistent with better health and more

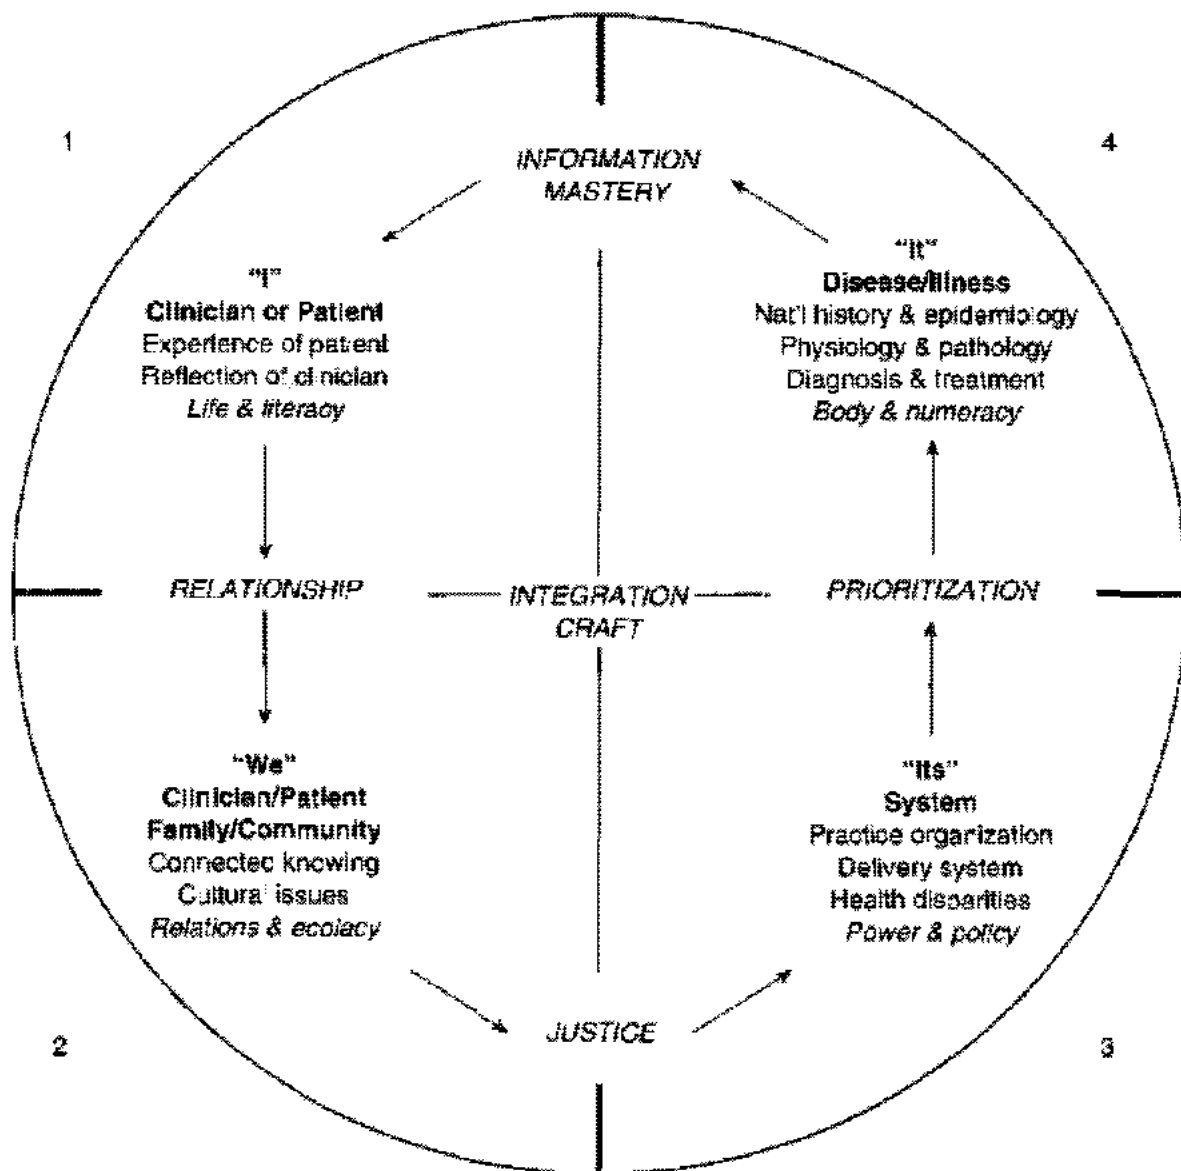

Figure 24.1. A Participatory Wheel of Inquiry

participatory research spaces. The precautionary principle essentially states that in the presence of scientific uncertainty and the plausibility of harm, precautionary measures must be taken (Raffensperger, 2002). This principle shifts the burden of proof to those who advocate or wish to sell a potentially harmful action or product and must be open, informed, and democratic, including all potentially affected parties. Thus, it opens the research space to a more democratic process of knowledge generation and sharing. The precautionary principle obliges us to observe and foresee (as far as seven generations) before acting. This involves examination of a full range of alternatives, including no action. It begins with

seeking to see the invisible, hear the unspeakable, and touch the untouchable. Learn to hear the stars and the trees and to talk to turtles, coyotes, and bears. Learn from children. Remember who you really were before the dominant culture silenced your deep awareness.

Participatory research approaches, supported by applying the participatory wheel of inquiry, valuing variation and improvisation, and adhering to the precautionary principle, all lead to *slow knowledge*, that is, knowledge that is consistent with the rhythms of life, sustainability, and appropriate scale (Orr, 2002). It assumes interdependence and uncertainty, and it acknowledges the absurdity and hubris of seeking perfection. Slow

knowledge works with the complexities of reality rather than seeking to control them, and it accepts that some conflict and suffering are inevitable. Rather than trying to eliminate them, slow knowledge pursues means of comfort, care, reconciliation, resilience, and restoration that optimize the healthy embedded interrelationships of all life, one local place at a time. Slow knowledge shifts the focus from outcomes to the nurturing of life together. For Jocelyn and her heartburn, slow knowledge means deemphasizing the PPI until more is known about its multiple and ecological consequences. Instead, there is more emphasis on supporting Jocelyn and expanding her community of concern and on changing the social, economic, and lifestyle factors creating the conditions of GERD. This is more difficult and slower work; it is healing work. Slow knowledge is the result of a clinical research of love and not instrumental rationality. This is learning at the speed and scale where all of life can participate. It represents the democratization of knowledge. Imagine the possibilities for clinical research if government funding prioritized slow knowledge. Now, enter the world of biomedicine and work to expand the BBM space, but do so as a gardener with the tools of participatory approaches and a wheel of inquiry, valuing variation and improvisation and applying the precautionary principle as you tend the plants of slow knowledge. Theory, collaboration, and critical multiplism are additional strategies for helping do clinical research above ground.

Using Theory

The double helix RCT proposed earlier also creates an opportunity for clinical researchers to reintroduce theory into clinical research. Theory is frequently not explicitly stated in standard quantitative clinical studies. This often results in ungrounded a posteriori speculation. Qualitative data help to surface hidden theoretical assumptions and suggest new possibilities and connections. Theory helps to bridge dominant biomedical and other cultural worlds. Recent theoretical discussions among medical anthropologists, phenomenologists, semioticians, and sociologists concerning

the *metaphor of the "body"* challenge biomedical assumptions about the human body and its boundaries and highlight the culturally and socially constructed aspects of the body that extend far beyond its corporeality (Csordas, 2002; Johnson, 1987; Kirmayer, 1992; Macnaghter, & Urry, 2001; Martin, 1994; Scheper-Hughes & Locke, 1987; Shildrick, 1997; Strathern, 1996; Turner, 1992). There is an individual body, a social body, and a body politic. There are medical bodies, the earth as body, and communicative bodies. Bodies are imagined as flexible, leaky, castles, machines, gardens, or effervescent, and these imaginations both shape and are shaped by the social body, the body politic, and the world body. Arthur Frank, for example, described the use of storytelling as a means of restoring voice to the body (Frank, 1995). Bodily symptoms are understood as the infolding of cultural traumas into the body; as these bodies create history, the symptoms unfold into social space. Because of their complexity, social bodies (e.g., practice organizations) are often best characterized using metaphors such as "brains," "machines," "organisms," and "ugly faces" (Morgan, 1998). Qualitative methods become a primary source for hearing these stories and their associated metaphors, caring in relationships, and resisting the colonizing narrative of institutionalized medicine (Mattingly, 1998; Sandelowski, 2002). The study of bodies and their place in the production and expression of sickness and health becomes a core strategy for clinical research that enables the bridging of paradigms and opens the clinical research space while also resisting the standardization of the body as commodity.

Collaborating Across Disciplines

This opened clinical research space requires collaboration that emphasizes multiple linkages and different types of cross-disciplinary relationships. Linkages occur vertically where one moves up and down through different levels or scales such as the molecular, individual, local, and regional levels. Linkages are also horizontal across different sectors at the same level of social organization

such as medical practices, schools, and local businesses. Linkages also occur over time or at different times. Finally, there are multiple academic linkages, including those with the "public," with practitioners, with policymakers, and with research participants (Miller, 1994).

Critical Multiplism

Orchestrating this type of multimethod, cross-disciplinary research requires the skills and mind-set of a generalist researcher using a framework of critical multiplism (Coward, 1990; Miller, 1994). The skills and perspectives of the generalist researcher consist of negotiation, translation, theoretical pluralism, methodological pluralism, a community orientation, and comfort with and rootedness in clinical practices. These are successfully implemented through a critical multiplist framework. Critical multiplism assumes that multiple ways of knowing are necessary and that these options require critical thought and choice. "Multiplism" refers not only to multiple methods but also to multiple triangulation, multiple stakeholders, multiple studies, and multiple paradigms and perspectives. "Critical" refers to the critical selection of these options based on local history, the role of power and patterns of domination, and how the different methods complement each other. Six principles help to guide critical multiplists in their complex work:

1. Know why you choose to do something.
2. Preserve method and paradigm integrity.
3. Pay attention to units of analysis.
4. Remember the research questions.
5. Ensure that the strengths and weaknesses of each selected option complement each other.
6. Continually evaluate methodology throughout the study.

Critical multiplism is a particularly powerful framework for doing participatory clinical research and provides discipline as one moves within the participatory wheel of inquiry.

Revealing the many kinds of evidence requires entering the EBM space, developing cross-disciplinary collaborations, using multiple methods with a critical multiplist conceptualization, using bridging metaphors and theories such as "bodies," and often emphasizing participatory and advocacy approaches and democratizing knowledge. With these strategies, the clinical research space opens for the tools of the generalist clinical researcher. Qualitative researchers have seen and heard the stories and sufferings of Jocelyn and others like her, but they have often been retold in a language that patients and clinicians do not understand (e.g., Fisher, 1986; Fisher & Todd, 1983; Lazarus, 1988; Mishler, 1984; West, 1984; Williams, 1984). Neither clinicians nor patients know the language of "ethnomethodology," "hermeneutics," "phenomenology," "semiotics," or "interpretive interactionism." Much qualitative clinical research is published in a language and in places that benefit only selected researchers and not the patients and practitioners. Qualitative researchers have asked that clinicians join, listen to, and speak the "voice of the lifeworld" (Mishler, 1984). We ask clinical qualitative researchers to do the same, and we recommend the work of Carolyn Ellis and Arthur Frank as powerful examples of clear and moving text (Ellis, 1995; Frank, 1991).

■ PROVIDING THE TOOLS AND TRANSLATIONS

This section presents the tools and translations necessary for bringing qualitative methods and traditions into the clinical research space at ground level. It begins by comparing the qualitative *research process* with the clinical process. The nearly direct correspondence enables the clinical researcher to make qualitative methods transparent to clinicians and patients. This is followed by a brief overview of qualitative methods and how to create mixed method *research designs* in the clinical setting. Finally, we *put it all together* with an example of clinical research that uses some of the strategies discussed and share tips for writing, demonstrating credibility, and getting published.

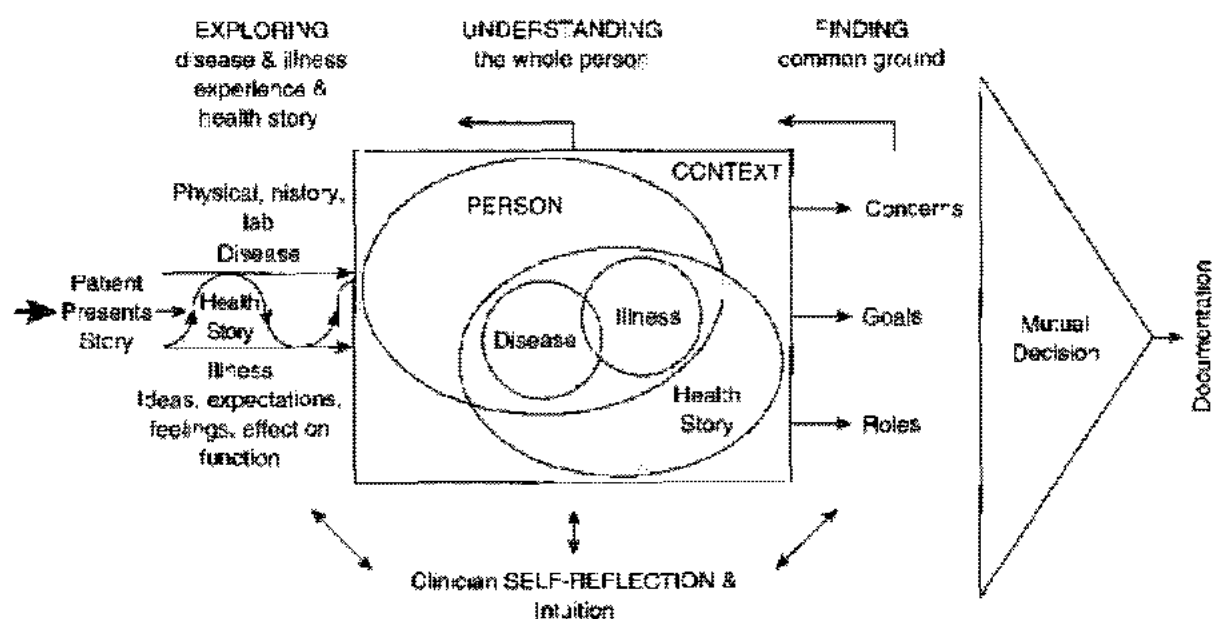

Figure 24.2. Relationship-Centered Clinical Method

Research Process

The clinical research space is created by focusing on the questions arising from the clinical experience and opens many possibilities for using the full range of qualitative data-gathering and analysis methods. Many of these qualitative approaches are presented elsewhere in this *Handbook* and are discussed in more detail in a text for primary care qualitative researchers (Crabtree & Miller, 1999). The challenge is to preserve the integrity of the questions and to translate qualitative collection and analysis methods into clear and jargon-free language without sacrificing the methods' integrity rooted in the soil of disciplinary conversations. A fundamental tenet of the proposed translation is that *the question and clinical context are primary; methods must adjust to the clinical setting and the clinical questions*. Interpretive social science traditionally has feared mixed methods because this usually meant treating qualitative as only a method subservient to the positivist paradigm or materialistic inquiry. We not only imagine a clinical research space where qualitative methods are empowered and where constructivist and critical/ecological paradigms are accepted but also note that it already exists. The key is to recognize

the similarity between the qualitative research process and the clinical process, particularly as it presents itself in primary care.

Figure 24.2 diagrams an idealized relationship-centered clinical method proposed as a model for family medicine (Stewart et al., 1995; Tresolini, 1994). Notice that the overall method consists of four separate processes: exploring, understanding, finding common ground, and engaging in self-reflection. These four processes flow sequentially, but they all iterate with each other and the whole process usually cycles multiple times over time for any given illness episode. For example, chronic illness care will occur over a lifetime of visits, whereas an episode of ear infection may require only two visits (i.e., two iterations of the clinical cycle). The four clinical processes directly correspond to the four processes of qualitative research, and these parallel processes are illustrated in Figure 24.3. (The clinical equivalents are italicized in brackets above the research processes.)

The clinician begins by gathering data using purposeful or information-rich sampling. The clinician focuses his or her interviewing, observing, and touching around possible explanations related to the patient's presenting concern or opening story. The exploration seeks "disease"

information following the biomedical model, but the process also searches for understanding of the patient's health story and illness experience, especially the patient's ideas, expectations, and feelings about his or her concern and its effect on everyday living. The clinician almost immediately begins to analyze the data while continuing to gather additional information. This analysis seeks to understand the patient's concern within the context of his or her lifeworld—personal, family, and community stories. This understanding is organized around sensitizing concepts, diagnostic categories, personal experience templates or scripts, and connections looked for and then corroborated against the known evidence. Using a participatory framework, the clinician periodically shares the emerging understanding with the patient (or others), and together they seek a common interpretation. Throughout this iterative process, the clinician is using self-reflection, personal feelings, and intuition to inform the gathering, analyzing, and interpreting. The visit ends when the clinician and patient agree that they have sufficient data (i.e., saturation) to implement an initial course of action. The outcome is an engaging plan for the patient and a report describing the encounter written (or dictated) by the clinician. These reports occasionally undergo peer review. This sounds like, looks like, and feels like qualitative research. However, most clinicians do not know it. Use clinical language to translate qualitative methods and standards. Let us get to work!

Finally, notice how clinical care also mirrors the double helix RCT. In both, simplified coherence for action ("disease") is in dynamic tension with personal/social/cultural complexity ("illness" and "health story") and the tension is held through the quest for care, that is, through the research questions. This is more likely when the clinical or research process is simultaneously participatory and cognizant of the power imbalances inherent in the relationships and in the greater health care system. All of the many voices must be surfaced and attention must be paid to them; we must protect the questions and prevent them from being co-opted and changed by hierarchy

and the biomedical paradigm. This is the work of democratizing knowledge. Out of this fabric of relational forces, within given biocultural boundaries, are woven senses. The methods must parallel the clinical process and provide self-critique and correction. This is the intersection of doing science and reflexivity.

Research Design

Research designs in clinical research inherently require multimethod thinking and critical multipism, with the particular combinations of data-gathering and analysis/interpretation approaches being driven by the research question and the clinical context. There are infinite possibilities for integrating qualitative and quantitative methods, with the design being created for each study and the qualitative aspects often evolving as a study progresses in response to the emerging questions. Participatory research approaches, in particular, usually involve a more emergent design process. In clinical research, research designs may be wholly qualitative (Shepherd, Hattersley, & Sparkes, 2000) or quantitative, including the use of a single method, but are increasingly combinations of these in what has been referred to as mixed methods (Borkan, 2004; Creswell, 2003; Creswell, Fetters, & Ivankova, 2004; Tashakkori & Teddlie, 1998). Clinical researchers must maintain multimethod thinking and remain free to mix and match methods as driven by particular clinically based questions.

There are many questions and contexts that require only a single method; however, single-method designs should still be considered within a multimethod context. When the investigator starts with the question and considers all possible methods before deciding that a single method is appropriate for the question, he or she is maintaining multimethod thinking. Most clinical research questions are more complex and require multiple approaches. Particular mixed method combinations of qualitative and quantitative methods are generally presented in terms of typologies of multimethod designs (Creswell, 2003; Stange, Miller, Crabtree, O'Connor, &

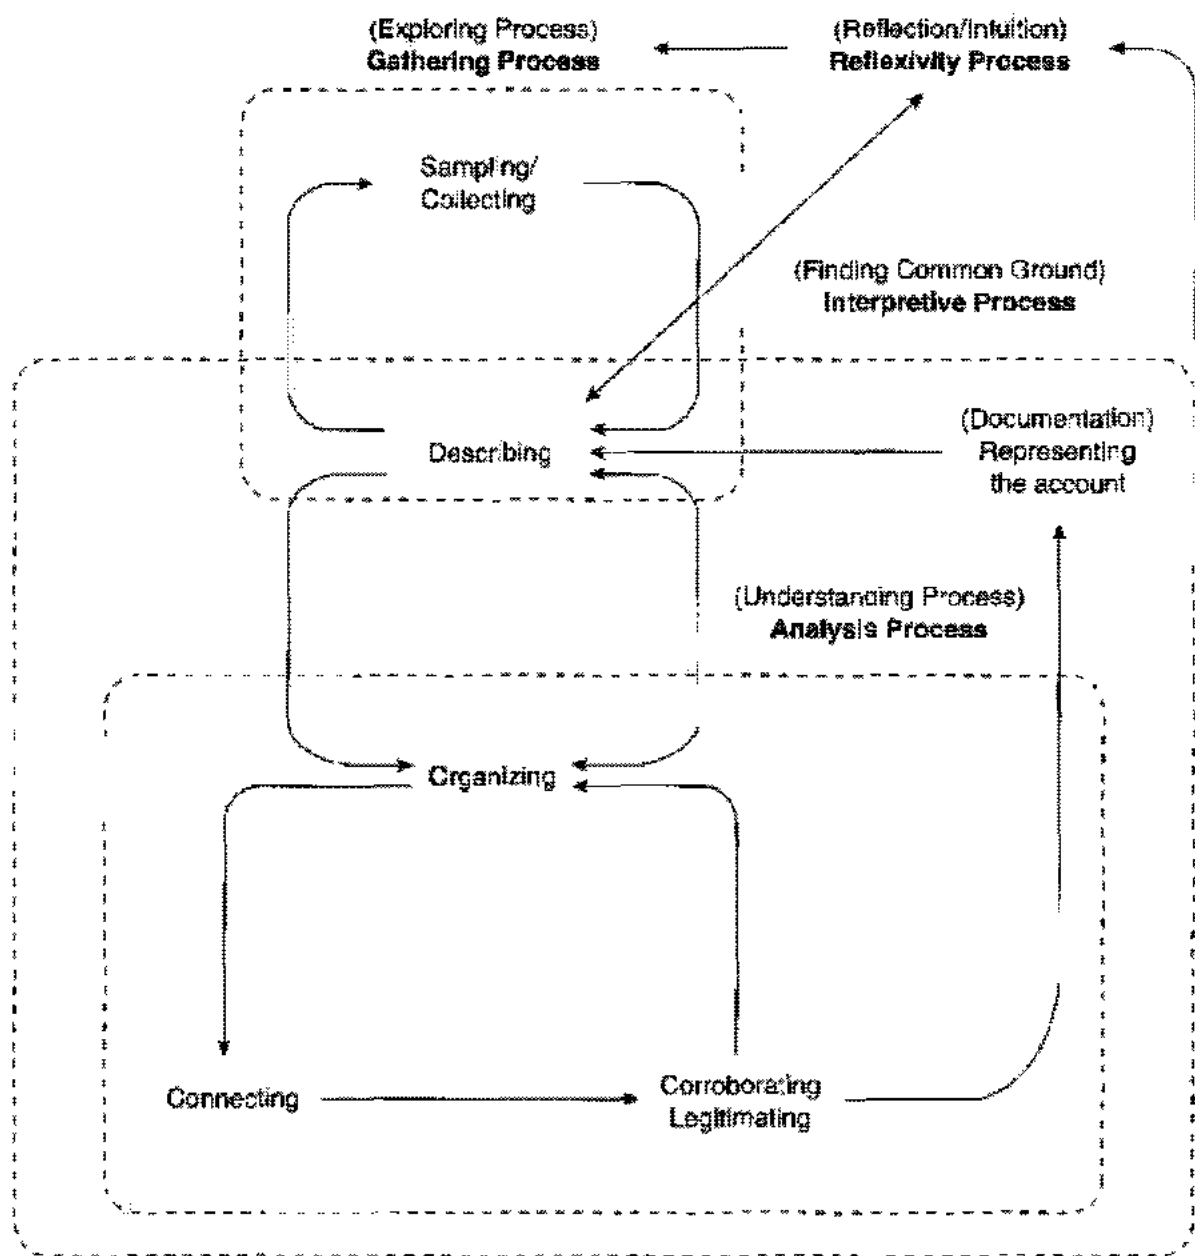

Figure 24.3. Qualitative Research Process and Clinical Parallels

Zyzanski, 1994). In actual practice, these typologies are too prescriptive and tend to oversimplify the complex dance of the research process. In conceptualizing a study, the clinical investigator creates a design from the full range of data collection and analysis tools, much like a child makes creations from the sticks and wheels of "Tinker Toys" or parts from a "Lego" set. There are airplanes, cars, windmills, and buildings, but they are rarely exactly alike.

One dimension of multimethod design is the longitudinal nature of the research process. Most clinical research questions are complex and

multifaceted and cannot be addressed in a single study. In constructing the design, the clinical researcher is constantly balancing the desire to fully address the question with the feasibility of being able to complete the study. Narrowing the focus potentially compromises the integrity of the question, whereas trying to accomplish too much can be overwhelming and possibly not fundable. Thus, in conceptualizing study designs, the researcher may do a series of studies in a longitudinal process that fits the larger research agenda. How a design is finally put together depends on the questions and the setting. Snadden and Brown

(1991) wondered how stigmatization affected adults with asthma. Answering this question required two steps. First, they identified patients with asthma who felt that they were stigmatized, and then they explored the perceived effect of that stigmatization on the patients' lives. The design solved these issues by initially using a questionnaire measuring attitudes concerning asthma to identify respondents reporting high levels of stigma. These individuals were then interviewed using interpretive interview and analysis methods.

Multiple methods can also be directly integrated within a single study in a number of ways. For example, sometimes it may be helpful to conduct two independent studies concurrently on the same study population and then to converge the results. This is the approach recommended for the double helix RCT (Wiles, 1998; Willms, 1991). Another widely used approach to designing multimethod research is to integrate multiple methods more intimately within a single research study. For example, Borkan, Quirk, and Sullivan (1991) noticed that breaking a hip was often a turning point toward death for many elderly patients. They puzzled about what distinguished those persons from others who had recovered with minimal complications. The research literature did not reveal any obvious traditional biomedical factors. They wondered whether patients' stories about the fractures had any connection with the outcomes. They used an epidemiological cross-sectional design with a sample of hospitalized elderly patients with hip fractures. Multiple biomedical indicators were measured as independent variables along with rehabilitation outcome measures as the dependent variable. There was nothing unusual here, and this design would ensure acceptance by the intended clinical audience. What distinguishes this study is that the researchers also conducted depth interviews with each patient concerning how he or she understood the hip fracture within his or her life story. Several distinguishable injury narratives emerged. These were coded and entered as another independent variable in the statistical outcome modeling. The narrative type was the most powerful predictor of rehabilitation outcome.

When discussing qualitative research design with clinicians and patients, we have simplified the jargon. The data-gathering methods are divided into interviewing, observing, and reviewing documents (including videotapes). Interviews are further subdivided into depth, focus group, and ethnographic (or key informant) (Mitchell, 1998). Participant observation is described as either short term or prolonged. Instead of using the jargon of grounded theory, phenomenology, ethnography, and hermeneutics, we frame the many traditions and techniques of analysis as a "dance of interpretation" in which three idealized organizing styles—immersion/crystallization, editing, and template (for details, see Figure 24.4 and Miller & Crabtree, 1999a)—promote the dynamic, creative, iterative, yet disciplined craft of qualitative interpretation. All three organizing styles may be used at some time during the different gathering/interpreting iterations of a particular research project.

Putting It All Together

To further demonstrate the use of a multimethod framework, we provide an overview of a longitudinal series of four federally funded studies focusing on family medicine patterns of care and change (Crabtree, Miller, Aita, Flocke, & Stange, 1998; Crabtree, Miller, & Stange, 2001; Goodwin et al., 2001; Stange et al., 1998). These studies all were funded separately by large federal grants, providing evidence of wider acceptance of the multimethod approach (for more details on funding qualitative research, see Saukko, chap. 13, this volume).

The National Cancer Institute funded the Direct Observation of Primary Care (DOPC) study. The DOPC study was designed to illuminate the "black box" of clinical practice by describing patient visits to family physicians in community practices with a special emphasis on the delivery of preventive health services. This largely quantitative cross-sectional descriptive study focused on the content and context of the outpatient visit. Data were obtained through the direct observation of patient visits using a variation of the highly structured Davis Observation Code

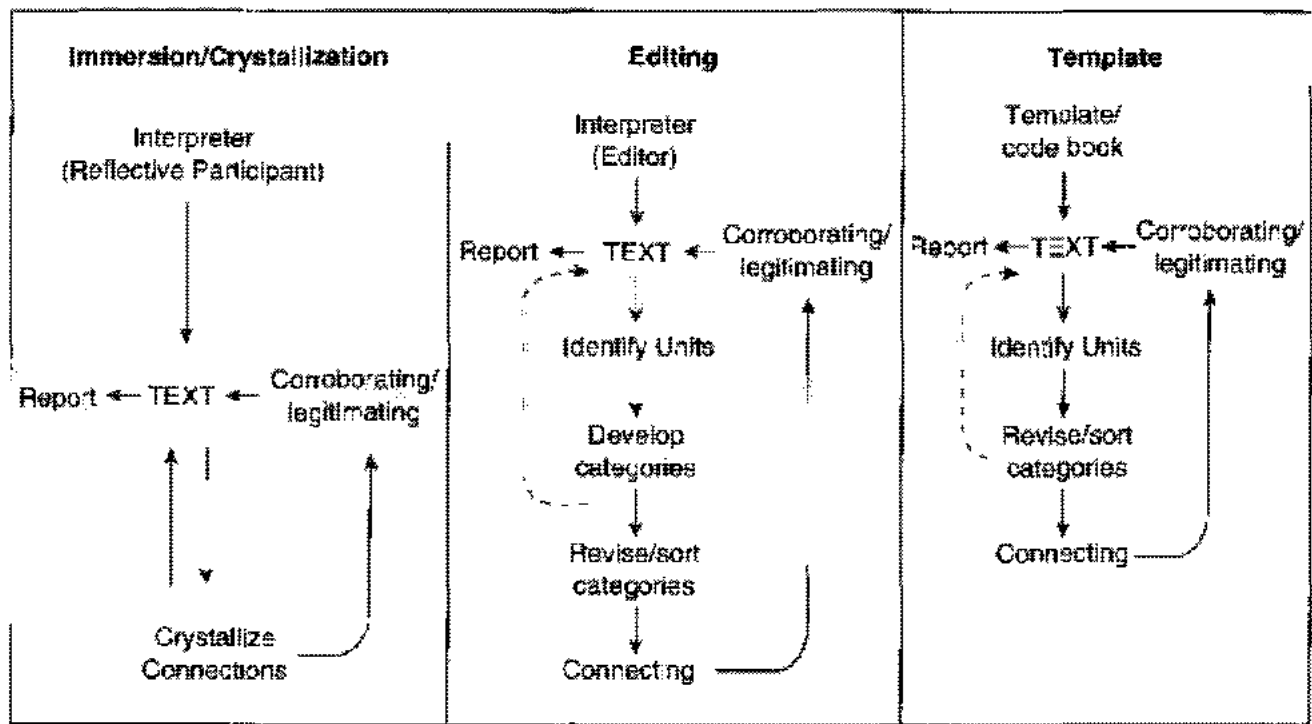

Figure 24.4. Diagrammatic Representation of Different Organizing Styles of Analysis

Source: Crabtree and Miller (1999).

(Callahan & Bertakis, 1991) along with checklists of the patient visit, patient exit questionnaires, medical record reviews, billing data abstractions, and physician questionnaires. To supplement and enhance these quantitative data, research nurses dictated observational field notes immediately after each visit to provide richer descriptions of the variables under study. This ethnographic data were impressionistic and focused on describing the practice in terms of key features such as the practice location, office relationships, and how the practice functioned. These data eventually totaled more than 2,000 pages of field notes from observation of 138 physicians in 84 different family medicine offices. The quantitative descriptions provided valuable insights into the overall content of family medicine (Stange et al., 1998) as well as into many other facets of family medicine (see the May 1998 issue of the *Journal of Family Practice*). The qualitative field notes identified a long list of key features that appear to be important for understanding how practices operate on a day-to-day basis, particularly in the delivery of preventive services (Crabtree et al., 1998). The qualitative data were also used to formulate a new

theoretical model of practice organization based on complexity theory that now provides the basis for subsequent federally funded studies (Miller, Crabtree, McDaniel, & Stange, 1998).

The Prevention and Competing Demands in Primary Care (P&CD) study was funded by the Agency for Healthcare Research and Quality as a follow-up to the DOPC study to provide a more in-depth look at how the practice and the people in the practice worked together. In the P&CD study, 18 practices were purposefully selected to include some that were doing really well in delivering preventive services and others that were doing less well. Trained observers spent weeks in each practice observing, taking detailed notes about how the organization functioned, and talking to people using key informant and depth interviews. They observed 30 encounters with each clinician and dictated field notes in the form of a chronology of what went on during the encounters. This largely qualitative study helped to refine the theoretical model developed in the DOPC study (Miller, McDaniel, Crabtree, & Stange, 2001).

The DOPC and P&CD studies directly challenged the ideology of standardization and

commodification of health care. Multiple analyses elucidated the tremendous variation that exists in practice organization and clinical care. Much of this variation was beneficial along with some problematic variation. Thus, we see clinicians prioritizing care in ongoing continuous relationships with patients (Flocke, Miller, & Crabtree, 2002) and opportunistically tailoring tobacco counseling (Jaen et al., 2001) while at the same time overprescribing antibiotics for upper respiratory infections (Scott et al., 2001) or failing to manage obvious depression (Robinson et al., 2001). Practices themselves, as complex organizations, exhibited much variation, including how they hire and use staff (Aita et al. 2001) or respond to hospital ownership (Tallia et al., 2003). Using concepts from family systems (McGoldrick, Gerson, & Shellenberger, 1999), it was possible to identify different ways in which practices organize themselves and to diagram patterns of communication in a "practice genogram" (McIlvain, Crabtree, Medder, Stange, & Miller, 1998). Urban practices were very different from rural practices, which in turn were very different from suburban practices (Pol, Rouse, Zyzanski, Rasmussen, & Crabtree, 2001). The larger health care system also created variation and surprise. For example, 24% of patients in managed care had to change their physicians during a 2-year period in the DOPC study, creating discontinuity in the care of many patients (Flocke, Stange, & Zyzanski, 1997).

Based on insights from the DOPC and P&CD studies, we developed an organizational change model for tailoring interventions to the local context that incorporated characteristics of patients, clinicians, the clinical encounter, the practice, the community, and the larger health system. This model was based on our emerging understanding of complexity theory and was initially tested in a National Cancer Institute-funded clinical trial called the Study to Enhance Prevention by Understanding Practice (STEP-UP). The STEP-UP intervention randomized 80 practices in Ohio and used an initial 2- to 5-day mixed methods assessment of the practice to provide insights for tailoring feedback to the practice (an example of a double helix trial design). Based on

the assessment, a facilitator would go back to the practice, show the practitioners their genogram, give them a summary report, and then negotiate a prevention-oriented intervention. The STEP-UP intervention resulted in a significant enhancement in the delivery of global preventive services in the intervention practices (as opposed to the control practices) over a 12-month period, a change that has been sustained for more than 3 years after the intervention (Goodwin et al., 2001).

An analysis of the qualitative field notes recorded during the STEP-UP intervention was used to develop a refined model of organizational change that seeks to stimulate self-reflective and ongoing learning in practices. This analysis, which focused on discovering why the intervention worked in some places and not in others, led to the National Heart, Lung, and Blood Institute (NHLBI)-funded Using Learning Teams for Reflective Adaptation (ULTRA) study. The ULTRA study is a collaborative participatory research study using a double helix design. In this study, an initial assessment of the organization by means of a 2-week multimethod assessment process (MAP) is used to stimulate a reflective adaptation process (RAP), which is an iterative team-building process combining assessment feedback with facilitation of learning teams in the practice. Patients are required as participants on these teams. The hypothesis underlying the ULTRA study is that change in overall practice processes will simultaneously affect a wide range of outcomes, including the organizational culture and clinical care such as smoking cessation counseling and the management of chronic illnesses (e.g., hyperlipidemia, hypertension, diabetes, asthma).

A research design has evolved from this series of studies that might best be characterized as an in-depth comparative case study of family medicine offices using ethnographic techniques and a multimethod participatory clinical trial using complexity theory to guide an interventional strategy. The potential for multisite, multimethod collaborative studies at ground level is demonstrated in the progression from a multimethod observational study (DOPC) to an in-depth comparative case study (P&CD), which then led

to an intervention trial that is grounded in insights from the previous work (STEP-UP). This finally resulted in a participatory collaboration with practices and patients (ULTRA).

An important aspect of all of these studies is their use of a collaborative research team (Miller, 1994). The team includes physicians, nurses, epidemiologists, statisticians, psychologists, anthropologists, economists, and sociologists. We design the study together, meet frequently during the study to review the qualitative data and make adjustments to the study, and do intensive reflexivity work (Barry, Britten, Barber, Bradley, & Stevenson, 1999). This long-term collaborative teamwork has enabled the group to expand its use of qualitative methods and its operating paradigms.

Writing Strategies

There are some specific writing strategies that facilitate communication of and receptivity to qualitative clinical research (Richardson, 1990; Wolcott, 1990). The most important is *avoiding jargon and keeping language simple and concrete*. Using typologies and continua as rhetorical frames is helpful because these initially appear to be rational and measurable—qualities valued by traditional clinical researchers. Interpretive aspects can be maintained by emphasizing cultural/historical and/or inductive construction and by grounding in lived clinical experience. It is also useful to communicate either in the biomedically dominant visual mode, through the use of tables, charts, diagrams, and data matrices, or through the clinically familiar narrative mode of case reports. Narrative reports often take the form of first-person voice pathographies (Hawkins, 1993) or first-person accounts by physicians of their patient encounters (Loxterkamp, 1997; Sacks, 1984). The strategy of autoethnography, where the voice of the researcher as deeply personal subject is explicitly woven into the context of the social issues being researched, also resonates with the clinical narrative mode (Ellingson, 1998; Ellis & Bochner, 1996).

The dominant audience for clinical research perceives the issues of “validity,” “reliability,” and

“generalizability” as scientific fundamentalist dogma resulting in heightened concerns about bias. The collaborative multimethod study of Daly and McDonald (1992) described the impact of echocardiography on patients’ perceptions of self. Their story described how difficult it can be to till the soil: “The biggest problem was that physicians saw qualitative research methods as . . . prone to bias. Highly structured methods of analyzing qualitative data were effectively used . . . and are probably necessary for ‘covering one’s back’ in multidisciplinary teams” (p. 416). They presented strategies for qualitative researchers to translate their insights and build tornado-proof hedges around their fields. The methodological guidelines for quantitative methods are not relevant for qualitative clinical researchers. The criteria for qualitative clinical research can be translated for clinical audiences in the form of telling methodologically, rhetorically, and clinically convincing stories.

Methodologically convincing stories answer the question, “How was the research designed and done?” It is important to make explicit how and why the research design, sampling strategies, and data collection and analysis techniques fit the question and research context as discussed earlier in this chapter. It is helpful to mention when the research design is cross-sectional, prospective, case-control, or similar to some other design from observational epidemiology (Ward, 1993). Specific techniques such as triangulation, member checking, and searching for disconfirming evidence should also be addressed when applicable (Malterud, 2001a, 2001b).

Relationship is essential to the clinical experience. Kahn (1993) proposed that a language of relationship be used to judge the methodological adequacy of clinical qualitative research. A methodologically convincing story addresses three different relationships: (a) the investigator’s *relationship with informants*, noting how each influences the other during the research process, (b) the *relationship with the data*, particularly the circularity or iterative aspects of the research experience, and (c) the *relationship with the readers*, so that the researcher’s authorial intent is clear.

One popular approach to helping primary care clinicians become "information masters" involves teaching them to recognize patient-oriented evidence that matters (POEMS) (Slawson et al., 1994). The first step is to scan an article's abstract and determine whether the results relate to outcomes that are common or important in everyday clinical practice and matter to patients and whether the results would potentially change what you currently do in practice. If the answers are yes, then the second step is to read the article and decide whether the conclusions are methodologically sound. There are simple one-page checklists for quantitative studies. The following, in an effort to enhance accessibility and quality while avoiding the checklist format that we condemned earlier, was developed by the authors and is currently being used for evaluating qualitative articles:

1. Is the method appropriate for the question?
2. Is the sampling adequate and information rich?
3. Is the research process iterative?
4. Is the interpretive process thorough and clearly described?
5. Is reflexivity addressed?

We hope that by using a question format and leaving space for interpretation, there is both sufficient flexibility for creativity and sufficient guidance for assurance of quality. A methodologically convincing story is not one that pleases a positivist or a postpositivist; rather, it is one that pleases qualitative research peers, clinicians, and patients. Thus, the use of explicit guidelines and checklists is problematic and must be tempered with a large dose of flexibility so as not to put off the doing of qualitative research (Chapple & Rogers, 1998). The preceding approach is consistent with Altheide and Johnson's (1998) idea of "validity-as-reflexive-accounting," where the researcher or team, the sense-making processes, and the question or topic are in interaction with a focus on how meanings are constructed. This is also a good description of the validity process in clinical care.

A *rhetorically convincing story* answers the question, "How believable is this text?" The readers are drawn into the story and begin imagining that the story is about them. When this occurs, the conclusions make more sense for the readers. The language and style of writing need to be familiar to the audience. Some of the quotations and observations selected to illustrate interpretations also need to reflect the readers' experience and/or values. A rhetorically convincing story assures the readers that you have "walked in their shoes." Bunge (1961) reviewed some of the features that characterize a believable story.

A *clinically convincing story* answers the questions, "Does this study make clinical sense?" and "How does this study help in the care of patients?" (Giacomini & Cook, 2000). A story is clinically convincing if it successfully addresses three features that are important in the clinical research space. The *question* must matter to clinical participants, and the results must specifically address that question. This usually means that attention is directed to the pragmatic intervention and policy focus of the clinical world. The *audience* or stakeholders are also clinical participants for whom the results matter, and this should be obvious in the text. Finally, the text reveals *assumptions* about the physical/behavioral, social/emotional, cultural/historical, and/or spiritual aspects of clinical participants' bodies, lives, and/or power. It is made clear to the readers who benefits most from the story.

A clinically convincing story is also one that enriches the possibilities for a narrative medicine (Brody, 2003; Greenhalgh & Hurwitz, 1998). In narrative-based care, the clinician views his or her primary task as partnering with the patient to create new stories from the broken ones. This involves learning the patient's language and discovering the life contexts and plans that make sense of it (Launer, 2002). This sounds like good clinical research. When possible, articulate this connection, especially in the discussion section of a manuscript. The work of Frank (1995) and his concepts of restitution, quest, and chaos narratives cited earlier are also quite relevant here.

Qualitative clinical research is convincing if the methods are appropriate for the question and

the investigator's relationship with informants, data, and audience are clearly addressed; if the audience recognizes itself in the findings; and if the question and results matter to clinical participants. All of these criteria are more easily satisfied if a collaborative team does the research. When this team includes clinical participants, it creates a community of discourse where conversations at ground level can grow (Denz-Penhey & Murdoch, 1993).

Even when the writing is clear and the results are convincing, it is still a challenge to find a publishing venue. Fortunately, the options are improving. Qualitative clinical research is widely presented and published in primary care internal medicine and family medicine, nursing, social work, and educational research books and journals. Much of this success over the past two decades has been due to specific efforts to translate and introduce qualitative research in workshops within professional meetings, through newsletters, and through methods' publications emphasizing clinical usefulness. Qualitative clinical research is now appearing in clinical journals, especially in the field of primary care. *Qualitative Health Research; Culture, Medicine, and Psychiatry; Health; and Social Science and Medicine* serve as bridge-building publications with a nearly exclusive or significant emphasis on qualitative clinical research. All of the primary care journals have reviewers trained in qualitative research and publish qualitative studies. The *Annals of Family Medicine* provides space on its Web site to "publish" supplementary materials, thereby making it possible to condense articles into the space requirements of medical journals. The next steps are to improve ways of communicating results to the patient population and international community. The use of the Web may become a valuable means of presenting findings to patients and the broader community.

■ CLINICAL RESEARCH BELOW GROUND

Connections are made slowly, sometimes they grow underground. You cannot tell always by looking what is happening.

More than half a tree is spread out in the soil under your feet. Penetrate quietly as the earthworm that blows no trumpet.

—Continuation of Marge Piercy's
"The Seven of Pentacles"

Still, the tornado approaches. When it will arrive, within our generation's lifetime or that of our grandchildren, is difficult to predict. What we believe is that the current destruction of the earth's life support systems, the widening gap between the rich and the poor, and all of the powers and structures that currently maintain this oppression of our earth community are ultimately unsustainable and self-destructive. This is, in our opinion, the most important clinical and health problem for our time. Acknowledging this, how do we, as individuals and clinical researchers, respond? We are not sure. We are not confident that the clinical research above ground is sufficient to bring about the necessary change. We are morally uncomfortable with leaving that change to others. In this section, we invite you into our conversation underground—into our own personal struggles, from positions of power, to maintain integrity and to be citizens working for the democracy and health of all life. Join with us, in solidarity as clinical researchers and as lovers of the earth, on our burrowing toward wholeness. This is "ecological identity" work—using direct experience with nature and others "as a framework for personal decisions, professional choices, political actions, and spiritual inquiry" (Thomashow, 1996, p. xiii). Our name for this pilgrimage below ground is *solidarity research*.

Clinical research above ground is opportunistic, challenging, helpful, and protective. It is public; it complicates and addresses important clinical questions and works for change. It is about career, making a living, getting published, holding positions of power, and openly challenging power. It seeks to mix methods and create new relationships, to surface the hidden, and to protect the miracle of life (Berry, 2000) where possible. These efforts at optimizing the ability to function within a dangerously broken system are critically important, and (it seems to us) they will not be

enough. The research plants that bloom in the sunshine, our works above ground, are only as healthy as the roots and rhizomes that sustain us. What supports our personal integrity and wholeness, keeps our senses open to the cries of suffering and alert to hidden danger, nourishes our vision and deep interdependence, and helps us to image and experience health as membership (Berry, 2000)? We suggest that these tasks call for clinical research below ground. This could be a solidarity research that nourishes the work above ground, tenaciously grounds us to our earth community (Rasmussen, 1996), and ensures an adequate soil and seed for life before and after the tornado passes.

Solidarity research might be the proactive work building and preparing for the future. This could be our night work. Maybe this is where we join with resistance movements and new alternative structures arising around the world and, using our research skills, we work, learn, and grow with them to create a life that can emerge before and after the tornado (Perlas, 2000). This is solidarity research. The name derives from the cooperative economics in Brazil connecting local alternatives together to create networks of resistance to elite corporate globalization that is called *economia solidária*, that is, solidarity economics. We propose that solidarity research represents inquiry and learning that increase solidarity with our selves as whole persons and increase solidarity with our earth community and with other communities of resistance. It is generating better questions for our above ground research. It is story sharing. It is relationships and building community. It is mysticism—the prayer, music, and poetry that enliven community and give it spirit. It is growing love.

Foundational sources for our current understanding and development of solidarity research include the work of Paulo Freire, Ivan Illich, and Vandana Shiva. Freire (1970) emphasized the importance of words as praxis—as part of an action/reflection cycle—and of working directly with the oppressed through “dialogics” with the goals of democratizing culture and raising critical consciousness or *conscientização*. We must “learn

how and what the people know.” We must “learn with the oppressed the indispensable ropes of their resistance” (Freire, 1998, p. 273). Illich (1970, 1976) highlighted the importance of creating alternative local systems of mutual support to resist the current disempowering institutions of education and health care. Shiva (1994) articulated and demonstrated, with her work in India, the power of linking ecology, feminism, and social justice concerns to local resistance efforts against corporate globalization threatening their habitat and way of life.

The resistance to global corporate capitalism and the work of solidarity economics and politics is present, in some form, in nearly every nation (Notes From Nowhere, 2003). People dreaming and reweaving the power to choose and shape alternative ways of living need the skills of clinical researchers to help them name, track, and learn from the stories of their journeys. This is where we, as solidarity researchers, can join in the reclaiming and can help “to open a crack in history” (Ponce de León, 2001, p. 216).

Solidarity research, as we currently understand it, involves no new methods or grand new scheme; it is quieter than that. It does build on the core concepts related to democratizing knowledge, and it emphasizes at least three related assumptions, namely that (a) life is interdependent, diverse, always changing, and sustainable; (b) all action, including doing science, is moral activity; and (c) moral activity should sustain the common good. Common good is understood to mean those pluralistic, social, and ecological conditions and processes that seek the good of all and are arrived at through public interaction that expresses differences and seeks to include the perspectives of the more vulnerable—in other words, participatory democracy (Moe-Lobeda, 2002). Solidarity research, we propose, is about local, participatory, community-based inquiry and learning that is connected with similar activities around the globe. This work is not usually funded and often occurs after hours, but it can often be woven into existing projects and everyday activities in the workplace. It is more about how we and our families and colleagues live our lives

and with whom and what we are in relationship and growing solidarity. Some of the purposes of solidarity research could be the following: (a) learning from others who are in different circumstances, (b) documenting and truth telling (the acts of testimony and witness), (c) restoring and nurturing personal and local community health, and (d) weaving connections with other communities of resistance around the globe. All four of these could inform, support, and maybe even transform the clinical research that we do above ground. So, what could solidarity research actually look like?

We suggest a three-step process: identify, connect, and create in solidarity. Solidarity research could begin by *identifying* alternative kinds of relationships and clinical practices occurring in our own communities. Where are people already meeting their clinical needs through practices that value democratic participation, cooperation, diversity, sustainability, testimony, and direct experience with nature? Examples from our own experience include local organic farming cooperatives, domestic violence shelters, drumming circles, a conservancy group working to restore and protect a local watershed, faith-based groups working with the homeless and malnourished, and community groups helping to meet the health care needs of latchkey children and recent Hispanic immigrants. Imagine the possibilities if these groups could get connected!

The next step, after joining with identified groups, could be to *connect* them with each other and begin the process of developing relationships of mutual support. Freire's dialogic approach might be particularly helpful in facilitating learning connections that are empowering rather than paternalistic. These connections should be about building meaningful and accountable relationships from which concrete and practical exchanges, new questions and research approaches, and strategy development emerge. The work of solidarity research might be to help discover and document the interconnections between and among the groups. How does the health of the local river relate to domestic violence, homelessness, malnutrition, and healthy food sources? How does

improvisational group drumming help to create community? Once local connections are established, consider connecting with similar communities and activities elsewhere in the larger region and world. We have not yet found a place where people are not working to heal the wounds and broken-ness resulting from the inherent excesses of colonialism, industrialism, and militarism and its current form as global corporate capitalism. We are in the early stages of developing connections with communities of resistance in Maine and Brazil, but the possibilities are probably unlimited. Keep expanding the circles of identification from self to local neighborhood to global commons.

It is hoped that, through the newly connected, emergent, and dynamic networks, we can begin to *create* alternative institutions and economies, new initiatives and community information systems, and refreshed imaginations. The specific role of clinical researchers would be to support all three steps by witnessing what is occurring, growing new embodied and embedded knowledge, and sharing in the empowerment of all participants. We can share the stories and use them to enhance our clinical research above ground. Just maybe, solidarity research is the small-scale, human-scale, local work interdependent with others around our earth that we do together, subversively, below ground to reclaim our homes and selves as spaces and bodies of love, healing, growth, and solidarity.

Let us imagine together. Jocelyn still works the grill at a fast-food restaurant while she takes classes at the community college for a degree in social work. She reads *Fast Food Nation* (Schlosser, 2002) and no longer eats where she works or at any other fast-food restaurants. Her family physician purchases a share in a local organic farm, and Jocelyn is able to barter for food at the same farm by agreeing to help during harvest season. The farmer also connects her by way of e-mail with an organic coffee collective in Chiapas, Mexico. That correspondence connects her with women's collectives in Chiapas whose members help to awaken Jocelyn to the relationships among her life situation, her heartburn,

fast-food restaurants, the purple pill, and the threat to the livelihoods and way of life of her new friends in Mexico. A clinical researcher in the nursing department at a local university is a guest lecturer at Jocelyn's community college class, becomes interested in her story, and agrees to help Jocelyn and her family physician establish a hearthurn recovery group. The researcher is now working with that group and the women's group in Chiapas to design a collaborative participatory research project. Is this a story of solidarity research? Are you connected?

■ SUMMARY

Live as if you liked yourself, and it may happen; reach out, keep reaching out, keep bringing in. This is how we are going to live for a long time: not always, for every gardener knows that after the digging, after the planting, after the long season of tending and growth, the harvest comes.

—Concluding stanza of Marge Piercy's
"The Seven of Pentacles"

There are many clinical worlds. Each of them is a place where support is sought and power is invoked. The clinical world and people's need for support occur in nursing, primary health care, specialized medical care, administration and management, education, social work, family therapy, mental health, public health, engineering, law, community organizing, and international activist work. In each of these worlds, there are questions emerging from practice. These are the questions, the settings, and the participants for doing qualitative clinical research. This is where the conversations start. Clinical research is disciplined inquiry regarding the conditions and processes that support and hinder the restoration and growth of interdependent and sustainable life.

People continue to meet in clinics, hoping to weave a comforting cloth of support, but the created relationships and patterns are now more varied, more confusing, and often too expensive.

Concerns about access and cost do matter but are not adequately addressed without facing the abusive and dismembering experience of being a woman in the clinic, the pervasive delegitimation of patient experience, the clinicians' increasing sense of helpless imprisonment, and the mounting problems, discontinuities, and cultural conflicts within local communities. Knowing the probabilities is not enough and is often inappropriate. Ignoring the powerful, and often unconscious, impacts of elite corporate globalization and its ideology is morally dangerous (Comaroff & Comaroff, 2001; Ritzer, 2001). The stories, uniqueness, and context are also essential threads in the fabric. Without them, care and moral discourse remain narrowly defined, our bodies and lives remain fragmented, and power is imposed. Jocelyn remains isolated and dependent on her purple pill. She and we need the breath of qualitative research. She and we need *relationship* restored to the clinical world.

A decade has passed. Jocelyn is now a member of a community health advisory council that provides guidance for several local primary care practices and a regional health network and hospital system. They are meeting with an interdisciplinary team of researchers, clinicians, local employers, pharmaceutical industry representatives, and a fellow from the National Institutes of Health (NIH). This group is designing a new regional research initiative, jointly funded by the NIH and a local foundation, that will test a promising new approach to the care of GERD using a double helix RCT design that includes the extensive use of qualitative methods. The analysis of the qualitative data will occur independently from the RCT analysis and will be ongoing through the trial. Jocelyn is a member of the qualitative analysis team. She has authority to end the study for any reason at any time. Imagine the possibility that "Nexium" becomes a nexus for bringing people together to create *conscientização*.

Qualitative methods are needed now more than ever, but with a participatory, collaborative, narrative, and multimethod twist. Qualitative clinical researchers must engage the clinical experience and its questions and must practice humility

and fidelity within a community of discourse at ground level. This is a dangerous—but exciting—conversation because it promises that no one can stay the same. Beware the idolatry of control, that is, the idolatry of measurement. If measurement is required, insist on inviting the patients and clinicians into the research process, insist on the precautionary principle, and insist on measuring suffering and love. Complicate the outcomes. Measure the dance of life's attachments and detachments, of mystery and grace, and of breathing and the rhythms of life. Measure the process of healing. Seek a healthier story. Our research needs to risk restoring relationship to the clinical world. Clinical research can heal by transforming into praxis. In time, all ideologies crumble, power shifts, and healing begins. We cannot prevent tornadoes. Thank heavens. It is much better than that. Go into the woods or beside the ocean. Join Jocelyn for the harvest at the local organic farm. *Practice solidarity research!* Do clinical research above ground that helps clinicians and patients now, and work to transform and heal. Let our clinical research also be the waters that break open fundamentalisms and flow between dualisms. At night, below ground, begin to grow a sustainable life together. When the sun rises, bloom!

■ NOTES

1. "Patient" derives from the Latin word *patiens* ("to suffer") and from the Latin *paene* ("almost") and *penuria* ("need"). People seek clinicians because they have needs and are suffering. They are no longer complete; they lack adequate support. People come to clinicians because they do not perceive themselves as equal and/or whole. They are "patients" in need of movement toward wholeness.

2. "Clinic" derives from the Greek words *klinikos* ("of a bed") and *klinein* ("to lean, recline"). From this sense, a clinic is a physical, emotional, conceptual, social, and spiritual place for those in need of support. (This support can be medical, managerial, educational, legal, economic, religious, nursing, social, or psychological.) This understanding defines clinic as a bounded text for research.

Part IV

METHODS OF COLLECTING AND ANALYZING EMPIRICAL MATERIALS

Nothing stands outside representation. Research involves a complex politics of representation. The socially situated researcher creates, through interaction and material practices, those realities and representations that are the subject matter of inquiry. In such sites, the interpretive practices of qualitative research are implemented. These methodological practices represent different ways of generating and representing empirical materials grounded in the everyday world. Part IV of the *Handbook* examines the multiple practices and methods of analysis that qualitative researchers-as-methodological *bricoleurs* now employ.

■ NARRATIVE INQUIRY

Today narrative inquiry is flourishing; it is everywhere. We know the world through the stories that are told about it. Even so, as Susan Chase (Chapter 25) reminds us, narrative inquiry as a particular type of qualitative inquiry is a field in the making. Chase defines narrative as retrospective meaning making and defines narrative inquiry as an "amalgam of interdisciplinary lenses, diverse disciplinary approaches, and both traditional and innovative methods—all revolving around an interest in biographical particulars as narrated by the one who lives them." She provides an excellent historical overview of this field, moving from the sociologists and anthropologists in the first half of the 20th century who championed the life history method, to the second-wave feminists who "poured new life into the study of personal narratives," to sociolinguists who treated oral narrative as a form of discourse, to contemporary scholars who turn the use of interviews into the study of how persons perform and tell stories about themselves.

Narratives are socially constrained forms of action, socially situated performances, ways of acting in and making sense of the world. Narrative researchers often write

in the first person, thus “emphasizing their own narrative action.” Chase identifies several distinct approaches to narrative analysis, including psychological, sociological, anthropological, autoethnographic, and performances studies of identity. She then outlines a series of issues that must be addressed in any narrative inquiry. These involve interpretive authority and “hearing” the story that is being told.

Narrative inquiry can advance a social change agenda. Wounded storytellers can empower others to tell their stories. *Testimonios*, as emergency narratives, can mobilize a nation against social injustice, repression, and violence. Collective stories can form the basis of a social movement. Telling the stories of marginalized people can help to create a public space requiring others to hear what they do not want to hear.

■ ARTS-BASED INQUIRY

Arts-based inquiry uses the aesthetics, methods, and practices of the literary, performance, and visual arts as well as dance, theater, drama, film, collage, video, and photography. Arts-based inquiry is intertextual. It crosses the borders of art and research. Susan Finley (Chapter 26) writes a history of this methodology, locating it in the postcolonial postmodern context. She assesses the usefulness of activist art (e.g., photographs of refugees of war, children and street art, street theater) when political activism is the goal. She shows how activist art can be used to address issues of political significance, including engaging community participants in acts of political self-expression.

When grounded in a critical performance pedagogy, arts-based work can be used to advance a progressive political agenda that addresses issues of social inequity. Thus do researchers take up their “cameras, paintbrushes, bodies, and voices” in the name of social justice projects. Such work exposes oppression, targets sites of resistance, and outlines a transformative praxis that performs resistance texts. Finley shows how she makes this commitment to transformative praxis work by offering moving examples from her At Home At School (AHAS) program for kindergarten through eighth-grade (K–8) children who live in shelter and transitional housing.

■ THE INTERVIEW

We live in an interview society, in a society whose members seem to believe that interviews generate useful information about lived experience and its meanings. The interview has become a taken-for-granted feature of our mediated mass culture. But the interview is a negotiated text—a site where power, gender, race, and class intersect. Stealing a narrative line from the film *Memento*, which begins at the end with a murder, Fontana and Frey (Chapter 27) begin their review of the history of the interview in the social sciences by starting in the present. They work back and forth in time from Kong, Mahoney, and Plummer’s (2002) essay, “Queering the Interview.” This essay shows how the interview became a tool of modernist democratization and ultimately of social reform.

Working back from the present, Fontana and Frey note the interview’s major forms—structured, unstructured, and open-ended—while showing how the tool is modified and changed during use. They also discuss the group (or focused) interview, the oral history interview, creative interviewing, online interviewing, and gendered, feminist, and post-modern (or multivoiced) active interviewing.

The interview is a conversation—the art of asking questions and listening. It is not a neutral tool, for at least two people create the reality of the interview situation. In this situation, answers are given. Thus, the interview produces situated understandings grounded in specific interactional episodes. This method is influenced by the personal characteristics of the interviewer, including race, class, ethnicity, and gender.

Fontana and Frey review the important work of feminist scholars on the interview, especially the arguments of Behar, Reinharz, Hertz, Richardson, Clough, Collins, Smith, and Oakley. The British sociologist Oakley (1981) and other feminist scholars have identified a major contradiction between scientific positivistic research, which requires objectivity and detachment, and feminist-based interviewing, which requires openness, emotional engagement, and the development of a potentially long-term trusting relationship between the interviewer and the subject.

A feminist interviewing ethic, as Fontana and Frey suggest, redefines the interview situation. This ethic transforms interviewers and respondents into coequals who are carrying on a conversation about mutually relevant, often biographically critical, issues. This narrative, performative, storytelling framework challenges the informed consent and deception models of inquiry discussed by Christians (Chapter 6) in Part I. This ethic changes the interview into an important tool for the types of clinical and applied action research discussed by Kemmis and McLaughart (Chapter 23) and Miller and Crabtree (Chapter 24) in Part III. This ethic also turns the interview into a vehicle for social change, as noted in Chase's (Chapter 25) discussion of the interview as a site for storytelling.

■ RECONTEXTUALIZING OBSERVATIONAL METHODS

Going into a social situation and looking is another important way of gathering materials about the social world. Drawing on previous arguments (Angrosino & Pérez, 2000), Michael Angrosino (Chapter 28) fundamentally rewrites the methods and practices of naturalistic observation. All observation involves participation in the world being studied. There is no pure, objective, detached observation; the effects of the observer's presence can never be erased. Furthermore, the colonial concept of the subject (the object of the observer's gaze) is no longer appropriate. Observers now function as collaborative participants in action inquiry settings. Angrosino and Pérez (2000) argue that observational interaction is a tentative situational process. It is shaped by shifts in gendered identity as well as by existing structures of power. As relationships unfold, participants validate the cues generated by others in the sitting. Finally, during the observational process, people assume situational identities that might not be socially or culturally normative.

Like Christians (Chapter 6), Angrosino offers compelling criticisms of institutional review boards (IRBs), noting that positivistic social scientists seldom recognize the needs of observational ethnographers. At many universities, the official IRBs are tied to the experimental, hypothesis-testing, so-called scientific paradigm. This paradigm creates problems for the postmodern observer, for the scholar who becomes part of the world that is being studied. To get approval for their research, scholars might have to engage in deception (in this instance of the IRB). This leads some ethnographers to claim that their research will not be intrusive and, hence, will not cause harm. Yet interactive observers are by definition intrusive. When collaborative inquiry is undertaken, subjects become stakeholders, persons who shape the inquiry itself. What this means for consent forms—and for

forms of participatory inquiry more broadly—is not clear. Alternative forms of ethnographic writing, including the use of fictionalized stories, represent one avenue for addressing this ethical quandary.

Angrosino offers an ethic of “proportionate reason.” This utilitarian ethic attempts to balance the benefits, costs, and consequences of actions in the field, asking whether the means to an end are justified by the importance and value of the goals attained. This ethic is then translated into a progressive social agenda. This agenda stresses social (not commutative), distributive, or legal justice. A social justice ethic asks the researcher to become directly involved with the poor and the marginalized, to become an advocate, and to facilitate empowerment in communities. A pedagogy for social justice based on a service learning model is outlined.

Angrosino demystifies the observation method. Observation is no longer the key to some grand analysis of culture or society. Instead, observational research now becomes a method that focuses on differences, on the lives of particular people in concrete, but constantly changing, human relationships. The relevance and need for a feminist ethics of care and commitment become even more apparent.

■ REIMAGINING VISUAL METHODS

Today visual sociologists and anthropologists use photography, motion pictures, the World Wide Web, interactive CDs, CD-ROMs, and virtual reality as ways of forging connections between human existence and visual perception. These forms of visual representation represent different ways of recording and documenting what passes as social life. Often called the mirror with a memory, photography takes the researcher into the everyday world, where the issues of observer identity, the subject's point of view, and what to photograph become problematic. Douglas Harper (Chapter 29) examines the status of visual thinking in the sociological community, the impact of new technologies on visual methods, the continuing development of traditional forms of visual documentary, and problematic issues surrounding ethics in the visual research world. Journals have become more sophisticated in the presentation of visual materials, and new technologies and skills using websites have created new ways of presenting visual materials. These methods have been taken up by experimental, reflexive digital ethnographers. Harper wisely notes that these developments exist within an unstable and constantly changing electronic world. The software and the computers that deliver these developments have short lives.

Historically, visual sociology began within the postpositivist tradition, providing visual information to support the realist tales of traditional ethnography. Photographs were a part of the unproblematic “facts” that constituted the “truth” of these tales. Now visual sociology, like ethnography, is in a period of deep questioning and great change. Visual sociology, Harper contends, must find a place in this new ethnography. Drawing from his own research, Harper illustrates the value of photo elicitation in the study of the meaning of change in the dairy industry in northern New York State. In photo elicitation studies, photos are used to stimulate a quality of memory that word-based interviewing does not.

Harper discusses the use of photographs to observe public life. IRBs have been reluctant to give permission to photograph the public without informed consent. But many visual sociologists base their photographic research on the model of documentary photography and photojournalism, where the right to photograph the public has been

guaranteed by amendments to the Constitution dealing with the freedom of expression. Visual sociologists point to these precedents and argue that harm to subjects is unlikely to occur from “showing normal people doing normal things” in public.

IRBs insist that confidentiality be maintained, that subjects remain anonymous. But in many cases, subjects are both willing and pleased to be identified; furthermore, their very identifiability may be critical to the research project. In such situations, the researcher is urged to develop an ethical covenant with those being studied so that only mutually agreed-on materials will be published.

We need to learn how to experiment with visual (and nonvisual) ways of thinking. We need to develop a critical visual sensibility, a sensibility that will allow us to bring the gendered material world into play in critically different ways. We need to interrogate critically the hyperlogics of cyberspace and its virtual realities. The rules and methods for establishing truth that hold these worlds together must also be better understood.

■ AUTOETHNOGRAPHY: MAKING THE PERSONAL POLITICAL

Stacy Holman Jones (Chapter 30) shows how autoethnography can be used to make the personal political. Her essay is about autoethnography as a radical democratic practice, a political practice intended to create a space for dialogue and debate about issues of injustice. Her chapter, like Madison's (Chapter 21) contribution on ethnography as street performance in Part III, tells by showing. Autoethnographic performances breathe life into life ethnographies.

Personal experience reflects the flow of thoughts and meanings people have in their immediate situations. These experiences can be routine or problematic. They occur within the life of a person. When they are talked about, they assume the shape of a story or a narrative. Lived experience cannot be studied directly because language, speech, and systems of discourse mediate and define the very experience one attempts to describe. We study the representations of experience, not experience itself. We examine the stories people tell one another about the experiences they have had. These stories may be personal experience narratives or self stories, interpretations made up as the person goes along.

Many now argue that we can study only our own experiences. The researcher becomes the research subject. This is the topic of autoethnography. Holman Jones's text reflexively presents the arguments for writing reflexive personal narratives. Indeed, her multivoiced text is an example of such writing; it performs its own narrative reflexivity. Holman Jones masterfully reviews the arguments for studying personal experience narratives, anchoring her text in the discourses of feminist poststructuralism and postmodernism, especially the works of Ronai, Ellis, Bochner, and Richardson.

Holman Jones reviews the history of and arguments for this writing form, the challenge to create texts that unfold in the life of the writer while embodying tactics that enact a progressive politics of resistance. Such texts, when performed (and writing is a form of performance), enact a politics of possibility. They shape a critical awareness, they disturb the status quo, and they probe questions of identity. Holman Jones writes out of her own history with this method, and in so doing she takes readers to the Alexander (Chapter 16) and Madison (Chapter 21) contributions on performance ethnography and critical ethnography in Part III. In a moving passage, she shares a poem/letter she wrote to and for her dead grandfather.

In her concluding sections, Holman Jones embeds the performance turn in the history of progressive theater. She then invites readers to perform the testimony and witnessing of personal stories, to stage improbable impossible encounters of possibility, to create disturbances and chaos, to stage arguments, and to use words in ways that move the world.

■ ONLINE ETNOGRAPHY

Annette Markham (Chapter 31) argues that computer-mediated construction of self, other, and social structure constitutes a unique phenomenon of study. Offline, the body is present and can be responded to by others. Identity construction is a situated, face-to-face process. Online, in contrast, the body is absent and interaction is mediated by computer technology and the production of written discourse. Markham examines many of the issues that can arise in the qualitative study of Internet-mediated situations. These are issues connected to definitions of what constitutes the field or boundaries of a text as well as what counts as text or empirical material. How the other is interpreted and given a textual presence is also problematic, as are ethical issues that are complex.

Ethical guidelines for Internet research vary sharply across disciplines and nations. Markham contrasts the utilitarian IRB ethical model predominant in the United States with the deontological or communitarian stance predominant in Europe. In some nations, citizens enjoy a greater protection of privacy regarding data collection and use. Under the usual IRB model, online ethnographers wrestle with securing informed consent, and with maintaining subject anonymity, while protecting subjects from harm. Under a communitarian, feminist ethical model, researchers enter into a collaborative relationship with a moral community of online interactants. Attempts are made to establish agreed-on understandings concerning privacy, ownership of materials, the use of personal names, and the meaning of broad principles such as justice and beneficence.

Markham wisely concludes, "Because the Internet is new, is widespread, and has the potential for changing the way in which people live their everyday professional and personal lives in a global society, it is essential to reflect carefully on the ethical frames that influence our studies and the political possibilities of our research."

■ ANALYTIC PERSPECTIVES

In a powerful programmatic statement, Paul Atkinson and Sara Delamont (Chapter 32) argue that social activity and representation have their own indigenous modes of organization. These modes include language, discourse, narratives, visual styles, and semiotic and cultural codes. Qualitative researchers must remain faithful to this indigenous organization and deploy analytic strategies that are fitted to it. We need rigorous work that pays systematic attention to the systemic relations among the interaction order, orders of talk, representational orders, and the organized properties of material culture. Atkinson and Delamont endorse the disciplined use of such analytic perspectives and approaches as discourse, narrative, and semiotic analysis.

Inquiry must also be concerned with forms of collective—not individual—social action. Furthermore, an engaged social science should remain faithful to the world and

its organization. Atkinson and Delamont reject certain postmodern positions that free qualitative analysis from the conventions of academic writing. We need more principled and disciplined ways of accounting for the world and its organization. The authors' perspective restores a particular sense of tradition and continuity to the qualitative research project, connecting it back, at one level, to the Chicago School of the 1930s and 1940s.

■ FOUCAULT'S METHODOLOGIES

It goes without saying that Michel Foucault was one of the giant intellectuals of the 20th century. The meanings of his legacy for the humanities and the social sciences are multiple and unfolding (see Holstein & Gubrium [Chapter 19 in Part III] and Peräkylä [Chapter 34]). At one level, as Kamberelis and Dimitriadis (Chapter 35) note in their contribution on focus groups, Foucault's project represents an attempt to understand how any object has been constituted out of a particular intersection of forces, discourses, and institutions. A genealogy maps the complex and contradictory ways in which forces and processes come together to produce a certain set of effects. Foucault's genealogies are not histories of causes; rather, they are histories of effects of consequences.

Foucault's work has traditionally been divided into three sequential phases: archaeology, genealogy, and care of the self. James Scheurich and Kathryn Bell McKenzie (Chapter 33) focus on the first two phases, offering a masterful reading of Foucault's methodologies and his use of archaeology and genealogy. Foucault offered nothing less than a sweeping critique of the modernist view of the human sciences and of the human subject (man) as the object of inquiry. He moved back and forth between systems of discourse, what he called *savoir* (e.g., implicit knowledge, everyday opinions, commercial practices), and formal bodies of learning (*connaissance*), including specific disciplines such as Freudian psychoanalysis. *Savoir* provides the discursive conditions for the development of *connaissance*. For example, an understanding of the history of psychiatry as a discipline requires the study of the relations among rules of jurisprudence, norms of industrial labor and bourgeois morality, and opinions of madness in daily life. Foucault's archaeology focused on the analysis of these local discourses, whereas his genealogy focused on the transformation of such knowledge into more formal disciplinary systems. Scheurich and McKenzie usefully outline the interpretive rules advocated by Foucault in his archaeologies and genealogies.

■ ANALYZING TALK AND TEXT

Qualitative researchers study spoken and written records of human experience, including transcribed talk, films, novels, and photographs. Interviews give researchers accounts of the issues being studied. The topics of research are not interviews themselves. Research studies using naturally occurring empirical materials—tape recordings of mundane interaction—constitute topics of inquiry in their own right. This is the topic of Anssi Peräkylä's (Chapter 34) contribution.

With Chase (Chapter 25), Fontana and Frey (Chapter 27), and Gubrium and Holstein (Chapter 19 in Part III), Peräkylä treats interview materials as narrative accounts rather than as true pictures of reality. Texts are based on transcriptions of interviews and other

forms of talk. These texts are social facts; they are produced, shared, and used in socially organized ways. Peräkylä discusses semiotics, discourse analysis, critical discourse analysis, and historical discourse analysis as approaches to understanding naturally occurring textual materials.

Peräkylä also discusses membership categorization analysis (MCA) as a less familiar form of narrative analysis. Drawing on the work of Harvey Sacks (Silverman, 1998), Peräkylä illustrates the logic of MCA. With this method, the researcher asks how persons use everyday terms and categories in their interactions with others.

Peräkylä turns next to the analysis of talk. There are two main social science traditions that inform the analysis of transcripts: conversation analysis (CA) and discourse analysis (DA). He reviews and offers examples of both traditions, arguing that talk is socially organized action that creates and maintains intersubjective reality. Drawing from his own research on AIDS and its treatment, Peräkylä notes that in observing the "skillful practices through which AIDS counselors encourage their clients to talk about their subjective experiences, we were also observing the operation of an institution, involving powerful relations and bodies of knowledge, at a particular moment in its historical development."

In sum, text-based documents of experience are complex. But if talk constitutes much of what we have, then the forms of analysis outlined by Peräkylä represent significant ways of making the world and its words more visible.

■ FOCUS GROUPS: PEDAGOGY, POLITICS, AND INQUIRY

Kamberelis and Dimitriadis (Chapter 35) significantly advance the discourse on focus group methodology by showing how focus groups have been used in market and military research, in emancipatory pedagogy, and in first-, second-, and third-generation feminist inquiry. Building on Foucault, they place these three genealogies of focus group activity in dialogue with one another.

Kamberelis and Dimitriadis contrast the dialogical, critical theory approach to focus groups with the use of such groups in propaganda and market research. In the marketing context, focus groups are used to extract information from people on a given topic. This information is then used to manipulate people more effectively. Critical pedagogy theorists, such as Freire and Kozol, use focus groups for imagining and enacting the "emancipatory political possibilities of collective work."

Kamberelis and Dimitriadis contrast these two approaches with the history of focus groups in feminist inquiry, noting the use of such groups in first-, second-, and third-wave feminist formations for consciousness-raising purposes. They draw on Madriz (2000), who offered a model of focus group interviewing that emphasizes a feminist ethic of empowerment, moral community, emotional engagement, and the development of long-term trusting relationships. This method gives a voice to women of color who have long been silenced. Focus groups facilitate women writing culture together. As a Latina feminist, Madriz placed focus groups within the context of collective testimonies and group resistance narratives. Focus groups reduce the distance between the researcher and the researched. The multivocality of the participants limits the control of the researcher over the research process.

Within this history, focus groups have been used to elicit and validate collective testimonies, to give a voice to the previously silenced by creating a safe space for sharing one's life experiences. The critical insights and practices of consciousness-raising groups have

helped us to move more deeply into the praxis-oriented commitments of the seventh and eighth moments. In these spaces, as the work of Radway and Lather and Smithies documents, focus groups can become the vehicle for allowing participants to take over and own the research. In these ways, focus groups become the sites where pedagogy, politics, and interpretive inquiry intersect and inform one another.

When this happens, as in the projects discussed by Fine and Weis (Chapter 3) in Part I, inquiry becomes directly involved in the complexities of political activism and policymaking.

Madriz, Olesen, Ladson-Billings, and Donnor remind us that women of color experience a triple subjugation based on class, race, and gender oppression. Critical focus groups, as discussed by Kamberelis and Dimitriadis, create the conditions for the emergence of a critical race consciousness, a consciousness focused on social change. It seems that with critical focus groups, critical race theory and progressive politics have found their methodology.

■ CONCLUSION

The researcher-as-methodological bricoleur should have a working familiarity with each of the methods of collecting and analyzing empirical materials presented in this part of the *Handbook*. This familiarity includes understanding the history of each method and technique as well as possessing hands-on experience with each. Only in this way can the limitations and strengths of each method and technique be fully appreciated. At the same time, the investigator will see more clearly how each, as a set of material interpretive practices, creates its own subject matter.

In addition, it must be understood that each paradigm and perspective, as presented in Part II, has a distinct history with these methods of research. Although methods-as-tools are somewhat universal in application, they are not used uniformly by researchers from all paradigms, and when they are used they are fitted and adapted to the particularities of the paradigm in question. However, researchers from all paradigms and perspectives can profitably make use of each of these methods of collecting and analyzing empirical materials.

NARRATIVE INQUIRY

Multiple Lenses, Approaches, Voices

Susan E. Chase

During the early 1990s, as I struggled to interpret and represent *as narrative* my interviews with women school superintendents, I relied on a rich interdisciplinary tradition defending the study of individuals in their social and historical context. That tradition includes works as diverse as Thomas and Znaniecki's (1918/1927) *The Polish Peasant in Europe and America*, Garfinkel's (1967) ethnomethodological study of Agnes, and the Personal Narratives Group's (1989) feminist explorations of women's journals, life histories, and autobiographies. In this tradition, researchers begin with the biographical leg of Mills's (1959) famous trilogy—biography, history, and society. Mills called these three “the co-ordinate points of the proper study of man” (p. 143). Of course, I was also writing after the narrative turn, and so Barthes's (1977) dramatic words—“narrative is present in every age, in every place, in every society” (p. 79)—had already infiltrated sociological theory. And yet I found few empirical sociological studies based on interview material that could serve as methodological models for the particular way in which I wanted to treat the women's interviews as narratives. Most helpful to me was Riessman's (1990) approach to interview material in *Divorce Talk*.¹

These days, narrative inquiry in the social sciences is flourishing. Signs of this burgeoning interest include an interdisciplinary journal called *Narrative Inquiry*, a book series on *The Narrative Study of Lives*, and professional conferences specifically showcasing narrative work.² Nonetheless, I still get the sense that narrative inquiry is a field in the making. Researchers new to this field will find a rich but diffuse tradition, multiple methodologies in various stages of development, and plenty of opportunities for exploring new ideas, methods, and questions.

In preparation for writing this chapter, I gathered and read as many examples of what might be called narrative inquiry as I could, and I wrestled with various ways of defining the contours of narrative inquiry, both past and present. Although qualitative researchers now routinely refer to any prosaic data (as opposed to close-ended or short-answer data) as “narrative” (Polkinghorne, 1995), I present narrative *inquiry* as a particular type—a subtype—of qualitative inquiry. Contemporary narrative inquiry can be characterized as an amalgam of interdisciplinary analytic lenses, diverse disciplinary approaches, and both traditional and innovative methods—all revolving around an interest in biographical particulars as narrated by the one who lives them.

In what follows, I begin by defining some pivotal terms and then discuss the predecessors of contemporary narrative researchers: sociologists and anthropologists who championed the life history method during the first half of the 20th century, second-wave feminists who poured new life into the study of personal narratives, and sociolinguists who treated oral narrative as a form of discourse worthy of study in itself. After that historical overview, I turn to contemporary narrative inquiry, articulating a set of analytic lenses through which narrative researchers view empirical material and outlining several current approaches to narrative research. Next come explorations of specific methodological issues in contemporary narrative inquiry. For researchers who collect narratives through intensive interviews, a central question is how to treat the interviewee as a narrator, both during interviews and while interpreting them. For all narrative researchers, a central question revolves around which voice or voices researchers should use as they interpret and represent the voices of those they study. And although all qualitative researchers address the question of the relationship between the relatively small "sample" they study and some larger whole, this question is particularly poignant for narrative researchers, who often present the narratives of a very small number of individuals—or even of just one individual—in their published works. The subsequent section addresses the relationship between narrative inquiry and social change. In the concluding paragraphs, I sketch some questions that arose for me as I worked on this chapter, questions that I hope narrative inquirers will explore during the coming years.

■ FOUNDATIONAL MATTERS AND HISTORICAL BACKGROUND

Pivotal Terms

The terms that narrative researchers use to describe the empirical material they study have flexible meanings, beginning with *narrative* itself.

A narrative may be oral or written and may be elicited or heard during fieldwork, an interview, or a naturally occurring conversation. In any of these situations, a narrative may be (a) a short topical story about a particular event and specific characters such as an encounter with a friend, boss, or doctor; (b) an extended story about a significant aspect of one's life such as schooling, work, marriage, divorce, childbirth, an illness, a trauma, or participation in a war or social movement; or (c) a narrative of one's entire life, from birth to the present.

Life history is the more specific term that researchers use to describe an extensive autobiographical narrative, in either oral or written form, that covers all or most of a life. But *life history* can also refer to a social science text that presents a person's biography. In that case, *life story* may be used to describe the autobiographical story in the person's own words (for the complexity of these terms, see Bertaux, 1981; Frank, 2000). Yet some researchers treat the terms *life history* and *life story* as interchangeable, defining both as birth-to-present narratives (Atkinson, 2002). For still others, a life story is a narrative about a specific significant aspect of a person's life, as in the second definition (b) in the preceding paragraph. A life story may also revolve around an epiphanal event (Denzin, 1989) or a turning point (McAdams, Josselson, & Lieblich, 2001) in one's life. Instead of *life story*, some researchers use *personal narrative* to describe a compelling topical narration (Riessman, 2002a). They may use this term to indicate that they are not talking about literary narratives or folklore (but see Narayan & George, 2002, for the intermingling of personal narrative and folklore). *Personal narrative* can also refer in a more generic sense to diaries, journals, and letters as well as to autobiographical stories (Personal Narratives Group, 1989).

Historians use *oral history* to describe interviews in which the focus is not on historical events themselves—historians' traditional interest—but rather on the meanings that events hold for those who lived through them (McMahan & Rogers, 1994; Thompson, 1978/2000). A *testimonio* is a type of oral history, life history, or life

story; it is an explicitly political narrative that describes and resists oppression (Beverley, 2000; Tierney, 2000; see also Beverley, chap. 22, this volume). For the past few decades, *testimonio* has been especially associated with the (usually oral) narratives of Latin American activists in revolutionary movements (e.g., Menchú, 1984; Moyano, 2000; Randall, 1981, 1994, 2003). Finally, a *performance narrative* transforms any oral or written narrative into a public performance, either on stage (Madison, 1998; McCall & Becker, 1990) or in alternative textual forms such as poems and fiction (Denzin, 1997, 2000, 2003; Richardson, 2002).

Sociology and Early Life Histories

The predecessors of today's narrative researchers include the Chicago School sociologists who collected life histories and other personal documents during the 1920s and 1930s.⁴ Thomas and Znaniecki's (1918/1927) *The Polish Peasant* is frequently cited as the first significant sociological use of life history. In the final 300 pages of the second volume, Thomas and Znaniecki presented the "life record" of a Polish immigrant, Wlodek Wiszniewski, whom they paid to write his autobiography (p. 1912). The sociologists' voice preceded the life record with nearly 800 pages on the disorganization and reorganization of social life in Poland as well as the organization and disorganization of social life after immigration to the United States. They also added explanatory footnotes throughout Wiszniewski's life record.

In explaining their interest in life records, Thomas and Znaniecki (1918/1927) stated,

A social institution can be fully understood only if we do not limit ourselves to the abstract study of its formal organization, but analyze the way in which it appears in the personal experience of various members of the group and follow the influence which it has upon their lives. (p. 1833)

Indeed, they claimed, "Personal life records, as complete as possible, constitute the *perfect* type of sociological material" (p. 1832). In their view,

social scientists turned to other materials and methods because of practical difficulties; it is too time-consuming to get sufficient numbers of life records on every sociological issue, and it is too time-consuming to analyze them. Nonetheless, some sociologists, especially in Poland, made the effort. Józef Chłasiński, a follower of Znaniecki, championed the method of using public competitions to solicit hundreds of ordinary people's autobiographies. His research demonstrated that "the formation and transformations of whole social classes (peasants, workers) could be described and understood by analyzing sets of autobiographies" (Bertaux, 1981, p. 3; see also Chłasiński, 1981).⁵

The Polish Peasant was followed by other Chicago School studies based on life histories, especially of juvenile delinquents and criminals (e.g., Shaw, 1930/1966; Sutherland, 1937). These sociologists had some interest in the individual's subjective experience, but they were primarily interested in explaining the individual's behavior as an interactive process between the individual and his or her sociocultural environment. Although studies of urban boys' and men's lives are frequently cited in reviews of the life history method, Hagood's (1939) *Mothers of the South: Portraiture of the White Tenant Farm Woman* also offers an example of early narrative methods.⁶

During the 1940s and 1950s, mainstream American sociology favored abstract theory along with survey and statistical research methods, and the life history method was marginalized. At this point, sociologists were more interested in positivist methods that use single studies to confirm or disconfirm predetermined hypotheses than in research based on the "mosaic" model offered by the Chicago School—studies that may produce no definitive conclusions of their own but that contribute to a larger collective research endeavor (Becker, 1966, pp. viii–ix, xvi–xviii; Bertaux, 1981, p. 1; Denzin, 1970, p. 219).

Anthropology and Early Life Histories

Anthropological use of the life history method emerged early in the 20th century, mostly as a way of recording American Indian cultures that were

assumed to be nearly extinct.⁶ During the 1920s, life history became a rigorous anthropological method with the publication of Radin's (1926) *Crashing Thunder* (Langness & Frank, 1981, pp. 17–18, 20). Crashing Thunder, a middle-aged Winnebago man in financial difficulty, wrote his autobiography for a fee in two sessions (Lurie, 1961, p. 92). Radin (1926) supplied the cultural context and heavy annotations of the life record.

During the early period, anthropologists gathered life histories as a way of understanding cultural facts, choosing to study people who they assumed were representative of their cultural group (Langness & Frank, 1981, p. 24). By the mid-1940s, under the influence of Edward Sapir, Ruth Benedict, and Margaret Mead, many anthropologists had developed a stronger interest in individuals per se and especially in the relationship between cultural context and distinct personality types (Langness, 1965, pp. 11, 19; see also DuBois, 1944/1960; Kardiner, 1945). Anthropologists also used life histories to present insiders' views of culture and daily life, as exemplified by Lewis's (1961) publication of the life stories of the members of one Mexican family in *The Children of Sánchez*. In this and other works, Lewis also developed the controversial concept of "the culture of poverty" (Langness & Frank, 1981, pp. 24–25). Finally, anthropologists have used life histories to study cultural change, as brought about either by contact between different cultural groups or as the result of revolutionary movements (Langness, 1965, p. 16; Langness & Frank, 1981, pp. 24–27). Although the majority of early anthropological life histories were studies of men, some anthropologists—mostly women—used life history methods to study women's lives (Watson & Watson-Franke, 1985, chap. 6).

Feminism and Personal Narratives

The liberation movements of the 1960s and 1970s helped to reinvigorate the life history method. For example, the civil rights movement led to renewed interest in slave narratives, many of which had been collected from 1936 to 1938 by unemployed writers working with

the Federal Writers' Project of the Works Project Administration. More than 2,000 oral histories of former slaves had been deposited in the Library of Congress, but only a glimpse of them was available to the public in Botkin's (1945) *Lay My Burden Down: A Folk History of Slavery*. Two and a half decades later, activists and academics returned to these narratives, and sociologist Rawick (1972) published them in their entirety in 18 volumes of *The American Slave: A Composite Autobiography*. In the introductory volume, he offered a beginning toward a social history of black community life under slavery, based on the narratives, countering previous academic treatment of slaves as voiceless victims (p. xiv).⁷

The second wave of the women's movement played a major role in the renaissance of life history methods and the study of personal narratives such as journals and autobiographies.⁸ As feminists critiqued the androcentric assumptions of social science—that men's lives and activities are more important than those of women and/or constitute the norm from which women's lives and activities deviate—they began to treat women's personal narratives as "essential primary documents for feminist research" (Personal Narratives Group, 1989, p. 4). By listening to previously silenced voices, feminist researchers challenged social science knowledge about society, culture, and history (Belenky, Clinchy, Goldberger, & Tarule, 1986; Franz & Stewart, 1994; Gluck, 1979; Gluck & Patai, 1991; Personal Narratives Group, 1989; Reinharz, 1992, chap. 7; Reinharz & Chase, 2002; Watson & Watson-Franke, 1985, chap. 6). Through the influence of working-class feminists and feminists of color (among others), race, ethnicity, nationality, social class, sexual orientation, and disability came to the fore as central aspects of women's lives (for an extensive overview, see Geiger, 1986; see also Olesen, chap. 10, this volume). The first decade or so of second-wave academic feminism produced many examples of feminist research based on life histories and personal narratives (e.g., Babb & Taylor, 1981; Hunt & Winegarten, 1983; Jacobs, 1979; Ruddick & Daniels, 1977; Sexton, 1981; Sidel, 1978; for an extensive list, see Reinharz, 1992, chap. 7).

The explosion of interest in women's personal narratives was accompanied by feminist challenges to conventional assumptions about research relationships and research methods. Thomas and Znaniecki (1918/1927), and many who followed in their footsteps, had said little about how they gathered their materials, noting only that they motivated people to write their life histories through monetary rewards or public contests (Langness & Frank, 1981; Watson & Watson-Franke, 1985). In addition, despite the early life historians' apparently humanistic bent (e.g., Shaw's [1930/1966] interest in ameliorating the miserable conditions of Stanley's life as a juvenile delinquent and anthropologists' interest in recording what they assumed were disappearing cultures), from a feminist point of view, the people in these life histories appeared as distant "others" or deviant "objects" of social scientist interest. It is important to keep in mind, of course, that the early life historians were writing in positivist times, during which the social sciences were struggling to gain recognition as sciences.⁹

Feminists resisted the idea that life histories and other personal narratives were primarily useful for gathering information about historical events, cultural change, or the impact of social structures on individuals' lives. Rather, they were interested in women as social actors in their own right and in the subjective meanings that women assigned to events and conditions in their lives. Importantly, these feminist lenses opened up new understandings of historical, cultural, and social processes. Furthermore, as feminists approached women as subjects rather than as objects, they also began to consider *their* subjectivity—the role that researchers' interests and social locations play in the research relationship. Whose questions should get asked and answered? Who should get the last say? How does power operate in the research relationship? And as feminists incorporated postmodern influences, they began to ask questions—which are still pertinent today—about voice, authenticity, interpretive authority, and representation. What does it mean to hear the other's voice? In what sense do—or don't—women's life histories and personal narratives "speak for themselves"? How do interactional,

social, cultural, and historical conditions mediate women's stories? In what ways are women's voices muted, multiple, and/or contradictory? Under what conditions do women develop "counternarratives" as they narrate their lives? How should researchers represent all of these voices and ideas in their written works? (Anderson & Jack, 1991; McCall & Wittner, 1990; Personal Narratives Group, 1989; Ribbens & Edwards, 1998).

Sociolinguistics and Oral Narratives

The mid-1960s saw the development of another line of inquiry that has influenced contemporary narrative research. At this time, anthropologists, sociologists, and sociolinguists (e.g., Erving Goffman, Harold Garfinkel, John Gumperz, Dell Hymes, Harvey Sacks, Emanuel Schegloff, William Labov) were exploring a "range of subject matters at the intersection of language, interaction, discourse, practical action, and inference" (Schegloff, 1997, p. 98).

A 1967 article by Labov and Waletzky, "Narrative Analysis: Oral Versions of Personal Experience," is often cited as a groundbreaking presentation of the idea that ordinary people's oral narratives of everyday experience (as opposed to full-fledged life histories, written narratives, folklore, and literary narratives) are worthy of study in themselves. In this article, Labov and Waletzky (1967/1997) argued that oral narratives are a specific form of discourse characterized by certain structures serving specific social functions. Using data from individual and focus group interviews, they claimed that narrative discourse consists of clauses that match the temporal sequence of reported events. They also identified five sociolinguistic features of oral narratives: Orientation (which informs listeners about actors, time, place, and situation), Complication (the main body of the narrative—the action), Evaluation (the point of the story), Resolution (the result of the action), and Coda (which returns the listener to the current moment).

In 1997, the *Journal of Narrative and Life History* reprinted Labov and Waletzky's 1967 article along with 47 then-current assessments

of how it had influenced linguistically informed narrative inquiry since it was first published. Bruner (1997), for instance, suggested that Labov and Waletzky's "fivefold characterization of overall narrative structure transformed the study of narrative profoundly. It set many of us thinking about the cognitive representation of reality imposed by narrative structure on our experience of the world and how we evaluate that experience" (p. 64). Referring to his own influential distinction between logico-scientific and narrative modes of thought—which he had articulated in *Actual Minds, Possible Worlds* (Bruner, 1986)—Bruner (1997) added, "I happily admit that it set me thinking about narrative not simply as a form of text but as a mode of thought" (p. 64).

Many of the assessments of the 1967 article point to the limits of Labov and Waletzky's narrowly structuralist formulation. For example, Riessman (1997) gave them credit for helping her attend to the fundamental structures and functions of oral narratives in her research on people's experiences of divorce. But she found their definition of narrative much too narrow, and so she developed a typology of narrative genres such as the habitual narrative and the hypothetical narrative (pp. 155–156). These helped Riessman to show how people recount their divorce experiences differently and to discuss the connection between the form and function of their speech.

In a different vein, Schegloff (1997) critiqued Labov and Waletzky's failure to take into account the interactional context in which oral narratives are elicited and received. Over the past three decades, conversation analysts such as Schegloff have explored (among other things) how stories arise and how they function in naturally occurring conversations (for an overview, see Holstein & Gubrium, 2000, chap. 7). Other sociolinguistically oriented researchers have investigated the research interview itself as a particular kind of discourse or communicative event in which narratives may be discouraged or encouraged (Briggs, 1986, 2002; Mishler, 1986). Furthermore, although Labov and Waletzky assumed a one-to-one correspondence between a narrative and the events it describes—between narrative and

reality—most researchers since then have resisted this referential view of language. A central tenet of the narrative turn is that speakers *construct* events through narrative rather than simply refer to events.¹⁰

Despite the limitations of the original formulation, the attention that Labov and Waletzky devoted to the linguistic structures and functions of ordinary people's oral narratives served as a launching pad for diverse explorations of the sociolinguistic features of oral discourse. Many contemporary narrative researchers embrace the idea that how individuals narrate experience is as important to the meanings they communicate as is what they say.

■ CONTEMPORARY NARRATIVE INQUIRY

Turning to the present, I begin by outlining a set of five analytic lenses through which contemporary researchers approach empirical material. These lenses reflect the influence of the histories just reviewed and, taken as a whole, suggest the distinctiveness of narrative inquiry—how it is different from (if connected to) other forms of qualitative research.

Analytic Lenses

First, narrative researchers treat narrative—whether oral or written—as a distinct form of discourse. Narrative is retrospective meaning making—the shaping or ordering of past experience. Narrative is a way of understanding one's own and others' actions, of organizing events and objects into a meaningful whole, and of connecting and seeing the consequences of actions and events over time (Bruner, 1986; Gubrium & Holstein, 1997; Hinchman & Hinchman, 2001; Laslett, 1999; Polkinghorne, 1995). Unlike a chronology, which also reports events over time, a narrative communicates the narrator's point of view, including why the narrative is worth telling in the first place. Thus, in addition to describing what happened, narratives also express emotions, thoughts, and interpretations. Unlike editorials,

policy statements, and doctrinal statements of belief, all of which also express a point of view, a narrative makes the self (the narrator) the protagonist, either as actor or as interested observer of others' actions. Finally, unlike scientific discourse, which also explains or presents an understanding of actions and events, narrative discourse highlights the uniqueness of each human action and event rather than their common properties (Bruner, 1986; Polkinghorne, 1995).

Second, narrative researchers view narratives as verbal action—as doing or accomplishing something. Among other things, narrators explain, entertain, inform, defend, complain, and confirm or challenge the status quo. Whatever the particular action, when someone tells a story, he or she shapes, constructs, and performs the self, experience, and reality. When researchers treat narration as actively creative in this way, they emphasize the narrator's voice(s). The word *voice* draws our attention to what the narrator communicates and how he or she communicates it as well as to the subject positions or social locations from which he or she speaks (Gubrium & Holstein, 2002). This combination of what, how, and where makes the narrator's voice particular. Furthermore, when researchers treat narration as actively creative and the narrator's voice as particular, they move away from questions about the factual nature of the narrator's statements. Instead, they highlight the versions of self, reality, and experience that the storyteller produces through the telling. Although narrators are accountable for the credibility of their stories, narrative researchers treat credibility and believability as something that storytellers accomplish (Holstein & Gubrium, 2000; Lincoln, 2000).

Third, narrative researchers view stories as both enabled and constrained by a range of social resources and circumstances. These include the possibilities for self and reality construction that are intelligible within the narrator's community, local setting, organizational and social memberships, and cultural and historical location. While acknowledging that every instance of narrative is particular, researchers use this lens to attend to similarities and differences across narratives. For

example, they emphasize patterns in the storied selves, subjectivities, and realities that narrators create during particular times and in particular places (Brockmeier & Carbaugh, 2001; Bruner, 2002; Hatch & Wisniewski, 1995; Holstein & Gubrium, 2000).

Fourth, narrative researchers treat narratives as socially situated interactive performances—as produced in this particular setting, for this particular audience, for these particular purposes. A story told to an interviewer in a quiet relaxed setting will likely differ from the "same" story told to a reporter for a television news show, to a private journal that the writer assumes will never be read by others, to a roomful of people who have had similar experiences, to a social service counselor, or to the same interviewer at a different time. Here, researchers emphasize that the narrator's story is flexible, variable, and shaped in part by interaction with the audience. In other words, a narrative is a joint production of narrator and listener, whether the narrative arises in naturally occurring talk, an interview, or a fieldwork setting (Bauman, 1986; Briggs, 1986, 2002; Mishler, 1986).

Fifth, narrative researchers, like many other contemporary qualitative researchers, view *themselves* as narrators as they develop interpretations and find ways in which to present or publish their ideas about the narratives they studied (Denzin & Lincoln, 2000). This means that the four lenses just described make as much sense when applied to the researcher as they do when applied to the researched. Breaking from traditional social science practice, narrative researchers are likely to use the first person when presenting their work, thereby emphasizing their own narrative action. As narrators, then, researchers develop meaning out of, and some sense of order in, the material they studied; they develop their own voice(s) as they construct others' voices and realities; they narrate "results" in ways that are both enabled and constrained by the social resources and circumstances embedded in their disciplines, cultures, and historical moments; and they write or perform their work for particular audiences. The idea that researchers are narrators opens up a range of complex issues about voice, representation, and

interpretive authority (Emihovich, 1995; Hertz, 1997; Josselson, 1996a; Krieger, 1991; Tierney, 2002; Tierney & Lincoln, 1997).

Theoretically, it is possible to treat these five analytic lenses as distinct. However, as researchers go about the business of hearing, collecting, interpreting, and representing narratives, they are well aware of the interconnectedness of the lenses. As they do their work, researchers may emphasize one or another lens or their intersections, or they may shift back and forth among the lenses, depending on their specific approaches to empirical narrative material.

Diverse Approaches

Although narrative inquiry as a whole is interdisciplinary, specific approaches tend to be shaped by interests and assumptions embedded in researchers' disciplines. Without claiming to be comprehensive or exhaustive in my categories, I briefly outline five major approaches in contemporary narrative inquiry.¹¹ It is here that we see diversity and multiplicity in this field of inquiry.

Some psychologists have developed an approach that focuses on the relationship between individuals' life stories and the quality of their lives, especially their psychosocial development.¹² In addition to gathering extensive life stories,¹³ these researchers sometimes use conventional psychological tests. For example, in a study of adults' narratives about turning points in their lives, McAdams and Bowman (2001) found that those who score high on conventional measures of psychological well-being and generativity (i.e., commitment to caring for and contributing to future generations) are likely to tell "narratives of redemption," that is, to construct negative events as having beneficial consequences. Conversely, those who score low in terms of psychological well-being and generativity are more likely to tell "narratives of contamination," that is, to present good experiences as having negative outcomes. While acknowledging that biographical, social, cultural, and historical circumstances condition the stories that people tell about themselves, narrative psychologists look for evidence (e.g., in

a person's score on conventional measures) that the stories that people tell affect how they live their lives. They emphasize "the formative effects of narratives" and propose that some stories cripple, and others enable, an efficacious sense of self in relation to life problems or traumas (Rosenwald & Oehberg, 1992, p. 6).

In their interpretations, these psychological researchers tend to emphasize *what* the story is about—its plot, characters, and sometimes the structure or sequencing of its content. Along these lines, McAdams (1997) argued that the content of a life story embodies a person's identity and that both develop and change over time. This idea was exemplified by Josselson's (1996b) longitudinal study of how women revise their stories *and* their lives as they move through their 20s, 30s, and 40s.

A second approach has been developed by sociologists who highlight the "identity work" that people engage in as they construct selves within specific institutional, organizational, discursive, and local cultural contexts. Unlike the psychologists just described, who conceptualize the life story as distinguishable from—yet having an impact on—the life, these researchers often treat narratives as lived experience. Thus, they are as interested in the *hows* of storytelling as they are in the *whats* of storytelling—in the narrative practices by which storytellers make use of available resources to construct recognizable selves. They often study narratives that are produced in specific organizational settings such as prisons, courts, talk shows, human service agencies, self-help groups, and therapy centers (Gubrium & Holstein, 2001; Holstein & Gubrium, 2000; Miller, 1997; Pollner & Stein, 1996). For example, in her study of support groups for women who have experienced domestic violence, Loseke (2001) showed how group facilitators often encourage battered women to transform their narratives into "formula stories" about wife abuse. She found that many women resist the counselors' version of their experience and resist identifying themselves as "battered women," and she suggested that the problem may lie less in women's psychological denial of their victimization and more in the formula story's failure to encompass the complexities of lived experience

(p. 122). As part of everyday lived experience, narratives themselves are messy and complex.

A major conceptual touchstone in this sociological approach is the "deprivatization" of personal experience. This approach highlights the wide range of institutional and organizational settings—some more and some less coercive—that shape "the selves we live by." A person's movement across a variety of settings creates further constraints as well as a plethora of options for narrating the self in a postmodern world (Holstein & Gubrium, 2000).

The third approach is also sociological.¹⁴ Here, narrative researchers share the interest in the *hows* and *whats* of storytelling but base their inquiry on intensive interviews about specific aspects of people's lives rather than on conversations in specific organizational contexts. These researchers are interested in how people communicate meaning through a range of linguistic practices, how their stories are embedded in the interaction between researcher and narrator, how they make sense of personal experience in relation to culturally and historically specific discourses, and how they draw on, resist, and/or transform those discourses as they narrate their selves, experiences, and realities.

Examples of this approach include Langellier's (2001) study of how a woman performs the self and resists medical discourse as she comes to terms with breast cancer, Mishler's (1999) exploration of adult identity formation in craft artists' work histories, Foley and Faircloth's (2003) study of how midwives both use and resist medical discourse to legitimize their work, Riessman's (1990) examination of women's and men's divorce stories in relation to discourse about marriage and gender, Bell's (1999) exploration of how diethylstilbestrol (DES)-exposed daughters negotiate tensions between scientific and feminist discourses, Luttrell's (1997) analysis of the gendered and racialized identities of working-class mothers who return to school to get general equivalency diplomas (GEDs), and Lempert's (1994) analysis of how a woman survivor of domestic violence narrates self-transformation in relation to her physical, psychological, social, and cultural environments.

These researchers often produce detailed transcripts to study interactional processes in the interview as well as linguistic and thematic patterns throughout the narrative. A major goal of this sociological approach is showing that people create a range of narrative strategies in relation to their discursive environments, that is, that individuals' stories are constrained but not determined by hegemonic discourses. Another goal is showing that narratives provide a window to the contradictory and shifting nature of hegemonic discourses, which we tend to take for granted as stable monolithic forces.

Anthropologists have led the way in a fourth approach to narrative inquiry. Some call this approach *narrative ethnography*, which is a transformation of both the ethnographic and life history methods. Like traditional ethnography, this approach involves long-term involvement in a culture or community; like life history, it focuses heavily on one individual or on a small number of individuals. What makes narrative ethnography distinct is that both the researcher and the researched "are presented together within a single multivocal text focused on the character and process of the human encounter" (Tedlock, 1992, p. xiii).

Myerhoff's (1979/1994) *Number Our Days* is an early example. In this study of a community of elderly immigrant Jews in California, Myerhoff highlighted the life of Shmuel Goldman, a tailor and one of the most learned members of the community. At the same time, she analyzed her subjectivity as well as her relationship with those she studied. Although Myerhoff presented page after page of Shmuel's life stories "verbatim," she also showed how her questions and interruptions shaped Shmuel's narrative. And she went further. She described her distaste on observing selfish bickering over food at a community lunch, and then—with the help of a dream—she reinterpreted those actions as reflecting the social and psychological conditions of community members' lives (pp. 188–189). When Shmuel died during the course of the study, Myerhoff wrote a conversation that she imagined she and Shmuel would have had about another community

member's death (pp. 228–231). Finally, she told her own story of how her grandmother's stories influenced her own life and research (pp. 237–241).

In more recent narrative ethnographies, researchers are even more explicit about the intersubjectivity of the researcher and the researched as they work to understand the other's voice, life, and culture (Behar, 1993/2003; Frank, 2000; Shostak, 2000b). A major goal of narrative ethnography is moving to the center of empirical anthropological work the issues of voice, intersubjectivity, interpretive authority, and representation.

A fifth approach to narrative inquiry is found in *autoethnography*, where researchers also turn the analytic lens on themselves and their interactions with others, but here researchers write, interpret, and/or perform their own narratives about culturally significant experiences (Crawley, 2002; Ellis & Berger, 2002; Ellis & Bochner, 1996; Ellis & Flaherty, 1992; see also Holman Jones, chap. 30, this volume). Autoethnographers who share an interest in a topic sometimes engage in collaborative research by conducting interviews with each other, tape-recording conversations with each other, and/or writing separate accounts of their experiences. For example, Ellis and Bochner (1992) narrated separate and joint accounts of their experience of Ellis's unwanted pregnancy and subsequent abortion. And Ellis, Kiesinger, and Tillmann-Healy (1997) used an interactive interviewing method to investigate Kiesinger's and Tillmann-Healy's experiences of bulimia and Ellis's responses to their accounts.

Autoethnographers often present their work in alternative textual forms such as layered accounts (Ellis & Berger, 2002; Ellis & Bochner, 1996), and many have experimented with performing their narratives as plays, as poems, or in various other forms (Denzin, 1997, 2000, 2003; McCall & Becker, 1990; Richardson, 2002). Sometimes autoethnographers resist analysis altogether, leaving interpretation up to the audiences of their performances (Hilbert, 1990). The goal of autoethnography, and of many performance narratives, is to *show* rather than to *tell* (Denzin, 2003, p. 203) and, thus, to disrupt the politics of traditional research relationships, traditional

forms of representation, and traditional social science orientations to audiences.¹⁵

■ METHODOLOGICAL ISSUES IN CONTEMPORARY NARRATIVE INQUIRY

The Research Relationship: Narrator and Listener in Interview-Based Studies

All narrative researchers attend to the research relationship, but those whose studies are based on in-depth interviews aim specifically at transforming the interviewer–interviewee relationship into one of narrator and listener. This involves a shift in understanding the nature of interview questions and answers. These researchers often illustrate this shift by telling about how they initially ignored, grew impatient with, or got thrown off track by interviewees' stories—and later realized their mistake (Anderson & Jack, 1991; Mishler, 1986; Narayan & George, 2002; Riessman, 1990, 2002a). For instance, in *Narrating the Organization*, Czarniawska (1997) described how she used to ask questions that encouraged interviewees to generalize and compare their experiences, for example, "What are the most acute problems you are experiencing today?" and "Can you compare your present situation with that of 2 years ago?" She found, however, that most people "would break through my structure" by offering stories about the background of current circumstances. "This used to bring me to the verge of panic—'How to bring them to the point?'—whereas now I have at least learned that this is the point" (p. 28).

The moral of Czarniawska's account, and of similar accounts, is that the stories people tell *constitute* the empirical material that interviewers need if they are to understand how people create meanings out of events in their lives. To think of an interviewee as a narrator is to make a conceptual shift away from the idea that interviewees have answers to researchers' questions and toward the idea that interviewees are narrators with stories to tell and voices of their own.

Let me pause to say that this idea need not reflect the romantic notion, critiqued by Atkinson

and Silverman (1997), that "the open-ended interview offers the opportunity for an authentic gaze into the soul of another" (p. 305). Similarly, Gubrium and Holstein (2002) critiqued the notion of a narrator's "own" voice, which implies that narrators' stories are not socially mediated. I contend that conceiving of an interviewee as a narrator is not an interest in the other's "authentic" self or unmediated voice but rather an interest in the other as a narrator of his or her particular biographical experiences as he or she understands them. Although any narration is always enabled and constrained by a host of social circumstances, *during interviews* the narrative researcher needs to orient to the particularity of the narrator's story and voice.

This conceptual shift has consequences for data collection (as well as for interpretive processes, which I will get to next). When researchers conceive of interviewees as narrators, they not only attend to the stories that people *happen* to tell during interviews but also work at *inviting* stories. Although some interviewees tell stories whether or not researchers want to hear them, other interviewees might not take up the part of narrator unless they are specifically and carefully invited to do so.

Paradoxically, assumptions embedded in our "interview society" may discourage interviewees from becoming narrators in the sense that I am developing that idea here. Denzin and Lincoln (2000) suggested that we live "in a society whose members seem to believe that interviews generate useful information about lived experience and its meanings" (p. 633; see also Atkinson & Silverman, 1997; Gubrium & Holstein, 2002). Yet interviewees often speak in generalities rather than specifics, even when talking about their experiences, because they assume (often accurately) that researchers are interested in what is general rather than particular about their experience (Weiss, 1994). As Czarniawska (1997) stated, researchers often "ask people in the field to compare, to abstract, to generalize" (p. 28). Sacks (1989) called these "sociological questions"—questions that are organized around the researcher's interest in general social

processes—even though the questions may be couched in everyday language (p. 88). When researchers ask sociological questions, they are likely to get sociological answers—generalities about the interviewee's or others' experiences. The interview questions that qualitative researchers include in appendixes to their studies show how often they encourage interviewees to speak generally and abstractly.¹⁶

How, then, do narrative researchers invite interviewees to become narrators, that is, to tell stories about biographical particulars that are meaningful to them? I have described this as a matter of framing the interview as a whole with a broad question about whatever story the narrator has to tell about the issue at hand (Chase, 1995b, 2003). This requires a certain kind of preparation before interviewing; it requires knowing what is "storyworthy" in the narrator's social setting, an idea that is most easily grasped through examples from non-Western cultures. Grima (1991), for instance, found that Paxtun women in Northwest Pakistan attributed the most value to stories of suffering and personal hardship and that these stories were intimately connected to an honorable identity. If a woman had no such experiences, she had no story to tell. Similarly, in Rosaldo's (1976) anthropological fieldwork with Tukbaw, an Ilongot man in the Philippines, the researcher told of realizing that he had come close to "assuming that every man has his life story within him" and that the narrator himself "should be the subject of the narrative" (pp. 121–122). Although Tukbaw had plenty of stories to tell, these Western assumptions about narratives were unfamiliar to him.

Although broad cultural assumptions condition narrators' voices and the stories they have to tell, so do specific institutional, organizational, and/or discursive environments (Gubrium & Holstein, 2001). In my study of women school superintendents, for example, the fact that they are highly successful women in an overwhelmingly white- and male-dominated occupation shapes their work narratives and makes them storyworthy in a particular way. Their work narratives revolve around the juxtaposition between

their individual accomplishments, on the one hand, and the gendered and racial inequities they face in their profession, on the other, and this juxtaposition makes their work narratives interesting not only to researchers and the general public but also to themselves (Chase, 1995a, pp. 14–15). Once a researcher has a sense of the broad parameters of the story that the narrator has to tell—of what is storyworthy given the narrator's social location in his or her culture, community, and/or organizational setting—the researcher can prepare for narrative interviews by developing a broad question that will invite the other to tell his or her story (Chase, 1995b). The point, of course, is not to ask for a “formula story” (Loseke, 2001); instead, the researcher needs to know the parameters of the story that others similarly situated *could* tell so as to invite *this* person's story.

In some cases, it may be easy to figure out how to frame the interview as a whole; it may be easy to articulate a broad open question that will invite a personal narrative. In my study of women superintendents, the question about their career histories turned out to be pivotal. (I confess that I did not understand it this way at the time and that my coresearcher, Colleen Bell, and I asked plenty of sociological questions along the way.) But it is not always so easy to know what the broad question will be. For example, Sacks (1989), in her ethnographic study of working-class women's militancy and leadership in the workplace, conducted interviews to understand the connection between what women learned from their families and from their workplace militancy. After her sociological interview questions produced dead ends, she finally began to ask “how they learned about work and what it meant to them.” She realized that this question invited stories that showed how “family learning empowered women to rebel” (p. 88).

Being prepared to invite a story, however, is only part of the shift in the research relationship. Burgos (1989) described a transformation that may occur when an interviewee takes up the invitation to become a narrator:

A life story comes off successfully when its narrator exercises her power upon the person who is ostensibly conducting the interview by derealising his interventions, capturing his attention, neutralizing his will, arousing his desire to learn something else, or something more, than what would be allowed by the logic of the narrative itself. (p. 33)

This statement offers a strong version of the narrator's voice as well as of the researcher's listening; in speaking from and about biographical particulars, a narrator may disrupt the assumptions that the interviewer brings to the research relationship. Thus, narrative interviewing involves a paradox. On the one hand, a researcher needs to be well prepared to ask good questions that will invite the other's particular story; on the other hand, the very idea of a particular story is that it cannot be known, predicted, or prepared for in advance. The narrator's particular story is not identical to—and may even depart radically from—what is “storyworthy” in his or her social context.

An example can be found in my own research. As Colleen Bell and I interviewed a woman superintendent who was leaving her job for a less prestigious and less stressful position, she showed us family photographs and began to tell stories about a family member who had a serious physical disability. At the time, I experienced this as a digression from her work narrative, and I waited patiently for her to get back to it. Later, as I reviewed the interview tapes, I realized that her sharing of family photos and stories was integral, not peripheral, to her work narrative; her career move “down,” away from the exhausting and very public work of the superintendency, was for her a move toward a more balanced work–family relationship. If I had been open to understanding the family photos and stories as central to her work narrative, I might have prompted for and heard a fuller account of the particular way in which this woman narrated her career history. She was speaking in a different voice, or from a different subject position, from what I had anticipated; she disrupted my assumption about the “logic” of a career narrative.

The Interpretive Process in Interview-Based Studies

When it comes to interpreting narratives heard during interviews, narrative researchers begin with narrators' voices and stories, thereby extending the narrator-listener relationship and the active work of listening into the interpretive process. This is a move away from a traditional theme-oriented method of analyzing qualitative material. Rather than locating distinct themes *across* interviews, narrative researchers listen first to the voices *within* each narrative.¹⁷

I realized the importance of this shift as I interpreted the women superintendents' interviews. At first, I tried to organize the transcripts into themes about work (e.g., aspirations, competence, confidence) and themes about inequality (e.g., barriers, discrimination, responses). But I soon found that it was difficult to separate a woman's talk about work and her talk about inequality. Finally it dawned on me that there was a connection between a woman's construction of self in one story (e.g., about her individual strength as a competent leader) and her construction of self in other stories (e.g., about her individual strength in fighting discrimination). Thus, I began to focus on connections among the various stories that a woman told over the course of the interview. I used the term *narrative strategy* to refer to the specific way in which each woman juxtaposed her stories about achievement and her stories about gendered and/or racial inequalities, that is, how she navigated the disjunction between individualistic discourse about achievement and group-oriented discourse about inequality (Chase, 1995a, pp. 23–25). The term *narrative strategy* draws attention to the complexity within each woman's voice—to the various subject positions each woman takes up—as well as to diversity among women's voices because each woman's narrative strategy is particular.

Narrative researchers who base their work on interviews use a variety of methods for listening to—for interpreting—complexity and multiplicity within narrators' voices. For example, in

their study of adolescent girls "at risk" for early pregnancy and dropping out of school, Taylor, Gilligan, and Sullivan (1995) described an explicitly feminist Listening Guide that requires reading each interview four times. First, they attended to "the overall shape of the narrative and the research relationship"; second, to the narrator's first-person voice—how and where she uses "I"; third and fourth, to "contrapuntal voices"—voices that express psychological development, on the one hand, and psychological risk and loss, on the other (pp. 29–31). In contrast, Bamberg (1997) focused on three levels of narrative positioning: how narrators position self and others (e.g., as protagonists, as antagonists, as victims, as perpetrators), how narrators position self in relation to the audience, and how narrators "position themselves to themselves," that is, construct "a [local] answer to the question 'Who am I?'" (p. 337).

In one way or another, then, narrative researchers listen to the narrator's voices—to the subject positions, interpretive practices, ambiguities, and complexities—*within* each narrator's story. This process usually includes attention to the "narrative linkages" that a storyteller develops between the biographical particulars of his or her life, on the one hand, and the resources and constraints in his or her environment for self and reality construction, on the other (Holstein & Gubrium, 2000, p. 108). Rather than unitary, fixed, or authentic selves, these researchers suggest that narrators construct "nonunitary subjectivities" (Bloom & Munro, 1995), "revised" identities (Josselson, 1996b), "permanently unsettled identities" (Stein, 1997), and "troubled identities" (Gubrium & Holstein, 2001).

Researchers' Voices and Narrative Strategies

Implicit in my discussion of how the researcher listens to the narrator's voice—both during the interview and while interpreting it—is the *researcher's* voice. Here, I return to issues I raised under the fifth analytic lens—issues of voice, interpretive authority, and representation.

To sort out a range of possibilities, I develop a typology of three voices or narrative strategies that contemporary narrative researchers deploy as they wrestle with the question of how to use their voice(s) to interpret and represent the narrator's voice(s). My typology is not an exhaustive and rigid classification of every possible narrative strategy; rather, it is a flexible device for understanding the diversity in narrative researchers' voices. In practice, researchers may move back and forth among them.

The Researcher's Authoritative Voice

Many narrative researchers develop an authoritative voice in their writing, including those I just described in the section on interpretive processes in interview-based studies and those I described previously in the section on diverse approaches as taking psychological and sociological approaches (the first three approaches). This narrative strategy connects and separates the researcher's and narrator's voices in a particular way. Sociologists usually present long stretches from narrators' stories or long excerpts of naturally occurring conversation, followed by their interpretations. Psychologists are more likely to offer long summaries of narrators' stories, followed by their interpretations. In each case, in the texts they create, researchers connect or intermingle their voices with narrators' voices.

At the same time, these researchers separate their voices from narrators' voices through their interpretations. They assert an authoritative interpretive voice on the grounds that they have a different interest from the narrators in the narrators' stories. For example, during an interview, both narrator and listener are interested in developing the fullness and particularity of the narrator's story, but when it comes to interpreting, the researcher turns to *how* and *what* questions that open up particular ways of understanding what the narrator is communicating through his or her story. These questions are about narrative processes that narrators typically take for granted as they tell their stories such as their use of cultural, institutional, or organizational discourses

for making sense of experience, their development of narrative strategies or narrative linkages in relation to conflicting discourses, their communication of meaning through linguistic features of talk, and/or their reconstruction of psychological issues through particular metaphors or subjugated storylines (Brockmeier & Carbaugh, 2001; Capps & Ochs, 1995; Chase, 1996; Gubrium & Holstein, 1997; Hinchman & Hinchman, 2001; Holstein & Gubrium, 2000; Ochsberg, 1996; Rosenwald & Ochsberg, 1992).

By writing with an authoritative voice, these researchers are vulnerable to the criticism that they "privilege the analyst's listening ear" at the narrator's expense (Denzin, 1997, p. 249). After all, as narrators work to make sense of their experiences through narration, they do not talk about "the selves we live by," "identity work," "nonunitary subjectivities," "discursive constraints," or "hegemonic discourses." Nor do researchers talk this way as they narrate stories in *their* everyday lives. But I prefer (in part because my work fits here) to understand these researchers as making visible and audible taken-for-granted practices, processes, and structural and cultural features of our everyday social worlds. The sociological concepts that researchers develop serve that aim. Ochsberg (1996) articulated this point from a psychological perspective: "Interpretation reveals what one [the narrator] might say if only one could speak freely, but we can see this only if we are willing to look beyond what our informants tell us in so many words" (p. 98).

By taking up an authoritative sociological or psychological voice, the researcher speaks differently from, but not disrespectfully of, the narrator's voice. Czarniawska (2002) suggested that "the justice or injustice done to the original narratives depends on the attitude of the researcher and on the precautions he or she takes" (p. 743). In discussing "narrative responsibility and respect," she recommended that researchers attend to diversity in the stories that various narrators tell, to dominant and marginal readings of narrators' stories, and to narrators' responses (including opposition) to the researchers' interpretations (pp. 742–744).¹⁸ It bears emphasizing

that when these researchers present extensive quotations from narrators' stories, they make room for readers' alternative interpretations (Laslett, 1999; Riessman, 2002).

The Researcher's Supportive Voice

At the other end of an imaginary continuum, some narrative researchers develop a supportive voice that pushes the narrator's voice into the limelight. This is characteristic of Latin American testimonios. For example, in *I Rigoberta Menchú: An Indian Woman in Guatemala* (Menchú, 1984), the translator, Ann Wright, offered a short preface, and anthropologist Elisabeth Burgos-Debray wrote an introduction in which she described how she conducted and edited the interviews with Menchú. But the majority of the book consists of Menchú's uninterrupted stories. Diana Miloslavich Tupac developed a similarly supportive voice as editor and annotator of the work and autobiography of martyred Peruvian activist Maria Elena Moyano (Moyano, 2000). Significantly, these two testimonios named the narrators—Menchú and Moyano—as the books' authors. Other testimonios, especially those that include two or more narrators, name the researchers as the authors (e.g., Randall, 1981, 1994, 2003).

Researchers who publish oral histories or life histories may also use a muted supportive voice. For instance, in Shostak's (1981/2000a) introduction and epilogue to *Nisa: The Life and Words of a !Kung Woman*, she described her research with Nisa and the !Kung people, and she began each chapter with anthropological commentary. But the majority of the book consists of Nisa's stories (see also Blauner, 1989; Gwaltney, 1980/1993; Terkel, 1995).

When researchers present performance narratives, they may also deploy supportive voices. For example, Madison (1998) described a theatrical performance of the personal narratives of two women cafeteria workers who led a strike for better pay and working conditions at the University of North Carolina. Although the strike took place in 1968, the public performance of the narratives took place 25 years later to a packed audience during the university's bicentennial

celebration. Both women were in the audience, and after the performance they received "a thunderous and lengthy standing ovation" (p. 280) as well as attention from the local media. On the occasion of the performance, the researcher's voice as interviewer and editor of the women's narratives was muted; the performance highlighted the women's voices and opened possibilities for political and civic engagement on the part of the women, the audience, and the performers.¹⁹

In each of these cases—testimonio, oral history, life history, and performance narrative—the researcher (and translator, who is sometimes—but not always—the same person) makes decisions about how to translate and transcribe the narrator's story, which parts of the story to include in the final product, and how to organize and edit those parts into a text or performance. And yet, because the goal of this narrative strategy is to bring the narrator's story to the public—to get the narrator's story heard—researchers do not usually dwell on how they engaged in these interpretive processes. Or if they do, they do so elsewhere. For example, in an article written after *Nisa* was published, Shostak (1989) discussed the complexities of these interpretive decisions, including the way in which she presented three voices in the book: Nisa's first-person voice, Shostak's anthropological voice, and Shostak's voice "as a young American woman experiencing another world" (pp. 230–231). Along somewhat different lines, Madison (1998, pp. 277–278) explained the idea of the "performance of possibilities," which underlies performance narratives and which provides a strong framework during the performance itself.

These researchers may encounter the criticism that they romanticize the narrator's voice as "authentic" (Atkinson & Silverman, 1997). At its best, however, this narrative strategy aims not for establishing authenticity but rather for creating a self-reflective and respectful distance between researchers' and narrators' voices. There is a time and there is a place, these researchers might say, for highlighting narrators' voices and for moving temporarily to the margins the ways in which researchers (along with a host of social,

cultural, and historical circumstances) have already conditioned those voices.

The Researcher's Interactive Voice

A third narrative strategy displays the complex interaction—the intersubjectivity—between researchers' and narrators' voices. These researchers examine *their* voices—their subject positions, social locations, interpretations, and personal experiences—through the refracted medium of narrators' voices. This narrative strategy characterizes narrative ethnographies as well as some autoethnographies.

Frank (2000) used this narrative strategy in *Venus on Wheels: Two Decades of Dialogue on Disability, Biography, and Being Female in America*, in which she presented her long-term relationship with Diane DeVries, a woman who was born without arms and legs. Frank not only presented DeVries's stories about living with her disability but also investigated her own interest in DeVries's stories:

In choosing to write about the life of Diane DeVries, I had to ask myself how it was that, as an anthropologist, I chose not to travel to some remote place, but to stay at home and study one individual, one with a congenital absence of limbs. (p. 85)

Through reflection on her experiences of others' disabilities, her own disabilities, and emotional lack and loss in her own life, Frank realized that "I had expected to find a victim in Diane" but instead found "a survivor" (p. 87).

Interestingly, in *Return to Nisa*, Shostak (2000b) developed the same narrative strategy while moving in the opposite geographic direction. Whereas Frank needed to understand why she chose to "stay at home," Shostak needed to understand why, after being diagnosed with breast cancer, she felt compelled to leave her husband and three young children to spend a month in Botswana with Nisa and the other !Kung people whom she had not seen for 14 years. In *Return to Nisa*, Shostak wrote not only about Nisa's life during the intervening years but also about her own complex interest in

reconnecting with Nisa, who (among other things) is a well-respected healer.

In narrative ethnographies and autoethnographies, researchers make themselves vulnerable in the text (Behar, 1996; Krieger, 1991). They include extensive discussions of their emotions, thoughts, research relationships, and their unstable interpretive decisions. They include embarrassing and even shameful incidents. Indeed, these researchers are vulnerable to the criticism that they are self-indulgent and that they air dirty laundry that nobody wants to see. Yet they ground these practices in the idea that researchers need to understand themselves if they are to understand how they interpret narrators' stories and that readers need to understand *researchers'* stories (about their intellectual and personal relationships with narrators as well as with the cultural phenomena at hand) if readers are to understand narrators' stories. These researchers aim to undermine the myth of the invisible omniscient author (Tierney, 2002; Tierney & Lincoln, 1997).

The Particular and the General

Despite differences in their narrative strategies for interpreting and representing narrators' voices, narrative researchers have in common the practice of devoting much more space in their written work to fewer individuals than do other qualitative researchers. Many anthropologists have written books based on one individual's life story (e.g., Behar, 1993/2003; Crapanzano, 1980; Frank, 2000; Shostak, 1981/2000a, 2000b).²⁰ And many sociologists, psychologists, and other narrative researchers have based books, book chapters, and articles on a small number of narratives (e.g., Bell, 1999; Bobel, 2002, chap. 1; Capps & Ochs, 1995; Chase, 1995a, 2001; DeVault, 1999, chap. 5; Ferguson, 2001, pp. 135–161; Josselson, 1996b, chaps. 4–7; Langellier, 2001; Lempert, 1994; Liebow, 1993, pp. 251–309; Luttrell, 2003, chap. 4; Mishler, 1999; Riessman, 1990, chap. 3; Rosier, 2000; Stromberg, 1993, chaps. 3–6; Wozniak, 2002, chaps. 2 and 9).

The question of whether and how an individual's narrative (or a small group of individuals' narratives) represents a larger population goes

back to *The Polish Peasant*. Thomas and Znaniecki (1918/1927) argued that sociologists should gather life histories of individuals who represent the population being studied (pp. 1834–1835). They defended their extensive use of Wisniewski's life record by claiming that he was "a typical representative of the culturally passive mass which, under the present conditions and at the present stage of social evolution, constitutes in every civilized society the enormous majority of the population" (p. 1907). In evaluating *The Polish Peasant*, however, Blumer (1939/1979) claimed that Thomas and Znaniecki had failed to demonstrate Wisniewski's representativeness and that it would have been difficult for them to do so anyway (p. 44).

Contemporary narrative researchers occupy a different social and historical location. Under the auspices of the narrative turn, they reject the idea that the small number of narratives they present must be generalizable to a certain population. Some researchers do this by highlighting the particularity of the narratives they present and by placing them in a broader frame. For example, Shostak's *Nisa* is about one woman's narrative, but Shostak (1989) used the stories of the other !Kung women she interviewed, as well as previous anthropological studies of the !Kung people, to show how *Nisa's* story is at once unique in some respects and similar to other !Kung women's stories in other ways.

Many contemporary narrative researchers, however, make a stronger break from Thomas and Znaniecki's (1918/1927) positivist stance regarding representativeness. Given "narrative elasticity" and the range of "narrative options" in any particular setting (Holstein & Gubrium, 2000), as well as constant flux in social and historical conditions, these researchers propose that the range of narrative possibilities within any group of people is potentially limitless. To make matters more complex, as Gubrium and Holstein (2002) suggested, "Treating subject positions and their associated voices seriously, we might find that an ostensibly single interview could actually be, in practice, an interview with several subjects, whose particular identities may be only partially clear" (p. 23).

Thus, many contemporary narrative researchers approach *any* narrative as an *instance* of the possible relationships between a narrator's active construction of self, on the one hand, and the social, cultural, and historical circumstances that enable and constrain that narrative, on the other. Researchers often highlight a range of possible narratives to show that no one particular story is determined by a certain social location, but they do not claim that their studies exhaust the possibilities within that context (see, e.g., Auerbach, 2002; Bell, 1999; Chase, 1995a; Mishler, 1999). From this perspective, any narrative is significant because it embodies—and gives us insight into—what is possible and intelligible within a specific social context.²¹

■ NARRATIVE INQUIRY AND SOCIAL CHANGE

As outlined by Denzin and Lincoln, a major goal of this edition of the *Handbook* is exploring how qualitative research can "advance a democratic project committed to social justice in an age of uncertainty" (personal communication, July 7, 2002). With that goal in mind, I now turn to questions about the relationship between narrative inquiry and social change. What kinds of narratives disrupt oppressive social processes? How and when do researchers' analyses and representations of others' stories encourage social justice and democratic processes? And for whom are these processes disrupted and encouraged? Which audiences need to hear which researchers' and narrators' stories?

For some people, the act of narrating a significant life event itself facilitates positive change. In discussing a breast cancer survivor's narrative, Langellier (2001) wrote, "The wounded storyteller reclaims the capacity to tell, and hold on to, her own story, resisting narrative surrender to the medical chart as the official story of the illness" (p. 146; see also Capps & Ochs, 1995; Frank, 1995). Along similar lines, Rosenwald and Ochsberg (1992) claimed that self-narration can

lead to personal emancipation—to “better” stories of life difficulties or traumas. In these cases, the narrator is his or her own audience, the one who needs to hear alternative versions of his or her identity or life events, and the one for whom changes in the narrative can “stir up changes” in the life (p. 8; see also Mishler, 1995, pp. 108–109).

For other narrators, the urgency of storytelling arises from the need and desire to have *others* hear one's story. Citing René Jara, Beverley (2000) described testimonios as “emergency narratives” that involve

a problem of repression, poverty, marginality, exploitation, or simply survival. . . . The voice that speaks to the reader through the text . . . [takes] the form of an I that demands to be recognized, that wants or needs to stake a claim on our attention. (p. 556)

But it is not only Latin American testimonios that are narrated with this urgent voice. The stories of many marginalized groups have changed the contemporary narrative landscape—to name just a few, the stories of transgendered people, people with disabilities, and the survivors of gendered, racial/ethnic, and sexual violence. Indeed, “giving voice” to marginalized people and “naming silenced lives” have been primary goals of narrative research for several decades (McLaughlin & Tierney, 1993; Personal Narratives Group, 1989).

If a previously silenced narrator is to challenge an audience's assumptions or actions effectively, the audience must be ready to hear the narrator's story—or must be jolted into listening to it. In writing about empathetic listening, Frank (2000) stated, “Taking the other's perspective is a necessary step in constructive social change” (p. 94). In a similar vein, Gamson (2002) argued that storytelling “promotes empathy across different social locations” (p. 189). Although he was writing about media discourse on abortion, Gamson's argument is relevant to the narrative approaches I have been discussing. Gamson resisted the critique of American popular media (e.g., newspapers, television) that they are too infused with personal

narratives. Because an unwanted pregnancy is ultimately a woman's problem, excluding stories about that “existential dilemma” from media and policy discourse silences women in particular. Thus, he argued that “personalization . . . opens discursive opportunities” (p. 189). Gamson had in mind “deliberation and dialogue in a narrative mode,” which (unlike abstract argument) “lends itself more easily to the expression of moral complexity.” In this sense, “storytelling facilitates a healthy democratic, public life” (p. 197).

During recent years, many narrative researchers have pushed beyond the goal of eliciting previously silenced narratives. Tierney's (2000) description of the goal of life history research applies to other forms of narrative research as well:

Life histories are helpful not merely because they add to the mix of what already exists, but because of their ability to refashion identities. Rather than a conservative goal based on nostalgia for a paradise lost, or a liberal one of enabling more people to take their places at humanity's table, a goal of life history work in a postmodern age is to break the stranglehold of metanarratives that establishes rules of truth, legitimacy, and identity. The work of life history becomes the investigation of the mediating aspects of culture, the interrogation of its grammar, and the decentering of its norms. (p. 546)

These statements offer a strong version of what I described earlier as the researcher's authoritative voice. When researchers' interpretive strategies reveal the stranglehold of oppressive metanarratives, they help to open up possibilities for social change. In this sense, audiences need to hear not only the narrator's story, but also the researcher's explication of how the narrator's story is constrained by, and strains against, the mediating aspects of culture (and of institutions, organizations, and sometimes the social sciences themselves). Audiences whose members identify with the narrator's story might be moved by the researcher's interpretation to understand *their* stories in new ways and to imagine how they could tell their stories differently. Audiences whose members occupy social locations different from the narrator's might be moved through

empathetic listening to think and act in ways that benefit the narrator or what he or she advocates (Madison, 1998, pp. 279–282).

What if the audience is hostile? DeVault and Ingraham (1999) broached this issue: "A radical challenge to silencing is not only about having a say, but about talking back in the strongest sense—saying the very things that those in power resist hearing" (p. 184). When the audience is both powerful and invested in the status quo—invested in oppressive metanarratives—narrators and narrative researchers may turn to "collective stories," which connect an individual's story to the broader story of a marginalized social group (Richardson, 1990). In discussing the collective stories of sexual abuse survivors and gays and lesbians, Plummer (1995) wrote, "For narratives to flourish, there must be a community to hear. . . . For communities to hear, there must be stories which weave together their history, their identity, their politics. The one—community—feeds upon and into the other—story" (p. 87). In the face of a hostile and powerful audience, narrators strengthen their communities through narratives and simultaneously seek to broaden their community of listeners. Thus, collective stories—or testimonios—become integral to social movements (see also Davis, 2002). However, it is important to heed Naples's (2003) cautionary note. In her analysis of how personal narratives function in the social movement of childhood sexual abuse survivors, she argued that we must determine when and where various strategies of speaking from personal experience are more effective and less effective in challenging oppression (p. 1152).

Although discussion of social movements and testimonios evokes the need for large-scale social change, we also need to consider the role of narratives and narrative research in small-scale, localized social change. For example, in Auerbach's (2002) study of Latino/Latina parent involvement in a college access program for their high school children, she heard many parents tell of poor treatment at the hands of school personnel. Auerbach also observed that the program gave parents some opportunities to

share their stories publicly with each other and that sometimes this public performance of their stories led to collective problem solving (p. 1381). Equally important, Auerbach pointed to the need for such programs to create "a third space" that "disrupts the official discourse and scripted behavior that normally dominates school events for parents, just as it does in classrooms for students" (p. 1386). In other words, such programs hold the promise of creating conditions that would allow school administrators, teachers, and counselors to hear parents' narratives so that school staff can be jolted into resisting metanarratives that usually prevail in their work environments—immigrant families of color are uninterested in their children's education, immigrant children of color have limited educational potential, and so forth (see also Rosier, 2000). Auerbach suggested that researchers can help to create public spaces in which marginalized people's narratives can be heard even by those who normally do not want to hear them.

■ NARRATIVE INQUIRY:

A FIELD IN THE MAKING

In *my* narrative, I have attempted to give shape to the massive material that can be called narrative inquiry, identifying its contours and complexities and arguing for the idea that it constitutes a sub-field within qualitative inquiry even amid its multiplicity. Here I raise some issues—in the form of a set of relationships—that I believe are pivotal to the future of this field.

First is the relationship between theoretical and methodological work within narrative inquiry. Narrative theorists point out that narrative research is embedded in and shaped by broad social and historical currents, particularly the ubiquity of personal narratives in contemporary Western culture and politics—from television talk shows, to politicians' speeches, to self-help groups. Clough (2000) warned, however, that the "trauma culture" we currently inhabit encourages proliferation of personal narratives about trouble and suffering without offering a theory

and politics of social change. Along similar lines, Atkinson and Silverman (1997) and Gubrium and Holstein (2002) pointed to the powerful tug of our "interview society," and they warned researchers against the romantic assumption that narrators reveal "authentic" selves and speak in their "own" voices, as if their selves and voices were not already mediated by the social contexts in which they speak. I argued earlier that treating interviewees as narrators does not mean succumbing to those problematic assumptions. Here, however, I suggest that narrative researchers need to do more, collectively, to integrate a critique of the trauma culture/interview society with discussion of methodological issues involved in conducting empirical research (e.g., inviting and interpreting narrators' stories). How do these two activities—one theoretical and the other methodological—support each other and serve a joint purpose? What specific research practices produce narrative research informed by a broad social critique and a politics of social change? Given the centrality of personal narrative in many political, cultural, and social arenas, narrative researchers have much work to do and much to offer by way of empirically grounded analysis and social critique (Crawley & Broad, 2004; Naples, 2003). No one theoretical or empirical project can do everything, of course, but it seems to me that one key lies in more conversation among narrative researchers across theoretical and methodological interests.

Second is the relationship between Western and non-Western narrative theories and practices. Gubrium and Holstein (2002) suggested that the interview society has gone global—that people around the globe know what it means to be interviewed. Even Nisa, a member of the (until recently) hunting and gathering !Kung people, knows how to place herself at the center of a life story (Shostak, 1981/2000a, 2000b). At the same time, narrative researchers need to understand cross-cultural differences more fully. What do Western narrative researchers (and Westerners in general) have to learn from the ways in which non-Westerners narrate the self, narrate group identities, or integrate folklore narratives into

personal narratives (Grima, 1991; Narayan & George, 2002; Riessman, 2002b)? If self or identity is not the central construct in (at least some) non-Western narratives (Rosaldo, 1976), what is? What do non-Western narrative researchers have to teach their Western counterparts about the kinds of narratives that need to be heard and about interpretive and narrative strategies for presenting and performing them? What is the relationship among narrative, narrative research, and social change in non-Western societies? For example, what impact do Latin American testimonios have in the local communities from which they arise? I am not suggesting that Western narrative researchers should take up residence in non-Western locales; rather, I am suggesting that we need to understand more fully how our research is imbued with Western assumptions about self and identity. Anthropologists may be ahead of the game here, but much American narrative research remains unreflective about its Western character.

The third issue revolves around the relationship between narrative inquiry and technological innovation. Although it is hard to imagine narrative researchers giving up the domain of face-to-face interviewing and on-site gathering of naturally occurring conversation, some researchers have already moved into the domain of virtual research and many others will follow in their footsteps (Mann & Stewart, 2002; see also Markham, chap. 31, this volume). How are e-mail, chat groups, online support groups, and instant messaging changing the meaning of "naturally occurring conversation"? How are they creating new arenas for narrating the self and for constructing identities, realities, relationships, and communities? As narrative researchers explore these new opportunities to hear people converse and to interview individuals and groups, what new risks and ethical issues will they encounter? What new forms of knowledge will emerge?

Fourth, researchers interested in the relationship between narrative and social change need to do more to address the issue of audience (Lincoln, 1997). We need to think more about who could benefit from, and who needs to hear,

our research narratives. Marginalized people in the communities we study? Power brokers and gatekeepers in the communities we study? Policymakers? Students in our classes? The public at large? Other researchers within our disciplines and substantive fields of study? Equally important, in my view, is the need for narrative researchers to explore the possible points of contact between *narrators'* stories and various audiences who need to hear them. What kinds of stories (and what kinds of research narratives) incite collective action? And to what effect? When do previously silenced narrators jolt powerful—and initially hostile—audiences to join in breaking the stranglehold of oppressive metanarratives? And how can researchers help to create the conditions of empathetic listening across social locations?

Along these lines, what do we have to learn from Ensler's (2001) wildly successful *Vagina Monologues*? How did Ensler transform interviews with women about their bodies into performances that have sparked a massive international movement against violence against women?²² Similarly, what do we have to learn about writing for the public from Ehrenreich's (2001) best-seller, *Nickel and Dimed: On (Not) Getting By in America*? In this mixture of undercover reporting and narrative ethnography, Ehrenreich wrote both seriously and humorously about her efforts to make ends meet for a month at a time as a waitress in Florida, a house cleaner in Maine, and a Wal-Mart employee in Minnesota. Many of my students claim that this text disrupts their attachment to individualist ideologies in ways that other texts do not. I am not suggesting that we should all aspire to off-Broadway performances or to best-sellerdom for our work; rather, I am suggesting that we need to think more concertedly and broadly about whom we write for and speak to—and how we do so. For many of us, this may mean thinking about how to create public spaces in our local communities where the personal narratives and collective stories of marginalized people can be heard by—and can jolt out of their complacency—those who occupy more powerful subject positions and social locations.

Finally, narrative researchers need to attend to the relationship between our work and that of our social science colleagues who work within other traditions of inquiry. We need to treat other social science scholars as an important audience for our work. We need to demonstrate that immersion in the biographical leg of Mills's trilogy—biography, history, and society—produces new significant concepts and analyses that other researchers in our substantive areas and disciplines *need* to do their work well. For example, Loseke's (2001) concept of the "formula story" of wife abuse, and her analysis of its inadequacy in capturing women's complex stories of domestic violence, is crucial to the work of other social scientists—whether quantitative or qualitative—who study the success or failure of battered women's shelters in helping women to leave abusive partners. Generally speaking, narrative inquiry's contributions to social science have to do with concepts and analyses that demonstrate two things: (a) the creativity, complexity, and variability of individuals' (or groups') self and reality constructions and (b) the power of historical, social, cultural, organizational, discursive, interactional, and/or psychological circumstances in shaping the range of possibilities for self and reality construction in any particular time and place. Narrative researchers need to confidently assert their contributions to, their interventions in, and their transformations of social science scholarship.

As narrative researchers grapple with these and myriad other issues and questions, it is hard to imagine Mills's argument for the joint investigation of biography, society, and history going out of style. What exactly that means, however, will likely undergo many further permutations, disrupting assumptions that many of us now hold dear.

■ NOTES

1. I thank Norman Denzin, Yvonna Lincoln, James Holstein, Ruthellen Josselson, and Catherine Riessman for their comments on earlier drafts of this chapter.

2. The *Journal of Narrative and Life History* was created in 1990, and it became *Narrative Inquiry* in

1998. As just two examples of conferences, in February 2003 the American Educational Research Association held a Winter Institute on Narrative Inquiry in Social Science Research at the Ontario Institute for Studies in Education, and in May 2004 the second biannual Narrative Matters conference was held at St. Thomas University in New Brunswick.

3. For overviews of early life history methods in sociology, see Becker (1966), Bertaux (1981), Denzin (1970), and Plummer (1983).

4. The life history and life story approaches continue to be international in scope. The 2003 Board of Biography and Society, a research committee of the International Sociological Association, included researchers from many European countries as well as from Japan, South Africa, and Russia.

5. In addition to summarizing the interview data that she gathered from 129 women about childbearing, child rearing, marriage, housework, fieldwork, and community participation, Hagnod (1939) presented two women's life stories in depth. This allows readers to see the impact on these two women's lives of the social and economic conditions described earlier in the book.

6. For overviews of early life history methods in anthropology, see Langness (1965), Langness and Frank (1981), and Watson and Watson-Franke (1985).

7. Two volumes of *The American Slave* consist of interviews conducted at Fisk University before the Federal Writers' Project was created. During the late 1960s and early 1970s, Laster (1968) and Yetman (1970), among others, were publishing parts of and writing about the slave narratives. After the publication of *The American Slave*, Rawick (1977) and other researchers searched for, found, and published many other slave narratives that had been deposited in state collections and libraries. Not surprisingly, they found evidence that some of the narratives had been tampered with, presumably to suppress negative portrayals of whites.

8. For overviews of early second-wave feminist use of life history and personal narratives, see Armitage (1983), Geiger (1986), Gluck (1979, 1983), Personal Narratives Group (1989), and Reinhartz (1992, chap. 7).

9. Even before feminism became a major influence in social science research, there were exceptions to this pattern of methodological indifference and objectification of research participants. For example, in *Mountain Wolf Woman: Sister of Crashing Thunder*, Lurie (1961) addressed many methodological issues and described in detail her relationship with Mountain Wolf Woman.

10. See Mishler (1995, pp. 90–102) on various ways in which narrative researchers connect the “telling” and the “told.”

11. Polkinghorne (1995) and Mishler (1995) also made distinctions among types of narrative research in the social sciences, but because they excluded some kinds of work that I want to include (and because they included some kinds that I want to exclude), I construct my own categories here.

12. Because quantitative modes of inquiry are so dominant in psychology, some psychologists treat narrative inquiry as synonymous with qualitative inquiry (Josselson, Lieblich, & McAdams, 2003). Nonetheless, I have tried to separate out a psychological approach that uses the analytic lenses I have articulated and so is not identical to qualitative research in general.

13. For interview guides used by psychological researchers who take a narrative approach, see McAdams and Bowman (2001, pp. 12–13) and Josselson (1996b, pp. 265–272).

14. Some of the researchers I include in this approach are not sociologists. For example, Mishler is a psychologist and Largellier is a communication scholar. Nonetheless, their approach is sociological in the ways described here.

15. Sometimes memoirs, even those not written by social scientists, have autoethnographic characteristics. For example, in *Crossing the Color Line: Race, Parenting, and Culture*, Reddy (1994) investigated her experiences as a white woman married to an African American man and as the mother of two biracial children. She showed how these racialized relationships disrupted her identity as a white woman and her understanding of racial issues in the social world. The writing itself, however, is not experimental in the same way that much autoethnographic writing is.

16. See Chase (1995b, 2003) for a comparison of sociological interview questions and questions oriented to inviting narratives.

17. The influence of narrative inquiry can be seen in the difference between Rubin's (1976) *Worlds of Pain: Life in the Working Class Family* and Rubin's (1994) *Families on the Faultline: America's Working Class Speaks About the Family, the Economy, Race, and Ethnicity*. In the earlier book, Rubin (1976) presented anonymous excerpts from a range of interviewees to represent various themes. In contrast, Rubin (1994) organized the more recent book around the stories of specific families, beginning and ending the book with the same four families.

18. See also Ochberg (1996) on the ways in which researchers "convert what we have been told from one kind of account into another" (p. 110). In addition, Josselson (1996a) offered an interesting discussion of the anxiety, guilt, and shame that may arise when "writing other people's lives" and sharing interpretations with those people.

19. Ferguson's (2001) *Bad Boys: Public Schools in the Making of Black Masculinity* offers an example of a researcher mixing narrative strategies. For the most part, Ferguson wrote with an authoritative voice. But in the middle of the book, she shifted to a supportive voice when she included a 27-page transcript from an interview with an African American mother whose attempt to discipline her son was itself disciplined by police, courts, and social service agencies. Ferguson stated, "You must read what Mariana had to say aloud. You cannot understand it unless you hear the words" (p. 135).

20. For many other examples, see Köehler (1981, pp. 89–93), Langness and Frank (1981), and Watson and Watson-Franke (1985).

21. Focusing on instances rather than representative cases is not unique to narrative inquiry, but the issue may seem more urgent in narrative research because of the small number of narratives that researchers present. For broader discussions of the relation between the particular and the general, see Blum and McHugh (1984, p. 37), Denzin (1997, p. 245), and Psathas (1995, p. 50).

22. *The Vagina Monologues* was originally an off-Broadway production based on interviews with 200 American women. It has been performed in many cities and communities across the United States as well as around the globe. When performed in conjunction with the "V-day" movement, profits are donated to organizations fighting violence against women.

ARTS-BASED INQUIRY

Performing Revolutionary Pedagogy

Susan Finley

The focus of this chapter is the usefulness of arts-based approaches to doing qualitative inquiry when political activism is the goal. References were chosen to include both theoretical discussions about arts-based inquiry methodologies and examples of arts-based representations as well as to underscore the notions of usefulness and political activism that are served by arts-based inquiry. In this review, special attention is given to arts-based research that is positioned toward future developments in the field of socially responsible, politically activist, and locally useful research methodologies. From an historical perspective and for the purpose of defining arts-based research, the chapter addresses concerns and issues that have dominated discussions about arts-based research methodologies. Ultimately, it is argued that arts-based research can contribute greatly to "a radical ethical aesthetic . . . [that] grounds its representations of the world in a set of interpretive practices that implement critical race, queer, and Third World postcolonial theory" (Denzin, 2000, p. 261).

This chapter begins with a description of characteristics of arts-based research that render it unique among the various forms of postmodern qualitative inquiry. Following this characterization of arts-based research, it presents a skeletal outline of broader social features that provide a contextual backdrop for a radical, ethical, and revolutionary arts-based inquiry. Finally, the chapter concludes with an example of community-based, activist, arts-based inquiry. The genealogy of arts-based research that I have chosen to follow is couched in the widely shared belief that social science inquiry is always moral and political, and I further interpret this as a timely proclamation that its practitioners should, therefore, be purposeful in performing inquiry that is activist, engages in public criticism, and is resistant to neoconservative discourses that threaten social justice. Moreover, I believe that this purposeful turn to a revolutionary, performative research aesthetics facilitates critical race, indigenous, queer, feminist, and border studies.

■ POSTMODERN INTEGRATIONS OF ACTIVISM, SOCIAL SCIENCE, AND ART: DEFINING THE FEATURES OF ARTS-BASED INQUIRY

Arts-based inquiry has emerged in postcolonial postmodern contexts, woven from complex threads of social, political, and philosophical shifts in perspectives and practices across multiple discourse communities. It has surfaced in the context of a reflexive turn that marked the social sciences, philosophy and literary criticism, science, education, and the arts, and it is evidenced in particular by the narrative turn in sociological discourse.

Arts-based inquiry is one methodological and theoretical genre among many new forms of qualitative inquiry. It is situated within what Lincoln (1995) described as an emerging tradition of participatory critical action research in social science. Practitioners of inquiry in this line propose reinterpretation of the methods and ethics of human social research and seek to construct action-oriented processes for inquiry that are useful within the local community where the research originates. Arts-based inquiry, as it is practiced by academics doing human social research, fits historically within a postmodern framework that features a developing activist dynamic among both artists and social researchers.

Three historical stories are used here to recount the genealogy of a radical aesthetic inquiry: (a) the turn to activist social science, (b) the emergence of arts-based research (and the turn to activist arts), and (c) the turn to a radical, ethical, and revolutionary arts-based inquiry (and the emergence of revolutionary pedagogy).

The Turn to Activist Social Science

Postmodern foundational shifts brought about new conceptualizations of how research works, how meanings are made, and what social purposes research might serve. Social scientists began to act on their realization that traditional techniques of research were not adequate to handle the many questions that needed to be asked

when the frame was shifted to take on new and diverse perspectives. For instance, writers such as Guba (1967) identified the proliferation of new questions as a profound movement in social research away from questions concerning technique to questions concerning theory, and he foresaw a reformist movement that would bring "art" to inquiry (p. 64) as researchers sought ways in which to merge theory and practice. New questions prompted new ways of looking, and the transformation of social science research to include qualitative methodologies began full bore by the early 1970s (Schwandt, 2000).

Two primary issues arose to create a space for arts-based social science inquiry. First, the dialogue turned to ethical issues that occur in the relationship between researchers and the communities in which they work. Qualitative researchers had embraced new practices that redefined the roles of researchers and research participants—who no longer were subjects but instead were collaborators or even coresearchers—so that the lines between the researcher and the researched blurred. In the context of this type of locally meaningful inquiry, researchers and participants were actively developing an ethics of care that ultimately became a quality standard in the new paradigm for social science research (Lincoln & Reason, 1996). Rather than following the quantitative scientific model of objectivity, qualitative social science inquiry was increasingly defined as action-based inquiry that takes its forms through interpersonal, political, emotional, moral, and ethical relational skills that develop and are shared between researchers and research participants (Lincoln, 1995; Lincoln & Reason, 1996).

Second, questions and issues arose in this new stance of researchers as community partners and initiated a "crisis of representation" (Denzin & Lincoln, 1994) that prompted questions from researchers. How should research be reported? Are the traditional approaches to dissemination adequate for an expanding audience that includes a local community? How do researchers "write up" their understandings without "othering" their research partners, exploiting them, or leaving them voiceless in the telling of their own stories?

What forms should research take? How can researchers make their work available and useful to participants rather than produce reports in the tradition of academics writing for other academics or policymakers?

Nontraditional methods and revised standards for evaluating research emerged from these questions and in 1995 gave rise to the publication of the journal *Qualitative Inquiry* (edited by Norman Denzin and Yvonna Lincoln) as a location for ongoing discussions about the practices and methodologies that take place in participatory, critical action forms of research (for a review of the first 7 years of publication of *Qualitative Inquiry*, see Finley, 2003a). Writing in *Qualitative Inquiry*, Lincoln (1995) and Lincoln and Reason (1996) identified particular skills that had emerged in the new tradition of inquiry. The skills that were increasingly necessary to new paradigm researchers included interpersonal, political, emotional, moral, and ethical competence; intellectual openness and creativity; and spiritual qualities related to empathy and understanding when confronted with human experience.

In this context of research reform, Eisner (e.g., 1991/1998) also argued that successful researchers in the new social science genre require a different kind of skill base than was previously expected among social researchers. He proposed a graduate school curriculum that values students' developing skills of imagination, perception, and interpretation of the qualities of things as well as mastery of skills of artistic representation. To address the representational crisis, Eisner encouraged reaching into the existing fields of arts and letters: "Art, music, dance, prose, and poetry are some of the forms that have been invented to perform this function" (p. 235). Likewise, Seale (1999) visualized a studio apprenticeship model for learning a wide variety of research skills "in much the same way as artists learn to paint, draw, or sculpt" (p. 476). Similarly, Tierney (1998, 1999) acknowledged that authors' attempts to include multiple textual voices called for narrative range as wide and experimental as offered in literature. Writing in a special issue of *Qualitative Inquiry* devoted to life history research that took its forms

in literary genres, Tierney (1999) observed, "What these authors are struggling over is how to get out of the representational straightjacket that social scientists have been in for most of this century" (p. 309). He continued, "The authors want to create greater narrative flexibility in time, space, and voice. Their assumption is that rather than a standard proof akin to the natural scientists, readers make meaning from emotive and affective aspects of a text" (pp. 309–310).

Thus, the turn to activist social science was simultaneous and mutual with the turn to narrative social science research. Casey (1995) explained that methodological shifts in research approaches are tied to political or theoretical interests charged by social and historical circumstances and that narrative research is politically situated in that it "deliberately defies the forces of alienation, anomie, annihilation, authoritarianism, fragmentation, commodification, deprecation, and dispossession" (p. 213). In the context of activism, what is called for is expressive research that portrays the multidimensionality of human life as compared with truth finding, proofs, and conclusivity in traditional social science. Recognition of the power dynamic between the researcher and the researched called for the adaptation of literary forms to serve the purpose of research texts that represent, as vividly as possible, the words as well as the worlds of participants. The prevailing ethics of care among new social science researchers moved narrative discourse (i.e., storytelling) to the forefront of social science research.

Working in this politically and ethically charged context of border crossing, activist researchers broke new ground, offering research narratives in multiple literary forms. Denzin (2004) wrote,

Experimental, reflexive ways of writing first-person ethnographic texts are now commonplace. Critical narrative perspectives have become a central feature of counter-hegemonic, decolonizing methodologies (Munua and Swadener, 2004, p. 16). Sociologists, anthropologists, and educators continue to explore new ways of composing ethnography, and cultural criticism is now accepted practice. (p. 1)

Indeed, Columbia University now offers its medical students courses in literature, literary theory, and creative writing as part of its Program in Narrative Medicine (Thernstrom, 2004).

The Emergence of Arts-Based Research

Within the context of burgeoning new practices that merged activist social science and narrative art forms, Eisner (1981) expounded on the differences between scientific and artistic approaches to qualitative research, giving rise to arts-based educational research. One of Eisner's important contributions was his insistence on the power of form to inform that included a call to use many different art forms (e.g., dance, film, plastic arts) as well as the various narrative forms that have proliferated in the new social science paradigm. Eisner's theories are couched in the historical antecedents of artists and social scientists whose works seem virtually interchangeable—art that is social science and social science that is artful. They are especially respectful of the contributions that artists have made to understanding social life. In the new construction of social science, borders were crossed, but boundaries were similarly breached by postmodern artists seeking political voice and power and audience-participant influence in the construction of social values.

Cultural, historical, and political contexts that shaped the reform of social science research similarly invigorated political activism among artists. For example, Felshin (1995) argued that activist art took hold in the context of feminist-driven paradigmatic shifts that emerged during the 1970s and then expanded and institutionalized over the subsequent 20 years. Felshin traced the particular influence of paradigmatic shifts on the role of artists in society. She pointed out, for instance, that whereas activist art addresses a broad spectrum of social issues—homelessness, AIDS, violence against women, environmental neglect, sexism, racism, illegal immigration, and other topics—common methodologies, formal strategies, and activist goals are shared by new paradigm activist artists.

Activist art, in this self-reflective, early postmodern phase, according to Felshin (1995), is characterized by six traits:

- Innovative use of public space to address issues of sociopolitical and cultural significance
- Encouragement of community or public participation in arts making as a means of effecting social change
- Engagement of community participants in acts of self-expression or self-representation as a way of promoting voice and visibility among participants and of making the personal political
- Use of mainstream media techniques (e.g., billboards, posters, subway and bus advertising, newspaper inserts) to connect to a wider audience and to subvert the usual uses of commercial forms
- Immersion in community for preliminary research and collaborations among artists and communities/constituencies that share a personal stake in the issues addressed
- Conscious use of public spaces to contextualize artworks and to encourage audiences to define themselves not as passive spectators but rather as active participants in the artworks

In sum, Felshin defined "new public art" in terms that recollect Lincoln's (1995) descriptions of developing trends in "new social science." In this border-crossing dynamic, new work that has been created stands neither inside nor outside the realms of social science or art; instead, this work is located in the spaces formed by emotionality, intellect, and identity.

In arts-based research, paradigms for making meaning in the contextual realms of art and social science collide, coalesce, and restructure to become something that is not strictly identifiable as either art or science. As Ulmer (1994) observed, "To do *heuretics* is to cross the discourses of art and theory" (p. 81). *Heuretics* refers to creative processes of discovery and invention such as those that have been enjoyed by arts-based researchers who have consciously brought the methodologies of the arts to define new practices of human social inquiry. Eisner offered seven organizing premises that make explicit

his definition of arts-based inquiry, and his formative book, *The Enlightened Eye* (Eisner, 1991/1998), is presented as an argument in support of each of the seven foundations:

1. There are multiple ways in which the world can be known. Artists, writers, and dancers, as well as scientists, have important things to tell about the world.
2. Human knowledge is a constructed form of experience and, therefore, is a reflection of mind as well as of nature. Knowledge is made and not simply discovered.
3. The terms through which humans represent their conception of the world have a major influence on what they are able to say about it.
4. The effective use of any form through which the world is known and represented requires intelligence.
5. The selection of a form through which the world is to be represented not only influences what humans can say but also influences what they are likely to experience.
6. Educational inquiry will be more complete and informative as humans increase the range of ways in which they describe, interpret, and evaluate the educational world.
7. The particular forms of representation that become acceptable in the educational research community are as much a political matter as they are an epistemological one. New forms of representation, when acceptable, will require new competencies.

Eisner's argument rests in a multiple intelligences stance that holds that there are varied ways in which the world can be known and that broadening the range of perspectives available for constructing knowledge increases the informative value of research. Arts-based researchers are increasingly using art forms that include visual and performing arts as well as forms borrowed from literature. This presents a boundary crossing among arts-based researchers; it critiques the privilege of language-based ways of knowing, and

it further challenges status quo responses to the question "what is research?" There is a political challenge in Eisner's foundational construction. Here again, he noted that who does research and whether it is recognized as research when it is presented in art forms is a political issue linked to education. If research is to become a site for the implementation of critical race, feminist, and Third World methodologies (among others), researchers need to emphasize and confront the power issues underscored in Eisner's foundations. There are multiple socially constructed ways of knowing the world, and diversity is achieved in and through the voices of diverse people brought forward in the act of doing research as well as in representing it. As I have said elsewhere,

It is an act of political emancipation from the dominant paradigm of science for new paradigm researchers to say "I am doing art" and to mean "I am doing research"—or vice versa. In either utterance, that art and research are common acts makes a political statement. (Finley, 2003a, p. 290)

On the one hand, a communal experience of research requires that the information-gathering and analytical processes of inquiry be communal in nature and open to participation among members of the community that the research intends to serve. On the other hand, the community of care encompassed in the research experience also includes the audiences to research. Making art is a passionate visceral activity that creates opportunities for communion among participants, researchers, and the various audiences who encounter the research text. Arts-based research crosses the boundaries of art and research as defined by conventions formed in historically, culturally bounded contexts of the international art market and in the knowledge market dominated by higher education.

It is important to acknowledge here that both art with political purpose and social inquiry with artistic qualities have long and rich histories. In the arts-based research example, however, what is profoundly different and starkly political is the

effort to claim that art is equal to—indeed, sometimes even profoundly more appropriate than—science as a way of understanding. Arts-based research is one of many systemic studies of phenomena undertaken to advance human understanding—not exactly art and certainly not science. As Slattery and Langerock (2002) stated, arts-based research takes place in “synthetical moments—experiences of profound insight that merge time, space, and self in seamless transhistorical moments [not] . . . easily discernible and not clearly categorized within the rigid disciplinary boundaries” of art and science (p. 350). A primary concern for arts-based researchers is how to make the best use of their hybrid, boundary-crossing approaches to inquiry to bring about culturally situated, political aesthetics that are responsive to social dilemmas. The response has been to create and encourage open hermeneutic texts that create spaces for dialogues that blur boundaries among researchers, participants, and audiences so that, ideally, roles reverse and participants lead researchers to new questions, audiences revert to questioning practitioners, and so forth as all interact within the text. In this instance, the text is defined in its broadest possible terms and invokes all of the actions in the world that can be “read.”

Intertextuality refers to a kind of play (fullness) between texts. One text plays with the next text; that is, the play of intertextuality is the process of reading through which one text refers to another text in the process of cultural production (Barthes, 1970/1974). Intertextuality in research display points to the more dynamic aspects of cultural production. The meaning texts of social science include all things that can be read, can be interpreted, or are the referents to which people make meanings about their world. Thus, personal identity is created within social structures that are themselves “performance texts” that play into ongoing and always changing social and cultural constructions. For example, Garoian (1999) and Finley (2001) have separately produced examples of collage-assemblage artworks that are self-consciously autobiographical, drawing into their representative forms textual referents to social constructions such as ethnicity,

gender, socioeconomic status, and cultural history. Although these works are profoundly personal accounts of “becoming” the people we are, they are also commentaries on cultural histories and the texts that shaped and formed us. The concept of intertextuality goes a long way in explaining why culture and other social constructions are always dynamic.

Aspects of intertextuality form the basis for arts-based inquiry. In the hyphen that connects “arts” and “based” is a textual reference to the arts as a basis for something else, something that is “not art.” Connecting activist movements in art and research is one of the fundamental acts of intertextual reading that forms the foundation for arts-based research. Among the particular skills of the arts-based researcher is the ability to play or, perhaps more accurately, to construct a field for play; there is a physical dimension to making something, a confluence of mind and body applied in efforts to understand (see also Butler, 1997, 1999; Finley, 2001; Fox & Geichman, 2001). For Richardson, this physical dimension to cognition implies a “kinesthetic balance” that moves the audience/reader to some kind of action (Richardson & Lockridge, 1998). Moving people to action can be the purpose of arts-based research. The primary characteristics of arts-based research provide a formula for a radical, ethical, and revolutionary qualitative inquiry.

This genealogy of arts-based inquiry exists in the identification of intertextual connections and tensions (i.e., disconnections) among “new wave” social science researchers and storytellers, poets, dancers, painters, weavers, dramatists, and filmmakers who have situated themselves and their work in dynamic and diverse postmodern social structures. A postmodern rewriting of the story of arts-based inquiry methodologies plays out in discontinuous, discordant, and intertextual constructions. That there is a shared urge to use their work to promote revolutionary social justice that brings artists and social scientists into collective discourse is just one such construction.

As Barone (2001a) noted, arts-based inquiry evidences elements of design that are aesthetic in

character and that, with variation according to art form, are "selected for their usefulness in recasting the contents of experience into a form with the potential for challenging (sometimes deeply held) beliefs and values" (p. 26). Imagination, community, and communal experience, as well as perceptual, emotional, and sensual awareness, all contribute to the aesthetic dimensions of arts-based research. In arts-based research, the artfulness to be found in everyday living composes the aesthetic (Barone, 2001a; Barone & Eisner, 1997; Dewey, 1934/1958). Denzin (2000) and others have encouraged researchers to focus on the vernacular and to capture the visceral ephemeral moments in daily life. Vernacular, expressive, and contextualized language forms open narratives that promote empathy and care (Barone, 2001b). These entreaties to the vernacular for the purpose of broader audience/participant voice, representation, and appeal, as well as the philosophical appeal to regarding people equally, recall Tolstoy's (1946/1996) comments about art:

We are accustomed to understand art to be only what we hear and see in theaters, concerts, and exhibitions, together with buildings, statues, poems, and novels. . . . [But] all human life is filled with works of art of every kind—from cradle-song, jest, mimicry, the ornamentation of houses, dress, and utensils, to church services, building monuments, and triumphal processions. It is all artistic activity. (p. 66)

In its use of everyday, localized, and personal language, and in its reliance on texts that are ambiguous and open to interpretation, arts-based research draws people into dialogue and opens the possibility for critical critique of social structures (Barone, 2001a, 2001b). *Performativity* is the writing and rewriting of meanings that continually disrupts the authority of texts. Resistance is a kind of performance that holds up for critique hegemonic texts that have become privileged stories told and retold. All knowledge claims are dependent on ascription within power structures (stories) that are performed within cultural boundaries.

This connection among political resistance, pedagogy, and performance has emerged as a way of understanding, and it represents an arts-based methodological approach for interpreting and taking action (for a more comprehensive discussion of the "dramaturgical turn," see Denzin, 1997, 2003). Dramaturgy as a research form draws from the rich history of politically motivated, activist theater used to resist oppression. Garoian (1999) argued that performances in this genre can be used to "critique dominant cultural assumptions, to construct identity, and to attain political agency" (p. 2). Garoian defined the human body as a "contested site" (p. 23) where the activity of the play enables culturally disenfranchised actors to push against tradition, hegemony, and dominant standpoints. With echoes of Felshin (1995), Garoian drew on the feminist arts movement as a site of activist performance art, particularly with references to the performance artist Suzanne Lacy. Broadening his definition of performance as pedagogy, Garoian observed,

[Lacy's] art work is performative curriculum because it opens a liminal space, within which a community can engage a critical discourse, a space wherein decisions are contingent upon the collective desires of its citizens, as well as an ephemeral space because it is applicable to the particular time and place for which it has been designed. Thus, for Lacy, communities are contested sites, and performance art is a function of community development. (p. 128)

The community aspects of Lacy's work are accomplished by the involvement of diverse communities of participants as experts and actors examining their own oppression, where expertise is defined by participants' lives in the community. The participants in her work are coresearchers, critiquing and challenging themselves to understand their community and to overcome cultural oppressions that occur there. Thus, art, politics, pedagogy, and inquiry are brought together in performance.

In tracing the evolution of performance as a primary site for revolutionary research methodology, Denzin (2003) explained,

Ethnography had to be taken out of a purely methodological framework and located first within a performative arena and then within the spaces of pedagogy, where it was understood that the pedagogical is always political. We can now see that interpretive ethnography's subject matter is set by a dialectical pedagogy. This pedagogy connects oppressors and the oppressed in capital's liminal, epiphonic spaces. (p. 31)

The Turn to a Radical, Ethical, and Revolutionary Arts-Based Inquiry

With reference to writers who have advanced the notion of critical performance pedagogy, such as Freire (1970/2001), Giroux (2000, 2001), Kincheloe and McLaren (2000), Conquergood (1998), Garoian (1999), Pineau (1998), and Hill (1998), Denzin (2003) put forward a model of performance ethnography "that moves from interpretation and emotional evocation to praxis, empowerment, and social change" (p. 133).

This turn by Denzin (1999) to critical performance delivered on his charge to critical ethnographers that performative pedagogy is needed to confront race relations and inequalities in the globalized capitalist democratic system. Denzin (2003) explained that, through an evolutionary process, the field of ethnography has reached its current critical, performative pedagogical moment; it is a point in time when performative ethnography can be enacted as critical social practice. A critical performance pedagogy should enable oppressed persons to "unveil the world of oppression and through praxis commit themselves to its transformation" (Freire, 1970/2001, p. 54, cited in Denzin, 2003, p. 30).

It is a shift in perspective and a call to action demanded by the cultural, social, and governmental epoch in which we live. As McLaren (2003) stated, there is renewed intensity in pleas to take reformatory action today in the face of globalized oppression and repressive political structures. These "dark times" as McLaren (1999) called them, demand that practitioners and theorists who have their work in an ethics of care and social responsibility will take critical pedagogy to the heights of political action. Revolutionary

performance pedagogy must move beyond the dialogical tasks of reframing, refunctioning, and reposing questions and formulations of knowledge that characterize critical pedagogy in preference for action (p. 8). Instead, the call to revolution is ethical: "to make liberation and the abolition of human suffering the goal of the educative enterprise" (p. 5).

Revolutionary pedagogy, as described by McLaren (1999, 2001, 2003), does the following:

- Resists heterogeneity in discourses and representations of history, culture, and politics that ignore the tensions and contradictions lived through raced and gendered difference
- Names and gives voice to nonparticipants in the power structures derived from world capitalism and colonialist practices
- Contests various assaults on protections for the poor, for women, and for people of color
- Challenges the assumptions and ideologies enacted in schooling and attempts to refashion a politics of education to the larger universal values of social democracy
- Offers a provisional glimpse of a new society freed from the bondage of the past
- Creates narrative spaces set against the subjectification of everyday experience and gives rise to an empowered way of being by recognizing and naming, in an uncompromising critique, the everyday signifiers of power and practices of concealment that typically prevent self-knowledge and by discouraging naming the tensions and contradictions wrought by capitalist colonialist practices
- Directly confronts differentiated totalities of contemporary society and their historical imbrications in the world system of global capitalism by engagement in revolutionary transformation (conceived as an opposition to social justice reforms)

From a postmodern perspective, Ullmer (1994) similarly argued for a revolutionary pedagogy that makes its task the transformation of institutions by using the formalizing structures of the institution itself to experimentally rearrange reality for critical effect. He cited Eco (1984, p. 409) to make his case for engaging in "revolutionary"

interventionist works that entertain the possibility, as in an ideal "guerilla" semiotics, of "changing the circumstances by virtue of which the receivers choose their own codes of reading. . . . This pragmatic energy of semiotic consciousness shows how a descriptive discipline can also be an active project" (Ulmer, 1994, p. 86).

Social crisis suggests that the next phase in the development of arts-based research will bring into focus the potential for arts-based inquiry to confront postmodern political issues such as diversity and globalization and for its practitioners to implement critical race, queer, and postcolonial epistemologies.

In performance, the emphasis is on doing. Thus, performance creates a specialized (open and dialogic) space that is simultaneously asserted for inquiry and expression. Performance requires some sort of imaginative interpretation of events and the contexts of their occurrences. A performance text redirects attention to the process of doing research rather than looking for truth, answers, and expert knowledge in a final report of findings from the researcher. "Open texts cannot be decontextualized; their (now unpredictable) meanings emerge within the sociology of space and are connected within the reciprocal relationships that exist between people and the political, dynamic qualities of place" (Finley, 2003a, p. 288).

Such performances are possible in any art form, including visual arts, music, dance, poetry, and narrative. In posing questions, analyzing information, making discoveries, and/or engaging in political action, the performative text is a politically, socially, and contextually grounded work (in the example of music, see Daspit, 2000; Frith, 1996).

It is in this liminal space that distinctions are made between private and public spheres, thereby rendering personal identity, culture, and social order unstable, indeterminate, inchoate, and amenable to change. Giroux (1995) argued, "It is within the tension between what might be called the trauma of identity formation and the demands of public life that cultural work is both theorized and made performative" (p. 5, cited in Garoian, 1999, pp. 40–41). From within the openings that are created by arts research, people—just ordinary

people, you and me, researchers as participants as audiences—can implement new visions of dignity, care, democracy, and other postcolonial ways of being in the world.

■ ARTS-BASED INQUIRY AS "GUERRILLA WARFARE": TAKING BACK THE STREETS

Denzin (1999) urged a new movement in qualitative inquiry in which researchers take up their pens (and their cameras, paintbrushes, bodies, and voices) so that we might "conduct our own ground-level guerrilla warfare against the oppressive structures of our everyday lives" (pp. 568, 572). Following Freire (1970/2001; see also discussion of this point in Denzin, 2003), there are two primary tasks that are the specific aims of human social inquiry in the context of a revolutionary arts-based pedagogy: (a) to unveil oppression and (b) to transform praxis. What follows is a discussion of those two tasks and an example of radical, ethical, and revolutionary arts-based inquiry. This inquiry has taken place (and is continuing) among various diverse communities of economically poor children and their families (both sheltered and unsheltered), street youths (unaccompanied minors, run-away and throwaway children, travelers, and other people between 17 and 24 years of age who live on the streets), and tent communities where unhoused people govern their own lives. It also includes the experience of field-based, community-centered research among college students, teachers, shelter workers, and other social services providers as well as the community more broadly. The discourse community is intentionally broad so as to involve as many individuals and role representatives as I can draw into dialogue, critical critique, inquiry, and social action around issues of poverty and homelessness as they influence the educational lives and experiences of children, youths, and adults. (For examples, see Finley, 2000a, 2000b, 2003b; Finley & Finley, 1999. For a discussion of Finley, 2000a, as participatory performance inquiry, see Denzin, 2003. For an adaptation into a stage performance of these and other research publications in this line of

social research, see Saldaña, Finley, & Finley, in press. For discussions of ethnomethodology, see Saldaña, 1999, 2003.)

"Mystory" Performances

With the intention of empowering children living in shelter and transitional housing to become active learners in classrooms, the At Home At School (AHAS) program that I organize brings together K–8 (kindergarten through eighth grade) children, their families, and preservice and inservice teachers in a field-based community project. All of us are students; we are both the researchers and the researched following an arts-based inquiry model of new paradigm human studies. Children experience arts-based literacy instruction (broadly conceived) throughout the school year during after-school educational enrichment and in an intensive 6-week summer school program. Doing drama, literature, visual arts, gardening, and computer technology are the mainstays of the children's program. Teachers learn firsthand what it means for children to live in a shelter or temporary apartment; they experience the encumbrances of poverty to education more closely than most have experienced previously, and they learn methods for integrating arts across the disciplines. Children in this setting have experienced the criminalization of homelessness in America, marginalization in schools, and disrupted lives in changing homes and schools as they and their families search for affordable housing. Of course, some are further injured to the vagaries of addictions, imprisonments of parents and siblings, and other social manifestations of poverty in a minimum-wage economy.

While enrolled in AHAS, children who reside in shelter and transitional housing live in a system that regulates their time—with rules for when they can bathe, sleep, eat, and so forth—simply because of their status as unhoused (longtime or recently) and economically poor persons.

Various, in addition to strengthening academic performance as a means to build self-esteem, my goal with the children who attend AHAS is to draw their attention to the relationship between themselves and society so as to help them redirect the anger that they sometimes feel at themselves

and their parents back toward the system of sustained poverty that subverts them. The goal is for the children to embrace their understandings of themselves and society in terms of political struggle and, in so doing, to encourage them to imagine all that they can do and be in their lives—and to dispute what might seem to be a destiny of lifelong poverty. My task is to provide tools for constructing new autobiographical images and then to encourage ongoing practices that these children and their families might use to transform their lives.

Equally important is my goal of providing tools for K–12 educators to recognize that their own compliance with a system that degrades and disenfranchises these children leaves "blood on their hands." The goal is to encourage them to find ways in which to assist students toward newly formed life stories built on the notion of a caring community that includes educators who, while part of the system, will use the system in its own transformation. Because art is a visceral and personal experience that gives expression to affective ways of being and knowing, I introduce arts-based inquiry in this curriculum as a way for the children and their teachers to create their own "mystories." Mystory performances are personal cultural texts (e.g., narratives, paintings, poetry, music) that contextualize important personal experiences and problems within the institutional settings and historical moments where their authors (e.g., painters, collagists, dramatists) find themselves. They attempt to make sense of seemingly senseless moments in life, to capture frustrations and turmoil and open them for critical critique. They open a liminal space, and create an open and dialogic text, where a diverse group of people can be brought to collective understanding of the sites of power, of conflicts between the empowered and the powerless, and from this point of understanding can begin to address the need for social change (for further discussions of the functions of mystory, see Denzin, 2003; Ulmer, 1989).

Teacher-led projects in which children have created mystories that have taken place in the context of AHAS include an extended effort at portraiture during which children painted their life histories first by learning to work within the

symbolic language of colors, lines, and space and brush work while working with charcoal, pens, and water and acrylic paints. Over a period of roughly 3 months (shelter stays are limited to 90 days, so there was a changing population of children, with some attending all of the sessions and some attending only a few), during weekly sessions children painted self-portraits, pictures of objects, and so forth to tell life stories. The project culminated with a day of communal painting of five mural panels (4 feet by 4 feet) with the theme of "the story of us." Again, the children followed up the session by verbally processing the meanings they intended when they began painting and by defining the meanings they constructed during the process.

Amid likenesses of "Sponge Bob," trees, peace symbols, and American flags, personal and community stories emerged. One child who had practiced and then painted a very pleasing tree blacked it out with other paint so that it was no longer even visible on the canvas, and two other boys joined him in his "scorched earth" efforts. When the child expressed his anger and frustration with multiple heart surgeries that left him physically smaller than his peers—a personal story, but one that had community ties—his teachers were better prepared to understand his occasional displays of seemingly unfounded temper. Telling his life story, he found compassion and understanding among his peers and teachers, and he began to attend tutoring sessions each week with absolute regularity, had fewer outbursts, and began (over a period of several months) to improve his school performance.

In this same setting, three girls had painted a scene in which two (gender-neutral) couples walked among trees and flowers. On close inspection, one couple held hands while the other couple did not, and the couple not holding hands had tears flowing from their eyes. These girls' storytelling turned to personal remembrances of divorce, of grandparents left in other states as a result of moves, and of feelings of being disconnected from peers when at school. From that point, beginning with the girls who had painted the scene but also involving other children, a conversation grew about loving their own mothers

but wanting to build lasting relationships in their own lives. Because the scene took a mural space very close to a U.S. flag, next to which another student had written "give peace a chance" and several had drawn peace signs, conversation shifted again, now having moved from the realm of personal experiences of divorce and separation, to a discussion of world instability and U.S. dominance, and the instability to children's lives introduced by war. Nothing was resolved—there were disagreements as to whether the United States was right or wrong to go to war—but most important was that there was a conversation about the war at all; children were expressing their opinions about world events and were confident that their ideas mattered. I could not help but think that students' understandings wrought by telling mystories would carry over, at least in minimal ways, to life at school.

Painted portraits are just one way for the children to tell "the story of us." We also have had occasions for movie making, writing, and performing rap and blues, and we have constructed a community in which personal storytelling is rewarded. Against this backdrop of unveiling personal and systemic events that have shaped the lives of the children, two events that have occurred convince me that we are achieving transformative praxis in AHAS.

First, a rule prohibited people living in the shelter from fraternizing with people living in transitional housing by going back and forth to each other's places of residence. Two 12-year-old girls—one who lived in a transitional housing apartment and the other who was housed at the shelter—became very close friends during tutoring. While the girls were making plans to visit one another after the program at the apartment of one of the girls, another student reminded them of the rule and that if it were enforced, the girls' families would be asked to leave. This was followed by a discussion among the children in which they recognized how unfair the situation was. They decided that they had to do something about it. Their solution was to write in their journals about the situation and then to show me what they had written and enlist my help in challenging the rule. They disputed the system, and they took action to

try and change the rule. In the end, because of their problem solving, the rule was changed.

Second, the painted murals were hung, along with excerpts from the narrative sessions, in the gallery of the Student Services building at the university where I teach. I took a class of 11 practicing teachers (who were enrolled in my advanced children's literature course) to see the display. Of these 11 teachers, 5 began volunteer tutoring on a weekly basis and several carried over beyond the end of the semester. In addition, they conducted book drives at their schools so that every child could take a book home with him or her. Most important, all of the teachers made statements similar to this comment offered by one:

I have always had these children in my classes, and I have always resented them being there. I have seen them as unprepared, [as] underparented, and as a waste of my time. I have changed. I'm a good teacher to a lot of the children. My goal now is—truly, not just as mere rhetoric—to become a teacher of all of the children in my classroom. These children are now my children.

In sum, although the painting of the portraits affected these children's perceptions of themselves as learners and in both their current and future participation in society, what is perhaps more profound is the impact that the children have had, through their paintings and stories, on other children in similar circumstances who will attend classes taught by the teachers and preservice teachers who have adopted activist pedagogies and practices.

As an educator, I want to encourage children to learn early to become lifelong activists who are equipped for guerrilla warfare against oppression by virtue of their ability to name their oppressors, dispute oppressive practices that are stereotyped or systematized into seeming normality, imagine a life lived otherwise, and then construct and enact a script that shifts them into an alternative space. Art, in any of its various forms, provides media for self-reflection, self-expression, and communication between and among creators and audiences. Performing social change begins with artful ways of seeing and knowing ourselves and the world in which we live.

The AHAS example demonstrates that art can be the catalyst for audiences to see themselves differently, to receive messages, and to find a level of understanding about people that they would have ignored in different circumstances. Knowing these children through their artful expressions of themselves motivated a group of adults to embrace their empathetic emotions and to give something of their time and expertise as teachers. Yet once they were in direct contact with the artists, the teachers became students of the social structures they helped to perpetuate and began to write small scripts based on the need for change, with book drives and gifts of books being the foundation for change in the emotional and physical spaces in which teaching and learning occur in their schools and classrooms. For the teachers, it takes a sustained effort at learning to use the tools that are available to create and revise their own self-portraits; practice is required. Artful performance in the community will occur if teachers look deeply enough into themselves and can paint their way to a more humanistic and communal portraiture than schools typically allow.

In these examples, the children have become researchers and artists of their own lives. Other examples, not given here because of space considerations, would demonstrate the arts-based inquiry that teachers have experienced in this context. Still another group of examples would be my own inquiries into the experiences of AHAS, some of which have been coauthored and copresented with K-12 students, teachers, street youths, and street artists. In this schema, arts-based research makes possible the erasure of distinctions between the researcher and the researched. We all are inquirers into our experiences and collaborators in efforts to create a better space to share our lives.

A major dilemma for arts-based researchers has emerged around definitions of quality criteria. What is good arts-based research? Is it incumbent on arts-based research to demonstrate the best in terms of artistic skill and craftsmanship? And, if demonstrations of artistic skill are necessary to arts-based research, can quality arts-based inquiry be achieved by community-members (e.g., children and teachers, as well as university researchers) who are not educated in the art-form chosen as the

representational text? How far can arts-based researchers go in becoming "community partners" where distinctions between the roles of researcher and researched converge? Who is an artist? Who is a researcher? These are questions that underscore the postmodern turn in sociological research, but they have become somewhat polarizing issues among arts-based researchers. Some practitioners of arts-based inquiry argue for the need to develop an established research tradition that has coherence and integrity in its methodological and epistemological commitments, whereas others take the position I have taken in this chapter—that quality control efforts force a singular way of knowing and shut off the possibilities for diverse voices and expressions. Performativity is the quality criterion I have emphasized in this chapter as being necessary to achieve arts-based approaches to inquiry that is activist, engages in public criticism, is resistant to threats to social justice, and purposefully intends to facilitate critical race, indigenous, queer, and feminist and border studies as entrée to multiple, new, and diverse ways of understanding and living in the world.

THE INTERVIEW

From Neutral Stance to Political Involvement

Andrea Fontana and James H. Frey

The movie *Memento* begins at the end, showing a killing and then backing up to the beginning scene by scene. We do not go that far here; after all, this is not a thriller but rather a chapter about interviewing. Yet we cut to the chase, beginning with the razor-edge state of interviewing and then backing up to the old days and progressing to our days through the chapter, with full knowledge of where we are going. If you think that this will spoil the ending, skip the first section and read it last.

We have no actual killing here, but metaphorically, traditional interviewing—as it is commonly understood—does get killed. The perpetrators (or liberators, depending on your point of view) are Kong, Mahoney, and Plummer (2002), the coauthors of "Queering the Interview." They focus on the changing public perception of gays and lesbians in the United States during the past few decades and on how that changing perception altered the tone of interviewing those groups. Decades ago, when gays were "homosexuals," the interview "was clearly an instrument of pathological diagnosis," yet when the milieu became one of social reform, "the interview became a tool of

modernist democratization and ultimately of social reform" (p. 240).

What this tells us about interviewing is that it is inextricably and unavoidably historically, politically, and contextually bound. This boundedness refutes the whole tradition of the interview of gathering objective data to be used neutrally for scientific purposes. If *queering* the interview denies its primary goal, what should be done? We could reject interviewing altogether. That is hardly feasible in today's society, which has been tabbed as "the interview society," where everyone gets interviewed and gets a moment in the sun, even if only to reveal dastardly aberrations on the *Jerry Springer* show. We certainly do not want to trivialize the interview in the same way as the mass media have tended to do. What should we do? Very simply, some sociologists have turned the timetable and returned the scope of the interview to that of the predecessors of interactionism, the pragmatists, focusing on social amelioration. If the interview cannot be a neutral tool (and we will see that it never really was), why not turn it into a walking stick to help some people get on their feet? This is where the interview is now, and we outline this development next.

■ EMPATHETIC INTERVIEWING

"Empathetic" emphasizes taking a stance, contrary to the scientific image of interviewing, which is based on the concept of neutrality. Indeed, much of traditional interviewing concentrates on the language of scientific neutrality and the techniques to achieve it. Unfortunately, these goals are largely mythical.

As many have argued convincingly (Atkinson & Silverman, 1997; Fontana, 2002; Hertz, 1997b; Holstein & Gubrium, 1995; Scheurich, 1995), interviewing is not merely the neutral exchange of asking questions and getting answers. Two (or more) people are involved in this process, and their exchanges lead to the creation of a collaborative effort called *the interview*. The key here is the "active" nature of this process (Holstein & Gubrium, 1995) that leads to a contextually bound and mutually created story—the interview. Some have highlighted the problematics of the interview. Atkinson and Silverman (1997) drew attention to the asymmetric nature of the interview and to the fact that the final product is a pastiche that is put together by fiat. Scheurich (1995) observed that the interviewer is a person, historically and contextually located, carrying unavoidable conscious and unconscious motives, desires, feelings, and biases—hardly a neutral tool. Scheurich maintained, "The conventional, positivist view of interviewing vastly underestimates the complexity, uniqueness, and indeterminateness of each one-to-one human interaction" (p. 241).

If we proceed from the belief that neutrality is not possible (even assuming that it would be desirable), then taking a stance becomes unavoidable. An increasing number of social scientists have realized that they need to interact as persons with the interviewees and acknowledge that they are doing so. Long ago, Douglas (1985) advocated revealing personal feelings and private situations to the interviewee as a *quid pro quo* of good faith. Yet Douglas, despite his openness, still placed primary importance on the traditional notion of obtaining better and more comprehensive responses; he failed to see that his openness was merely a technique to persuade the interviewee

to reveal more and be more honest in his or her responses.

New empathetic approaches in interviewing differ from the conventional approach; they see that it is time to stop treating the interviewee as a "clockwork orange," that is, looking for a better juicer (techniques) to squeeze the juice (answers) out of the orange (living person/interviewee). Scheurich (1995) concurred; "The modernist representation is not sheer fabrication, but all of the juice of the lived experience has been squeezed out" (p. 241). The new empathetic approaches take an ethical stance in favor of the individual or group being studied. The interviewer becomes an advocate and partner in the study, hoping to be able to use the results to advocate social policies and ameliorate the conditions of the interviewee. The preference is to study oppressed and underdeveloped groups.

Kong and colleagues (2002), as mentioned earlier, showed that the change toward empathy might not be so much of an individual decision as it is the result of changing historical, political, and cultural perspectives. They discussed changes in interviewing regarding same-sex experiences. They showed that during the past few decades, as Americans underwent a profound change from "homosexuals" to "gays," *"the sensibilities of interviewing are altered with the changing social phenomena that constitute the 'interview'"* (p. 240, italics in original). Thus, interviews changed from "instruments of pathological diagnosis" (p. 240) to become much more humanized in the wake of social reform. Interviews became "a methodology of friendship" (p. 254). Kong and colleagues concluded that the interview is bound in historical, political, and cultural moments and that as those moments change, so does the interview. The work by these three coauthors was radical in that it collapsed decades of alleged "objective interview findings." As they clearly stated, framing the interview within specific parameters (i.e., "We are interviewing pathological, sick, deviant individuals" vs. "We are interviewing individuals who should not be ostracized because of their diverse sexual sensibilities") will lead to entirely different results. These results will be anything but neutral;

they will be politically laden and used for or against the group studied.

Researchers have strongly emphasized the removal of barriers between the interviewer and the interviewee in the process of interviewing women. Many female researchers advocate a partnership between the researcher and respondents, who should work together to create a narrative—the interview—that could be beneficial to the group studied. Most researchers address factors beyond that of gender. Hertz and Ferguson (1997) addressed the plight of single mothers—both heterosexuals and lesbians. Weston (1998) also attended to groups of same-sex preferences in academia. Collins (1990) added the element of being black to that of being female. Denzin (2003a, 2003b) extended the interest in amelioration of oppressed groups to that in reporting the results of the study. He maintained that traditional reporting modes are ill equipped to capture the attention and hearts of the readers (see also Behar, 1996). Denzin (2003a) issued a “manifesto” calling for performance ethnography: “We need to explore performance ethnography as a vehicle for enacting a performative cultural politics of hope” (p. 202).

Some researchers are becoming keenly attuned to the fact that in knowing “others,” we come to know “ourselves.” Holstein and Gubrium (1995) urged researchers to be reflexive not only about *what* the interview accomplishes but also about *how* the interview is accomplished, thereby uncovering the ways in which we go about creating a text. Wasserfall (1993) noted that even when the researcher and respondents are women, if there is a discordant view of the world (in her study, a political one), there is a great divide between the two. She added that, despite claims to “friendship and cooperation,” it is the researcher who ultimately cuts and pastes together the narrative, choosing what will become a part of it and what will be cut. Similarly, El-Or (1992) pointed to a gap between the researcher and respondents created by religious differences (in her study, when a nonreligious ethnographer studies an ultra-orthodox group). El-Or also reflexively addressed the notion of “friendship” between the

researcher and respondents and concluded that it is fleeting and somewhat illusory: “We can’t be friends because she [the respondent] was the object and we both know it” (p. 71). Atkinson and Silverman (1997) also emphasized self-restraint and self-reflexivity in warning that researchers should not replace a false god (the authorial monologue of classical sociology) with another (the monologue of a privileged speaking respondent). Researchers should not privilege any ways of looking at the world or at a particular technique but should instead continue to question, question, and question.

Atkinson and Silverman’s (1997) chilly warning can be turned on the proponents of the empathetic approach because they strongly privilege a method of inquiry over all others. Yet as Denzin (2003a) observed, “Symbolic interactionism is at a crossroad. We need to reclaim the progressive heritage given to us by DuBois, Mead, Dewey, and Blumer” (p. 202). As Fontana (2003) pointed out, perhaps Denzin (and we could add all of the others) is being a postmodern Don Quixote in his approach, yet the windmills of racism, sexism, and ageism are not mere shadows in our minds; rather, they are very real and very oppressive. The empathetic approach is not merely a “method of friendship”; it is a method of morality because it attempts to restore the sacredness of humans before addressing any theoretical or methodological concerns.

We too have “queered” the chapter to follow by framing it in the light of today’s development and new awareness in interviewing. Let us turn the time back and see how interviewing has come to be where it is.

■ INTERVIEWING IN PERSPECTIVE

Asking questions and getting answers is a much harder task than it may seem at first. The spoken or written word always has a residue of ambiguity, no matter how carefully we word the questions and how carefully we report or code the answers. Yet interviewing is one of the most common and powerful ways in which we try to understand our

fellow humans. Interviewing includes a wide variety of forms and a multiplicity of uses. The most common form of interviewing involves individual, face-to-face verbal interchange, but interviewing can also take the form of face-to-face group interchange and telephone surveys. It can be structured, semistructured, or unstructured. Interviewing can be used for marketing research, political opinion polling, therapeutic reasons, or academic analysis. It can be used for the purpose of measurement, or its scope can be the understanding of an individual or a group perspective. An interview can be a one-time brief exchange, such as 5 minutes over the telephone, or it can take place over multiple lengthy sessions, at times spanning days as in life history interviewing.

The use of interviewing to acquire information is so extensive today that it has been said that we live in an "interview society" (Atkinson & Silverman, 1997; Silverman, 1993). Increasingly, qualitative researchers are realizing that interviews are not neutral tools of data gathering but rather active interactions between two (or more) people leading to negotiated, contextually based results. Thus, the focus of interviews is moving to encompass the *hows* of people's lives (the constructive work involved in producing order in everyday life) as well as the traditional *whats* (the activities of everyday life) (Cicourel, 1964; Dingwall, 1997; Gubrium & Holstein, 1997, 1998; Holstein & Gubrium, 1995; Kvale, 1996; Sarup, 1996; Seidman, 1991; Silverman, 1993, 1997a). Interviews are moving toward new electronic forms and have seen a return to the pragmatic ideal of political involvement.

In this chapter, after discussing the interview society, we examine interviews by beginning with structured methods of interviewing and gradually moving to more qualitative types, examining interviews as negotiated texts and ending with electronic interviews and new trends in interviewing. We begin by briefly outlining the history of interviewing and then turn to a discussion of the academic uses of interviewing. Although the focus of this volume is qualitative research, to demonstrate the full import of interviewing, we need to discuss the major types of interviewing

(structured, group, and unstructured) as well as other ways in which to conduct interviews. One caveat is that, in discussing the various interview methods, we use the language and rationales employed by practitioners of these methods; we note our differences with these practitioners and our criticisms later in the chapter in our discussion of gendered and other new types of qualitative interviewing. Following our examination of structured interviewing, we address in detail the various elements of qualitative interviewing. We then discuss the problems related to gendered interviewing, as well as issues of interpretation and reporting, as we broach some considerations related to ethical issues. Finally, we note some of the new trends in qualitative interviewing.

■ THE INTERVIEW SOCIETY

Before embarking on our journey through interviewing per se, we comment briefly on the tremendous reliance on interviewing in the U.S. society today. This reliance on interviewing has reached such a level that a number of scholars have referred to the United States as "the interview society" (Atkinson & Silverman, 1997; Silverman, 1993).

Both qualitative and quantitative researchers tend to rely on the interview as the basic method of data gathering whether the purpose is to obtain a rich, in-depth experiential account of an event or episode in the life of the respondent or to garner a simple point on a scale of 2 to 10 dimensions. There is inherent faith that the results are trustworthy and accurate and that the relation of the interviewer to the respondent that evolves during the interview process has not unduly biased the account (Atkinson & Silverman, 1997; Silverman, 1993). The commitment to, and reliance on, the interview to produce narrative experience reflects and reinforces the view of the United States as an interview society.

It seems that everyone—not just social researchers—relies on the interview as a source of information, with the assumption that interviewing results is a true and accurate picture of

the respondents' selves and lives. One cannot escape being interviewed; interviews are everywhere in the form of political polls, questionnaires about visits to doctors, housing applications, forms regarding social service eligibility, college applications, talk shows, news programs—the list goes on and on. The interview as a means of data gathering is no longer limited to use by social science researchers and police detectives; it is a “universal mode of systematic inquiry” (Holstein & Gubrium, 1995, p. 1). It seems that nearly any type of question—whether personal, sensitive, probing, upsetting, or accusatory—is fair game and permissible in the interview setting. Nearly all interviews, no matter their purposes (and these can be varied—to describe, to interrogate, to assist, to test, to evaluate, etc.), seek various forms of biographical description. As Gubrium and Holstein (1998) noted, the interview has become a means of contemporary storytelling in which persons divulge life accounts in response to interview inquiries. The media have been especially adept at using this technique.

As a society, we rely on the interview and, by and large, take it for granted. The interview and the norms surrounding the enactment of the respondent and researcher roles have evolved to the point where they are institutionalized and no longer require extensive training; rules and roles are known and shared. (However, there is a growing group of individuals who increasingly question the traditional assumptions of the interview, and we address their concerns later in our discussion of gendered interviewing and new trends in interviewing.) Many practitioners continue to use and take for granted traditional interviewing techniques. It is as if interviewing is now part of the mass culture, so that it has actually become the most feasible mechanism for obtaining information about individuals, groups, and organizations in a society characterized by individuation, diversity, and specialized role relations. Thus, many believe that it is not necessary to “reinvent the wheel” for each interview situation given that “interviewing has become a routine technical practice and a pervasive, taken-for-granted activity in our culture” (Mishler, 1986, p. 23).

This is not to say, however, that the interview is so technical and the procedures are so standardized that interviewers can ignore contextual, societal, and interpersonal elements. Each interview context is one of interaction and relation, and the result is as much a product of this social dynamic as it is the product of accurate accounts and replies. The interview has become a routine and nearly unnoticed part of everyday life. Yet response rates continue to decline, indicating that fewer people are willing to disclose their “selves” or that they are so burdened by requests for interviews that they are much more selective in their choices of which interviews to grant. Social scientists are more likely to recognize, however, that interviews are interactional encounters and that the nature of the social dynamic of the interview can shape the nature of the knowledge generated. Interviewers with less training and experience than social scientists might not recognize when interview participants are “actively” constructing knowledge around questions and responses (Holstein & Gubrium, 1995).

We now turn to a brief history of interviewing to frame its roots and development.

■ THE HISTORY OF INTERVIEWING

At least one form of interviewing or another has been with us for a very long time. Even ancient Egyptians conducted population censuses (Babbie, 1992). During more recent times, the tradition of interviewing evolved from two trends. First, interviewing found great popularity and widespread use in clinical diagnosis and counseling where the concern was with the quality of responses. Second, during World War I, interviewing came to be widely employed in psychological testing, with the emphasis being on measurement (Maccoby & Maccoby, 1954).

The individual generally credited with being the first to develop a social survey relying on interviewing was Charles Booth (Converse, 1987). In 1886, Booth embarked on a comprehensive survey of the economic and social conditions of the people of London, published as *Life and Labour of*

the People in London (Booth, 1902–1903). In his early study, Booth embodied what were to become separate interviewing methods because he not only implemented survey research but also triangulated his work by relying on unstructured interviews and ethnographic observations:

The data were checked and supplemented by visits to many neighborhoods, streets, and homes, and by conferences with various welfare and community leaders. From time to time Booth lived as a lodger in districts where he was not known, so that he could become more intimately acquainted with the lives and habits of the poorer classes. (Parten, 1950, pp. 6–7)

Many other surveys of London and other English cities followed, patterned after Booth's example. In the United States, a similar pattern ensued. In 1895, a study attempted to do in Chicago what Booth had done in London (Converse, 1987). In 1896, the American sociologist W. E. B. DuBois, who admittedly was following Booth's lead, studied the black population of Philadelphia (DuBois, 1899). Surveys of cities and small towns followed, with the most notable among them being the Lynds' *Middletown* (Lynd & Lynd, 1929) and *Middletown in Transition* (Lynd & Lynd, 1937).

Opinion polling was another early form of interviewing. Some polling took place well before the start of the 20th century, but it really came into its own in 1935 with the forming of the American Institute of Public Opinion by George Gallup. Preceding Gallup, in both psychology and sociology during the 1920s, there was a movement toward the study (and usually the measurement) of attitudes. W. I. Thomas and Florian Znaniecki used the documentary method to introduce the study of attitudes in social psychology. Thomas's influence along with that of Robert Park, a former reporter who believed that sociology was to be found out in the field, sparked a number of community studies at the University of Chicago that came to be known collectively as the works of the Chicago School. Many other researchers, such as Albion Small, George H. Mead, E. W. Burgess, Everett C. Hughes,

Louis Wirth, W. Lloyd Warner, and Anselm Strauss, were also greatly influential (for a recent discussion of the relations and influence of various Chicago School members, see Becker, 1999).

Although the members of the Chicago School are reputed to have used the ethnographic method in their inquiries, some disagree and have noted that many of the Chicago School studies lacked the analytic component of modern-day ethnography and so were, at best, "firsthand descriptive studies" (Harvey, 1987, p. 50). Regardless of the correct label for the Chicago School members' fieldwork, they clearly relied on a combination of observation, personal documents, and informal interviews in their studies. Interviews were especially in evidence in the work of Thrasher (1927/1963), who in his study of gang members relied primarily on some 130 qualitative interviews, and in that of Anderson (1923), whose classic study of hobos relied on informal in-depth conversations.

It was left to Herbert Blumer and his former student, Howard Becker, to formalize and give impetus to sociological ethnography during the 1950s and 1960s, and interviewing began to lose both the eclectic flavor given to it by Booth and the qualitative accent of the Chicago School members. Understanding gang members or hobos through interviews lost importance; instead, what became relevant was the use of interviewing in survey research as a tool to quantify data. This was not new given that opinion polls and market research had been doing it for years. But during World War II, there was a tremendous increase in survey research as the U.S. armed forces hired great numbers of sociologists as survey researchers. More than a half million American soldiers were interviewed in one manner or another (Young, 1966), and their mental and emotional lives were reported in a four-volume survey, *Studies in Social Psychology in World War II*, the first two volumes of which were directed by Samuel Stouffer and titled *The American Soldier*. This work had tremendous impact and led the way to widespread use of systematic survey research.

What was new, however, was that quantitative survey research moved into academia and came

to dominate sociology as the method of choice for the next three decades. An Austrian immigrant, Paul Lazarsfeld, spearheaded this move. He welcomed *The American Soldier* with great enthusiasm. In fact, Lazarsfeld and Robert Merton edited a book of reflections on *The American Soldier* (Merton & Lazarsfeld, 1950). Lazarsfeld moved to Columbia in 1940, taking with him his market research and other applied grants, and he became instrumental in directing the Bureau of Applied Social Research. Two other "survey organizations" were also formed: the National Opinion Research Center (formed in 1941 by Harry Field, first at the University of Denver and then at the University of Chicago) and the Survey Research Center (formed in 1946 by Rensis Likert and his group at the University of Michigan).

Academia at the time was dominated by theoretical concerns, and there was some resistance toward this applied, numbers-based kind of sociology. Sociologists and other humanists were critical of Lazarsfeld and the other survey researchers. Herbert Blumer, C. Wright Mills, Arthur Schlesinger, Jr., and Pitirim Sorokin were among those who voiced their displeasure. According to Converse (1987), Sorokin felt that "the new emphasis on quantitative work was obsessive, and he called the new practitioners 'quantophrenics'—with special reference to Stouffer and Lazarsfeld" (p. 253). Converse also quoted Mills: "Those in the grip of the methodological inhibition often refuse to say anything about modern society unless it has been through the fine little mill of the Statistical Ritual" (p. 252). Converse noted that Schlesinger called the survey researchers "social relations hucksters" (p. 253).

But the survey researchers also had powerful allies such as Merton, who joined the Bureau of Applied Social Research at Columbia in 1943, and government monies were becoming increasingly available for survey research. The 1950s saw a growth of survey research in the universities and a proliferation of survey research texts. Gradually, survey research increased its domain over sociology, culminating in 1960 with the election of Lazarsfeld to the presidency of the American Sociological Association. The methodological

dominance of survey research continued unabated throughout the 1970s, 1980s, and 1990s, although other methods began to erode the prominence of survey research.

Qualitative interviewing continued to be practiced hand in hand with participant observation methods, but it too assumed some of the quantifiable scientific rigor that preoccupied survey research to a great extent. This was especially visible in grounded theory (Glaser & Strauss, 1967), with its painstaking emphasis on coding data, and in ethnomethodology, with its quest for invariant properties of social action (Cicourel, 1970). Other qualitative researchers suggested variations. Lofland (1971) criticized grounded theory for paying too little attention to data-gathering techniques. Douglas (1985) suggested lengthy, existential one-on-one interviews that lasted at least 1 day. Spradley (1980) tried to clarify the difference between ethnographic observation and ethnographic interviewing.

Recently, postmodernist ethnographers have concerned themselves with some of the assumptions present in interviewing and with the controlling role of the interviewer. These concerns have led to new directions in qualitative interviewing focusing on increased attention to the voices of the respondents (Marcus & Fischer, 1986), the interviewer-respondent relationship (Crapanzano, 1980), the importance of the researcher's gender in interviewing (Gluck & Patai, 1991), and the role of other elements such as race, social status, and age (Seidman, 1991).

Platt (2002), in her recent chapter on the history of interviewing, correctly noted that the interview encompasses so many different practices that it is extremely hard to derive meaningful generalization about it and that the changes that have taken place over time are driven partly by methodological concerns and partly by sociopolitical motives.

■ STRUCTURED INTERVIEWING

In structured interviewing, the interviewer asks all respondents the same series of preestablished

questions with a limited set of response categories. There is generally little room for variation in response except where open-ended questions (which are infrequent) may be used. The interviewer records the responses according to a coding scheme that has already been established by the project director or research supervisor. The interviewer controls the pace of the interview by treating the questionnaire as if it were a theatrical script to be followed in a standardized and straightforward manner. Thus, all respondents receive the same set of questions asked in the same order or sequence by an interviewer who has been trained to treat every interview situation in a like manner. There is very little flexibility in the way in which questions are asked or answered in the structured interview setting. Instructions to interviewers often include some of the following guidelines:

- Never get involved in long explanations of the study; use the standard explanation provided by the supervisor.
- Never deviate from the study introduction, sequence of questions, or question wording.
- Never let another person interrupt the interview; do not let another person answer for the respondent or offer his or her opinion on the question.
- Never suggest an answer or agree or disagree with an answer. Do not give the respondent any idea of your personal views on the topic of the question or survey.
- Never interpret the meaning of a question; just repeat the question and give instructions or clarifications that are provided in training or by the supervisor.
- Never improvise such as by adding answer categories or making wording changes.

Telephone interviews, face-to-face interviews in households, intercept interviews in malls and parks, and interviews generally associated with survey research are most likely to be included in the structured interview category.

This interview context calls for the interviewer to play a neutral role, never interjecting his or her opinion of a respondent's answer. The interviewer

must establish what has been called "balanced rapport"; he or she must be casual and friendly, on the one hand, but must be directive and impersonal, on the other. The interviewer must perfect a style of "interested listening" that rewards the respondent's participation but does not evaluate these responses (Converse & Schuman, 1974).

It is hoped that in a structured interview, nothing is left to chance. However, response effects, or nonsampling errors, that can be attributed to the questionnaire administration process commonly evolve from three sources. The first source of error is respondent behavior. The respondent may deliberately try to please the interviewer or to prevent the interviewer from learning something about him or her. To do this, the respondent will embellish a response, give what is described as a "socially desirable" response, or omit certain relevant information (Bradbourn, 1983, p. 291). The respondent may also err due to faulty memory. The second source of error is found in the nature of the task, that is, the method of questionnaire administration (face-to-face or telephone) or the sequence or wording of the questions. The third source of error is the interviewer, whose characteristics or questioning techniques might impede proper communication of the question (Bradbourn, 1983). It is the degree of error assigned to the interviewer that is of greatest concern.

Most structured interviews leave little room for the interviewer to improvise or exercise independent judgment, but even in the most structured interview situation, not every contingency can be anticipated and not every interviewer behaves according to the script (Bradbourn, 1983; Frey, 1989). In fact, a study of interviewer effects found that interviewers changed the wording of as many as one third of the questions (Bradbourn, Sudman, & Associates, 1979).

In general, research on interviewer effects has shown interviewer characteristics such as age, gender, and interviewing experience to have a relatively small impact on responses (Singer & Presser, 1989). However, there is some evidence to show that student interviewers produce a larger response effect than do nonstudent interviewers,

higher status interviewers produce a larger response effect than do lower status interviewers, and the race of interviewers makes a difference only on questions specifically related to race (Bradburn, 1983; Hyman, 1954; Singer, Frankel, & Glassman, 1983).

The relatively minor impact of the interviewer on response quality in structured interview settings is directly attributable to the inflexible, standardized, and predetermined nature of this type of interviewing. There is simply little room for error. However, those who are advocates of structured interviewing are not unaware that the interview is a social interaction context and that it is influenced by that context. Good interviewers recognize this fact and are sensitive to how interaction can influence response. Converse and Schuman (1974) observed, "There is no single interview style that fits every occasion or all respondents" (p. 53). This means that interviewers must be aware of respondent differences and must be able to make the proper adjustments called for by unanticipated developments. As Gordon (1992) stated, "Interviewing skills are not simple motor skills like riding a bicycle; rather, they involve a high-order combination of observation, empathic sensitivity, and intellectual judgment" (p. 7).

It is not enough to understand the mechanics of interviewing; it is also important to understand the respondent's world and forces that might stimulate or retard responses (Kahn & Cannell, 1957). Still, the structured interview proceeds under a stimulus-response format, assuming that the respondent will truthfully answer questions previously determined to reveal adequate indicators of the variable in question so long as those questions are phrased properly. This kind of interview often elicits rational responses, but it overlooks or inadequately assesses the emotional dimension.

Developments in computer-assisted interviewing (Couper et al., 1998) have called into question the division between traditional modes of interviewing such as the survey interview and the mail survey. Singleton and Straits (2002) noted that today we are really looking at a continuum of data-collecting methods rather than

clearly divided methods; in fact, as these authors observed, many surveys today incorporate a variety of data-gathering methods driven by concerns such as time constraints, financial demands, and other practical elements.

■ GROUP INTERVIEWING

The group interview is essentially a qualitative data-gathering technique that relies on the systematic questioning of several individuals simultaneously in a formal or informal setting. Thus, this technique straddles the line between formal and informal interviewing.

The use of the group interview has ordinarily been associated with marketing research under the label of *focus group*, where the purpose is to gather consumer opinions on product characteristics, advertising themes, and/or service delivery. This format has also been used to a considerable extent by political parties and candidates who are interested in voter reactions to issues and policies. The group interview has also been used in sociological research. Bogardus (1926) tested his social distance scale during the mid-1920s, Zuckerman (1972) interviewed Nobel laureates, Thorpison and Demerath (1952) looked at management problems in the military, Morgan and Spanish (1984) studied health issues, Fontana and Frey (1990) investigated reentry into the older worker labor force, and Merton and his associates studied the impact of propaganda using group interviews (see Frey & Fontana, 1991). In fact, Merton, Fiske, and Kendall (1956) coined the term "focus group" to apply to a situation where the researcher/interviewer asks very specific questions about a topic after having completed considerable research. There is also some evidence that established anthropologists such as Malinowski used this technique but did not report it (Frey & Fontana, 1991). Today, all group interviews are generically designated *focus group* interviews, even though there is considerable variation in the nature and types of group interviews.

In a group interview, the interviewer/moderator directs the inquiry and the interaction among

respondents in a very structured fashion or in a very unstructured manner, depending on the interviewer's purpose. The purpose may be exploratory; for example, the researcher may bring several persons together to test a methodological technique, to try out a definition of a research problem, or to identify key informants. An extension of the exploratory intent is to use the group interview for the purpose of pretesting questionnaire wording, measurement scales, or other elements of a survey design. This is now quite common in survey research (Desvousges & Frey, 1989). Group interviews can also be used successfully to aid respondents' recall or to stimulate embellished descriptions of specific events (e.g., a disaster, a celebration,) or experiences shared by members of the group. Group interviews can also be used for triangulation purposes or used in conjunction with other data-gathering techniques. For example, group interviews could be helpful in the process of "indefinite triangulation" by putting individual responses into a context (Cicourel, 1974). Finally, phenomenological purposes may be served whether group interviews are the sole basis for gathering data or are used in association with other techniques.

Group interviews take different forms, depending on their purposes. They can be brainstorming interviews with little or no structure or direction from the interviewer, or they can be very structured such as those in nominal/delphi and marketing focus groups. In the latter cases, the role of the interviewer is very prominent and directive. Fieldwork settings provide both formal and informal occasions for group interviews. The field researcher can bring respondents into a formal setting in the field context and ask very directed questions. Or, a natural field setting, such as a street corner or a neighborhood tavern, can be conducive to casual but purposive inquiries.

Group interviews can be compared on several dimensions. First, the interviewer can be very formal, taking a very directive and controlling posture, guiding discussion strictly, and not permitting digression or variation from topic or agenda. This is the mode of focus and

nominal/delphi groups. In the latter case, participants are physically isolated but share views through a coordinator/interviewer. The nondirective approach is more likely to be implemented in a naturally established field setting (e.g., a street corner) or in a controlled setting (e.g., a research laboratory) where the research purpose is phenomenological to establish the widest range of meaning and interpretation for the topic. Groups can also be differentiated by question format and purpose, which in the case of group interviews usually means exploration, phenomenological, or pretest purposes. Exploratory interviews are designed to establish familiarity with a topic or setting; the interviewer can be very directive (or the opposite), but the questions are usually unstructured or open-ended. The same format is used in interviews with phenomenological purposes, where the intent is to tap intersubjective meaning with depth and diversity. Pretest interviews are generally structured in a question format, with the interview being directive in style. Table 27.1 compares the types of group interviews on various dimensions.

The skills that are required to conduct the group interview are not significantly different from those needed for the individual interview. The interviewer must be flexible, objective, empathetic, persuasive, a good listener, and so forth. But the group interview does present some problems not found in the individual interview. Merton and colleagues (1956) noted three specific problems, namely, that (a) the interviewer must keep one person or small coalition of persons from dominating the group, (b) the interviewer must encourage recalcitrant respondents to participate, and (c) the interviewer must obtain responses from the entire group to ensure the fullest coverage of the topic. In addition, the interviewer must balance the directive interviewer role with the role of moderator, and this calls for management of the dynamics of the group being interviewed. Furthermore, the group interviewer must simultaneously worry about the script of questions and be sensitive to the evolving patterns of group interaction.

Group interviews have some advantages over individual interviews, namely, that (a) they are

Table 27.1. Types of Group Interviews and Dimensions

Type	Setting/Purpose	Role of Interviewer	Question Format	Purpose
Focus group	Formal, preset	Directive	Structured	Exploratory, pretest
Brainstorming	Formal or informal	Nondirective	Unstructured	Exploratory
Nominal/Delphi exploratory	Formal	Directive	Structured	Exploratory, pretest
Field, natural	Informal, spontaneous	Moderately nondirective	Very unstructured	Exploratory Phenomenological
Field, formal	Preset In field	Somewhat directive	Semistructured	Phenomenological

Source: Frey and Fontana (1991, p. 184).

relatively inexpensive to conduct and often produce rich data that are cumulative and elaborative, (b) they can be stimulating for respondents and so aid in recall, and (c) the format is flexible. Group interviews are not, however, without problems. The results cannot be generalized, the emerging group culture may interfere with individual expression (a group can be dominated by one person), and "groupthink" is a possible outcome. The requirements for interviewer skills are greater than those for individual interviewing because of the group dynamics that are present. Nevertheless, the group interview is a viable option by both qualitative and quantitative research.

Morgan (2002) advocated a systematic approach to focus group interviewing so as to create a methodological continuity and the ability to assess the outcomes of focus group research. Morgan suggested that, just as social scientists were originally inspired to use focus groups by the example of marketing, it might be time to look at marketing again to see what is being done and use the marketing example to innovate in the field of social sciences.

■ UNSTRUCTURED INTERVIEWING

Unstructured interviewing can provide greater breadth than do the other types given its qualitative

nature. In this section, we discuss the traditional type of unstructured interview—the open-ended, in-depth (ethnographic) interview. Many qualitative researchers differentiate between in-depth (ethnographic) interviewing and participant observation. Yet, as Lofland (1971) pointed out, the two go hand in hand, and much of the data gathered in participant observation come from informal interviewing in the field. Consider the following report from Malinowski's (1967/1989) diary:

Saturday 8 [December 1917]. Got up late, felt rotten, took enema. At about 1 I went out. I heard cries; [people from] Kapwapu were bringing *uri* to Teyava. I sat with the natives, talked, took pictures. Went back. Billy corrected and supplemented my notes about *wasi*. At Teyava, an old man talked a great deal about fishes, but I did not understand him too well. Then we moved to his *bwayama*. Talked about *lili'u*. They kept questioning me about the war—In the evening I talked to the policeman about *bwaga'u*, *lili'u*, and *yoyeva*. I was irritated by their laughing. Billy again told me a number of interesting things. Took quinine and calomel. (p. 145)

Malinowski's (1967/1989) "day in the field" shows how very important unstructured interviewing is in the conduct of fieldwork and clearly illustrates the difference between structured interviewing and unstructured interviewing.

Malinowski had some general topics he wanted to know about, but he did not use close-ended questions or a formal approach to interviewing. What is more, he committed (as most fieldworkers do) what structured interviewers would see as two “capital offenses.” First, he answered questions asked by the respondents. Second, he let his personal feelings influence him (as all fieldworkers do); thus, he deviated from the “ideal” of a cool, distant, and rational interviewer.

Malinowski's example captures the difference in structured versus unstructured interviewing. The former aims at capturing precise data of a codable nature so as to explain behavior within preestablished categories, whereas the latter attempts to understand the complex behavior of members of society without imposing any a priori categorization that may limit the field of inquiry.

In a way, Malinowski's interviewing is still structured to some degree; there is a setting, there are identified informants, and the respondents are clearly discernible. In other types of interviewing, there might be no setting; for instance, Hertz (1995, 1997b, 1997c) focused on locating women in a historic moment rather than in a place. In addition, in their study of single mothers, Hertz and Ferguson (1997) interviewed women who did not know each other and who were not part of a single group or village. At times, informants are not readily accessible or identifiable, but anyone the researcher meets may become a valuable source of information. Hertz and Ferguson relied on tradespeople and friends to identify single mothers in the study. Fontana and Smith (1989) found that respondents were not always readily identifiable. In studying Alzheimer's disease patients, they discovered that it was often possible to confuse caregivers and patients during the early stages of the disease. Also, in Fontana's (1977) research on the poor elderly, the researcher had no fixed setting at all; he simply wandered from bench to bench in the park where the old folks were sitting, talking to any disheveled old person who would talk back.

Spradley (1979) aptly differentiated among various types of interviewing. He described the following interviewer–respondent interaction,

which would be unthinkable in traditional sociological circles yet is the very essence of unstructured interviewing—the establishment of a human-to-human relation with the respondent and the desire to *understand* rather than to *explain*:

Presently she smiled, pressed her hand to her chest, and said: “Tsetchwe.” It was her name. “Elizabeth,” I said, pointing to myself. “Nisabe,” she answered. . . . Then, having surely suspected that I was a woman, she put her hand on my breast gravely, and, finding out that I was, she touched her own breast. Many Bushmen do this; to them all Europeans look alike. “Iasu si” (women), she said. Then after a moment's pause, Tsetchwe began to teach me. (pp. 3–4)

Spradley (1979) went on to discuss all of the things that an interviewer learns from the natives—their culture, their language, their ways of life. Although each and every study is different, these are some of the basic elements of unstructured interviewing. These elements have been discussed in detail already, and we need not elaborate on them too much here (for detailed accounts of unstructured interviewing, see Adams & Preiss, 1966; Lofland, 1971; Spradley, 1979). Here we provide brief synopses. Remember that these are presented only as heuristic devices; every study uses slightly different elements and often in different combinations.

It is important to keep in mind that the following description of interviewing is highly modernistic in that it presents a structured format and definite steps to be followed. In a way, it mimics structured interviewing in an attempt to “scientize” the research, albeit by using very different steps and concerns. Later in this chapter, in discussing new trends, we deconstruct these notions as we frame the interview as an active emergent process. We contend that our interview society gives people instructions on how to comply with these heuristics (Silverman, 1993, 1997a, 1997b). Similarly, Scheurich (1995, 1997) was openly critical of both positivistic and interpretive interviewing because they are based on modernistic assumptions. For Scheurich (1997), rather than being a process

"by the numbers," interviewing (and its language) is "persistently slippery, unstable, and ambiguous from person to person, from situation to situation, from time to time" (p. 62).

Although postmodern researchers follow Scheurich, more traditional sociologists and researchers from other disciplines still follow this "how to" approach to interviewing, where the illusion exists that the better they execute the various steps, the better they will apprehend the reality that they assume is out there, ready to be plucked.

Accessing the Setting. How do we "get in"? That, of course, varies according to the group that one is attempting to study. One might have to disrobe and casually stroll in the nude if he or she is doing a study of nude beaches (Douglas, Rasmussen, & Flanagan, 1977), or one might have to buy a huge motorbike and frequent seedy bars in certain locations if he or she is attempting to befriend and study the Hell's Angels (Thompson, 1985). The different ways and attempts to get in vary tremendously, but they all share the common goal of gaining access to the setting. Sometimes there is no setting per se, as when Fontana (1977) attempted to study the poor elderly on the streets and had to gain access anew with each and every interviewee.

Understanding the Language and Culture of the Respondents. Wax (1960) gave perhaps the most poignant description of learning the language and culture of the respondents in her study of "disloyal" Japanese in concentration camps in America between 1943 and 1945. Wax had to overcome a number of language and cultural problems in her study. Although respondents may be fluent in the language of the interviewer, there are different ways of saying things—or indeed, certain things that should not be said at all—linking language and cultural manifestations. Wax made this point:

I remarked that I would like to see the letter. The silence that fell on the chatting group was almost palpable, and the embarrassment of the hosts was painful to see. The *faux pas* was not asking to see a letter, for letters were passed about rather freely. It rested on the fact that one did not give a Caucasian a letter in which the "disloyal" statement of a friend might be expressed. (p. 172)

Some researchers, especially in anthropological interviews, tend to rely on interpreters and so become vulnerable to added layers of meanings, biases, and interpretations, and this may lead to disastrous misunderstandings (Freeman, 1983). At times, specific jargon, such as the medical metalanguage of physicians, may be a code that is hard for nonmembers to understand.

Deciding How to Present Oneself. Do we present ourselves as representatives from academia studying medical students (Becker, 1956)? Do we approach the interview as a woman-to-woman discussion (Spradley, 1979)? Do we "dress down" to look like the respondents (Fontana, 1977; Thompson, 1975)? Do we represent the colonial culture (Malinowski, 1922), or do we humbly present ourselves as "learners" (Wax, 1960)? This is very important because once the interviewer's presentational self is "cast," it leaves a profound impression on the respondents and has a great influence of the success of the study (or lack thereof). Sometimes inadvertently, the researcher's presentational self may be misrepresented, as Johnson (1976) discovered in studying a welfare office when some of the employees assumed that he was a "spy" for management despite his best efforts to present himself to the contrary.

Locating an Informant. The researcher must find an insider—a member of the group being studied—who is willing to be an informant and act as a guide and translator of cultural mores and, at times, of jargon or language. Although the researcher can conduct interviews without an informant, he or she can save much time and avoid mistakes if a good informant becomes available. The "classic" sociological informant was Doc in Whyte's (1943) *Street Corner Society*. Without Doc's help and guidance, it is doubtful that Whyte would have been able to access his respondents to the level he did. Rabinow's (1977) discussion of his relation with his main informant, Abd al-Malik ben Lahcen, was very instructive. Malik acted as a translator but also provided Rabinow with access to the cultural ways of the

respondents, and by his actions he provided Rabinow with insights into the vast differences between a University of Chicago researcher and a native Moroccan.

Gaining Trust. Survey researchers asking respondents whether they would or would not favor the establishment of a nuclear dump in their state (Frey, 1993) do not have too much work to do in the way of gaining trust; respondents have opinions about nuclear dumps and are very willing to express them, sometimes forcefully. But it is clearly a different story if one wants to ask about people's frequency of sexual intercourse or preferred method of birth control. The interviewer needs to establish some trust with the respondents (Cicourel, 1974). Rasmussen (1989) had to spend months as a "wallflower" in the waiting room of a massage parlor before any of the masseuses gained enough trust in him to divulge to him, in unstructured interviews, the nature of their "massage" relation with clients. Gaining trust is essential to the success of the interviews, and once it is gained, trust can still be very fragile. Any faux pas by the researcher may destroy days, weeks, or months of painfully gained trust.

Establishing Rapport. Because the goal of unstructured interviewing is *understanding*, it is paramount to establish rapport with respondents; that is, the researcher must be able to take the role of the respondents and attempt to see the situation from their viewpoint rather than superimpose his or her world of academia and preconceptions on them. Although a close rapport with the respondents opens the doors to more informed research, it may create problems in that the researcher may become a spokesperson for the group studied, losing his or her distance and objectivity, or may "go native" and become a member of the group and forgo his or her academic role. At times, what the researcher might feel is a good rapport turns out to not to be, as Thompson (1985) found out in a nightmarish way when he was subjected to a brutal beating by the Hell's Angels just as his study of them was coming to a close. At the other end of the spectrum, some researchers might never feel that

they have established a good rapport with their respondents. Malinowski (1967/1989), for example, always mistrusted the motives of the natives and at times was troubled by their brutish sensuality or angered by their outright lying or deceptions: "After lunch I [carried] yellow calico and spoke about the *baloma*. I made a small *sagali*, Navavile. I was *fed up* with the *niggers*" (p. 154).

Collecting Empirical Material. Being out in the field does not afford one the luxury of video cameras, soundproof rooms, and high-quality recording equipment. Lofland (1971) provided detailed information on doing and writing up interviews and on the types of field notes that one ought to take and how to organize them. Yet field-workers often must make do with what they can have in the field; the "tales" of their methods used range from holding a miniature tape recorder as inconspicuously as possible to taking mental notes and then rushing to the privacy of a bathroom to jot down notes—at times on toilet paper. We agree with Lofland that, regardless of the circumstances, researchers ought to (a) take notes regularly and promptly, (b) write down everything no matter how unimportant it might seem at the time, (c) try to be as inconspicuous as possible in note taking, and (d) analyze notes frequently.

Other Types of Unstructured Interviewing

We consider the issue of interpreting and reporting empirical material later in the chapter. In this subsection, we briefly outline some different types of unstructured interviews.

Oral History

The oral history differs from other unstructured interviews in purpose but not methodologically. The oral collection of historical materials goes back to ancient times, but its modern-day formal organization can be traced to 1948 when Ailan Nevins began the Oral History Project at Columbia University (Starr, 1984, p. 4). The oral history captures a variety of forms of life, from common folks talking about their jobs in Terkel's

(1975) *Working* to the historical recollections of President Harry Truman in Miller's (1974) *Plain Speaking* (see also Starr, 1984, p. 4). Often oral history transcripts are not published, but many may be found in libraries. They are like silent memoirs waiting for someone to rummage through them and bring their testimony to life. Recently, oral history has found great popularity in the feminist movement (Gluck & Patai, 1991), where it is seen as a way of understanding and bringing forth the history of women in a culture that has traditionally relied on masculine interpretation: "Refusing to be rendered historically voiceless any longer, women are creating a new history—using our own voices and experiences" (Gluck, 1984, p. 222).

Relevant to the study of oral history (and, in fact, to all interviewing) is the study of memory and its relation to recall. For instance, Schwartz (1999) examined the ages at which we recall critical episodes in our lives, concluding that "biographical memory . . . is better understood as a social process" and that "as we look back, we find ourselves remembering our lives in terms of our experience with others" (p. 15; see also Schwartz, 1996). Ellis (1991) resorted to the use of "sociological introspection" to reconstruct biographical episodes of her past life. Notable among Ellis's work in this genre was her reconstruction of her 9-year relationship with her partner, Gene Weinstein. Ellis (1995) described the emotional negotiations the two of them went through as they coped with his downward-spiraling health until the final negotiation with death.

Creative Interviewing

Close to oral history, but used more conventionally as a sociological tool, is Douglas's (1985) "creative interviewing." Douglas argued against the "how to" guides to conducting interviews because unstructured interviews take place in the largely situational everyday world of members of society. Thus, interviewers must necessarily be creative, must forget "how to" rules, and must adapt to the ever-changing situations they face. Similar to oral historians, Douglas described

interviewing as collecting oral reports from the members of society. In creative interviewing, these reports go well beyond the length of conventional unstructured interviews and may become "life histories," with interviewing taking place in multiple sessions over many days with the respondents.

■ POSTMODERN INTERVIEWING

Douglas's (1985) concern with the important role played by the interviewer as human, a concern that is also shared by the feminist oral historians, became a paramount element in the interviewing approaches of postmodern anthropologists and sociologists during the mid-1980s. Marcus and Fischer (1986) addressed ethnography at large, but their discussion was germane to unstructured interviewing because, as we have seen, such interviewing constitutes the major way of collecting data in fieldwork. Marcus and Fischer voiced reflexive concerns about the ways in which the researcher influences the study, both in the methods of data collection and in the techniques of reporting findings. This concern led to new ways of conducting interviews in the hope of minimizing, if not eliminating, the interviewer's influence. One such way is through *polyphonic* interviewing, where the voices of the respondents are recorded with minimal influence from the researcher and are not collapsed together and reported as one through the interpretation of the researcher. Instead, the multiple perspectives of the various respondents are reported, and differences and problems encountered are discussed, rather than glossed over (Krieger, 1983). *Interpretive interactionism* follows in the footsteps of creative and polyphonic interviewing, but borrowing from James Joyce, it adds a new element—that of epiphanies, which Denzin (1989a) described as "those interactional moments that leave marks on people's lives [and] have the potential for creating transformational experiences for the person" (p. 15). Thus, the topic of inquiry becomes dramatized by the focus on existential moments in people's lives, possibly

producing richer and more meaningful data. Finally, as postmodernists seek new ways of understanding and reporting data, we note the concept of "oralysis," which refers to "the ways in which oral forms, derived from everyday life, are, with the recording powers of video, applied to the analytical tasks associated with literate forms" (Ulmer, 1989, p. xi). In oralysis, the traditional product of interviewing, talk, is coupled with the visual, providing a product consonant with a society that is dominated by the medium of television (Ulmer, 1989).

■ GENDERED INTERVIEWING

The housewife goes into a well-stocked store to look for a frying pan. Her thinking probably does not proceed exactly this way, but it is helpful to think of the many possible two-way choices she might make: Cast iron or aluminum? Thick or thin? Metal or wooden handle? Covered or not? Deep or shallow? Large or small? This brand or that? Reasonable or too high in price? To buy or not? Cash or charge? Have it delivered or carry it? . . . The two-way question is simplicity itself when it comes to recording answers and tabulating them. (Payne, 1951, pp. 55–56)

The preceding quote represents the prevalent paternalistic attitude toward women in interviewing (Oakley, 1981, p. 39) as well as the paradigmatic concern with coding answers and, therefore, with presenting limited dichotomous choices. Apart from a tendency to be condescending to women, the traditional interview paradigm does not account for gendered differences. In fact, Babbie's (1992) classic text, *The Practice of Social Research*, briefly referenced gender only three times and did not even mention the influence of gender on interviews. As Oakley (1981) cogently pointed out, both the interviewer and the respondent are considered to be faceless and invisible, and they must be if the paradigmatic assumption of gathering value-free data is to be maintained. Yet, as Denzin (1989a) told us, "gender filters knowledge" (p. 116); that is, the sex of the interviewer and the sex of the respondent make

a difference because the interview takes place within the cultural boundaries of a paternalistic social system in which masculine identities are differentiated from feminine ones.

In the typical interview, there exists a hierarchical relation, with the respondent being in the subordinate position. The interviewer is instructed to be courteous, friendly, and pleasant:

The interviewer's manner should be friendly, courteous, conversational, and unbiased. He should be neither too grim nor too effusive; neither too talkative nor too timid. The idea should be to put the respondent at ease, so that he will talk freely and fully. (Selltiz, Jahoda, Deutsch, & Cook, 1965, p. 576, emphasis added)

Yet, as the last line of this quote shows, this demeanor is a ruse to gain the trust and confidence of the respondent without reciprocating those feelings in any way. The interviewer is not to give his or her own opinions and is to evade direct questions. What seems to be a conversation is really a one-way pseudoconversation, raising an ethical dilemma (Fine, 1983–1984) inherent in the study of people for opportunistic reasons. When the respondent is female, the interview presents added problems because the preestablished format directed at information relevant for the study tends both to ignore the respondent's own concerns and to curtail any attempts to digress and elaborate. This format also stymies any revelation of personal feelings and emotions.

Warren (1988) discussed problems of gender in both anthropological and sociological fieldwork, and many of these problems are also found in the ethnographic interview. Some of these problems are the traditional ones of entrée and trust that may be heightened by the sex of the interviewer, especially in highly sex-segregated societies:

I never witnessed any ceremonies that were barred to women. Whenever I visited compounds, I sat with the women while the men gathered in the parlors or in front of the compound. . . . I never entered any of the places where men sat around to drink beer or palm wine and to chat. (Sudarikasa, 1986, quoted in: Warren, 1988, p. 16)

Solutions to the problem have been to view the female anthropologist as androgyny or to grant her honorary male status for the duration of her research. Warren (1988) also pointed to some advantages of the researcher being female and, therefore, being seen as harmless or invisible. Other problems are associated with the researcher's status and race and with the context of the interview, and again these problems are magnified for female researchers in a paternalistic world. Female interviewers at times face the added burden of sexual overtures or covert sexual hassles (p. 33).

Feminist researchers are suggesting ways in which to circumvent the traditional interviewing paradigm. Oakley (1981) noted that interviewing is a masculine paradigm that is embedded in a masculine culture and stresses masculine traits while at the same time excluding traits, such as sensitivity and emotionality, that are culturally viewed as feminine traits. However, there is a growing reluctance, especially among female researchers (Oakley, 1981; Reinharz, 1992; Smith, 1987), to continue interviewing women as "objects" with little or no regard for them as individuals. Although this reluctance stems from moral and ethical reasons, it is also relevant methodologically. As Oakley (1981) pointed out, in interviewing there is "no intimacy without reciprocity" (p. 49). Thus, the emphasis is shifting to allow the development of a closer relation between the interviewer and the respondent. Researchers are attempting to minimize status differences and are doing away with the traditional hierarchical situation in interviewing. Interviewers can show their human side and can answer questions and express feelings. Methodologically, this new approach provides a greater spectrum of responses and a greater insight into the lives of the respondents—or "participants," to avoid the hierarchical pitfall (Reinharz, 1992, p. 22)—because it encourages them to control the sequencing and language of the interview while also allowing them the freedom of open-ended responses (Oakley, 1981; Reinharz, 1992; Smith, 1987). To wit, "Women were always . . . encouraged to 'digress' into details of their personal histories and to recount anecdotes of

their working lives. Much important information was gathered in this way" (Yeandle, 1984, quoted in Reinharz, 1992, p. 25).

Hertz (1997a) made the self of the researcher visible and suggested that it is only one of many selves that the researcher takes to the field. She asserted that interviewers need to be reflexive; that is, they need to "have an ongoing conversation about experience while simultaneously living in the moment" (p. viii). By doing so, they will heighten the understanding of differences of ideologies, culture, and politics between interviewers and interviewees.

Hertz also underscored the importance of "voices"—how we (as authors) express and write our stories, which data we include and which data we exclude, whose voices we choose to represent and whose voices we choose not to represent. The concern with voices is also found, very powerfully, in Vaz's (1997) edited *Oral Narrative Research With Black Women*. One of the contributors, Obbo (1997), stated,

"This chapter is a modest exercise in giving expression to women's voices and in rescuing their perceptions and experiences from being mere murmurs or backdrop to political, social, and cultural happenings. Women's voices have been devalued by male chronicles of cultural history even when the men acknowledge female informants; they are overshadowed by the voice of male authority and ascendance in society. (pp. 42–43)

This commitment to maintaining the integrity of the phenomena and preserving the viewpoint of the respondents, as expressed in their everyday language, is very akin to phenomenological and existential sociologies (Douglas & Johnson, 1977; Koturba & Fontana, 1984) and also reflects the concern of postmodern ethnographers (Marcus & Fischer, 1986). The differences are (a) the heightened moral concern for respondents/participants, (b) the attempt to redress the male/female hierarchy and existing paternalistic power structure, and (c) the paramount importance placed on membership because the effectiveness of male researchers in interviewing female respondents has been largely discredited.

Behar (1996) addressed the ambiguous nature of the enterprise of interviewing by asking the following questions. Where do we locate the researcher in the field? How much do we reveal about ourselves? How do we reconcile our different roles and positions? Behar made us see that interviewer, writer, respondent, and interview are not clearly distinct entities; rather, they are intertwined in a deeply problematic way. Behar and Gordon (1995) also cogently pointed out that the seminal work by Marcus and Fischer (1986) broke ground with modernistic ethnography but remains an example of paternalistic sociology because it did not address women's concerns.

Some feminist sociologists have gone beyond the concern with interviewing or fieldwork in itself. Richardson (1992a) strove for new forms of expression to report the findings and presented some of her fieldwork in the form of poetry. Clough (1998) questioned the whole enterprise of fieldwork under the current paradigm and called for a reassessment of the whole sociological enterprise and for a rereading of existing sociological texts in a light that is not marred by a paternalistic bias. Their voices echoed the concern of Smith (1987), who eloquently stated,

The problem (of a research project) and its particular solution are analogous to those by which fresco painters solved the problems of representing the different temporal moments of a story in the singular space of the wall. The problem is to produce in a two-dimensional space framed as a wall a world of action and movement in time. (p. 281)

A growing number of researchers believe that we cannot isolate gender from other important elements that also "filter knowledge." For example, Collins (1990) wrote eloquently about the filtering of knowledge through memberships—of being black and female in American culture, in her case. Weston (1998) made just as powerful a case for sexuality, contending that it should not be treated as a compartmentalized subspecialty because it underlies and is integral to the whole of social sciences. It is clear that gender, sexuality, and race cannot be considered in isolation; race, class, hierarchy, status, and age (Seidman, 1991) all are

part of the complex, yet often ignored, elements that shape interviewing.

■ FRAMING AND INTERPRETING INTERVIEWS

Aside from the problem of framing real-life events in a two-dimensional space, we face the added problems of how the framing is being done and who is doing the framing. In sociological terms, this means that the type of interviewing selected, the techniques used, and the ways of recording information all come to bear on the results of the study. In addition, data must be interpreted, and the researcher has a great deal of influence over what part of the data will be reported and how the data will be reported.

Framing Interviews

Numerous volumes have been published on the techniques of structured interviewing (see, e.g., Babbie, 1992; Bradburn et al., 1979; Gordon, 1980; Kahn & Cannell, 1957). There is also a voluminous literature on group interviewing, especially on marketing, and survey research (for a comprehensive review of literature in this area, see Stewart & Shamdasani, 1990). The uses of group interviewing have also been linked to qualitative sociology (Morgan, 1988). Unstructured interviewing techniques also have been covered thoroughly (Denzin, 1989; Lofland, 1971; Lofland & Lofland, 1984; Spradley, 1979).

As we have noted, unstructured interviews vary widely given their informal nature and depending on the type of the setting, and some eschew the use of any preestablished set of techniques (Douglas, 1985). Yet there are techniques involved in interviewing whether the interviewer is just being "a nice person" or he or she is following a format. Techniques can be varied to meet various situations, and varying one's techniques is known as using tactics. Traditionally, the researcher is involved in an informal conversation with the respondent; thus, the researcher must maintain a tone of "friendly" chat while

trying to remain close to the guidelines of the topics of inquiry that he or she has in mind. The researcher begins by "breaking the ice" with general questions and gradually moves on to more specific ones while also—as inconspicuously as possible—asking questions intended to check the veracity of the respondent's statements. The researcher should avoid getting involved in a "real" conversation in which he or she answers questions asked by the respondent or provides personal opinions on the matters discussed. The researcher can avoid "getting trapped" by shrugging off the relevance of his or her opinions (e.g., "It doesn't matter how I feel; it's your opinion that's important") or by feigning ignorance (e.g., "I really don't know enough about this to say anything; you're the expert"). Of course, as we have seen in the case of gendered interviewing, the researcher may reject these techniques and "come down" to the level of the respondent to engage in a "real" conversation with give and take and shared empathetic understanding.

The use of language, particularly that of specific terms, is important to create a "sharedness of meanings" in which both interviewer and the respondent understand the contextual nature of specific referents. For instance, in studying nude beaches, Douglas and Rasmussen (1977) discovered that the term "nude beach virgin" had nothing to do with chastity; rather, it referred to the fact that a person's buttocks were white, indicating to others that he or she was a newcomer to the nude beach. Language is also important in delineating the type of question (e.g., broad, narrow, leading, instructive).

Nonverbal techniques are also important in interviewing. There are four basic modes of nonverbal communication:

Proxemic communication is the use of interpersonal space to communicate attitudes, *chronemic* communication is the use of pacing of speech and length of silence in conversation, *kinesic* communication includes any body movements or postures, and *paralinguistic* communication includes all the variations in volume, pitch, and quality of voice. (Gorden, 1980, p. 335)

All four of these modes represent important techniques for the researcher. In addition, the researcher should carefully note and record respondents' use of these modes because interview data are more than verbal records and should include, as much as possible, nonverbal features of the interaction. Finally, techniques vary with the group being interviewed; for instance, interviewing a group of children requires a different approach from the one that the interviewer may use when interviewing a group of elderly widows (Lopata, 1980).

An interesting proposal for framing interviews came from Saukko (2000), who asked, "How can we be true and respect the inner experiences of people and at the same time critically assess the cultural discourses that form the very stuff from which our experiences are made?" (p. 299). Using the metaphor of patchwork quilts (which have no center), Saukko patched and stitched together the stories of five anorexic women. Thus, she rejected the idea of framing characters as monological and instead, borrowing from Bakhtin (1986), presented them as "dialogic characters" (Saukko, 2000, p. 303).

Interpreting Interviews

Many studies that use unstructured interviews are not reflexive enough about the interpreting process. Common platitudes proclaim that data speak for themselves and that the researcher is neutral, unbiased, and "invisible." The data reported tend to flow nicely, there are no contradictory data, and there is no mention of what data were excluded and why. Improprieties never happen, and the main concern seems to be the proper (if unreflexive) filing, analyzing, and reporting of events. But anyone who has engaged in fieldwork knows better. No matter how organized the researcher may be, he or she slowly becomes buried under an increasing mountain of field notes, transcripts, newspaper clippings, and audiotapes. Traditionally, readers were presented with the researcher's interpretation of the data, cleaned and streamlined and collapsed in a rational non-contradictory account. More recently, sociologists

have come to grips with the reflexive, problematic, and sometimes contradictory nature of data and with the tremendous, if unspoken, influence of the researcher as author. What Van Maanen (1988) called "confessional style" began in earnest during the 1970s (Johnson, 1976) and has continued unabated to our days in a soul cleansing by researchers of problematic feelings and sticky situations in the field. Although perhaps somewhat overdone at times, these "confessions" are very valuable because they make readers aware of the complex and cumbersome nature of interviewing people in their natural settings and lend a tone of realism and veracity to studies. Malinowski (1967/1989) provided a good example: "Yesterday I slept very late. Got up around 10. The day before I had engaged Omega, Koupa, and a few others. They didn't come. Again I fell into a rage" (p. 67).

Showing the human side of the researcher and the problematics of unstructured interviewing has taken new forms in deconstructionism (Derrida, 1976). Here, the influence of the author is brought under scrutiny. Thus, the text created by the rendition of events by the researcher is "deconstructed"; the author's biases and taken-for-granted notions are exposed, and sometimes alternative ways of looking at the data are introduced (Clough, 1998).

Postmodern social researchers, as we have seen, attempt to expose the role of the researcher as field-worker and minimize his role as author. For instance, Crapanzano (1980) reported Tuhami's accounts, whether they were sociohistorical renditions, dreams, or outright lies, because they all constituted a part of this Moroccan Arab respondent's sense of self and personal history. In interviewing Tuhami, Crapanzano learned not only about his respondent but also about himself:

As Tuhami's interlocutor, I became an active participant in his life history, even though I rarely appear directly in his recitations. Not only did my presence, and my questions, prepare him for the text he was to produce, but they produced what I read as a change of consciousness in him. They produced a change of consciousness in me too. We were both jostled from our assumptions about the nature of the everyday world and ourselves and groped for common reference points within this limbo of interchange. (p. 11)

No longer pretending to be a faceless respondent and an invisible researcher, Tuhami and Crapanzano were portrayed as individual humans with their own personal histories and idiosyncrasies, and the readers learn about two people and two cultures.

Gubrium and Holstein (2002) actually considered the interview as a contextually based, mutually accomplished story that is reached through collaboration between the researcher and the respondent. Thus, just to tell what happened (the *what*) is not enough because the *what* depends greatly on the ways, negotiations, and other interactive elements that take place between the researcher and the respondent (the *how*). Others have addressed the same concerns, at times enlarging the one-to-one interaction to interaction between the researcher and a whole community or outlining the various types of collaborative interviewing (Ellis & Berger, 2002).

The discovery of reflexivity proved to be an epiphanic moment for Banister (1999). Once she was able to realize that her study of midlife women resonated strong personal notes with her midlife experience, Banister acknowledged that she was not just a witness to her respondents and came to see the liminality of her position. Thus, she was able to understand the women's midlife experience as well as her own and to reach a deep ethnographic understanding.

Another powerful way in which to accentuate reflexivity in interviewing is through narrative, where in trying to understand the "other" we learn about (our) "selves," reaching the hermeneutic circle, that is, the circle of understanding (Rabinow & Sullivan, 1987; Warren, 2002). Denzin (2003b) noted that writers can gain knowledge about themselves by bringing forth their autobiographical past; in a way, they are bringing the past into the present (Pinar, 1994). Denzin (2003a) proposed that this perhaps can best be achieved through the use of performances rather than traditional writing modes as a way in which to reach across the divide and extend a hand to those who have been oppressed. In performance, we infuse powerful feelings and try to recreate a way in which to understand those we study and ourselves

in our relationship to them, that is, not merely to create new sociological knowledge but also to use that hand to grasp and pull the downtrodden out of the mire in which they are suffocating.

■ ETHICAL CONSIDERATIONS

Because the objects of inquiry in interviewing are humans, extreme care must be taken to avoid any harm to them. Traditionally, ethical concerns have revolved around the topics of *informed consent* (receiving consent by the respondent after having carefully and truthfully informed him or her about the research), *right to privacy* (protecting the identity of the respondent), and *protection from harm* (physical, emotional, or any other kind).

No sociologists or other social scientists would dismiss these three ethical concerns, yet there are other ethical concerns that are less unanimously upheld. The controversy over overt/covert fieldwork is more germane to participant observation but could include the surreptitious use of tape-recording devices. Warwick (1973) and Douglas (1985) argued for the use of covert methods because they mirror the deceitfulness of everyday-life reality, whereas others, including Erickson (1967), vehemently opposed the study of uninformed respondents.

Another problematic issue stems from the researcher's degree of involvement with the group under study. Whyte (1943) was asked to vote more than once during the same local elections (i.e., to vote illegally) by the members of the group to which he had gained access and befriended, thereby gaining the group members' trust. He used "situational ethics," that is, judging the legal infraction to be minor in comparison with the loss of his fieldwork if he refused to vote more than once. Thompson (1985) was faced with a more serious possible legal breach. He was terrified at the prospect of having to witness one of the alleged rapes for which the Hell's Angels had become notorious, but as he reported, none took place during his research. The most famous, and widely discussed, case of questionable ethics in qualitative sociology took place

during Humphreys's (1970) research for *Tearoom Trade*. Humphreys studied homosexual encounters in public restrooms in parks ("tearooms") by acting as a lookout ("watch queen"). Although this fact in itself may be seen as unethical, it is the following one that raised many academic eyebrows. Humphreys, unable to interview the men in the tearoom, recorded their cars' license plate numbers, which led him to find their residences with the help of police files. He then interviewed many of the men in their homes without being recognized as having been their watch queen.

A twist in the degree of involvement with respondents came from a controversial article by Goode (2002) in which he summarily dismissed years of research with the fat civil rights organization as a "colossal waste of time." Goode discussed the problematics of sexual intimacy between researchers and respondents and acknowledged that he had casual sexual liaisons with some of the respondents. In fact, he fathered a child with a person he had met at research meetings. Goode's article was published along with a number of responses, all of them very critical (in different ways) of Goode's cavalier approach (Bell, 2002; Manning, 2002; Sagui, 2002; Williams, 2002). Perhaps the following quote from Williams (2002) best summarized the feelings of the scholars responding to Goode: "I would hope and expect that sociologists and their audiences could understand public discrimination without sleeping with its victims" (p. 560).

Another ethical problem is raised by the veracity of the reports made by researchers. For example, Whyte's (1943) famous study of Italian street corner men in Boston has come under severe scrutiny (Boelen, 1992) as some have alleged that Whyte portrayed the men in demeaning ways that did not reflect their visions of themselves. Whyte's case is still unresolved; it illustrates the delicate issue of ethical decisions in the field and in reporting field notes, even more than 50 years later (Richardson, 1992b).

A growing number of scholars, as we have seen (Oakley, 1981), feel that most of traditional in-depth interviewing is unethical, whether wittingly or unwittingly. The techniques and tactics

of interviewing, they say, are really ways of manipulating the respondents while treating them as objects or numbers rather than as individual humans. Should the quest for objectivity supersede the human side of those we study? Consider the following:

One day while doing research at the convalescent center, I was talking to one of the aides while she was beginning to change the bedding of one of the patients who had urinated and soaked the bed. He was the old, blind, ex-wrestler confined in the emergency room. Suddenly, the wrestler decided he was not going to cooperate with the aide and began striking violently at the air about him, fortunately missing the aide. Since nobody else was around, I had no choice but to hold the patient pinned down to the bed while the aide proceeded to change the bedding. It was not pleasant. The patient was squirming and yelling horrible threats at the top of his voice; the acid smell of urine was nauseating; I was slowly losing my grip on the much stronger patient, while all along feeling horribly like Chief Bromden when he suffocates the lobotomized MacMurphy in Ken Kesey's novel. *But there was no choice; one just could not sit back and take notes while the patient tore apart the aide.* (Fontana, 1977, p. 187, emphasis added).

A chapter (Edwards & Mauthner, 2002) in a recent edited volume (Mauthner, Birch, Jessop, & Miller, 2002) presented new insight on the ethics of feminist research. Edwards and Mauthner (2002) outlined the various models of ethics currently existing: the universalist models based on "universal principles such as honesty, justice, and respect" or based on "'goodness' of outcomes of research" (p. 20). In contrast, a third model is based on "contextual or situational ethical position" (p. 20). The authors noted that a majority of feminist researchers (if not all of them) have focused on care and responsibility, that is, on contextually based "feminist-informed social values" (p. 21). The authors lauded the work of Denzin (1997) for applying these feminist principles to social research. However, they found that some of Denzin's ideas could be refined to some degree. For instance, Denzin (1997) advocated a symmetrical relation between researchers and respondents,

whereas others (e.g., Young, 1997) criticized this as "neither possible nor desirable" (Edwards & Mauthner, 2002, p. 26) and called instead for "asymmetrical reciprocity." In the words of the Edwards and Mauthner (2002), "Rather than ignoring or blurring power positions, ethical practice needs to pay attention to them" (p. 27).

Clearly, as we move forward with sociology, we cannot—to paraphrase what Blurrier said so many years ago—let the methods dictate our images of humans. As Punch (1986) suggested, as field-workers we need to exercise common sense and responsibility—and, we would like to add, to our respondents first, to the study next, and to ourselves last. As Johnson (2002) empathically proclaimed, regardless of what criteria we wish to adopt for interviewing, "the most important ethical imperative is to tell the truth" (p. 116).

■ NEW TRENDS IN INTERVIEWING

The latest trends in interviewing have come some distance from structured questions; we have reached the point of the interview as negotiated text. Ethnographers have realized for quite some time that researchers are not invisible neutral entities; rather, they are part of the interaction they seek to study, and they influence that interaction. At last, interviewing is being brought in line with ethnography. There is a growing realization that interviewers are not the mythical neutral tools envisioned by survey research. Interviewers are increasingly seen as active participants in an interaction with respondents, and interviews are seen as negotiated accomplishments of both interviewers and respondents that are shaped by the contexts and situations in which they take place. As Schwandt (1997) noted, "It has become increasingly common in qualitative studies to view the interview as a form of discourse between two or more speakers or as a linguistic event in which the meanings of questions and responses are contextually grounded and jointly constructed by interviewer and respondent" (p. 79). We are beginning to realize that we cannot lift the results of interviews out of the contexts in which they

were gathered and claim them as objective data with no strings attached.

The Interview as a Negotiated Accomplishment

Let us briefly recap the two traditional approaches to the interview, following Holstein and Gubrium (1995, 1997). The authors use Converse and Schuman's (1974) *Conversations at Random* as an exemplar of the interview as used in survey research. In this context, the interviewer is carefully instructed to remain as passive as possible so as to reduce his or her influence; the scope of the interviewer's function is to access the respondent's answers. This is a *rational* type of interviewing; it assumes that there is an objective knowledge out there and if that one can access it if he or she is skilled enough, just as a skilled surgeon can remove a kidney from a donor and use it in a different context (e.g., for a patient awaiting a transplant).

Holstein and Gubrium (1995, 1997) regarded Douglas's (1985) creative interviewing as a romanticist type of interviewing. Douglas's interviewing is based on *feelings*; it assumes that researchers, as interviewers, need to "get to know" the respondents beneath their rational facades and that researchers can reach respondents' deep well of emotions by engaging them and by sharing feelings and thoughts with them. Douglas's interviewer is certainly more active and far less neutral than Converse and Schuman's interviewer, but the assumptions are still the same—that the *skills* of the interviewer will provide access to knowledge and that there is a *core knowledge* that the researcher can access.

Holstein and Gubrium (1995) finally considered the new type of interviewing, although "new" isn't exactly accurate given that their reference for this is the work of Ithiel de Sola Pool, published in 1957. To wit, "Every interview is . . . an interpersonal drama with a developing plot" (Pool, 1957, p. 193, quoted in Holstein & Gubrium, 1995, p. 14). Holstein and Gubrium went on to discuss that so far we have focused on the *whats* of the interview (the substantive findings)

and that it is now time to pay attention to the *hows* of the interview (the context, particular situation, nuances, manners, people involved, etc., in which interview interactions take place). This concept harks back to ethnomethodology, according to Holstein and Gubrium: "To say that the interview is an interpersonal drama with a developing plot is part of a broader claim that reality is an ongoing, interpretive accomplishment" (p. 16). Garfinkel, Sacks, and others clearly stated during the late 1960s that reality is an ever-changing, ongoing accomplishment based on the practical reasoning of the members of society. It is time to consider the interview as a practical production, the meaning of which is accomplished at the intersection of the interaction of the interviewer and the respondent.

In a later essay, Gubrium and Holstein (1998) continued their argument by looking at interviews as storytelling, which they saw as a practical production used by members of society to accomplish coherence in their accounts. Once more, they encouraged us to examine the *hows* as well as the *whats* of storytelling. Similarly, Sarup (1996) told us,

Each narrative has two parts, a story (*histoire*) and a discourse (*discourse*). The story is the content, or chain of events. The story is the "what" in a narrative, the discourse is the "how." The discourse is rather like a plot, how the reader becomes aware of what happened, [and] the order of appearance of the events. (p. 17)

Gubrium and Holstein are not alone in advocating this reflexive approach to interviews. Both Silverman (1993) and Dingwall (1997) credited Cicourel's (1964) classic work, *Method and Measurement in Sociology*, with pointing to the interview as a social encounter. Dingwall (1997) noted,

If the interview is a social encounter, then, logically, it must be analysed in the same way as any other social encounter. The products of an interview are the outcome of a socially situated activity where the responses are passed through the role-playing and impression management of both the interviewer and the respondent. (p. 56)

Seidman (1991) discussed interviewing as a relationship by relying on a principal intellectual antecedent of the ethnomethodologist Alfred Schutz. Seidman analyzed the interviewer–respondent relation in terms of Schutz’s (1967) “I–Thou” relation, where the two share a reciprocity of perspective and, by both being “thou” oriented, create a “we” relationship. Thus, the respondent is no longer “an object or a type” (Seidman, 1991, p. 73); rather, the respondent becomes an equal participant in the interaction.

To recapitulate, we must find someone willing to talk to us (Arksey & Knight, 2002). Then we go through many creative stratagems to find more respondents (Warren, 2002; Weiss, 1994). Then, we talk to the respondents and attend to the meaning of the stories they weave while interjecting our own perspectives. Warren (2002) puts it beautifully: “In the social interaction of the qualitative interview, the perspectives of the interviewer and the respondent dance together for the moment but also extend outward in social space and backward and forward in time” (p. 98). Finally, we try to piece together the kaleidoscope of shapes and colors into a coherent story—something that has some meaning and, in the common understanding that we achieve, brings us all closer together (Atkinson, 2002).

The Problematics of New Approaches

Some of the proponents of the ethnomethodologically informed interview are critical of both interactionist and positivist interview methods. Dingwall (1997), as well as others, spoke of the romantic movement in ethnography (and interviewing)—the idea that the nearer we come to the respondent, the closer we are to apprehending the “real self.” This assumption neglects the fact that the self is a process that is ever negotiated and accomplished in the interaction. Dingwall also faulted the “postmodern” turn; that is, if there is no real self, then there is no real world and so we can create one of our own. Finally, Dingwall was troubled by the “crusading” nature of the romantics and asked, “What is the value of a scholarly enterprise that

is more concerned with being ‘right on’ than with being right?” (p. 64).

In a similar vein, Atkinson and Silverman (1997) rejected the postmodern notion of “polyphonic voices,” correctly noting that the interviewer and the respondent collaborate together to create an essentially monologic view of reality. This same rejection could be made by using Schutz’s (1967) argument, that is, “I” and “thou” create a unified “we” rather than two separate versions of it.

Ethnomethodologically informed interviewing is not, however, immune from criticism itself. Schutz (1967) assumed a reciprocity of perspective that might not exist. Granted, in our interview society, we all know the commonsense routines and ground rules of interviewing, but in other societies this might not be the case. Bowler (1997) attempted to interview Pakistani women about their experience with maternity services and found a total lack of understanding of the value of social research and interviewing:

I had told them that I was writing a book on my findings. Yams, who spoke the better English, translated this with a look of disbelief on her face, and then they both dissolved into laughter. The hospitals were very good. There weren’t any problems. All was well. (p. 72)

Bowler was forced to conclude that interviewing might not work when there is no “shared notion of the process of research” (p. 66).

Silverman (1993) envisioned a different problem. He seemed to feel that some ethnomethodologists have suspended their interest in substantive concerns of everyday life, claiming that they cannot address them until they knew more about the ways in which these realities are accomplished. He noted, “Put simply, according to one reading of Cicourel, we would focus on the conversational skills of the participants rather than on the content of what they are saying and its relation to the world outside the interview” (p. 98).

Cicourel (1970) stated that sociologists need to outline a workable model of the actor before engaging in the study of self and society. Garfinkel held similar beliefs. For instance, in his famous

study of a transsexual named Agnes, Garfinkel (1967) examined the routines by which societal members pass as males or females; he had little or no interest in issues of transsexuality *per se*. Thus, it would follow that, according to Silverman's reading of ethnomethodology, we should learn the conversational methods before attempting to learn substantive matters in interviewing.

■ FUTURE DIRECTIONS

To borrow from Gubrium and Holstein (1997), "Where do we go from here?" (p. 97). We share with these two authors a concern with appreciating the new horizons of postmodernism while simultaneously remaining conservatively committed to the empirical description of everyday life. Gubrium and Holstein (1998) introduced a technique called "analytic bracketing" to deal with the multiple levels of interviewing (and ethnography):

We may focus, for example on *how* a story is being told, while temporarily deferring our concern for the various *whats* that are involved—for example, the substance, structure, or plot of the story, the context within which it is told, or the audience to which it is accountable. We can later return to these issues. (p. 165)

The use of this analytic bracketing allows the authors to analyze interviewing in its coherence and diversity as an event that is collaboratively achieved and in which product and process are mutually constituted.

A pressing problem in interviewing concerns the kinds of standards that we should apply to these new and different types of interviews. To assume absolute relativism is not the solution because it would lead, in Silverman's (1997b) words, to the "sociology of navel-gazing" (p. 240). Silverman proposed an aesthetics for research, rejecting attempts to use literary forms in sociology: "If I want to read a good poem, why on earth should I turn to a social science journal?" (p. 240). Silverman's critique of interactionist sociology and proposal for aesthetic values seemed to focus on the following three points. First, he attacked the

grandiose political theorizing of British sociology and invoked a return to more modest, more minute goals. Second, he rejected the romanticist notion of equating experience (from the members' viewpoint) with authenticity. Third, he noted that in sociology we mimic the mass media of the interview society, thereby succumbing to the trivial, the kitschy, the gossipy, and the melodramatic and ignoring simplicity and profundity.

Silverman's (1997b) notions that we should pay attention to minute details in sociological studies, rather than embarking on grandiose abstract projects, in a way was not dissimilar to Lyotard's (1984) appeal for a return to local elements and away from metatheorizing. For Silverman, the "minute" details are the small details that go on in front of our eyes in our everyday life—very similar to Garfinkel's mundane routines that allow us to sustain the world and interact with each other.

We agree with Silverman that we need to stop deluding ourselves that in our particular method (whichever it may be), we have the key to the understanding of the self. We also agree that it is imperative that we look for new standards given that we are quickly digressing into a new form of the theater of the absurd (and without the literary flair, we fear). But we cannot wait to find a model of the methods used by participants in interviews or in everyday life before we proceed; Cicourel's (1970) invariant properties of interaction turned out to be so general as to be of little use to sociological inquiry.

We need to proceed by looking at the substantive concerns of the members of society while simultaneously examining the constructive activities used to produce order in everyday life and, all along, remaining reflexive about how interviews are accomplished (Gubrium & Holstein, 1997, 1998). For instance, as Baker (1997) pointed out, a researcher telling a respondent that "I am a mother of three" versus telling the respondent that "I am a university professor" accesses different categories and elicits different accounts. We need to move on with sociological inquiry, even though we realize that conditions are less than perfect. To paraphrase Robert Solow, as cited by

Geertz (1973), just because complete asepsis is impossible does not mean that we may just as well perform surgery in a sewer.

A different kind of future direction for interviewing stems largely from the new feminist interviewing practices. The traditional interview has painstakingly attempted to maintain neutrality and achieve objectivity and has kept the role of the interviewer as invisible as possible. Feminists instead are rebelling against the practice of *exploiting* respondents and wish to use interviewing for ameliorative purposes. To wit, "As researchers with a commitment to change, we must decenter ourselves from the 'ivory tower' and construct more participatory, democratic practices. *We must keep people and politics at the center of our research*" (Benmayor, 1991, pp. 172–173, emphasis added). Denzin (1997) referred to this approach as the "feminist, communitarian ethical model" (see also Lincoln, 1995) and told us,

The feminist, communitarian researcher does not invade the privacy of others, use informed consent forms, select subjects randomly, or measure research designs in terms of their validity. This framework presumes a researcher who builds collaborative, reciprocal, trusting, and friendly relations with those studied. . . . It is also understood that those studied have claims of ownership over any materials that are produced in the research process, including field notes. (Denzin, 1997, p. 275)

Combining the roles of the scholar and the feminist may be problematic and sometimes may lead to conflict if the researcher has a different political orientation from that of the people studied (Wasserfall, 1993), but this approach may also be very rewarding in allowing the researcher to see positive results stemming from the research (Gluck, 1991).

A third kind of future direction, one that is already here but is likely to expand greatly in the near future, is that of performance and poetics. I combine the two because they stem from the same concerns for speaking with the voices of the respondents and taking a helping stance toward them. Also, they both possess an expressional trope that goes beyond the traditional

one of social sciences—prose. Denzin (2003a) championed performance to the exclusion of other modes of relating social science (ethnography and interview). Performance does not become fixed in a written text to be read later; rather, performance is doing, is now, and has feelings, passions, joy, tears, despair, and hope. Performance can reach to people's hearts and not only their minds. Performance can be a powerful instrument for social reform, for righting some wrongs, and for helping those in need. Performance relates to people in our media society; it draws interest, draws attention, and leads to questioning.

Poetics operates in a similar way by encapsulating in a welter of feelings and emotions a life story, an epiphanic moment in the life, a tragedy, a moment of sorrow, or a moment of utter joy. Consider the reply of Louisa May, a sort of average woman from Tennessee, when her partner asked her to terminate her pregnancy:

Jody May's father said,
 "Get an Abortion."
 I told him,
 "I would never marry you.
 I would never marry you.
 I would never.
 I am going to have this child.
 I am going to.
 I am. I am.

Richardson's (1997) masterful poem captured the soul of Louisa May, and through the poem we come to know that woman, we know her feelings, and our heart goes out to her.

Richardson (2002), in speaking about poetry pointed out that prose is privileged only because it is empowered by the current system, yet it is only one of many tropes of expression, including performance and poetry, in a newly fragmented world in which not only metatheories but also modes of expression have been fragmented, and we can now speak in many voices and in different tropes.

Electronic Interviewing

Another direction currently being taken in interviewing is related to the changing technologies available. The reliance on the interview as a means of information gathering most recently has expanded to electronic outlets, with questionnaires being administered by fax, electronic mail, and websites. Estimates suggest that nearly 50% of all households have computers and that nearly half of these use the Internet. Software that allows researchers to schedule and archive interview data gathered by chat room interviews is now available. The limited population of potential respondents with access to computers makes surveys of the general population infeasible, but electronic interviewing can reach 100% of some specialized populations (Schaefer & Dillman, 1998).

It is now possible to engage in "virtual interviewing," where Internet connections are used synchronously or asynchronously to obtain information. The advantages include low cost (no telephone or interviewer charges) and speed of return. Of course, face-to-face interaction is eliminated, as is the possibility of both the interviewer and the respondent reading nonverbal behavior or of cueing from gender, race, age, class, or other personal characteristics. Thus, establishing an interviewer-interviewee "relationship" and "living the moment" while gathering information (Hertz, 1997a) is difficult if not impossible. Internet surveys make it easy for respondents to manufacture fictional social realities without anyone knowing the difference (Markham, 1998). Of course, interviewers can deceive respondents by claiming to have experiences or characteristics that they do not have in hopes of establishing better rapport. They can feign responses for the same purpose by claiming "false nonverbals," for example, telling respondents that they "laughed at" or "were pained by" particular comments. Markham (1998), in her autoethnography of Internet interviewing, reported that electronic interviews take longer than their traditional counterparts and that responses are more cryptic and less in depth; however, the interviewer has time to phrase follow-up questions or probes properly.

It is also virtually impossible to preserve anonymity in Internet e-mail surveys, but chat rooms and similar sites permit the use of pseudonyms. Although electronic interviews are currently used primarily for quantitative research and usually employ structured questionnaires, it is only a matter of time before researchers adapt these techniques to qualitative work, just as they have adapted electronic techniques of data analysis. For example, Markham (1998) immersed herself in the process of engaging with various electronic or Internet formats (e.g., chat rooms, listservs) to interview other participants and to document her journey in the virtual world, learning the experience of cyberspace and the meanings that participants attached to their online lifestyles. She asked an intriguing question: "Can I have a self where my body does not exist?" (p. 8).

The future may see considerable ethnography by means of computer-mediated communication, where virtual space—rather than a living room or workplace—is the setting of the interview. It remains to be seen whether electronic interviewing will allow researchers to obtain "thick descriptions" or accounts of subjective experiences or whether such interviewing will provide the "process context" that is so important to qualitative interviews. In addition, researchers conducting such interviewing can never be sure that they are receiving answers from desired or eligible respondents. Interviewing by way of the Internet is so prominent today that researchers are studying its effects on response quality. Schaefer and Dillman (1998), for example, found that e-mail surveys achieved response rates similar to those of mail surveys but yielded better quality data in terms of item completion and more detailed responses to open-ended questions.

There are clearly many unanswered questions and problems related to the use of electronic interviewing. This mode of interviewing will obviously increase during the new millennium as people rely increasingly on electronic modes of communication. But just how much Internet communication will displace face-to-face interviewing is a matter that only time will tell.

■ CONCLUSION

In this chapter, we have examined the interview, from structured types of interview to the interview as negotiated text. We outlined the history of interviewing, with its qualitative and quantitative origins. We looked at structured, group, and various types of unstructured interviewing. We examined the importance of gender in interviewing and the ways in which framing and interpreting affect interviews. We examined the importance of ethics in interviewing. Finally, we discussed the new trends in interviewing.

We have included discussion of the whole gamut of the interview, despite the fact that this book is concerned with qualitative research, because we believe that researchers must be cognizant of all the various types of interviews, both modern and postmodern, if they are to gain a clear understanding of interviewing. Clearly, certain types of interviewing are better suited to particular kinds of situations, and researchers *must be aware of the implications, pitfalls, and problems of the types of interview they choose*. If we wish to find out how many people oppose the establishment of a nuclear repository in their area, then a structured type of interview, such as that used in survey research, is our best tool; we can quantify and code the responses and can use mathematical models to explain our findings. If we are interested in opinions about a given product, then a focus group interview will provide us with the most efficient results. If we wish to know about the lives of Palestinian women in the resistance (Gluck, 1991), then we need to interview them at length and in depth in an unstructured way. In the first example just cited, and perhaps in the second, we can speak in the formal language of scientific rigor and verifiability of findings. In the third example, we can speak of understanding a negotiated way of life.

More scholars are realizing that to pit one type of interviewing against another is a futile effort—a leftover from the paradigmatic quantitative/qualitative hostility of past generations. Thus, an increasing number of researchers are using a multimethod approach to achieve broader and often

better results. This multimethod approach is referred to as *triangulation* (Denzin, 1989b; Flick, 1998) and allows researchers to use different methods in different combinations. For instance, group interviewing has long been used to complement survey research and is now being used to complement participant observation (Morgan, 1988). Humans are complex, and their lives are ever changing. The more methods we use to study them, the better our chances will be to gain some understanding of how they construct their lives and the stories they tell us about them.

The brief journey we have taken through the world of interviewing should allow us to be better informed about, and perhaps more sensitized to, the problematics of asking questions for sociological reasons. We must remember that each individual has his or her own social history and an individual perspective on the world. Thus, we cannot take our task for granted. As Oakley (1981) noted, "Interviewing is rather like a marriage: Everybody knows what it is, an awful lot of people do it, and yet behind each closed front door there is a world of secrets" (p. 41). She was quite correct. We all think that we know how to ask questions and talk to people, from common everyday folks to highly qualified quantophrenic experts. Yet to learn about people, we must treat them as people, and they will work with us to help us create accounts of their lives. So long as many researchers continue to treat respondents as unimportant faceless individuals whose only contributions are to fill more boxed responses, the answers that researchers will get will be commensurate with the questions they ask and the way in which they ask them. As researchers, we are no different from Gertrude Stein, who, while on her deathbed, asked her lifelong companion Alice B. Toklas, "What is the answer?" When Alice could not bring herself to speak, Gertrude asked, "In that case, what is the question?"

RECONTEXTUALIZING OBSERVATION

Ethnography, Pedagogy, and the Prospects for a Progressive Political Agenda

Michael V. Angrosino

Observation has been characterized as “the fundamental base of all research methods” in the social and behavioral sciences (Adler & Adler, 1994, p. 389) and as “the mainstay of the ethnographic enterprise” (Werner & Schoepfle, 1987, p. 257). Even studies that rely mainly on interviewing as a data collection technique employ observational methods to note body language and other gestural cues that lend meaning to the words of the persons being interviewed. Social scientists are observers both of human activities and of the physical settings in which such activities take place. Some such observation may take place in a laboratory or

clinic, in which case the activity may be the result of a controlled experiment. On the other hand, it is also possible to conduct observations in settings that are the “natural” loci of those activities. Some scholars have criticized the very concept of the “natural” setting, particularly when fieldwork is conducted in Third World locations (or in domestic inner-city sites) that are the products of inherently “unnatural” colonial relationships (Gupta & Ferguson, 1996, p. 6), but the designation is still prevalent throughout the literature. In that case, it is proper to speak of “naturalistic observation,” or fieldwork, which is the focus of this chapter.

Author's Note. This chapter builds on the essay, “Rethinking Observation: From Method to Context” (Angrosino & Pérez, 2000), which appeared in the second edition of this *Handbook*. In that chapter, we argued that observation-based ethnographic research is not so much a specific method of inquiry as a context in which new ways of conducting qualitative research are emerging. I suggested that researchers’ activities were developing in response to a greater consciousness of situational identities, the ethical demands of the modern research enterprise, and relationships of relative power in the field setting, particularly in reference to studies dealing with gender, sexuality, and people on the sociocultural margins (e.g., people with disabilities). The current chapter explores the ramifications of seeing observational research as context, with an emphasis on a convergence of pedagogy and political action in service to a progressive social agenda.

Observations in natural settings can be rendered as descriptions either through open-ended narrative or through the use of published checklists or field guides (Rossman & Rallis, 1998, p. 137; for an historical overview of this dichotomy, see Stocking, 1983a). In either case, in the past it was generally assumed that naturalistic observation should not interfere with the people or activities under observation. Most social scientists have long recognized the possibility of observers affecting what they observe; nonetheless, careful researchers were supposed to adhere to rigorous standards of objective reporting designed to overcome potential bias. Even cultural anthropologists, who have usually thought of themselves as "participant observers" and who have deliberately set out to achieve a degree of subjective immersion in the cultures they study (Cole, 1983, p. 30; Wolcott, 1995, p. 66), still claim to be able to maintain their scientific objectivity. Failure to do so would mean that they had "gone native," with their work consequently being rendered suspect as scientific data (Pelto & Pelto, 1978, p. 69). The achievement of the delicate balance between participation and observation remains the ideal of anthropologists (Stocking, 1983b, p. 8), even though it is no longer "fetishized" (Gupta & Ferguson, 1996, p. 37). Objectivity remains central to the self-images of most practitioners of the social and behavioral sciences. Objective rigor has most often been associated with quantitative research methods, and the harmonization of empathy and detachment has been so important that even those dedicated to qualitative methods have devoted considerable effort to organizing their observational data in the most nearly objective form (i.e., the form that looks most quantitative) for analysis (see, e.g., Altheide & Johnson, 1994; Bernard, 1988; Miles & Huberman, 1994; Silverman, 1993).

Adler and Adler (1994), in fact, suggested that in the future observational research will be found as "part of a methodological spectrum," but that in this spectrum it will serve as "the most powerful source of validation" (p. 389). Observation, they claimed, rests on "something researchers can find constant," meaning "their own direct knowledge

and their own judgment" (p. 389). In social science research, as in legal cases, eyewitness testimony from trustworthy observers has been seen as a particularly convincing form of verification (Pelto & Pelto, 1978, p. 69). In actuality, the production of a convincing narrative report of the research has most often served as *de facto* validation, even if the only thing it validates is the ethnographer's writing skill and not his or her observational capacities (Kuklick, 1996, p. 60).

Postmodernist analysts of society and culture certainly did not invent the current critique of assumptions about the objectivity of science and its presumed authoritative voice, but the prevalence of that analysis in contemporary scholarship has raised issues that all qualitative researchers need to address. The postmodernist critique is not necessarily directed toward the conduct of field-based observational research, but it is impossible to consider postmodern discourse on the production and reproduction of knowledge without taking into account the field context from which so much of our presumed "data" are said to emerge. Earlier criticism of field-workers might have been directed at particular researchers, with the question being whether they had lived up to the expected standards of objective scholarship. In the postmodernist milieu, in contrast, the criticism is directed at the standards themselves. In effect, it is now possible to question whether observational objectivity is either desirable or feasible as a goal. Clifford (1983a), who has written extensively and critically about the study of culture and society, even called into question the work of the revered Bronislaw Malinowski, the archetype of the scientific participant observer who, according to Stocking (1983a), is the scholar most directly responsible for the "shift in the conception of the ethnographer's role, from that of inquirer to that of participant 'in a way' in village life" (p. 93). Perhaps more surprisingly, Clifford (1983a) also questioned the research of the very influential contemporary interpretivist Clifford Geertz, whom he took to task for suggesting that the ethnographer, through empathy, can describe a culture in terms of the meanings specific to

members of that culture. In other words, the ethnographer, as a distinct person, disappears—just as he or she was supposed to do in Malinowski's more openly positivistic world. This assessment was echoed by Sewell (1997), who pointed out that Geertz did not expect field-workers to "achieve some miracle of empathy with the people whose lives they briefly and incompletely share; they acquire no preternatural capacity to think, feel, and perceive like a native" (p. 40). The problem is not that Geertz failed to achieve some sort of idealized empathetic state; rather, the question is whether such a state is even relevant to ethnographic research and whether it is desirable to describe and/or interpret cultures as if those depictions could exist without the ethnographer's being part of the action.

The postmodernist critique, which emphasizes the importance of understanding the ethnographer's "situation" (his or her gender, class, ethnicity, etc.) as part of interpreting the ethnographic product, is particularly salient because the remote, traditional folk societies that were the anthropologist's stock-in-trade have virtually disappeared. Most cultural anthropology now is carried out in communities that, if not literate themselves, are parts of larger literate societies that are themselves parts of global communication and transportation networks. Like sociologists, anthropologists now "study up" (i.e., they conduct research among elites), if only to help them understand the predicament of the poor and marginalized people who remain their special concern. Doing so overcomes some of the problems associated with the lingering colonialist bias of traditional ethnography (Wolf, 1996, p. 37), but it raises new issues regarding the position and status of the observational researcher. For one thing, ethnographers can no longer claim to be the sole arbiters of knowledge about the societies and cultures they study because they are in a position to have their analyses read and contested by those for whom they presume to speak (Bell & Jankowiak, 1992; Larcom, 1983, p. 191). In effect, objective truth about a society or culture cannot be established because there are inevitably going to be conflicting versions of what happened. Sociologists and other

social scientists were working in such settings long before anthropologists came onto the scene and were already beginning to be aware of the problems inherent in claiming the privilege of objective authoritative knowledge when there are all too many "natives" ready and able to challenge them. As Wolf (1992) wryly commented,

We can no longer assume that an isolated village will not within an amazingly short period of time move into the circuit of rapid social and economic change. A barefoot village kid who used to trail along after you will one day show up on your doorstep with an Oxford degree and your book in hand. (p. 137)

The validity of the traditional assumption—that the truth can be established through careful cross-checking of ethnographers' and insiders' reports—is no longer universally granted because contemporary social and behavioral scientists are increasingly inclined to expect differences in testimony grounded in gender, class, ethnicity, and other factors that are not easy to mix into a consensus. Ethnographic truth has come to be seen as a thing of many parts, and no one perspective can claim exclusive privilege in the representation thereof. Indeed, the result of ethnographic research "is never reducible to a form of knowledge that can be packaged in the monologic voice of the ethnographer alone" (Marcus, 1997, p. 92).

Ethnographers of various disciplines have responded to this new situation by revising the ways in which they conduct observation-based research and present their analyses of this research. No longer can it be taken for granted that ethnographers operate at a distance from their human subjects. Indeed, the very term *subject*, with its implicit colonialist connotations, is no longer appropriate. Rather, there is said to be a *dialogue* between researchers and those whose cultures/societies are to be described. "Dialogue" in this sense does not literally mean a conversation between two parties; in practice, it often consists of multiple, even contradictory, voices. As a result, discussions of ethnographers' own interactions, relationships, and emotional states while in the field have been moved from their traditional discreet place in acknowledgments or forewords to

the centers of the ethnographies themselves. The increasing acceptance of autoethnography and performance-based ethnography has also resulted in a greater personalization of the activities of the researchers (see, e.g., Bochner & Ellis, 2002; see also Holman Jones, chap. 30, this volume). Although these practices have certainly opened up new horizons in ethnographic reportage, they raise further issues of their own. For example, because it is likely to be the ethnographers who write up (or at least collate or edit) the results of field studies, do they not continue to claim the implicit status of arbiters/mediators of social/cultural knowledge (Wolf, 1992, p. 120)? Ethnographers may assert that they represent the many voices involved in the research, but we still have only their assurance that such is the case.

Nonetheless, we now function in a context of "collaborative" research. *Collaboration* no longer refers only to the conduct of multidisciplinary teams of professional researchers; it often means the presumably equal participation of professional researchers and their erstwhile "subjects" (Kuhlmann, 1992; Wolf, 1996, p. 26). Matsumoto (1996), for example, sent a prepared list of questions to the people she was interested in interviewing for an oral history project. She assured them that any questions to which they objected would be eliminated. The potential respondents reacted favorably to this invitation to participate in the formulation of the research design. As such situations become more common, it is important that we rethink our current notions about "observation"—what it is, how it is done, what role it plays in the generation of ethnographic knowledge. To that end, it might be useful to shift from a concentration on observation as a "method" *per se* to a perspective that emphasizes observation as a context for interaction among those involved in the research collaboration.

■ OBSERVATION-BASED

RESEARCH: TRADITIONAL ASSUMPTIONS

Observational researchers traditionally have attempted to see events through the eyes of the

people being studied. They have been attentive to seemingly mundane details and to take nothing in the field setting for granted. They were taught to contextualize data derived from observation in the widest possible social and historical frame, all without overgeneralizing from a necessarily limited (and probably statistically nonrepresentative) sample. Their research design usually involved the use of as many means of data collection as were feasible to supplement purely observational data. Although observational research has played a part in many different schools of social theory, it has been most prominently associated with those orientations that seek to construct explanatory frameworks only after careful analysis of objectively recorded data.

There are three main ways in which social scientists have conducted observation-based research. Despite considerable overlap, it is possible to distinguish among (a) participant observation, grounded in the establishment of considerable rapport between the researcher and the host community and requiring the long-term immersion of the researcher in the everyday life of that community; (b) reactive observation, associated with controlled settings and based on the assumption that the people being studied are aware of being observed and are amenable to interacting with the researcher only in response to elements in the research design; and (c) unobtrusive (nonreactive) observation, conducted with people who are unaware of being studied.

All forms of observational research involve three procedures of increasing levels of specificity: (a) descriptive observation (the annotation and description of all details by an observer who assumes a nearly childlike stance, eliminating all preconceptions and taking nothing for granted), a procedure that yields a large amount of data, some of which will prove to be irrelevant; (b) focused observation (where the researcher looks only at material that is pertinent to the issue at hand, often concentrating on well-defined categories of group activity such as religious rituals and political elections); and (c) selective observation (focusing on a specific form of a more general category such as

initiation rituals and city council elections). (For an elaboration of these points, see Werner & Schoepfle, 1987, pp. 262–264.)

Underlying these various methodological points was the assumption that it is both possible and desirable to develop standardized procedures that can “maximize observational efficacy, minimize investigator bias, and allow for replication and/or verification to check out the degree to which these procedures have enabled the investigator to produce valid, reliable data that, when incorporated into his or her published report, will be regarded by peers as objective findings” (Gold, 1997, p. 397). True objectivity was held to be the result of agreement between participants and observers as to what is really going on in a given situation. Such agreement was obtained by the elicitation of feedback from those whose behaviors were being reported. Ethnography’s “self-correcting, investigative process” has typically included adequate and appropriate sampling procedures, systematic techniques for gathering and analyzing data, validation of data, avoidance of observer bias, and documentation of findings (Clifford, 1983b, p. 129; Gold, 1997, p. 399). The main difference between sociological and anthropological practitioners of ethnography seems to be that the former have generally felt the need to validate their eyewitness accounts through other forms of documentation, whereas the latter have tended to use participant observation—“relatively unsystematized” as it might be—as the ultimate reality check on “all the other, more refined research techniques” (Pelto & Pelto, 1978, p. 69).

One classic typology (Gold, 1958) divided naturalistic researchers into “complete participants” (highly subjective and, hence, scientifically questionable), “participants-as-observers” (insiders with a little bit of scientific training but still not truly acceptable as scientists), “observers-as-participants,” and “complete observers.” Gold (1997) went on to advocate a form of ethnographic research that seeks to collect data that are “grounded in the informants’ actual experience” (p. 399). He insisted on the continuing importance of maintaining standards of reliability and validity through “adequate and appropriate

sampling procedures, systematic techniques for gathering and analyzing data, validation of data, avoidance of observer bias, and documentation of findings,” although he admitted that such goals are met in ethnographic research “in ways that differ from conventional (statistical) procedures” (p. 399).

A somewhat different perspective is represented by Adler and Adler (1987), who emphasized a range of “membership roles” as opposed to roles defined relative to some presumed ideal of pure observation. This shift was occasioned by the realization that pure observation was, first, nearly impossible to achieve in practice and, second, ethically questionable, particularly in light of the evolving professional concern with informed consent. Therefore, Adler and Adler wrote about (a) peripheral member researchers (those who believe they can develop a desirable insider’s perspective without participating in those activities that constitute the core of group membership), (b) active member researchers (those who become involved with the central activities of the group, sometimes even assuming responsibilities that advance the group without necessarily fully committing themselves to members’ values and goals), and (c) complete member researchers (those who study settings in which they are already members or with which they become fully affiliated during the course of research). In the scholarly world prior to the ascendancy of the postmodernist critique, even complete member researchers, who were expected to celebrate the “subjectively lived experience,” were still enjoined to avoid using their insider status to “alter the flow of interaction unnaturally” (Adler & Adler, 1994, p. 380).

■ OBSERVATION-BASED RESEARCH: CURRENT ASSUMPTIONS

Contemporary observation-based social research may be characterized by the following trends. First, there is an increasing willingness on the part of ethnographers to affirm or develop a “membership” identity in the communities they study.

Second, researchers recognize the possibility that it may be neither feasible nor possible to harmonize observer and insider perspectives so as to achieve a consensus about "ethnographic truth." Thus, there is a recognition that our erstwhile "subjects" have become collaborators, although they often speak in a voice different from that of hegemonic authoritative science.

Traditional researchers' concern with process and method, therefore, has been supplemented with (but by no means supplanted by) an interest in the ways in which ethnographic observers interact with, or enter into a dialogic relationship with, members of the group being studied. In light of these trends, an earlier incarnation of this chapter suggested that observation-based ethnographic research was not so much a specific method of inquiry as a context in which new roles for the qualitative researcher were emerging. Research roles were said to be developing in response to a greater consciousness of situational identities and to the perception of relative power, particularly in reference to studies dealing with gender, sexuality, and people on the sociocultural margins (e.g., people with disabilities). (For a detailed review of research illustrating these trends, see Angrosino & Pérez, 2000, pp. 678–690.)

At this point, however, it no longer seems fruitful to go on arguing the case for rethinking observation. The numerous studies cited by Angrosino and Pérez (2000) demonstrate quite plainly that the new perspective is already part and parcel of the conceptual framework and methodological toolkits of a wide range of contemporary qualitative researchers.¹ If the battle cannot be said to have been definitively won, there is no longer any doubt that the traditional view—with its fixation on objectivity, validation, and replicability—is now simply one point on a continuum and not the unique voice of reputable social research. The pressing question that now faces us is the following: How do we move this new perspective beyond the confines of academic discourse and ensure its relevance in ways that help us to advance a progressive social agenda?

■ THE ETHICAL DIMENSION OF OBSERVATION-BASED RESEARCH

Before answering the question at the end of the previous section directly, we must first consider the matter of ethics as it bears on the conduct of observation-based research. Ethics concerns us on two levels. First, we must take into account the current standards operative in most universities and other research institutions that govern the ways in which we work. Second, and perhaps more important in the long run, is the matter of what we mean by a "progressive social agenda." In other words, what values may we invoke to explain and justify the ways in which we seek to use our ethnographic knowledge?

Institutional Structures

Observation was once thought of as a data collection technique employed primarily by ethnographers who thought of themselves as objective researchers extrinsic to the social settings they studied. It has become a context in which researchers who define themselves as members of those social settings interact with other members of those settings. This transition has also effected a shift in the parameters of research ethics.

For good or ill, virtually all social research in our time is governed by the structure of institutional review boards (IRBs), which grew out of federal regulations, beginning in the 1960s, that mandated informed consent for all those participating in federally funded research. Rules governing the use of human subjects are "rooted in scandal" (Gunsalus, 2002, p. B24), specifically the scandal of experiments that led to injury or even death of participants. The perceived threat was from "intrusive" research (usually biomedical). The new rules were designed so that participation in such research would be under the control of the "subjects," who had a right to know what was going to happen to them and who were expected to agree formally to all provisions of the research. The right of informed consent, and the IRBs that were eventually created to enforce it at all institutions receiving federal moneys (assuming a

function originally carried out centrally by the U.S. Office of Management and Budget), radically altered the power relationship between the researcher and the human subject, allowing both parties to have a say in the conduct and character of research. (For more detailed reviews of this history, see Fluehr-Lobban, 2003; Wax & Cassell, 1979.) Although few would criticize the move toward protection of human subjects and the concern for their privacy, the increasingly cautious approach of IRBs and their tendency to expand their jurisdiction over all aspects of the research process have turned IRBs into "de facto gatekeepers for a huge amount of scholarly inquiry" (Gunsalus, 2002, p. B24).

Ethnographic researchers, however, have always been uncomfortable with this situation—not because they wanted to conduct covert harmful research but rather because they did not believe that their research was intrusive. Such a claim stemmed from the assumptions typical of the observers-as-participants role, although it is certainly possible to interpret it as a relic of the "paternalism" that traditional researchers often adopted with regard to their human subjects (Fluehr-Lobban, 2003, p. 172). Ethnographers were also concerned that the proposals sent to IRBs had to be fairly complete when it came to explicating the methodology so that all possibilities of doing harm could be adequately assessed. Their research, they argued, often grew and changed as it went along and could not always be set out with the kind of predetermined specificity that the legal experts seemed to expect. They further pointed out that the statements of professional ethics promulgated by the relevant disciplinary associations already provided for informed consent; thus, the IRBs were being redundant in their oversight.

During the 1980s, social scientists won from the U.S. Department of Health and Human Services an exemption from review for all social research except that dealing with children, people with disabilities, and others defined as members of "vulnerable" populations (Fluehr-Lobban, 2003, p. 167). Nevertheless, legal advisers at many universities (including the University of South

Florida [USF], where I am based) have opted for caution and been very reluctant to allow this near blanket exemption to be applied. Indeed, at USF, proposals that may meet the general federal criteria for exemption must still be reviewed, although they may be deemed eligible for an "expedited" review. Even proposals that are completely exempt (e.g., studies relying on on-the-record interviews with elected officials about matters of public policy) must still be filed with the IRB. It is ironic that one type of observational research is explicitly mentioned in the "exempt" category—research that is "public" (e.g., studying patterns of where people sit in airport waiting rooms). This is one of the increasingly rare remaining classic "pure observer" types of ethnography. The exemption, however, is disallowed if the researcher intends to publish photos or otherwise identify the people who make up the "public" being researched.

USF now has two IRBs: one for biomedical research and one for "behavioral research." Because the latter is dominated by psychologists (by far the largest department in the social sciences division of the College of Arts and Sciences), this separate status rarely works to the satisfaction of ethnographic researchers. The psychologists, who are used to dealing with hypothesis-testing, experimental clinical or lab-based research, have been reluctant to recognize a subcategory of "observational" research design. As a result, the form currently required by the behavioral research IRB is couched in terms of the individual human subject rather than in terms of populations or communities, and it mandates the statement of a hypothesis to be tested and a "protocol for the experiment." Concerned ethnographers at USF have discovered that some other institutions have developed forms more congenial to their particular needs, but as of this writing they have had no success in convincing the USF authorities to adopt any of them as an alternative to the current "behavioral research" form for review. Indeed, the bias in favor of clinical research seems to have hardened. For example, of the many hundreds of pages in the federal handbook for IRBs, only 11 paragraphs are devoted to behavioral research (Gunsalus, 2002, p. B24). Moreover,

it is now mandated that all principal investigators on IRB-reviewed research projects take continuing education on evolving federal ethical standards. It is possible to do so over the Internet, but during the 2001–2002 academic year, all of the choices of training modules were drawn from the realm of health services research.

Issues for Contemporary Observational Researchers

Ethical ethnographers who adopt more clearly “membership”-oriented identities, therefore, are caught between two equally untenable models of research. On the one hand is the official IRB, which is tied to the hypothesis-testing, experimental clinical model. On the other hand are those ethnographers who, in their zeal to win exemption from irrelevant and time-consuming strictures, appear to be claiming that their research is not—or should not be considered—intrusive at all. Yet the interactive, membership-oriented researchers *are by definition* intrusive—not in the negative sense of the word, to be sure, but they are still deeply involved in the lives and activities of the community members they study, a stance fraught with all sorts of possibilities for “harm.” The dilemma becomes particularly difficult when we attempt to move beyond academic research to the application of research in service to a social agenda. Such action would seem to require intervention and advocacy—or even conflict in some cases—to bear fruit. As such, there is certainly the possibility of harm, but it is difficult to anticipate what form that harm might take. In principle at least, it might be possible to say that because research collaborators are no longer “subjects,” by definition they have as much power as do researchers in shaping the research agenda; they do not need to be warned or protected. But in reality, the researcher is still in a privileged position, at least where actually conducting the research and disseminating its results are concerned. The contemporary researcher probably does not want to retreat to the objective cold of the classic observer, but neither does he or she want to shirk the responsibility for

doing everything possible to avoid hurting or embarrassing people who have been trusting partners in the research endeavor. (For another perspective on these matters, see Kemmis & McTaggart, chap. 23, this volume.)

■ VALUES AND THE SOCIAL AGENDA

Observational research, as it has evolved during recent times, is essentially a matter of interpersonal interaction and only rarely is a matter of objective hypothesis testing. As Fluehr-Lobban (2003) suggested, this turn of events makes it more imperative that we be mindful of the relational ethics implied by the informed consent process (pp. 169–172). Ethnographers should not try to exempt themselves from monitoring; we can, in contrast, work toward a less burdensome and more appropriate set of ethical standards. It is important to keep in mind, however, that human action must always be interpreted in situational context and not in terms of universally applicable objective “codes.” Angrosino and Pérez (2000) suggested a method of “proportionate reason” as one way in which to link social research to an ethical framework (pp. 692–695). This position, associated with the philosophical writings of Cahill (1981), Curran (1979), Hoose (1987), and Walter (1984), assesses “the relation between the specific value at stake and the . . . limitations, the harm, or the inconvenience which will inevitably come about in trying to achieve that value” (Gula, 1989, p. 273). In other words, although it is certainly important to weigh the consequences of an action, we must keep in mind that consequences are only one part of the total meaning of an action. Proportionate reason defines what a person is doing in an action (e.g., an ethnographer engaged in an observational context); the person and the action are inseparable. (The opposite, of course, would be the old notion of the ethnographic observer as extrinsic to the action he or she is recording.)

There are three criteria that help us to decide whether a proper relationship exists between the specific value and the other elements of the act

(McCormick, 1973; McCormick & Ramsey, 1978). First, *the means used will not cause more harm than necessary to achieve the value*. In traditional moral terms, the ends cannot be said to justify the means. If we take "the value" to refer to the production of some form of ethnography, we must be careful to ensure that the means used (e.g., inserting oneself into a social network, using photographs or other personal records) do not cause disproportionate harm. We might all agree that serving as *comadre* or *compadre* to a child of the community that one is studying is sufficiently proportionate; in contrast, we might well argue about whether becoming the lover of someone in that community (particularly if that sexual liaison is not intended to last beyond the time of the research) does more harm than an ethnographic book, article, or presentation might be worth. Volunteering as a classroom tutor in a program that serves adults with mental retardation whom one is interested in observing and interviewing is probably sufficiently proportionate; in contrast, becoming a bill-paying benefactor to induce cooperation among such adults in a group home would be morally questionable.

The second criterion is that *no less harmful way to protect the value currently exists*. Some might argue that observational research always and inevitably compromises personal privacy, such that no form of research can ethically protect that cherished value. But most researchers would probably reject such an extreme view and instead take the position that there is real value in disseminating the fruits of ethnographic research so as to increase our knowledge and understanding of cultural diversity, the nature of coping strategies, or any number of currently salient social justice issues. Granted that *all* methods have the potential to harm, we must be sure to choose those that do the *least* amount of harm but that still enable us to come up with the sort of product that will be effective in communicating the valuable message. The strategy of writing ethnographic fiction, for example, might be one way in which to make sure that readers do not know exactly who is being described.

The third criterion is that *the means used to achieve the value will not undermine it*. If one sets out, for example, to use research to promote the dignity of people defined as mentally disabled, one must make sure that the research techniques do not subject those people to ridicule. Videotaping a group of people with mental retardation as they play a game of softball might conceivably result in confirming the popular stereotypes of such people as clumsy or inept—objects of pity (at best) or of scorn (at worst)—rather than as dignified individuals. Videotaping as an adjunct to observational research is itself ethically neutral; its appropriateness must be evaluated in this proportionate context.

McCormick (1973) suggested three modes of knowing whether there is a proportionate reason to carry out a suggested action. First, we know that a proper relation exists between a specific value and all other elements of an act through *experience*, which sometimes amounts to plain common sense. For example, although we may think that it is important to encourage individual expression, we know from experience that doing so in the context of a traditional community, where the individual is typically subordinate to the group, will do real violence to the precepts by which the people we are intent on studying have historically formed themselves into a cohesive society. Experience might suggest that we rethink a decision to collect personal life histories of people in such communities in favor of focusing on the collective reconstruction of remembered common activities or events.

Second, we might know that a proper relationship exists through our own *intuition* that some actions are inherently disproportionate, even if we do not have personal experience of their being so. For example, we should intuitively know that publishing information of a personal nature collected from undocumented migrant workers might mean that such information could be used against them. Our righteous goal of improving the lot of the migrants might well be undermined by giving authorities the ammunition to harass them further. A perception of what *could* happen (the result of intuition) is, of course, different

from a perception of what *will* happen (the result of experience), and we are clearly not well served by dreaming up every conceivable disaster. It serves no purpose to allow ourselves to be paralyzed beforehand by overactive guilty consciences. But there is certainly a commonsensical hierarchy of plausibility that occurs in such cases; some things that *could* happen are more likely to come about than are others.

Third, we know through *trial and error*. This is a mode of knowing that would be completely impossible under current institutional ethical guidelines. But the fact is that we do not, and cannot, know all possible elements in any given human social interaction, and the idea that we can predict—and thereby forestall—all harm is naïve in the extreme. An ethical research design would omit (or seek to modify) that which experience and intuition tell us is most likely to do harm. We can then proceed, but only on the understanding that the plan will be modified during the course of the action when it becomes clear what is feasible and desirable in the real-life situation. For those uncomfortable with the indeterminacy of the term “trial and error,” Walter (1984) suggested “rational analysis and argument” (p. 38). By gathering evidence and formulating logical arguments, we try to give reasons to support our choices for certain actions over others. But this way of knowing does indeed involve the possibility of committing errors, perhaps some that may have unexpected harmful consequences. It is nonetheless disingenuous to hold that all possibilities of harm can be anticipated and that any human action, including a research project based on interpersonal interaction, can be made risk free. The moral advantage of the proportionate reasoning strategy is that it encourages researchers to admit to errors once they have occurred, to correct the errors so far as possible, and to move on. The “objective” mode of research ethics, in contrast, encourages researchers to believe that they have eliminated all such problems, and so they are disinclined to own up to problems that crop up and, hence, are less capable of repairing the damage. Those who work with people with developmental disabilities

are familiar with the expression “the dignity of risk,” which is used to describe the habilitation of clients for full participation in the community. To deny clients the possibility of making mistakes (by assuming that all risks can be eliminated beforehand and by failing to provide training in reasonable problem-solving techniques) is to deny them one of the fundamental characteristics of responsible adult living. One either lives in a shelter, protected from risk by objectified codes, or lives real life. The ethical paradigm suggested here does nothing more than allow the observational researcher the dignity of risk.

The logic of proportionate reason as a foundation for an ethical practice of social research might seem, at first glance, to slide into subjective relativism. Indeed, the conscience of the individual researcher plays a very large part in determining the morality of a given interaction. But proper proportionalism cannot be reduced to a proposition that an action can mean anything an individual wants it to mean or that ethics is simply a matter of personal soul searching. Rather, the strategy is based on a sense of community; the individual making the ethical decision must ultimately be guided by a kind of “communal discernment” (Gula, 1989, p. 278). When we speak of “experience,” for example, we refer not only to personal experience but also to the “wisdom of the past” embodied in a community’s traditions. As such, it

demands broad consultation to seek the experience and reflection of others in order to prevent the influence of self-interest from biasing perception and judgment. Using proportionalism requires more moral consultation with the community than would ever be required if the morality of actions were based on only one aspect . . . apart from its relation to all the . . . features of the action. (Gula, 1989, p. 278)

That being the case, the ideal IRB would not be content with a utilitarian checklist of presumed consequences. Rather, it would constitute a circle of “wise” peers with whom the researcher could discuss and work out the (sometimes conflicting) demands of experience, intuition, and the potential for rational analysis and argument. The essential problem with current ethical codes, from the

standpoint of the qualitative observational researcher, is that they set up an arbitrary—and quite unnecessary—adversarial relationship between researchers and the rest of the scholarly community. The framework of proportionate reason implies that ethical research is the product of shared discourse and not of a species of prosecutorial inquisition.

■ ELEMENTS IN A SUGGESTED PROGRESSIVE SOCIAL AGENDA

The abstractions of the proportionate reason framework can be translated into a progressive social agenda to guide the researcher. Progressive politics seeks a just society, although traditional moral philosophy speaks of four different types of justice: (a) commutative justice, which is related to the contractual obligations between individuals involving a strict right and the obligation of restitution (e.g., when one person lends another person a sum of money, the borrower is obliged to return that money according to the terms of the agreement); (b) distributive justice, which is related to the obligation of a government toward its citizens with regard to its regulation of the burdens and benefits of societal life (e.g., a government may tax its citizens but must do so fairly, according to their ability to pay, and must distribute the proceeds according to need); (c) legal justice, which is related to citizens' obligation toward the government or society in general (e.g., citizens are obligated to pay taxes, serve on juries, and possibly serve in the military, although they reserve the right to engage in conscientious objection—or even civil disobedience—if they deem the demands of the government unjust); and (d) social justice, which is related to the obligation of all people to apply moral principles to the systems and institutions of society (e.g., individuals and groups are urged to take an active interest in necessary social and economic reforms). My own personal vision tends to emphasize the element of social justice, and I suggest three ways in which researchers can work toward the principles embodied in the concept of social justice.

First, the researcher should be directly connected to the poor and marginalized. Helping the latter might well involve intensive study of power elites, but a progressive agenda goes by the boards if the researcher comes to identify with those elites and sees the poor simply as a "target population." Direct connection necessarily involves becoming a part of the everyday life of a community. The middle-class researcher who *chooses* to live with the poor and otherwise marginalized in our society (or with entire societies that are poor and marginalized vis-à-vis larger global powers) is, of course, in a very different position compared with residents of such communities who have no choice in the matter. But research in service to a progressive agenda flows from a degree of empathy (not simply "rapport" in the way that term was used by traditional participant observers) that is not available to those who do not even try to maintain such ongoing contact.³

Second, the researcher should ask questions and search for answers. This might seem like an obvious thing for a researcher to do, but we are in the habit of asking questions based primarily on our scholarly knowledge of the literature. We move in a more productive direction if we begin to ask questions based on our experience of life among the poor and marginalized rather than on our experience of what others have written or said about them. By the same token, we must avoid the sentimental conclusion that "the people" have all the answers, just as we shun the assumption that "the experts" know what is best for the people. Asking the relevant questions might lead us to look within the community for answers drawing on its own untapped resources, or it might lead us to explore options beyond the community.

Third, the researcher should become an advocate. Advocacy might mean becoming a spokesperson for causes or issues already defined by the community. It also might mean helping the people to discern and articulate issues that may have been inchoate to that point. Advocacy often means engaging in some sort of conflict (either among factions within the community or between the community and the powers-that-be), but it can also mean finding ways in which to

achieve consensus in support of an issue that has the potential to unite. In either case, one ends up working with the community as opposed to working for the community (with the latter implying a more distanced stance).

The overall goal of this process is to empower the community to take charge of its own destiny to whatever extent is practical. The researcher might well retain a personal agenda (e.g., collecting data to complete a dissertation), but his or her main aim is to work with the community to achieve shared goals. Such a philosophy can be difficult to convey to students or other apprentice researchers (e.g., how does it all work out "on the ground"?). To that end, it might be instructive to consider a form of pedagogy that, although not specifically designed for this purpose, certainly serves these ends.

Pedagogy for Social Justice: Service Learning

The concept of "service learning" was given a boost by the Johnson Foundation/Wingspread report titled *Principles of Good Practice for Combining Service and Learning*. Service learning is more than simply a way in which to incorporate some local field research into social science courses. As a strategy adopted by USF and others in response to the *Principles* report, service learning is the process of integrating volunteer community service combined with active guided reflection into the curriculum to enhance and enrich student learning of course material. It is designed to reinvigorate the spirit of activism and volunteerism that energized campuses during the 1960s but that waned during subsequent decades. Colleges and universities that accepted this challenge formed a support network (Campus Compact) to develop and promote service learning as a pedagogical strategy. Service learning is now a national movement.

The philosophical antecedent and academic parent of service learning is experiential learning (e.g., cooperative education, internships, field placements), which was based on the direct engagement of the learner in the phenomenon being studied. The critical difference and

distinguishing characteristic of service learning is its emphasis on enriching student learning while also revitalizing the community. To that end, service learning involves students in course-relevant activities that address real community needs. Course materials (e.g., textbooks, lectures, discussions, reflection) inform students' service, and the service experience is brought back to the classroom to inform the academic dialogue and the quest for knowledge. This reciprocal process is based on the logical continuity between experience and knowledge.

The pedagogy of service learning reflects research indicating that we retain 60% of what we do, 80% of what we do with active guided reflection, and 90% of what we teach or give to others. The pedagogy is also based on the teaching of information processing skills rather than on the mere accumulation of information. In a complex society, it is nearly impossible to determine what information will be necessary to solve particular problems. All too often the content that students learn in class is obsolete by the time they obtain their degrees. Service learning advocates promote the importance of "lighting the fire" (i.e., teaching students how to think for themselves) as opposed to "filling the bucket" (i.e., giving students predigested facts and figures). Learning is not a predictable linear process. It may begin at any point during a cycle, and students might have to apply their limited knowledge in a service situation before consciously setting out to gain or comprehend a body of facts related to that situation. The discomfort arising from the lack of knowledge is supposed to encourage further accumulation of facts or the evolutionary development of a personal theory for future application. To ensure that this kind of learning takes place, however, skilled guidance in reflection on the experience must occur. By providing students with the opportunity to have a concrete experience and then assisting them in the intellectual processing of that experience, service learning not only takes advantage of a natural learning cycle but also allows students to provide a meaningful contribution to the community.

It is important to note that the projects that form the basis of the students' experience are generated by agencies or groups in the community. The projects can be either specific one-time efforts (e.g., a Habitat for Humanity home-building project) or longer term initiatives (e.g., the development of an after-school recreation and tutoring program based at an inner-city community center). Given the theme of this chapter, it is significant that all such activities build on the fundamentals of observational research. Student volunteers gradually adopt membership identities in the community and must nurture their skills as observers of unfamiliar interactions so as to carry out the specific mandates of the chosen projects and to act as effective change agents in the community. In this way, service learning projects affiliated with courses outside the social and behavioral sciences require students to become practitioners of observational research methods, although such an outcome is not a specifically identified goal of the course. Recently at USF, service learning has been a key feature of a diverse set of courses, including an anthropology seminar on community development, a sociology course on the effects of globalization, an interdisciplinary social science course on farm-worker and other rural issues, a psychology course on responses to the HIV/AIDS epidemic, a social work course on racial and ethnic relations, and a business seminar on workplace communication.

In sum, service learning, which affects the professional educator as well as the novice/student, is more than simply traditional "applied social science," which often had the character of "doing for" the community. Service learning, which begins with the careful observation of a community on the part of a committed student adopting a membership identity, is active engagement in and with the community in ways that foster the goals of a social justice-oriented progressive political and social agenda.

Prospects for Observational Research

Although it is certainly true that "forecasting the wax and wane of social science research

methods is always uncertain" (Adler & Adler, 1994, p. 389), it is probably safe to say that observation-based research is going to be increasingly committed to what Abu-Lughod (1991) called "the ethnography of the particular" (p. 154). Rather than attempting to describe the composite culture of a group or to analyze the full range of institutions that supposedly constitute the society, the observational ethnographer will be able to provide a rounded account of the lives of particular people, with the focus being on individuals and their ever-changing relationships rather than on the supposedly homogeneous, coherent, patterned, and (particularly in the case of traditional anthropologists) timeless nature of the supposed "group." Currently the "ethnography of the particular" coexists uneasily with more quantitative and positivistic schools of sociology, anthropology, and social psychology. There is, however, considerable doubt as to how long that link can survive given the very different aims and approaches of the diverging branches of the once epistemologically unified social sciences. It seems likely that observational techniques will find a home in a redefined genre of cultural studies, leaving their positivist colleagues to carry on in a redefined social science discipline.

Observation once implied a notebook and pencil and perhaps a sketch pad and simple camera. The conduct of observational research was revitalized by the introduction of movie cameras and then video recorders. Note taking has been transformed by the advent of laptop computers and software programs that assist in the analysis of narrative data. But as our technological sophistication increases, we face an increasing intellectual dilemma in doing research. On the one hand, we speak the theoretical language of "situatedness," indeterminacy, and relativism; on the other hand, we rely more and more on technology that suggests the capture of "reality" in ways that could be said to transcend the individual researcher's relatively limited capacity to interpret. The technology makes it possible for the ethnographer to record and analyze people and events with a degree of particularity that would have been impossible just a decade ago, but it also has the

potential to privilege what is captured on the record at the expense of the lived experience as the ethnographer has personally known it. It would be foolish to suggest that, for the sake of consistency, observation-based ethnographers should eschew further traffic with sophisticated recording and analytic technology. But it would be equally foolish to assume that the current strong trend in the direction of individualized particularism can continue without significant modification in the face of technology that has the perceived power to objectify and turn into "data" everything it encounters. Perhaps it will become necessary for us to turn our observational powers on the very process of observation, that is, to understand ourselves not only as psychosocial creatures (which is the current tendency) but also as users of technology. As Postman (1993) pointed out, technological change is never merely additive or subtractive; it is never simply an aid to doing what has always been done. Rather, it is "ecological" in the sense that a change in one aspect of behavior has ramifications for the entire system of which that behavior is a part. Under those circumstances, perhaps the most effective use of observational techniques we can make in the near future will be to discern the ethos of the technology that we can no longer afford to think of as a neutral adjunct to our business-as-usual mentality. It is a technology that itself has the capacity to define our business. We need to turn our observational powers to what happens not only when "we" encounter "them" but also when we do so with a particular kind of totalizing technology.

No technological revolution has been more challenging to the traditions of observational research than the rise of the Internet and with it the increasing prevalence and salience of the "virtual community." Ethnographers have long observed communities that are defined by some sort of geographic "reality," although we have also recognized the importance of social networks that are not place bound. Contemporary virtual communities are an extension of such older "communities of interest," although they depend on computer-mediated communication and are

characterized by online interactions. Research needs to be developed to explore the nature of these virtual communities. How are they similar to traditional communities or social networks? How are they different? How does electronic communication make new kinds of community possible? How does it facilitate existing communities? (Regarding questions such as these, see Gabriel, 1998; Hine, 2000; Jones, 1998, 1999; Markham, 1996; Miller & Slater, 2000). As Bird and Barber (2002) noted, "Life on-line is becoming simply another part of life in the twenty-first century. On-line communities may replicate many of the features of other non-place-based communities, but they also make available new possibilities and new kinds of connections" (p. 133).

The increasing salience of electronic media poses some special ethical challenges for the ethnographic observer. It goes without saying that the traditional norms of informed consent and protection of privacy and confidentiality continue to be important, even though we are observing and otherwise dealing with people we do not see face to face. It is true that the Internet is a kind of public space, but the people who inhabit its virtual terrain are still individuals entitled to enjoy the same rights as are people in more traditional communities. There are as yet no comprehensive guidelines applicable to online research, but a few principles seem to be emerging by consensus. First, research based on a content analysis of a public website need not pose an ethical problem, and "it is probably acceptable to quote messages posted on public message boards" (Bird & Barber, 2002, p. 134). But the attribution of such quotes to identifiable correspondents would be a breach of privacy. Second, when observing an online community, the researcher should inform the members of his or her presence and of his or her intentions. The members should be assured that the researcher will not use real names, e-mail addresses, or any other identifying markers in any publication based on the research. Third, many online groups have their own rules for entering and participating. The "virtual" community should be treated with the same respect as if it were a "real" community, and its norms of

courtesy should be observed carefully. Some researchers conducting online ethnographies, therefore, have accepted as standard procedure the sharing of drafts of research reports for comments by members of the online community. By allowing members to help decide how their comments will be used, this practice realizes the larger ethical goal (discussed earlier) of turning research "subjects" into truly empowered collaborators.

Bird and Barber (2002) pointed out that "electronic communication is stripped of all but the written word" (p. 134). As such, the ethnographer is at somewhat of a disadvantage given that the traditional cues of gestures, facial expressions, and tones of voice—all of which give nuances of meaning to social behavior—are missing. By the same token, the identity of the person with whom the researcher is communicating can be concealed—or even deliberately falsified—in ways that would not be possible in face-to-face communication. Therefore, it is necessary to develop a critical sense, to evaluate virtual sources carefully, and to avoid making claims of certainty that cannot be backed up by other means.

Whether in the virtual world or the real world, observation-based researchers continue to grapple with the ethical demands of their work. In light of comments in this chapter, it is heartening to learn that a recent report from the Institute of Medicine (IOM) has presented us with the challenge of rethinking the whole notion of research ethics. Ethical regulations, as discussed previously, have tended to ask basically negative questions (e.g., What is misconduct? How can it be prevented?). The IOM report, however, invites us in the near term future to consider the positive (e.g., What is integrity? How do we find out whether we have it? How can we encourage it?). According to Frederick Grinnell, a member of the IOM committee that produced the report, the promotion of researcher integrity has both individual and institutional components, namely "encouraging individuals to be intellectually honest in their work and to act responsibly, and encouraging research institutions to provide an environment in which that behavior can

thrive" (Grinnell, 2002, p. 315). Grinnell went so far as to claim that qualitative social researchers have a central role to play in this proposed evolution of the structures of research ethics because they are particularly well equipped to conduct studies that would identify and assess the factors that influence integrity in research in both individuals and large social institutions.

■ A CLOSING WORD

It seems clear that the once unquestioned hegemony of positivistic epistemology that encompassed even so fundamentally humanistic a research technique as observation has now been shaken to its roots. One telling indication of the power of that transition—and a challenging indication of things to come—was a comment by the late Stephen Jay Gould, the renowned paleontologist and historian of science, who ruefully admitted,

No faith can be more misleading than an unquestioned personal conviction that the apparent testimony of one's eyes must provide a purely objective account, scarcely requiring any validation beyond the claim itself. Utterly unbiased observation must rank as a primary myth and shibboleth of science, for we can only see what fits into our mental space, and all description includes interpretation as well as sensory reporting. (p. 72)

■ NOTES

1. In the chapter that appeared in the second edition of this *Handbook*, Pérez and I discussed a number of such studies. One of the authors we cited, James Mieniczakowski, has asked that we clarify some of the remarks we made about his work. Noting his use of "alternative" means of reporting ethnographic data, we linked him with others experimenting with ethnographic writing, including autoethnographers. In so doing, we might have unwittingly left the impression that Mieniczakowski's work fell into the category of autoethnography. Although that work is not dealt with in this chapter, I feel honor bound to allow Mieniczakowski to present what he believes is a

more accurate representation of his work. In a personal communication (May 17, 2004), he noted, "My work unequivocally describes not self-location or auto-ethnography but a very different form of ethnographic research construction. In fact, . . . my personal experiences or location . . . are not relevant to, or the focus of, my published researches in detoxification therapy."

2. "Empathy" in this context should be interpreted in a political sense; that is, the researcher takes on a commitment to the community's agenda. Use of the term in this way should not be taken to imply anything about the totality of the community's culture or about the ability of the researcher to achieve a capacity to enter totally into the ethos of that community—if such a thing as an enveloping community ethos even exists.

WHAT'S NEW VISUALLY?

Douglas Harper

One faces the task of a chapter on the same subject for the third edition of this *Handbook* with a certain amount of trepidation. After all, not that much changes in the social sciences, especially within such a few brief years. Yet there are new themes, technologies, and practices mixed into the gradual evolutions of established patterns in visual methods. With that in mind, my goal in this chapter is to minimize overlap with the chapters in the earlier editions, with the modest proposal of seeing what indeed is new in visually inspired qualitative research.

Thus, readers interested in the postmodern critique of visual ethnography; the relationship among visual sociology, visual anthropology, and documentary photography; and the development of a research typology of visual thinking in visual research should consult the earlier chapters (Harper, 1993, 2000). I suggested that visual sociology offered the opportunity to address the postmodern critiques of ethnography and documentary photography and, in so doing, to fashion a new method based on the understanding of the social construction of the image and the need for collaboration between the subject and the photographer.

This chapter examines the status of visual thinking in the sociological community, the impact of new technologies on visual methods, the

continuing development of visual documentary and visual sociology, and problematical ethics questions in the visual research world.

In the background is a much discussed separation in the visual studies movement between the study of social life using images, which is often referred to as the empirical wing of visual sociology, and the study of the meanings of visual culture, which is usually called cultural studies. Some have argued that this clouds the fact that we share a fundamental interest in the meanings of visual imagery.

As an example of visually oriented cultural studies, Fuery and Fuery (2003) explore Foucault's imaging of the body, Lacanian theories of abjection and reflection, Kristeva's ideas about body fragmentation and visual culture, Derrida's notions about social reproduction and the semiotics of imagery, and Barthes's semiotics of photography. Their book contains only one image—a reproduction of a 1992 *Calvin and Hobbes* cartoon to illustrate Kristeva's theory of the abjection of the self. However, the arguments are grounded in examples of visual imagery on websites that are listed at the ends of the chapters. Thus, the reader can refer to the images of Magritte, Dali, Warhol, Caravaggio, and Bernini, to the photographs of Newton, and to the films of Hitchcock without the expense and inconvenience of having the images

in the book itself. Of course, reading the book implies access to a computer and the Internet, and referencing websites in this way assumes that the images will still be available online for as long as the book is used. Because the images are not esoteric, this is probably a safe bet. So, the book presents itself as a postmodern argument against the hegemony of its own form.

But more to the point of this chapter, Fuery and Fuery (2003) show how cultural studies use images to advance theories of the self, society, existence itself, and/or symbolism. I have suggested elsewhere (Harper, n.d.) that cultural studies generally use images (from fine arts to mass media, from architectural shapes to fashion, from body decoration and shapes to imagery of nightmares) as a referent for the development of theory. One can argue that these cultural studies are ethnographic in an indirect manner; they are based on the analysis of the visual culture writ large.

This chapter has a different orientation because I believe that a handbook of qualitative research should focus on field research. From my perspective, the emphasis should be on the practical, that is, using imagery to study specific questions and issues in sociology, anthropology, communications, and the like. Much of what I discuss in the following draws on photography, although there are several other suitable ways in which to visually represent the world in social research. For example, in my own study of the work of a rural artisan (Harper, 1987), drawings complemented photographs. The drawings allowed a more subjective take; elements could be left out, and interiors of objects could be invaded with cutaways. So, there is no reason why photography must dominate empirical visual sociology beyond the fact that it has proven to be enormously useful.

Most of the visual sociology discussed in this chapter depends on photographs—processed, juxtaposed, deconstructed, and captioned, but still evidence of something seen. It is a reminder, once again, of photography as both empirical and constructed. It has become something of a ritual to repeat this idea in all articles or chapters on visual sociology, but it appears to be necessary.

■ INNOVATIONS IN JOURNAL PUBLICATION

Sociological research that relies on visual data is being published with increasing frequency. Journals such as *Qualitative Inquiry* and *Symbolic Interaction* include imagery—not exactly routinely, but more and more frequently nonetheless. Several new visually oriented journals have joined established visual social science journals, such as *Visual Anthropology* and *Visual Sociology* (renamed *Visual Studies* in 2001), as outlets for visual research.

A promising development within American sociology was the introduction of the American Sociological Association's (ASA) journal, *Contexts*, in 2001. *Contexts*, intended to popularize sociology for a mass audience, is the first American sociology journal to forefront visual information, albeit with not entirely consistent results.

Visual illustration in *Contexts* is used in three ways. I call the first the “illustrated research article,” with an example being Rank's (2003) study of the incidence of poverty in the United States. Rank uses photographs to portray a spectrum of the poor, including well-dressed job seekers, some using cell phones, in an unemployment line in New York; a group of perhaps 200 disheveled homeless people gathering for shelter in San Francisco; a young homeless family in Eugene, Oregon, sitting on a curb across the street from a grocery store; and an African American woman and an aged white immigrant in the daily routines of their poverty. The images put a face on statistical data, but what do they add beyond that?

First, they contextualize poverty with other sociological variables such as family life, unemployment, and global migration. Visual documentation becomes a part of research triangulation, confirming theories using different forms of data. In these instances, the photographs argue that visual traces of the world adequately describe the phenomenon under question.

The photographs also subjectively connect the viewer to the argument. The well-dressed job seekers in New York connect poverty directly to employment. The homeless couple and child in Oregon do not look like the stereotyped vision of

poverty; we would expect to see their attractive faces in a typical middle-class home. The immigrant in poverty is an elderly man from the Netherlands, showing us that nonminority immigrants also struggle to make ends meet in the United States.

But although these photographs are important to the text, they remain secondary. The visual dimension is not integrated into the research; the images are added by an editor who has the challenging job of securing photos from a variety of sources. The result is that useful photos are often found and published, but so are images that fall short of their mandate to visually tell a sociological story.

Contexts also publishes photo essays, where sociological thinking emerges directly from images rather than reinforcing and elaborating on word-based thinking. Gold's (2003) photo essay on the Israeli diaspora is a good example. The body of the article consists of 12 photographs and captions organized around the themes of "Individual and Community Business," "Designing and Finding Communities," and "Transnational Networks and Identities." The photographs locate people in various environments—from their homes, to businesses, to public settings—interacting in the routines of various social scenes. The images are organized conceptually and are the main way in which the ideas are presented. Gold's photo essay (and others published in *Contexts*) shows the possibility of sociological thinking that derives nearly entirely from images. The intention is that sociologists will regard the photographs in these essays as visual data, that is, that sociologists will engage the photographs with active intellectual "looking." Because photographs saturate popular culture and are generally treated superficially, this is a big leap.

As hinted at previously, asking sociologists to take photographs seriously raises the matter of their truth status—or their validity, in sociological terminology. Here, as has been stated many times previously and has already been mentioned in this chapter, rests a central irony of the photograph: It is both true and constructed. It is true in the sense that it reflects light falling

on a surface, but it is also constructed by the technical, formalistic, and other selections that go into making the image and by the contexts (from historical to presentational format) in which it is viewed. In this way, photos are similar to all forms of data—both qualitative and quantitative.

It is hoped that the *Contexts* photo essays will elevate sociologists' understanding of this essential similarity between photographic data and other forms of data.

Contexts also publishes photo essays on social change, that is, images that show the same social scene at an earlier time and a more contemporary time. Photography is especially helpful in studies of social change because photographs can be matched with earlier images to reveal extraordinarily detailed renditions of changes in human habitation, landscape, and/or traces of human interaction. This approach draws on the work of a single sociologist, Jon Rieger, who has applied the fine arts and documentary "rephotography" movement to the study of social change in northern Michigan (Rieger, 1996, 2003) and other settings.

Although *Contexts* has broken new ground in sociology, it remains to be seen whether the journal will successfully make the case for visual data in research or whether it will be considered less rigorous precisely because the journal relies heavily on visual displays. For *Contexts* to redefine visual thinking in sociological publishing, it must initiate a discussion of the role of visual information in sociological thinking and presentation.

The journal must also improve its means of attaining images; it is simply not feasible to assume that good-hearted photographers will donate the use of their photos. It is also not feasible to assume that volunteer staff members (despite their success so far) can do what professional photo editors do, that is, find and get access to the very best photos to develop visual arguments.

■ NEW TECHNOLOGIES: NEW WAYS OF THINKING

What is genuinely new in visual sociology is the use of technology in recording, organizing,

presenting, and analyzing visual information. Emerging technologies have revolutionized the use of imagery in social science, and some intrepid researchers have already provided convincing examples. The basis of the revolution is the computer, but more specifically it is software programs such as Macromedia's *Director* and, in some cases, the Web. All of these technologies are several generational offsprings of *HyperCard*, a program bundled with early Apple computers that allowed information to be organized in a nonlinear manner. In what follows, I briefly examine four projects that demonstrate the range of these new ways of thinking and doing field research visually.

Jay Ruby's ethnographic study of Oak Park, Illinois, uses the Web to disseminate the ongoing results of a field study (Ruby, n.d.). The website (<http://astro.ocis.temple.edu/~ruby/opp/>) includes interviews, photographs, observations, historical commentary, and video segments in various forms of completion. Ruby also established a listserv of residents of Oak Park, inviting people who are the subject of the study to disagree, elaborate, or simply comment on the ongoing study. According to Ruby's website,

Oak Park Stories is a series of experimental, reflexive, and digital ethnographies that attempt to explore a forty-year-old social experiment in Oak Park, a Chicago suburb. It is experimental in that I have not followed the traditional method of producing a book or film but instead made an interactive and nonlinear work that has both video and text. It is reflexive in that the subject of my research is my hometown. . . . It is digital in its form of delivery—on a DVD using QuickTime movies and html documents. I have constructed these Stories in a nonlinear fashion; that is, unlike a book or a film, there is no defined beginning, middle, or end. Viewers/Readers are free to begin anywhere. They can ignore anything that doesn't interest them. I have provided many links to materials that will allow anyone interested to pursue a topic in more depth. I have found writing in a nonlinear fashion to be amazingly freeing.

The website is organized around "modules," which are broad categories with scroll-down subcategories. These include an extensive discussion

of ethnography, histories of families that represent the community, the black migration to Chicago and Oak Park itself, biographies of individuals who have played an important role in the community, and other modules that explore themes such as racial integration.

The module organization is similar to chapters in a book but also is distinctly different. The modules include subcategories of photo essays (often from archival sources) that show, for example, images of race riots in 1919 and images of a single African American on an otherwise all-white championship football team. The module format establishes a logic for the overall project: The first-order categories are the modules themselves, the second-order categories are scrollable items beneath the module title, and the third-order information exists in the many linked articles, photo essays, newspapers, and other archival documents that are sprinkled liberally throughout. This is similar to the organization of a book with a chapter structure, text, and endnotes, but it is markedly different because of the freedom allowed to go into more depth than a particular subject in a book might allow or to add material that might be too tangential for a scholarly study. For example, Ruby's study develops a central theme of racial and ethnic integration. Subcategories of the integration module present the history of African Americans in Chicago in more detail than would likely be included in an academic monograph. Ruby's pages-long overview of housing policies, race politics, and shifting demographic information can, however, easily be included in the Web presentation. It is contextualizing information that some, but certainly not all, viewers/readers will use. Links to additional sites further these possibilities.

Ruby posts quarterly reports from the field and asks for feedback by way of Web discussions. His importance in visual anthropology and prominence in a visual communication listserv generates a Web-based audience for his work.

The attractiveness of this mode of dissemination is precisely that a variety of communication modes—text, still images, and moving images—can be integrated. However, the memory-hungry

nature of video makes it (so far) impractical to include more than a few seconds of video clips, with the moving images being bracketed into a small thumbnail on the screen. The final project is intended as a number of DVDs, where longer video segments can be included.

The sharing of the project-in-progress by way of an evolving website has not, to my knowledge, been done before. The project could be left in this form and updated on a continual basis through the near future. However, Ruby intends to finalize the project as one or more DVDs distributed in the same way as other emerging visual anthropology multimedia projects are distributed, that is, through commercial or academic publishers.

Other visually oriented sociologists have begun to develop the potential of advanced interactivity with Macromedia's *Director*. The first of these projects was Biella, Chagnon, and Seaman's (1997) *Yanamamo Interactive*, which is an interaction version of Chagnon and Asch's classic ethnographic film, *The Ax Fight*.¹ *The Ax Fight* is a 10-minute film showing a hostile interaction between two groups of Yanamamo tribespeople in Venezuela. The film has become an important teaching tool as well as an important research tool. It is a commonly cited example of how minimally edited ethnographic film can tell several layers of ethnographic stories. So, the Biella project is based on expanding the potential of a classic in visual anthropology, primarily (but not exclusively) for teaching.

The traditional means of teaching this material has been to show the film, assign readings on the Yanamamo, and integrate these materials in lectures and discussions. Researchers use a similar strategy—close study of the film and consideration of visual material in the context of written sources.

By packaging the film with different kinds of information (still photographs, graphs, tables, and extensive texts) so that various parts can be connected in novel ways, *Yanamamo Interactive* opens up heretofore unexplored pedagogical and research possibilities.

The *Yanamamo Interactive* CD-ROM includes three versions of the film (unedited and edited in

two forms), 380 paragraphs that describe the events as they unfold in the film (these are viewed alongside the scrolling film), more than 100 captioned photographs of the participants in the ax fight, genealogical charts that plot the participants' relationships, and maps of the village and the interaction of the fight. As noted, the software architecture allows viewers to move among filmed events, biographical sketches, maps of important places, and ethnographic explanations freely and creatively. The format invites theory testing, both formally and informally. The CD-ROM defines film as being integral to ethnography rather than as a form of ethnography itself. As a result, the film can be seen as ethnographic information that is deconstructed by reading the anthropology that gives background information.

My experience with the CD-ROM has been nothing short of inspiring. I am well aware of how difficult it is to teach ethnographic film; students see the film in one parcel of time and then read or discuss it in another parcel of time. Thus, the emotional and subjective experience of studying film is separated from the more analytical experience of studying texts. This separation often leads to stereotyping precisely because emotions and analysis become ever more distant from each other.

The interactivity potential of the CD-ROM allows the viewer to, for example, stop the video, select a particular participant in the fight, and trace the participant's genealogy in the village and his social position vis-à-vis his participation in village groups and activities. Thus, students and researchers can study the contexts of social action and begin to understand the layers of meaning that reside under the surface of the fight. In fact, the organization of the material invites students and researchers to ask new questions and to investigate new lines of reasoning.

The project has been distributed with an introductory anthropology textbook and is widely used in university anthropology courses. The CD-ROM allows students from a wide range of backgrounds to actually encounter ethnographic information and, thus, to do visual research at a fairly sophisticated level.

It is likely that the format introduced in *Yanamamo Interactive* will soon become common in visual anthropology, extending the usefulness of ethnographic film for both teaching and research. Several projects by the authors of this CD-ROM and others are under way.

Macromedia's *Director* has also been used to produce a searchable archive of the work of documentary photographer Jean Mohr. Mohr is best known for his collaborations with John Berger (Berger & Mohr, 1967, 1975, 1982) and for his work in the area of international human rights for several international organizations (Mohr's first photographs, taken during the early 1950s, documented the everyday lives of Palestinian refugees). He has also photographed less known projects involving the Chicago police on patrol and international tours of a European symphony.

The CD-ROM titled *Jean Mohr: A Photographer's Journey* (Mohr, n.d.) collects more than 1,200 of Mohr's black-and-white and color photographs (from more than 1 million taken during his 50-year career) and includes brief interviews with Mohr and others about the meaning of his work as well as brief texts that explain and elaborate on the projects from which the images were drawn.

The core of the project is the photographs, which are organized in five categories, the most important of which are "image type," "subjects," and "regions." Each of these categories includes several subcategories accessible as drop-down menus. For example, the image category of "subjects" includes the subcategories of "migrants," "music," "refugees," and several others. Thus, the viewer is able to create a corpus of images by clicking on one subcategory in each main category. For example, I direct the CD-ROM to gather Mohr's black-and-white portraits of refugees who were photographed in Africa. Or, the viewer could direct the CD-ROM to select color images on the general subject of music that Mohr photographed in the Middle East. Combining a different subelement from each of the main categories allows the viewer to construct hundreds of individualized archives.

These advanced searching capabilities allow the viewer to use Mohr's work efficiently and creatively. I found that, after several hours of

working with the archive, the only limitation that suggested itself was the number of photographs that it included. A total of 1,200 images might seem like a lot at first glance, but they are a tiny percentage of Mohr's life work. Most searches cross-referenced across several categories yield 20 to 30 images, whereas Mohr's full corpus would include several times that number. The most challenging aspect of this project was clearly in programming the navigation; one senses that more images could have easily been scanned and added to the archive. Thus, if the project had included three to four times the number of images, the archive would be that much more useful.

Electronic and searchable photograph archives from newspapers or public collections are increasingly available. Mohr's project, however, might be the first to present the life work of a sociologically oriented photographer with information that describes his career, publications, self-reflections, and commentary on his relationship with Berger. As an overview of the work of a single photographer, it sketches the working methods of an artist. It also provides visual evidence on sociological themes such as refugees as well as visual area studies of the places where Mohr concentrated his efforts. Short video clips also humanize Mohr.

One would hope that the considerable effort represented in this CD-ROM project will lead others to synthesize their photographic work, especially when the work so broadly addresses subject matters of interest to sociological researchers.

Two projects with a smaller scope show the potential of interactive media in visual research. Ricabeth Steiger photographed an aspect of daily life—a train commute she makes several times a week from Basel to Zurich, Switzerland, to construct a visual ethnography of a taken-for-granted aspect of daily life (Steiger, 2000) (Figure 29.1). The images are both impressionistic (showing blurred landscapes through the train windows—the world speeding by as viewed from inside the train) and ethnographic (showing the tacit social scripts—how people interact on a train—that underlie the public behavior in Switzerland).

Steiger's project was published in *Visual Sociology* as a research article in two forms. The

Figure 29.1. Inside the Train

Source: Photograph by Ricaheth Steiger.

article text and photo sequence were published as thumbnail-sized images in the print journal and on a CD-ROM that housed a *Director*-based movie version of the project. The CD-ROM format allowed Steiger to transform still photographs into a new mode of communication—a virtual movie consisting of an automatically advancing slide show. This was an ideal solution; the images were too numerous to work as an article but were too few to constitute a book, and they needed to be viewed in sequence to achieve the intended effect. Although the thumbnail images published in the journal are a catalog of the photos, the virtual movie clearly constitutes the actual article.

The publication of the project in *Visual Sociology* was a breakthrough in the presentation of visual research. The development of the CD-ROM required the journal designer to have knowledge of relevant software and cross-platform development. The International Visual Sociology Association (IVSA), the sponsoring academic

organization of the journal, devoted considerable resources to fund the CD-ROM and to package and distribute it as a regular part of the journal. It did so with the hope that the project's revolutionary character would help to encourage a new way in which to see and do visual research.

Finally, Dianne Hagaman recently published a photographic project using the same software, with considerably more elaborate development (Hagaman, 2002). As in the case of Steiger's project, the subject is a visual ethnography of daily life, in this case her life with her husband, the sociologist Howard S. Becker.

The photographs are organized into 14 "sonnets," with each sonnet named after a jazz standard such as "Night and Day," "Slow Boat to China" (Figure 29.2), or "One Morning in May." Jazz has been an important part of Becker's life; he was (and remains) a practicing musician, and his studies of jazz are important contributions to cultural sociology. The photographs also have a jazzy

Figure 29.2. From "Slow Boat to China" Sonnet of the CD-ROM *Howie Feeds Me*.

Source: Photographs by Dianne Haganman.

quality; they are subtle and present reality from an oblique angle, transforming otherwise unremarkable subject matter, such as window frames and beds, into poetic visual statements. Likewise, jazz presents familiar melodies in unusual and provocative frames of musical reference.

The photographs are about place (the couple's homes in Seattle and San Francisco and the couple's travels to Paris and other locations where Becker lectures), landscape (Haganman is a master at rendering sky as a part of landscape, often inhabited by birds on the wing), social gatherings (often with well-known sociologists), and (most centrally) their own relationship. According to Haganman's introduction,

We weren't kids when we met and decided to live together, and we didn't have our whole lives ahead of us. . . .

He played the piano and knew hundreds of songs from his days when he played clubs in Chicago. And he could cook. And liked to do it. He told me that after his wife Nan died, he made himself three full meals a day, every day, in order to establish a routine and structure in his life in a time of change and grief.

I, however, had never learned to cook. It wasn't deliberate. I just somehow fell through the cracks. But, maybe as a consequence, I've never taken the

preparation or the social aspects of food for granted: how central eating is and preparing the food that you eat (that magical skill) is, who we eat with and where.

Thus, the project is titled *Howie Feeds Me*, and the photographs allude to a relationship rooted in caring for and nourishing the body and spirit. In this way, the project is an ethnography of the daily life of a couple and their loving relationship, as told from the perspective of one partner. The only similar attempts to communicate this theme are Laura Letinsky's photo essay *Venus Inferred* (Letinsky, 2000), which focuses on the banalities of the sexual lives of several couples, and Pernette and Leeuwenberg's (2001) photo essay on their intimate relationship. But whereas Letinsky (2000) focuses on the obvious (i.e., a series of couples looking embarrassed in the act of coupling) and Pernette and Leeuwenberg (2001), both photographers in their early 30s, use the camera to record the energy and lovingness of sexual union, Haganman (2002) communicates the mundane aspects of nonsexual intimacy with subtlety and humor that suggests the stuff of daily life.

Much of the message of Haganman's essay is in the medium. The project is rooted in

35-millimeter black-and-white photos, but from the beginning it was intended for the computer. Hagaman organized the CD-ROM-mounted photo sequences in what she calls sonnets: "I took the idea of the fourteen lines of a sonnet and used it to organize my photographs, a group of fourteen images making a kind of poem: rhyming, repeating, alluding, and suggesting, the way photographs do when you put them into groups."

The sonnets are of two forms. One is a series of individual images presented on the computer screen against a white background, like images on the wall of a gallery. These have short captions that usually identify the place or action depicted. The viewer studies these images individually and in sequence as well as in the context of the story hinted at by the title of the sonnet (a jazz standard).

Other sonnets are continuous visual loops of joined images that the viewer scrolls through. The images adjoin each other completely; the viewer creates new images composed of parts of the adjoining images by stopping the scroll bar in other than the borders of the photographs. Thus, when the viewer scrolls, images suddenly combine exteriors of a room from one image and exteriors of a street from another; other images contain both night and day, and so forth. The

continually joined images add a dimension that could not be achieved if the images stood alone either on a gallery wall or on a computer screen.

The photographs are also presented as thumbnails with detailed descriptions of location, people, and events that are useful points of reference.

New developments such as those described heretofore have revolutionary potential in visual studies. There are, however, several issues that may affect their contributions.

The first issue concerns longevity. The software that runs the various programs is under constant development, and the systems that run the computers are as well. For example, Apple's recent operating system, OS-X (already in its third iteration), has required full redesign of participating software. Similar developments in PC operating systems have led to the same challenges. With the rate of current development, it is nearly impossible to predict the hardware, operating system, and/or software compatibility for today's projects that will be in use 10 or even 5 years from now. Of course, the book that I just removed from the shelf will be there, in exactly the same form, 50 years from now.

The second issue is that, as noted previously, electronic delivery and organization of material

often allows information to be packaged in a way that could not be presented in print form. But the opposite is also true: Old-fashioned media, including books, articles, and handmade images, have been shown to have a remarkable resiliency precisely because of the very qualities that the electronic forms transcend. The illustrated book or journal article, for example, imposes limitations that the Web does not and that might lead to more judicious editing or organization. The linearity of old-fashioned presentations remains meaningful as a frame by which ideas and images can be organized.

There is also the matter by which various forms of information find their way to consumers. Books and articles are published and distributed through a system that draws on well-articulated institutional structures and a public that consumes in a certain way. This is a multilayered and conservative system. Nontextual media, such as CD-ROMs and DVDs, have only recently begun to get a foothold in this system.

This is not to say that the old forms are necessarily better or worse than newer competing forms of visual communication. It is simply to say that some aspects of change come slowly. This must be said in the context of the increasing success of the Web and multimedia platforms.

■ THE CONTINUATION OF THE OLD

Certain themes and forms of visual research, however, continue to produce useful visual research. One is the visual critical analysis, such as Margolis's (1998, 1999) studies of education and labor processes. This work traces its roots to studies such as Stein's (1983) critical investigation of early social reform-oriented photography. Stein's study focuses on how the sponsorship, photographic technology, and forms of dissemination influenced what the photos communicated. These arguments often suggest that the photographs have latent meanings that reinforce the very structures they seem to be criticizing.

A more informal use of images to ask critical questions of the past is Norfleet's (2001) *When We*

Liked Ike. Norfleet, who may have been the first practicing visual sociologist (she worked in photography and sociology for several decades at Harvard University), here assembles photographs from archives from the 1950s that document everyday life—families, institutions, organizations, leisure life, and so forth. She captions these images with excerpts from popular sociological texts of the time (e.g., those of David Reisman and Vance Packard), excerpts from novelists (e.g., J. D. Salinger), and quotes from the popular press (e.g., *Ladies Home Journal*). The viewer is taken to the everyday world that became the basis of sociological analysis.

Empirical visual sociology lives on as well. For example, Rich and Chalfen (1999) use visual methods in a study of disease phenomenology. In their research, chronic asthma sufferers in their teens or younger made and analyzed videos of their personal worlds under the influence of asthma. The films and discussions opened a window into the private world of a disease at a particular stage of the life cycle. The visual dimension served as a means of discovery by the disease victims (they filmed their worlds to tell the story of their disease experience), and it also served as the basis of dialogue among asthma sufferers, adults in their social worlds (e.g., parents, teachers), and the medical community. The videos described social isolation, parental irresponsibility, and other themes that led to a fuller understanding of how the teens and younger children manage a debilitating disease.

Rich and Chalfen's use of native-produced imagery draws originally from Worth, Adair, and Chalfen's (1972/1997) Navajo project of the late 1960s, where anthropologists taught reservation Navajo to use 16-millimeter cameras to tell their cultural stories. Many other examples followed.

Native-produced still images, however, have also become important visual research tools in social science. An early example was Ewald's work with Appalachian youth. Her approach was to teach young children to photograph their families and surroundings, develop the black-and-white film, and print the images. She asked the children

she taught what they imagined and dreamed about and how they interpreted their daily surroundings. Ewald's initial success led to several similar projects in South America, Holland, and other settings (Ewald, 1985, 1992, 1996).

Photo elicitation is another approach that belongs exclusively to the visual. In a recent description of the method (Harper, 2002), I found photo elicitation to be the primary method in 40 studies, including doctoral theses, books, articles, and reports. Several studies have been finished during the period since the article was published, and certainly many were missed in the review. The disciplines represented in these studies include anthropology, communication, education, sociology (especially urban, rural, and communities studies), photojournalism, cultural studies, ethnic studies, and industrial management. In these vastly dissimilar kinds of research, the common desire to understand the world as defined by the subject led to wide applications of the photo elicitation method.

In what follows, I explain one way in which photo elicitation operates in a brief review of a study of the meaning of change in dairy farming in northern New York (Harper, 2001). In this project, my goal was to understand how agriculture had changed and what these changes meant for those who lived through them. To this end, I showed elderly farmers photographs from the 1940s, (a period when they had been teens or young adult farmers) and asked them to remember events, stories, or commonplace activities that the photos brought to mind. The success of the project rested on the coincidence of the availability of an extraordinary archive of documentary photographs (the Standard Oil of New Jersey archive) from just the era that elderly farmers had experienced at the beginnings of their careers and the fact that these photographs were of such a quality as to inspire detailed and often deep memories.

The farmers described the mundane aspects of farming, including the social life of shared work (Figure 29.3). But more important, they explained what it meant to have participated in agriculture that had been neighbor based, environmentally

friendly, and oriented toward animals more as partners than as exploitable resources.

In this and other photo elicitation studies, photographs proved to be able to stimulate memories that word-based interviewing did not. The result was discussions that went beyond "what happened when and how" to themes such as "this was what this had meant to us as farmers."

Visual methods have also been applied to approaches that have not previously been thought to be visual. A recent issue of *Visual Studies* (Volume 18, Issue 1) was devoted to ethnomethodology. The visual worlds that ethnomethodologists studied included the textual materials in various administrative jobs (Carlin, 2003) and the work objects of scientific endeavors (Kawatoko & Ueno, 2003). These studies draw on Sudnow's (1993) pioneering ethnomethodological studies of jazz performance that were communicated partly through photographic imagery.

Several texts on visual methods have been published during recent years. The most useful are Pink's (2001) *Doing Visual Ethnography*, Banks's (2001) *Visual Methods in Social Research*, and van Leeuwen and Jewitt's (2001) edited *Handbook of Visual Analysis*. Pink has studied visual research broadly, whereas Banks has concentrated on visual anthropology. Van Leeuwen and Jewitt's handbook is a useful collection of cultural studies and empirical research. Their contributors describe content analysis, visual anthropology, cultural studies, semiotics, ethnomethodology, and film analysis. Although most contributors downplay approaches that favor "researchers making photos to analyze reality," the collection is a useful starting place. Less useful is Emission and Smith's (2000) *Researching the Visual*, which is largely a polemic against the photocentric orientation of visual sociology.

It is especially interesting that those who have synthesized the strains and traditions of visual social studies have come largely from outside the United States and, most significant during the past few years, from the United Kingdom. The "U.K. School" emphasizes cultural studies but is increasingly eclectic, with recent and forthcoming collections that center on visual ethnography (e.g., Knowles & Sweetman, 2004).

Figure 29.3. A Farm Work Crew Eating Dinner

The other significant European movement in visual sociology is situated in Italy, primarily at the University of Bologna. Beginning in the early 1990s, Patrizia Faccioli and her colleagues have conducted visual research on a wide range of topics using photo elicitation, documentary photography, content analysis, and semiotics (for an overview, see Faccioli & Losacco, 2003). Losacco's (2003) recent monograph uses family photography to understand the negotiation of cultural identities of Italian immigrants in Canada.

That the IVSA meets regularly in Europe helps to facilitate the growth of visual methods internationally. The development of visual social science in the remaining areas of the world where social sciences are taught is a critical next development.

However, although there are many recent texts on visual methods, there are few new in-depth

studies based on visual data or visual analysis. Quinney has written and photographed a series of introspective ethnographies of place, with the most recent (Quinney, 2001) exploring the meaning of what he refers to the "borderland"—Hamlin Garland's "middle border," which he presents as a landscape, a state of mind, and a basis for philosophical orientation. Barndt (2002) uses photographs to both gather and present information in a study of the globalization of the food. *Changing Works* (Harper, 2001) is one of the few recent ethnographic studies based on photographs.

However, photo documentary studies continue to be published. Recent examples include Coles and Nixon's (1998) *School*, which explores the social realities of three schools in Boston; Goodman's (1999) *A Kind of History* (1999), which documents 20 years in the life of an ordinary American town;

and Wilson's (2000) photo study of the *Hutterites of Montana*. Yet the documentary tradition remains the scope or attention of most social scientists. Unfortunately, Becker's suggestion back in 1974 that documentary photographers and sociologists with an interest in photography should explore their overlap and get on with learning from each other is still largely underrealized (Becker, 1974).

■ UNRESOLVED ISSUES: ETHICS OF VISUAL RESEARCH—SPECIAL ISSUES AND SPECIAL CONSIDERATIONS

The scientific world, of which sociology is a part, has become increasingly concerned with research ethics. This preoccupation is partly due to past misuses of scientific research. This has, in turn, led to the increased use of institutional review boards (IRBs) as legally mandated monitors of all research at U.S. universities. These issues are also the subjects of codes of ethics of professional societies such as the ASA.

Qualitative researchers, however, often have a difficult time in defining their work in terms that meet the expectations of IRBs. This is especially the case for photographic researchers. The primary issue concerns the matter of subject informed consent and subject anonymity. The problems for qualitative researchers, and the special case of sociological photographers, are detailed in what follows.

The first concerns the observation of public life and, in the case of visual sociology, the photography of public life. Observation of public life has been a part of sociology since Georg Simmel's studies of generic forms of social interaction, based in part on his observations of public life from his Berlin apartment window, or since Irving Goffman's observations of the nuances of human interaction in social gatherings. Anderson (2003) refers to this style of sociological observation as "folk ethnography." Anderson's method involves observing the public on bus trips and walks through a city as well as overhearing conversations in restaurants and other instances of public life.

In large part, IRBs appear to be ready to accept that observation of public life may take place without informed consent. But the right to photograph the public without the subjects' consent has, by and large, not been tested by passage of research proposals by members of the visual sociological community. Many visual sociologists model our photographic research on documentary photography and photojournalism, where the right to photograph in public has been guaranteed by amendments to the U.S. Constitution dealing with freedom of expression. In these studies, it is precisely the clearly portrayed face of a stranger doing the things people normally do that leads to compelling documentary statements or sociologically meaningful insights.

Visual sociologists point to the precedent of photojournalism and documentary and argue that harm to subjects is unlikely to occur from showing normal people doing normal things. In a personal example, I was photographed unawares at a recent Pittsburgh Pirates baseball game by a photographer working for the *Pittsburgh Post Gazette*, and I was presented in a half-page photograph to support the message of an article that alleged low attendance at the Pirates games. In fact, I had chosen to sit by myself in an otherwise empty section because I like the vantage point of that section and I enjoy the solitude in a baseball stadium early in the season. Having the photo in the *Post Gazette* made me a celebrity for a day, but it also opened up other questions. Was I skipping work? Was I a social isolate? And so forth. However, the public accepts that being in a public space makes one susceptible to public photography. I was not harmed by my momentary celebrity status, and the ethics of photojournalism were not violated. I was portrayed accurately in the mundane performance of my life.

Those of us who want to use photography in sociology believe that it is logical to argue that we have the same rights as those who work in the closely related worlds of photojournalism and photodocumentary. Indeed, some of us have come to define ourselves as documentary photographers, rather than as visual sociologists, to avoid

IRB scrutiny, although this is surely not a solution to this issue.

The second matter concerns the loss of confidentiality in photos that portray people clearly. The language of the current ethics literature (in the ASA code of conduct or the IRB guidelines) is strongly aligned with protecting the anonymity of subjects. That is commendable if subjects wish to remain anonymous. But what about subjects who are pleased and willing to be subjects (and who sign releases to this effect)? The identifiability of subjects is critical to the sociological usefulness of the images; these include elements such as subjects' expressions, gestures, hairstyles, clothing, and other personal attributes.

There has been little written about the ethics of photographic research. Several years ago, Gold (1989) argued that the biomedical model did not sufficiently address the ethical issues of visually based research, arguing instead for a "research outlook—sensitivity—that is rooted in the covenantal ethical position . . . as a means of addressing the ethical problems of visual sociology" (p. 100). This sensitivity "requires the researcher to develop an in-depth understanding of subjects so that he or she may determine which individuals and activities may be photographed, in what ways it is appropriate to do so, and how the resulting images should be used" (p. 103). This involves understanding the point of view of subjects, especially their thoughts on how and where the images will be used. According to Gold, "Unlike a contract that simply specifies rights and duties, a covenant requires the researcher to consider his or her relationship with subjects on a much wider level, accepting the obligations that develop between involved, interdependent persons" (p. 104).

The practical implications are that one will sometimes find oneself in research situations where photography would violate the norms of the setting or the feelings of the subjects; in such cases, photography should not be done. Gold (1989) suggests that sociologists use their knowledge as well as their ethical sensitivities to guide their actions. Whether this can be the basis of an acceptable method remains to be seen.

For visual ethnography to come out of the closet, these issues need to be resolved. Visual researchers must have their work sanctioned by boards that eventually will accept research that varies radically from the formal experiment and that depends on the right to document life in glaring exactitude.

■ SUMMARY

My hope is that visual methods will become ever more important in the various research traditions where it already has a foothold and that this growth will take place in a way that acknowledges the potential of new media, while preserving what is useful in the old media, and acknowledges the subjects' rights but calls forth a larger ethical stance than the biomedical contractual model determines as appropriate. I hope that during the next decade, visual social studies will become a world movement and, thus, a means to long overdue internationalization of sociology.

For visual social science to develop, professional rules and norms concerning ethics must acknowledge the rights of photographers/researchers to photograph in public and to present identifiable subjects, but in the context of ethical considerations that consider photographers/researchers as connected by webs of obligation and moral regard.

■ NOTE

1. Biella and colleagues' (1997) project, as well as Steiger's (2000) article (which had just been released when the second iteration of this chapter was written), both were mentioned briefly in my chapter in the second edition of this *Handbook*.

AUTOETHNOGRAPHY

Making the Personal Political

Stacy Holman Jones

The next moment in qualitative inquiry will be one at which the practices of qualitative research finally move, without hesitation or encumbrance, from the personal to the political.

—Norman Denzin,

"Aesthetics and the Practices of Qualitative Inquiry," 2000, p. 261

We cannot move theory into action unless we can find it in the eccentric and wandering ways of our daily life. . . . [Stories] give theory flesh and breath.

—Minnie Bruce Pratt, *S/HE*, 1995, p. 22

I think theater is primarily a site for liberation stories and a sweaty laboratory to model possible strategies for empowerment.

—Tim Miller,

"Solo Performing as Call to Arms," 2002, para. 3

This is a chapter about the personal text as critical intervention in social, political, and cultural life. Please do not read it alone.

This chapter is more than a little utopian in its call to disrupt, produce, and imagine a breakthrough in—and not a respite from—the way things are and perhaps should be (Ricoeur, 1986, pp. 265–266). It cannot stand alone in the world.

This is a chapter about how looking at the world from a specific, perspectival, and limited vantage point can tell, teach, and put people in motion. It is about autoethnography as a radical democratic politics—a politics committed to creating space for dialogue and debate that instigates and shapes social change (Reinelt, 1998, p. 286). It does not act alone.

This is a chapter about how a personal text can move writers and readers, subjects and objects, tellers and listeners into this space of dialogue, debate, and change. It does not speak alone.

This chapter is meant for more than one voice, for more than personal release and discovery, and for more than the pleasures of the text. It is not a text alone.

This chapter is meant for public display, for an audience. It is not meant to be left alone.

This chapter is an ensemble piece. It asks that you read it with other texts, in other contexts, and with others. It asks for a performance, one in which we might discover that our autoethnographic texts are not alone. It is a performance that asks how our personal accounts count.

■ TURNING TO NARRATIVE: CRISES, HISTORIES, AND MOVEMENTS

Demanding a Response

"Don't read this until you steady yourself. This isn't just the third essay on the list of assigned reading for next week. It will make you cringe. It will haunt you. It will change you."

This is what I said to friends in my team ethnography graduate course at California State University, Sacramento.¹ It was, for me, a novel course in many ways: We were working together as a research team; we were writing Van Maanen's (1988) realist, impressionist, and confessional tales; and we were creating a text together as a class.² In the midst of the creativity and camaraderie we experienced in this course, Ronai's (1995) "Multiple Reflections of Child Sex Abuse: An Argument for a Layered Account" altered us and the way in which we approached our work. In the essay, Ronai juxtaposed reflections on being sexually abused as a child with an argument for a layered account—a telling that creates a "continuous dialectic of experience, emerging from the multitude of reflexive voices that simultaneously produce and interpret . . . text[s]" (p. 396).

"Multiple Reflections" is autoethnography, although I did not know it then. Ronai (1995)

offered up her own terrifying experience in the name of saying something startling and intricate about sexual abuse and the force and import of her scholarly and personal efforts to make sense of this experience. Ronai's story had a powerful effect on me. My thinking—about sexual abuse, about writing and scholarship, about the power of texts—shifted. Her language and story accomplished something that, up until that point, I had believed to be the business of music, novels, and film; they invited me into a lived felt experience. I could not stand outside of her words at safe remove. Ronai's story demanded that I respond and react. I marveled at the beauty of her language. I talked about her essay with my colleagues and listened as they recounted their own experiences of sexual abuse. I was enraged about what happened to Ronai and to my friends.

This is the story of my first encounter with autoethnography as a communication scholar. Of course, I had been experiencing autoethnographic texts all my life—in Raymond Carver's short stories, Sylvia Plath's poetry, Milan Kundera's novels, and Billie Holiday's singing. Until I read "Multiple Reflections," however, I did not make the connection between what these works and acts accomplished and what I believed scholarship to be about.

Autoethnography Is . . .

A balancing act. Autoethnography and writing about autoethnography, that is,³ Autoethnography works to hold self and culture together, albeit not in equilibrium or stasis. Autoethnography writes a world in a state of flux and movement—between story and context, writer and reader, crisis and denouement. It creates charged moments of clarity, connection, and change.

Writing about autoethnography is also a balancing act. In a handbook chapter that wants to move theory and method to action, what do I leave in and leave out? How do I balance *telling* (about autoethnography's history, methods, responsibilities, and possibilities) with *showing* (doing the work of autoethnography here on these pages)? How much of my self do I put in and leave out?

I begin with another sort of balancing act, sifting through books and essays, looking for words that others have used to describe the doing of autoethnography. Autoethnography is . . .

"research, writing, and method that connect the autobiographical and personal to the cultural and social. This form usually features concrete action, emotion, embodiment, self-consciousness, and introspection . . . [and] claims the conventions of literary writing." (Ellis, 2004, p. xix)

"a self-narrative that critiques the situatedness of self with others in social contexts." (Spry, 2001, p. 710)

"texts [that] democratize the representational sphere of culture by locating the particular experiences of individuals in a tension with dominant expressions of discursive power." (Neumann, 1996, p. 189)

Soon, however, I find myself wanting to bend the rules, to reinscribe words about other endeavors—autobiographies, personal narratives, memoirs, short fiction, performances—as defining moments for autoethnography. I tell myself that this is not a selfish impulse—wanting beautiful phrases of other origins for autoethnography—because autoethnography is not a practice alone in the world. Autoethnography does have a story, one that was told in loving detail by Reed-Danahay (1997, pp. 4–9), Ellis and Bochner (2000, pp. 739–743), and Neumann (1996, pp. 188–193), among others. But because autoethnography is what Geertz (1983) referred to as a blurred genre, it overlaps with, and is indebted to, research and writing practices in anthropology, sociology, psychology, literary criticism, journalism, and communication (for these histories, see Denzin, 1997, pp. 203–207; Ellis, 2004, pp. 12–18; Neumann, 1996, pp. 193–195), to say nothing of our favorite storytellers, poets, and musicians.

And so I allow words about other sorts of personal texts to make themselves heard in the dance of my fingers on the keys. Autoethnography is . . .

"a catastrophic encounter, a moment of vulnerability and ambiguity that is sensuous, embodied, and profoundly implicated in the social and ideological

structures of their lifeworlds." (Marilyn Brownstein, quoted in Grumet, 2001, p. 177)

"the kind [of art] that takes you deeper inside yourself and ultimately out again." (Friedwald, 1996, p. 126)

"storytelling [that] can change the world." (Wade Davis, quoted in Chadwick, 2003).

Taking these words as a point of departure, I create my own responses to the call: Autoethnography is . . .

Setting a scene, telling a story, weaving intricate connections among life and art, experience and theory, evocation and explanation. . . . and then letting go, hoping for readers who will bring the same careful attention to your words in the context of their own lives.

Making a text present. Demanding attention and participation. Implicating all involved. Refusing closure or categorization.

Witnessing experience and testifying about power without foreclosure—of pleasure, of difference, of efficacy.

Believing that words matter and writing toward the moment when the point of creating autoethnographic texts is to change the world.

I return to the books balanced on my lap. I keep looking, unsatisfied with my textual portrait. It feels tentative and unfinished. And perhaps it should be. I decide on one final entry because it says something I have not managed to put into my collected words. Autoethnography is . . .

"[a] performance text . . . turning inward waiting to be staged." (Denzin, 1997, p. 199)

I decide to stop here, knowing that this is not the end of a story about autoethnography, only a beginning. I return to my own story of autoethnographic history and my encounter with Rona's (1995) story. More than creating connections and shifts in my thinking, more than inspiring both

rage and desire, this story also signals a crisis, one that began long before Ronai's story or my reading of it and one that continues as we speak, as we write and are written on these pages and on the stages of our experience.

■ CRISIS

It is a triple crisis, a triple threat, a triple crown of thorns: representation, legitimation, and praxis. These crises, which mark and coincide with a turn toward interpretive, qualitative, narrative, and critical inquiry in the human disciplines, are summoned in an oft-recited line in a familiar play: How much does a scholar know, how does she know it, and what can she do with this knowledge in the world?⁴

The idea of a triple crisis implies that it is something new and something different. But these crises are not new (Denzin, 1997, p. 203). Crisis itself is not new. It is simply the result of forces in conflict, the dramatic nature of human action, and the choices (conscious and unconscious) we make in a world full of possibilities (Pelias, 1992, p. 7). The drama of representation, legitimation, and praxis is part of an ongoing dialogue between self and world about questions of ontology, epistemology, method, and praxis: What is the nature of knowing, what is the relationship between knower and known, how do we share what we know and with what effect? What makes this triple crisis feel urgent is the ways in which this dialogue has increasingly questioned the stability and coherence of our lives as we live and tell about them. This dialogue asks how, in lifeworlds that are partial, fragmented, and constituted and mediated by language, we can tell or read our stories as neutral, privileged, or in any way complete. In answering these questions, we have looked to the personal, concrete, and mundane details of experience as a window to understanding the relationships between self and other or between individual and community. We use the contingent and skeptical languages of poststructuralism and postmodernism (among others) to tell and understand our lives and our world,

hoping to confront questions of "self, place, [and] power" in ways that are more satisfying and—yes—more subversive than in previous performances (Neumann, 1996, p. 195; see also Denzin, 1997; Reinelt, 1998, p. 285).

A crisis is a turning point, a moment when conflict must be dealt with even if we cannot resolve it. It is a tension that opens a space of indeterminacy, threatens to destabilize social structures, and enables a creative uncertainty (Reinelt, 1998, p. 284). Interpretive, qualitative, narrative, and critical inquiry have had many such moments, all of which led to shifts in genres and methods. We have traveled from . . .

the impossibility of careful, faithful, and authoritative cataloguing of an exotic other . . .

to partial, reflexive, and local narrative accounts . . .

to texts that work to create a space for an ethics committed to dialogue.

In the current moment . . .

we confront the impossibility of representing lived experience by troubling the link between life and text . . .

we develop (and question the development of) criteria for understanding and evaluating the work we do to narrate the conditions of our lives . . .

we resolve to do work that makes a difference by writing the social imaginary in inciterial and revolutionary ways.⁵

We rise to the challenge of movement. . . .

■ MOVEMENT

Even though I was able to place "Multiple Reflections" within the larger context of turns and movements in interpretive, qualitative, narrative, and critical inquiry, I did not know what to do with the rage I felt on the day I read Ronai's (1995) essay. I looked for a place to put my anger, a way to assuage it, and a means to act on it without

forgetting or dismissing it. In her chapter in the second edition of this *Handbook*, Olesen (2000) wrote, "Rage is not enough" (p. 215). Olesen's challenge—to me, to you—is to move from rage to "progressive political action, to theory and method that connect politics, pedagogy, and ethics to action in the world" (N. Denzin & Y. Lincoln, personal communication, September 23, 2002).

This is a challenge that autoethnographers have been working to meet slowly and incrementally. It is the challenge of creating texts that unfold in the intersubjective space of individual and community and that embrace tactics for both *knowing* and *showing* (Jackson, 1998; Kemp, 1998, p. 116). Responding to this challenge means asking questions about the following:

- How knowledge, experience, meaning, and resistance are expressed by embodied, tacit, intentional, gestural, improvisational, coexperiential, and covert means (Conquergood, 2002, p. 146). Autoethnographic texts focus on how subordinated people use deliberately subtle and opaque forms of communication—forms that are not textual or visual—to express their thoughts, feelings, and desires by performing these practices on the page and on stage (Daly & Rogers, 2001; Jones, 1997a; Stewart, 1996).

- How emotions are important to understanding and theorizing the relationship among self, power, and culture. Autoethnographic texts focus on creating a palpable emotional experience as it connects to and separates from other ways of knowing, being, and acting in/on the world (Bochner, 2001; Ellis, 1997, 1995; Jagu, 2002; Spry, 2001).

- How body and voice are inseparable from mind and thought as well as how bodies and voices move and are privileged (and are restricted and marked) in very particular and political ways. Autoethnographic texts seek to invoke the corporeal, sensuous, and political nature of experience rather than collapse text into embodiment or politics into language play (Alexander, 2000; Gingrich-Philbrook, 1997; Jackson, 1998; Jones, 1997b; Pineau, 2000; Stoller, 1997).

- How selves are constructed, disclosed, and implicated in the telling of personal narratives as well as how these narratives move in and change the contexts of their telling.⁶ Texts aspire to purposeful and tension-filled "self-investigation" of an author's (and a reader's) role in a context, a situation, or a social world. Such self-investigation generates what Gornick (2001) termed "self-implication," that is, seeing "one's own part in the situation"—particularly "one's own frightened or cowardly or self-deceived part" (pp. 35–36)—in creating the dynamic and movement of a text (see also Bochner, 2001; Ellis, 2002; Garrick, 2001; Hartnett, 1998; Langellier, 1999; Park-Fuller, 2000; Spry, 2000; Vickers, 2002).

- How stories help us to create, interpret, and change our social, cultural, political, and personal lives. Autoethnographic texts point out not only the necessity of narrative in our world but also the power of narrative to reveal and revise that world, even when we struggle for words, when we fail to find them, or when the unspeakable is invoked but not silent (Bochner, 2001; Denzin, 2000; Hartnett, 1999; Lockford, 2002; Neumann, 1996; Pelias, 2002; Richardson, 1997).

These questions challenge us to create work that acts through, in, and on the world and to shift our focus from representation to presentation, from the rehearsal of new ways of being to their performance. These questions posit the challenge of *movement*—to talk and share in new and difficult ways, to think and rethink our positions and commitments, to push through resistance in search of hope (Becker, 2000, pp. 523, 541–542). Responding to these questions has led me and others to turn to performance. In making this turn, we must consider how the practices of autoethnography are informed by a rich history in performance, a history that needs to be written into accounts of autoethnographic theory and practices (Denzin, 2003; Ellis & Bochner, 1996). Our abiding interest in performance ethnography, performative writing, and personal performance narratives is telling. These endeavors point to how personal stories become a means for interpreting

the past, translating and transforming contexts, and envisioning a future.

■ TURNING TO PERFORMANCE: LETTERS OF/FOR/ON CHANGE

The Impossibility of Iser

I went to the University of Texas at Austin to study organizational culture and to learn more about ethnography, writing, and scholarship. When I looked through the graduate course offerings in the Department of Communication, I kept coming back to a course titled Reading and Performing. I was intrigued. I wanted to learn about performance studies, and I wanted to explore theories and practices of reading. But performing? I was not sure I was ready for that.

The professor² encouraged me to come to the first class to see what it was all about, and so I did. The material was compelling, the students were engaging, and the professor was witty and commanding. But what about the performances? My last—and only—performance experience was playing the baby Jesus in the church Christmas pageant. I was not sure whether I should stay, but I knew I wanted to stay. Then the professor began assigning reading reports, and I began to sweat. And then it was my turn. He looked at me and said, “Well, I don’t know you, but you look like a nice person. I am assigning you Wolfgang Iser because he is a nice person.”

I had to stay. I had to report on Iser. It is what a nice person would do. I read *The Fictive and the Imaginary* (Iser, 1993), and I understood that Iser was talking about reading and also about writing and performing. He stated,

The impossibility of being present to ourselves becomes our possibility to play ourselves out to the fullness that knows no bounds, because no matter how vast the range, none of the possibilities will “make us tick.” This impossibility suggests a purpose for literary staging. . . . Literature becomes a panorama of what is possible, because it is not hedged in by either the limitations or the

considerations that determine the institutionalized organizations within which human life otherwise takes its course. (p. xviii)

As I wrote my report, I kept coming back to this passage because it speaks to the fertile space within which we confront the impossibility of full or complete knowledge (of self, of others, and of the relationships between the two). Because we cannot know, write, or stage it “all,” we are free to create a vision of what is possible. Reading Iser, I was convinced that texts both written and read might engage and exceed these constraints in liberatory ways. I was also convinced that performance offered a possibility for realizing this goal.

Performance Rising

Conquergood (1991) traced the rise of performance in ethnographic research³ and writing in his essay, “Rethinking Ethnography.”⁴ He tracked the turn to performance to Victor Turner’s characterization of humankind as *homo performans*—humanity as performer—“a culture-inventing, social-performing, self-making, and self-transforming creature” (p. 187). Turner’s move to link ethnography with performance as a lived and living practice accomplishes four goals. First, it turns our attention to how bodies and voices are situated in contexts—in and of “time, place, and history” (p. 187). Second, the performative turn moves researchers and researched toward a relationship of embodied “intimate involvement and engagement of ‘coactivity’ or co-performance with historically situated, named, unique individuals” (p. 187; see also Kisliuk, 2002, pp. 105–106). Third, performance-centered ethnography points up the visual, linguistic, and textual bias of Western civilization and redirects our attention to an aural, bodily, and postmodern expression of culture and lifeworld, fieldwork and writing (Conquergood, 1991, p. 189; see also Tyler, 1986). Fourth, in highlighting the “polysemic” and constitutive nature of social life and cultural performances, the performance paradigm asks us to focus on how texts can be created, communicated,

and most notably critiqued on multiple levels (Conquergood, 1991, p. 189).

Conquergood¹⁰ (1991) was not suggesting that ethnography abandon text or field in favor of performance; rather, he was suggesting that we use performance as a metaphor, means, and method for thinking about and sharing what is lost and left out of our fieldwork and our texts as well as thinking about how performance complements, alters, supplements, and critiques these texts (p. 191).¹¹

Ekphrastic Criticism

A thief drives to the museum in his black van. The night watchman says, Sorry, closed, you have to come back tomorrow. The thief sticks the point of his knife in the guard's ear. I haven't got all evening, he says, I need some art. Art is for pleasure, the guard says, not possession, you can't something, and then the duct tape is going across his mouth. Don't worry, the thief says, we're both on the same side. He finds the Dutch Masters and goes right for a Vermeer: "Girl Writing a Letter." The thief knows what he's doing. He has a Ph.D. He slices the canvas on one edge from the shelf holding the salad bowls right down to the square of sunlight on the black and white checked floor. The girl doesn't hear this, she's too absorbed in writing her letter, she doesn't notice him until too late.¹²

I chose Carpenter's (1993) "Girl Writing a Letter" for my first performance for Reading and Performing. I chose this poem because it is smart and funny and has a happy ending. I thought these things, that is, until I began to work on the

performance. There were too many characters, too many stories, too many voices and attitudes to attend to all at once. But it was too late. I stayed the course. I reported on Iser. Now I had to perform.

I finished my performance of "Girl Writing a Letter," and the professor was silent. I waited, my heart pulsing in my head. He walked to the chalkboard and wrote "Ekphrastic." Ekphrastic? What does that mean? Was it good? Awful? He explained that ekphrastic works, such as my poem, are meditations on others' creative acts (Scott, 1994, p. xi), usually texts considering a visual or aural work of art. Think John Keats's "Ode to a Grecian Urn." Ekphrastic texts attempt to "invoke 'the picture-making capacity of words in poems'" (Krieger, 1992, p. 1).

After this brief lesson, the professor moved on, inviting the next performance. I was left to wonder—about the poem, about the performance, about ekphrasis. Later that week, I saw my professor in the hallway outside of his office. He said, "Nice work the other day. Great poem. Great performance. I thought you said you weren't a performer."

"I'm not."

"You are a performer."

I spent the next several weeks reading and thinking about performance, texts, and ekphrasis. Although it is typically the domain of the poet and literary scholar, ekphrasis describes our attempts to translate and transmute an experience to text and text to experience. Ekphrasis "breathes words into the mute picture; it makes pictures out of the suspended words of its text. It is as much about urgency as it is about rest, as much voyage as interlude" (Scott, 1994, p. xii). And what happens when we perform an ekphrastic text? What happens when we perform the artist performing the artist, repeating the act of connection and creation, breaking that experience out of one form and context and remaking it in another? Perhaps we create a critical ekphrasis, a performance that moves through *mimesis* (imitation) and *poesis* (creation) to *kinesis* (movement) (Conquergood, 1992, p. 84).¹³

Inventory

I was hooked. I changed parties and turned to performance studies. I enrolled in Performance History, Autobiography, and Performance and in Performance Ethnography. On the first day of Performance Ethnography, the professor¹⁴ asked students to pair up and said, "Without speaking, write three observations or assumptions about your partner and then discuss."

There were an odd number of students, so I was paired with the professor. I wrote, "Sings well, writes poetry, believes in reincarnation." She wrote, "Married or in a committed relationship, precise and particular, doesn't relax easily." We shared our lists and laughed over the entries. Some of them were on target, and others were not. But each item on our lists spoke to our projections, our hopes, things we wanted for ourselves, and things we did not want.

At the end of class, the professor asked us to do a self-inventory, answering questions about our physical, emotional, spiritual, intellectual, artistic, and artifactual selves:

What are three of your typical gestures?

When you cried last, what was it about?

What spiritual activities do you engage in each day?

What was the last book you read that was not assigned for a class?

In what activities are you the most creative?

How do you typically adorn your body?

Answering these questions and others, I thought about how performance ethnography is an inventory of both self and other, an act of interpretation and a performance of that assessment, and a journey through imitation and creation into movement. I wondered where this journey would take me.

Doing Bodies Doing Culture

Jones (2002) wrote that performance ethnography is "most simply, how culture is done in the body" (p. 7). The process of creating and staging

performance ethnography, however, is not simply placing, and then playing, bodies in cultures. Rather, performance ethnography seeks to *implicate* researchers and audiences by creating an experience that brings together theory and praxis in complicated, contradictory, and meaningful ways.

Performance ethnography is grounded in two primary ideas: (a) that our identities and daily practices are a series of performance choices (conscious and unconscious) that we improvise within cultural and social guidelines and (b) that we learn through participation or through performance (p. 7; see also Denzin, 2003, pp. 14–16). Performance ethnography can take many forms, ranging from recreating cultural performances for audiences invested and interested in understanding, preserving, and/or challenging particular identities and ways of life (Conquergood, 1985, 1994) to presenting individual (autoethnographic) experiences as a means for pointing up the subjective and situated nature of identity, fieldwork, and cultural interpretation (Jones, 1996; Spry, 2001). Performance ethnography can also be presented in various ways, ranging from traditionally "theatrical" settings complete with fourth-wall conventions (in which the audience observes the action on stage) to installations and scenes in which audience members are invited/compelled to participate in the creation of the performance. Whatever the form or process, performance ethnographies seek to "explore bodily knowing, to stretch the ways in which ethnography might share knowledge of a culture, and to puzzle through the ethical and political dilemmas of fieldwork and representation" (Jones, 2002, p. 7). Jones (2002) asserted that performance ethnography achieves these goals by focusing on four principles: (a) creating a specific context for the performance, (b) working in collaboration with and being accountable to a fieldwork community, (c) highlighting the performer's "situated and interested role" in the interpretation of culture, and (d) providing a multitude of perspectives that audience members must actively synthesize (pp. 8–9).

Doing bodies doing culture can be these things if we are willing to remember and perform context.

accountability, subjectivity, and multivocality, that is, if we create work that is both "community-based and community active" (Kisliuk, 2002, p. 116). We must be willing not only to implicate our audiences but also to incite them to participate, to act, and to take risks.

Girl Writing (another) Letter

During the second semester of my Ph.D. program, insomnia came to live with me. I would lie in bed with my mind racing. I rehashed rehearsals and classroom conversations. I wondered whether I had paid the electric bill. I agonized over who or what to choose as my subject for Performance Ethnography. I considered sites and contexts as well as organizations and individuals, but nothing seemed right. I changed positions, tried to focus on the hum of the air conditioner and the steady pulse of the highway traffic, and then fell into a shallow sleep and dreamed of my grandfather.

A few months before insomnia came to stay, my grandfather had died. I was in the heat of my first semester at Texas when my mother called to tell me. My grandfather had spent the past 2 years mourning the death of my grandmother, and a heart attack had rescued him from living alone without her.

I did not go to the funeral. My mother convinced me to stay in school. That was where my grandfather had wanted me, where he was proud of me. Months later, my sleepless nights began and ended with dreams of my grandfather and the hazy edges of my un-lived grief. One night after my eyes flew open to greet the red glare of 2 o'clock, I decided that I had had enough. I decided that I would meet my grandfather in the space he cared about most and to live my grief at school in Performance Ethnography. I got up and composed another letter—another poem for performance.

Dear Grandpa

I didn't hear you leave.

I was too busy writing,
your college girl,

never noticing until too late.

Grandma phoned from her hospital bed
asked me to look in on you.

Said last night you were hit by a car,
walking home in the rain.

I drive to you teeth clenched.

Fear works the doorbell and
twists into my breathing

until I hear you call over barking dogs.

The door opens and you shrink in its frame.
Angry bruises glow violent beneath pale skin,
your left eye pinched shut against the pain.

My own vision blurs as we embrace.

You don't want to see a doctor, don't want
to lie down, don't want to rest.

You need to get to the hospital, to her.

You've been gone too long.

I take you to her, but say I can't stay.

That's right, I'm your college girl.

I watch you touch her face and stroke her hair.

I am furious you don't want to live without her.

I tell you both good-bye, not knowing
this is the last time, not knowing

I left you together. Is this how you wanted it?

I didn't hear you leave.

I wove this letter into a performance that included my grandfather's letters to me, family photos, reflections on his life and death, and arguments for the performance of grief.¹⁵ I used monologue, epic, and "everyday life" performance techniques to show my grandfather, myself, and the process of performing an other (Hopper, 1993; Stucky, 1993). I felt closer to my grandfather; more in tune with his presence in my life, dreams, and grief; and proud to share both with an audience.

This performance was my response to the project of performance ethnography. It was my

subjective and vulnerable experience. It did not produce “findings”; it was not generalizable outside of asking audience members to recall and reinhabit their own moments of grieving (Goodall, 2000, p. 2). It generated whatever credibility it earned out of my fumbling attempts to make sense of my loss. This is a hallmark of autoethnography and autoethnographic performance—speaking in and through experiences that are unspeakable as well as inhabiting and animating the struggle for words and often our failure to find them (A. Bochner & C. Ellis, personal communication, September 6, 2003). These are risky performances for all involved, and not only because they testify to the spaces of failure, silence, and loss. They are risky because in the rush to identification, empathy, and our desire for an “authentic” experience, audiences and performers can give and receive testimony in ways that move too quickly from a connected yet distinctive “you” and “me” to an unquestioned and violent “we” (Salverson, 2001, p. 124; see also Diamond, 1992). This collapsing of me into you and you into me can work to shut down engagement and responsibility. It can fail to recognize the ethical move required to make autoethnography and autoethnographic performances “a doorway, an instrument of encounter, a place of public and private negotiations—where the goal is not just to empathize, but to *attend*” (Salverson, 2001, p. 125, emphasis added). My performance of my grief for my grandfather stopped short of asking my audience and myself to take a greater risk, to move through *mimesis* (reflection) to *poiesis* (creation) and *kinesis* (movement). That performance—the performance of critique and change—required another letter.

Connecting

I flew to St. Louis, Missouri, and met an old friend. We drove into a new territory, with her convertible twisting and winding into the state park, where we breathed in the scents of pine and sunlight. We were there for a conference on performative writing. We collected there to share the work—the words—we believed to be performative

writing. I was nervous, tentative, and unsure. Should I be here? Should it be someone else instead? Of course. I felt guilty about leaving work on a dissertation about torch singing as a feminist performance practice. Should I be *here*? Should I be at home writing—focused on finishing—instead? Of course. But I was here to listen, to read my words, and to experience. And I knew that when we embody stories and identities, there is always danger and always risk,¹⁶ so I went.

We began by talking about performative writing. What is it? How do we know it? What does it aspire to be? How do we judge? What does performance have to do with it? We talked and questioned and made notes, never deciding but instead piling on detail and nuance. Performative writing . . .

“[is a] kind of writing where the body and the spoken word, performance practice and theory, the personal and the scholarly, come together.” (Miller & Pelias, 2001, p. v)

“requires faith that language inked on a page can ‘do’ as well as ‘be.’” (Stucky, 2001, p. vii)

“depends upon the performative body believing in language.” (Gingrich-Philbrook, 2001, p. vii)

“creates a performance, rather than describes one.” (Barthes, 1977, p. 114)

The hurried and rich discussion left me breathless and nervous. Did my words embody a belief in the power of language? Move beyond the pages of their inscription? Invoke, conjure, and create a new world? As much as the warm atmosphere and kind eyes of the participants told me to relax—to enjoy this performance—I was afraid of how my work would be read, heard, and judged.

Reading, reception, and judgment—conversations about why and how to evaluate alternative auto/ethnographic work abound.¹⁷ For example, Richardson (2000) offered five criteria that she uses when reviewing what she calls creative analytic practices (CAP) ethnography: (a) substantive contribution to an understanding of social life, (b) aesthetic merit, (c) reflexivity, (d) emotional and intellectual impact, and (e) a clear

expression of a cultural, social, individual, or communal sense of reality (p. 937). Using Richardson's and others' models, I have developed a list of actions and accomplishments that I look for in my work and in the work of others. They are changing. They are generated in the doing of this writing rather than outside or prior to it:

- *Participation as reciprocity.* How well does the work construct participation of authors/readers and performers/audiences as a *reciprocal* relationship marked by mutual responsibility and obligation (Flam, 1997, p. 78; hooks, 1995, p. 221)?

- *Partiality, reflexivity, and citationality as strategies for dialogue (and not "mastery").* How well does the work present a partial and self-referential tale that connects with other stories, ideas, discourses, and contexts (e.g., personal, theoretical, ideological, cultural) as a means of creating a dialogue among "authors, readers, and subjects written/read" (Pollock, 1998, p. 80; see also Denzin, 1997, pp. 224–227; Lather, 2001, p. 216; Richardson, 1997, p. 91)?

- *Dialogue as a space of debate and negotiation.* How well does the work create a space for and engage in meaningful dialogue among different bodies, hearts, and minds (Conquergood, 1985, p. 9; Denzin, 1997, p. 247)?

- *Personal narrative and storytelling as an obligation to critique.* How do narrative and story enact an ethical obligation to critique subject positions, acts, and received notions of expertise and justice within and outside of the work (Conquergood, 2002, p. 152; Denzin, 1997, p. 200; Langellier, 1999, 128–131)?

- *Evocation and emotion as incitements to action.* How well does the work create a plausible and visceral lifeworld and charged emotional atmosphere as an incitement to act within and outside the context of the work (Bochner, 2000, p. 271; Denzin, 1997, p. 209)?

- *Engaged embodiment as a condition for change.* How does the work place/embody/interrogate/intervene in experience in ways that make

political action and change possible in and outside of the work? In other words, how does the work "make writing *do*" (Diamond, 1996, p. 2; Pollock, 1998, pp. 95–96)?

I brought these actions and accomplishments with me to the gathering on performative writing. As the first author/performer began, I heard them sound and reverberate on his tongue and in his words and through his story. I heard them sound and reverberate as we listened to each other that weekend, writing and telling and remaking selves in the words on our pages, in our mouths, on our bodies, and in the room with the green window on the world.¹⁸

(Re)Making the Self

Miller (1998)¹⁹ maintained that the gathering interest in autobiographical performance has much to do with a shift in performance studies from aesthetic performance to "a more integral paradigm for explaining, critiquing, and experiencing how contemporary life is lived" (p. 318). This shift, like the move toward interpretive, qualitative, narrative, and critical inquiry in other human disciplines, was precipitated by a rethinking of the relationships among texts, performers, audiences, and contexts; a proliferation in the number and nature of communication technologies; and a postmodern decentering of the authority, autonomy, and stability of institutions, subjectivities, and texts (pp. 319–320). Out of this shift emerged an emphasis on personal narrative as a situated, fluid, and emotionally and intellectually charged *engagement* of self and other (performer and witness) made possible in the "evolving, revelatory dance between performer and spectator" (Miller, 1995, p. 49). In such exchanges, audiences and performers (often composed of people who are classified by virtue of race, class, age, sexual preference, gender identity, and experience as "others") create and constitute a shared history and, thus, break into and diminish their marginalization. These performances create highly personal encounters within an increasingly impersonal public sphere.

Autobiographical performances provide an opportunity to "educate, empower, and emancipate" (Langellier, 1999, p. 129). Langellier (1999) located a means of mitigating and complicating the "either/or" logic of celebration (resistance) and suspicion (dominance) within personal narrative performance, specifically in the interaction between performance and performativity. Langellier asserted that "stories are made, not found" in performances that mediate between experience and story, between the doing and the done (p. 128; see also Denzin, 2003, p. 10).

These distinctions between experience and story, between the doing and the done, rely on a notion of performativity that states that a life story—an identity—is not something an author/performer "elects to do, but . . . [rather] is *performative* in the sense that it constitutes an effect of the very subject it appears to express" (Butler, 1991, p. 24). Performativity points to how identities, and thus life stories, are not easily adopted or changed (as a role taken on by an actor) but instead accrue "gradually, yet [do] not attach [themselves] to some blank, some actor cast in a play she's not yet read; [such identities] come into being by virtue of being performed" (Solomon, 1997, p. 169). That is, life stories are created and recreated in the moments of their telling.

Performativity points to the impossibility of separating our life stories from the social, cultural, and political contexts in which they are created and the ways in which performance as a site of dialogue and negotiation is itself a contested space (Diamond, 1996, p. 2). Langellier (1999) wrote,

Identity and experience are a symbiosis of performed story and the social relations in which they are materially embedded. . . . This is why personal narrative performance is especially crucial to those communities left out of the privileges of dominant culture, those bodies without voice in the political sense. (p. 129)

The challenge is to consider how particular performances of personal stories "need performativity to comprehend [their] constitutive

effects" as well as how performativity "relies upon performance to show itself" (Langellier, 1999, p. 136). In the iterative and unstable move between performance and performativity, "questions of embodiment, of social relations, of ideological interpellations, of emotional and political effects, all become discussable" (Diamond, 1996, p. 4). It is a discussion that moves discourse to storytelling performance, from autonomous texts to situated practices, from received storylines to emergent dramas with numerous possible "endings," and from omniscient narrators to a proliferation of unreliable reflexive voices. It is a discussion that creates and challenges social relations "within the performance event and perhaps even beyond it" (Langellier, 1999, p. 132; see also Denzin, 2003, pp. 10–11).

Performative writing brings the performance–performativity dynamic to the moment of texting in which identities and experiences are constructed, interpreted, and changed. It occurs when we encounter the page with the intention of entering into a discussion marked by contest and negotiation, embodied knowledge and vociferous exchange, emotional and intellectual charge. It occurs when we invite an audience into dialogue as we write, speak, and perform the words on the page, in our mouths, on our bodies, and in the world. Because the performance–performativity dynamic asserts that performances are inseparable from performers and that performativity is inseparable from politics, autobiographical performance, personal narrative, and performative auto/ethnography enmesh the personal within the political and the political within the personal in ways that can, do, and must matter.

A Love Letter

It was my turn. I moved from my seat on the floor and into the chair beneath the window. All eyes—expectant and encouraging—were on me. I took a breath and began a story about torch singers and ghosts.

On the flight from Detroit to Paris, I read about the Edith Piaf Museum in the guidebook:

Paris. Open by appointment 1–6 p.m.
Closed Friday, Saturday, Sunday, and
bank holidays. Private museum in an
apartment. Memorabilia of the singer.
China collection. Free.

I circle the phone number. I turn the dog-eared page. I close my eyes and begin listening for Piaf as she haunts Paris, as she haunts me, a present history singing her invisibility. . . .

I arrive at the apartment museum at 1 p.m. Melissa accompanies me as translator. The proprietor, Bernard Marchois, invites us in. Standing immediately in front of us is a black-and-white cardboard cutout of Piaf. Marchois tells us that the cutout was created as a lobby display for one of her last concerts at the Paris Olympia. He smiles. This is a life-sized portrait, he says. He puts his arm around the cardboard statue. He is not a tall man, but Edith looks like a tiny bird under his arm—yes, a sparrow.

He shows us into the sitting room, and Melissa and I look around. This place, like all of the others, is packed tight with Piaf memorabilia. These are *her* things—her records, her jewelry, her hastily scrawled letters, her black dress, her china. We sit on a couch. (Is it hers? Did she sit here?) Marchois pulls up a chair. Melissa explains that we're interested in hearing about Piaf's performances, about Piaf the woman. He nods and smiles. I ask him to tell us how they met. Melissa asks again, in French. He laughs. He explains that he met Piaf when he was a teenager. An older couple—friends of the family—invited him to see Piaf at the Olympia. Before the show, the couple took Marchois backstage to meet her. He was disappointed. She was frail and plain. She looked like a cleaning lady.

"Surprised?" she asked.

Marchois nodded sheepishly.

She laughed a round, full laugh. "You come back and see me after the show, eh?"

He was sure he had seen enough, but he nodded again.

"The show was electrifying. By the end of the show, I was smitten. I could barely contain my excitement

as we made our way backstage. When we entered the dressing room, she turned that lightning smile on me."

"So, what do you think of me now?"

"She saw everything in my eyes."

She laughed. "Come," she said, and she pulled me into her embrace.

Marchois's eyes glisten. He sighs. He says they were friends, never lovers. He says she loved life, loved to laugh and play music, loved to sing. He says her songs were full of heartache, but that heartache was never hopeless. It was simply part of the equation of living. Her songs were signposts of the places she was in between—spaces of contradiction, tension, and immanent possibilities.²⁰ He says she loved sharing these places, these wounds of feeling. He says, again, she loved life.

I see the cardboard likeness of Piaf in the next room. I see the picture of Marchois with his arm around her—not the life-sized photo but [rather] what is pressing in from the other side of the image displayed within her tiny frame.²¹ I see him sitting here, in an apartment filled with her teacups and earrings and stationery. I glance down at my notebook. My next question is, "Why do this? Why invite strangers into your home to talk about Edith Piaf?" I look up at him and I have my answer. He is an amateur, a careful collector of memories. He does this so that he might breathe life back in where only a vague memory or a bare trace was visible to those who bothered to look.²² He lives among her things because looking at them and showing them to others is his lover's discourse.²³ He is writing ghost stories in a language of commonplace things that take on an immense power.²⁴ And with each day, with each conversation, he proclaims his love and writes his memories anew.

We leave the museum and walk toward the Metro station. Melissa asks if I got what I wanted. I say, Yes. No. I'm not sure, and maybe that's the point. I came to Paris looking for the real Edith Piaf, and I'm leaving with her ghost.

Melissa stops. Why do this? Why follow her ghost around Paris?

I have my answer: Because following a ghost is about making contact, and that contact changes you.²⁵

Later, when I sit down to write this story of my encounter with Piaf and her ghost, I feel her watching over my shoulder as I move my fingers along the keys, always with me, the questioning, critical ghost of my text. She leaves wounds of feeling on my language, never hopeless, just part of living. My stories are love letters, invitations to hear the unspoken, unheard voices of the singer and myself.

Performing Possibilities

I finished my story, and the audience was still and silent. Then the discussion began, pulling my story and me into a new performance. We talked of rhythm and thick description, theory and practice, haunting and writing. I was challenged and energized by our conversation. I envisioned new possibilities for my story and for the power of narrative to inscribe and embody a horizon of movement. I left the chair under the window and returned to my place on the floor.

I flew home from the conference and spent a few days writing and reading about performance, personal narrative, and performativity. I made note of what Madison (1998a) stated about the "performance of possibilities" that is, the "active, creative work that weaves the life of the mind with being mindful of life, of 'merging text and world,' of critically traversing the margin *and* the center, of opening more and different paths for enlivening relations and spaces" (p. 277).

Performances of possibilities are created in the momentum of movement from silence to voice and from margin to center. They provide a gathering place for narratives that seek change in "systems and processes that limit possibilities" (Madison, 1998a, p. 279). The space and movement of performances of possibilities are infused with the responsibility to ethically engage with selves and others in ways that do not forestall or foreclose dialogue. Performances of possibilities provide both the means and the method for an alternative, alternative ethnography. They are, to

use Sandoval's (2000) description, subjunctive; they join together the possible and what is, they provide the medium "through which difference both arises and is undone; [they] join together through *movement*" (p. 180).

Then I returned to my dissertation, my love letter to torch singing. I brought these questions with me to my writing.

Intimate Provocation

Madison's questions link the personal with the political and suggest how the turn toward performative narratives and narrative performances creates a politically efficacious poetics in and through movement (see also Conquergood, 2002; Langelier, 1999; Hartnett, 1998; Jones, 2002; Spry, 2001).

The lessons and challenges for autoethnography in the turn toward performance, performative writing, and personal narrative are clear. Autoethnographic texts are personal stories that are both constitutive and performative. They are charged exchanges of presence or "mutual presentness" (Dolan, 1993, p. 151). They are love letters—processes and productions of desire—for recognition, for engagement, and for change. Tedlock (1991) characterized the ethnographer's process as that of an amateur, which derives from the Latin *amatus* or "to love" (p. 82). Written and experienced in this way, autoethnography becomes an intimate provocation, a critical ekphrasis, a story of and with movement.

But like all stories, my account is partial, fragmented, and situated in the texts and contexts of my own learning, interpretations, and practices. Rather than end here in the intersections and interactive possibilities of narrative and performance, I want to tell you one more story, invent one more history, invoke one more discussion of the intricacies of theory and praxis. I want to tell you about socially resistive performance as a site and means of intimate provocation. I want to ask you to consider the place of autoethnography in this story.

■ TURNING AGAIN: PERFORMING SOCIAL RESISTANCE

Watching and Writing

When I was young—4 and 5 and 6 years old—I loved staying over on Saturday nights with my grandparents. I relished staying up late nights and having their undivided attention. But most of all, I loved watching *The Lawrence Welk Show*. My grandmother marveled at my fixation on the set. At first, she thought it was the bubbles that held my attention, but I watched everything—the musical numbers, the singers, the dancing. I clapped in time with the movement of Bobby and Sissy. I clapped in time with my grandfather's typewriter click-clacking in the other room.

My grandmother would call him in to see my performance, and the typing—the writing of letters, histories, and wild fictions—would stop. My grandfather would stroll into the living room to watch me. He would smile and pick me up, swinging me high over his head and onto his shoulders. He would hold my hands and spin me in time to Bobby and Sissy's waltz, swing, or foxtrot. And when the number was over, he would return me to my spot on the floor in front of the television and then return to his typewriter.

Out of sight, he would place his fingers on the keys and furiously tap out his own rhythm, vision, and story. And I would return to the dancing, the music, the singing, and the bubbles.

Hopeful Openness

First, consider several ideas about theater and social change:

- That art does not mirror or transcend experience but rather is a means for creating and experiencing the world
- That what happens in a performance can influence, and can *change*, what happens in the world
- That the performer-spectator relationship is not fixed but rather malleable—that a spectator can be an active agent (e.g., cocreator, participant) in

a performance rather than a passive consumer of a performance

- That performance creates a space in which participants not only glimpse who and what they are and desire but also come into contact with different identities, positions, and desires
- That such encounters can demand and facilitate response and action

Now, imagine these ideas as they are played out on stages and street corners, in lecture halls, and in coffee shops. Can you see and hear these performances? Can you imagine that each “models a hopeful openness to the diverse possibilities of democracy” (Dolan, 2001b, p. 2)?

Wait. Do not answer yet. I want to tell you one more story.

Performance has long been a site and means for negotiating social, cultural, and political dialogue (for two historical accounts of this process in different contexts, see Denning, 1997, and Scott, 1990). In the United States, activist theater has coalesced around social movements such as the labor movement of the 1930s, the civil rights and feminist movements of the 1960s and 1970s, and the AIDS activism of the 1980s (Cohen-Cruz, 2001, p. 95). The associations between social movements and activist performance, however, are opportunistic, tenuous, and changing. Such associations do not adequately describe the changing nature of social change theater. Instead, as Cohen-Cruz (2001) proposed, movements in the form and function of activist performance correspond to shifts in the ways in which performance posits the performer-audience-text-context relationship.²⁶

During the late 1960s and early 1970s, the conditions for activist theater were ripe. Actors formed radical collectives that produced both realist drama and original work. The goals of these “actor-based, movement-linked” companies “were plain: get the United States out of Vietnam, enforce equal rights for all people regardless of race or ethnicity, boycott grapes” (Cohen-Cruz, 2001, p. 98). Although techniques were many, much of this work drew on Bertolt Brecht's concept of epic theater—performances

that create a distinction among—and distance between—actor and character, text and context. Epic theater asks audiences to critically engage with and evaluate the performance and its social implications rather than get swept away in the emotional and nonevaluative force of theater-as-entertainment. Distinction and distance are what make theater an occasion for enlightened and involved citizenship as well as a powerful site and means for breaking into and refiguring our world (Brecht, 1957/1998, p. 125).

As the national movements with which these performances were allied began to fracture and shift, socially resistant performance also began to change (Cohen-Cruz, 2001, p. 99). Performers turned their attention to issues in their own communities and began to grapple with the need to express not only solidarity and unity but also the intricacies of identity, difference, and identification (pp. 98–99). During the 1980s, identity politics (e.g., efforts focused specifically on gay rights or gender equality) emphasized personal storytelling and creating an environment and process in which community members could participate in performances. Whereas 1960s “political theater was more consistently radical in *content*, community-based theater is more consistently radical in, and focused on, *process*” (p. 100, *emphasis added*). The force and power of this work inheres in creating reciprocity among artists and community members, linking the personal with the political, and instigating specific, local actions. Working with untrained participants meant that community-based theater relied heavily on workshops for developing and rehearsing performances. Workshop techniques, such as those developed by Augusto Boal, facilitated this process. Boal (1979/1985), whose work draws and builds on Brechtian principles, outlined several techniques to assist community members in creating “theater [as] a rehearsal for revolution” (p. 122). Whereas Brecht advocated a critically active spectator, Boal asserted that spectators must learn to become “spect-actors” and, as such, to actively participate in the unfolding drama on stage. In so doing, spect-actors train themselves for real action in the world (p. 122).

Participants did learn to become active participants on stage and in the world. They benefited from the performance in definable and material ways. Challenges surrounding the need to balance aesthetic concerns with the sharing of experience, the splintering effects of identity-based dialogues, and the need to connect local action to larger contexts precipitated a shift from community-based performance to theater and civic dialogue (Cohen-Cruz, 2001, p. 104). Theater and civic dialogue is focused on realigning and reconnecting the politics surrounding gender, race, class, and sexuality (among other identities and positions) in a way that does not obfuscate or collapse differences but instead puts these identities and positions in conflict and conversation with one another around an issue of civic importance (Dolan, 2001a, p. 90). The goal of civic dialogue performance is to “engage the public more fully with contemporary issues” (p. 106). As such, civic dialogue returns to the broad social, cultural, and political contexts and issues “reminiscent of 1960s theater, but from multiple perspectives” (p. 106). Civic dialogue performance is inspired and informed by an impetus to involve audiences in the wake of actual events to create critical engagement (hooks, 1995, p. 214).

Whereas the techniques of both Brecht and Boal formed the cornerstone for much theater practice in movement- and community-based theater, civic dialogue theater embraces a fluid and opportunistic approach to performative paradigms and styles (hooks, 1995, p. 219). Civic dialogue performance also takes advantage of the multiple sites available for engagement—live theater and street performance, television and the Internet, dance parties and spectacles (Orenstein, 2001, pp. 149–150). These performances must, as Orenstein (2001) asserted, “appeal to a broad audience by offering frameworks for protest that leave room for individual creativity and by eschewing overly restrictive or exclusive ideologies” (p. 151).

What lessons does this history offer for autoethnography? First, it provides another context for the turn to performance, performative writing, and personal performance narratives in interpretive, qualitative, critical, and narrative

inquiry. Second, this history traces the movement between and among art and politics, individual and community, representation and participation. In the shifts toward reflexivity, inclusion, personal stories, local actions, multiple perspectives, and civic dialogue, social protest theater demonstrates how paradigms and techniques can be used in the service of making art matter and generating action in the world. Social protest theater's history also speaks to how the stories we tell can and do reflect back on, become entangled in, and critique this current historical moment and its discontents (Denzin, 1997, p. 200).

Journalist . . . Artist

When I got a little older, my Saturday night stays with my grandparents in the company of Lawrence Welk were extended to weeklong visits over summer vacation. I would visit them at their lake house, with its screened porch, sloping lawn, and dense stand of trees. Inside the house, there was a guest bedroom with a white iron twin bed, just for me. There was my grandmother's electric organ, with its waltz, foxtrot, and bossa nova accompaniment. There were shelves of books and stacks of board games—Monopoly, Scrabble, and Parcheesi. There were all of these things to keep my hands and mind busy, and after 20 minutes or so I would whine that there was absolutely nothing to do.

I would start wondering how much longer it would be until my parents came to pick me up.

I would sprawl on the couch and sulk.

I would wander into the kitchen and watch my grandmother peeling potatoes. I would watch her so intently that she would turn around and ask, "What's the matter?"

"I'm *bored*."

"Do you want to read?"

"No."

"Want to go outside and play?"

"Nope."

"Want Grandpa to play Scrabble with you?"

"No."

"Well then, dear, what do you want to do?"

And I would stare back at her, expressionless, until she would shrug and return to the potatoes.

We enacted this scene nearly every day during my visits. And then one day, my grandmother turned to me and said, "Why don't you write something?"

"What?" I had not heard that one before.

"Why don't you pretend you're a reporter and you're going to write a story for the evening edition of the paper?"

"But I don't know how to be a reporter."

"I'll show you."

And with that, my grandmother set off to look for my reporter's costume. She gave me a small pad and pencil. She gave me an old hat of my grandfather's. She wrote "Press" on a slip of paper and stuck it in the band. Then she said, "Why don't you interview Grandpa for your story?"

At least I think that is what she said. I was already looking for my grandfather.

He was sitting at the dining room table, staring at his typewriter. His hands were clasped behind his head. He was reading the newly typed sheet in front of him, silently mouthing the words. He looked up from his work and said, "Well, who is this?"

"I'm a reporter and I'm here to interview you for the evening edition!"

"Sure. Pull up a chair. Care for a drink?"

"Can't. I'm on the job."

"Very well, then. What can I do for you?"

I asked my grandfather how old he was, how much he weighed, and how tall he was.

I asked about his favorite color, record, and book. I asked him why he loved Grandma and whether he wished he could live forever. I asked him why he sat at his typewriter all afternoon and into the darkness, typing. He said that he was writing stories.

"Stories about what?"

"Stories about what I see when I close my eyes and listen very, very carefully."

"Listen to what?"

"To the radio. To the mourning doves. To you playing the organ. To the beating of my own heart."

He smiled and asked me whether I had any other questions. I said, "No, that does it." He went back to staring at the page and reading his words to himself. And then he put his fingers on the keys and began typing.

I stayed there, very still in my chair and wrote down the things I noticed about my grandfather as he worked—the way his glasses glinted when the light hit them, the way his right hand would raise up from the keys and push the return key and land back on the keys in one fluid motion, the way he smiled at being watched and documented.

I worked on my story for several days. When I was done, my grandmother pasted it onto a large sheet of construction paper. Both of my grandparents said that they liked my story very much.

The story I wrote at my grandparents' house that summer did not come out of nowhere. I intended to write it. I donned the costume of a reporter and played the role as I remembered it—watching carefully, asking questions, and writing things down. I do not recall how the story went, but I do know that it was about my grandfather's performance as an artist—as a writer. It was my attempt to document music, movement, and the beating of his heart. And although I did not know it then, this story was my attempt to write a text that enacted the very art it sought to inscribe.

On Location

The "documentary idea" in solo performance, as Kalb (2001) put it, is to give an audience the impression of having been there "*on location*" (p. 20, emphasis added). For Kalb, the actual fact of being there is not as important as the rhetorical power of solo performance to generate "powerful topical narratives that are not easily dismissed or second-guessed, and for performance circumstances" in which Brecht's epic theater²⁷ "becomes a living concept again because the reality of the performer-researcher has been made an active part of the art" (p. 16). Documentary solo performance subscribes to an inherent duplicity—of fact and fiction, imagination and realism, objectivity and partisanship—that "recognizes the audience's sophistication regarding stories" (p. 22). It is this duplicity, along with a performer's ability to bridge and exploit the possibilities inherent in the move between documentary realism and fictionalization, that makes a performance compelling.

Anna Deavere Smith's performances *Fires in the Mirror* (regarding the 1991 riots in Crown Heights, Brooklyn, New York, following the death of a black boy struck by a rabbi's motorcade and the retaliatory stabbing of a Jewish student) and *Twilight Los Angeles* (regarding the 1992 riots in Los Angeles following the acquittal of the police officers accused of beating Rodney King) offer striking examples of the duplicity of solo documentary performance.²⁸ Smith constructed these performances by interviewing people directly and indirectly involved in the events and delivered, "verbatim, their words and the essence of their physical beings in characterizations which fall somewhere between caricature, Brechtian epic gestures, and mimicry" (Reinelt, 1996, p. 609). Reinelt (1996) characterized Smith's performance technique as "a bridge that makes the unlikely seem connected. She ghosts her portraits with her own persona, signifying sympathy, fairness, and also her own subject position" (p. 615). Reinelt argued²⁹ that, in filtering the voices of (many) others through her own voice and oscillating between identification and difference,

Smith needs to have it both ways. . . . She needs to be identified as both journalist and artist. In a sense, Smith dares to speak (for others) . . . not because she is objective, fair-minded, and even-handed, but because she demonstrates the process of bridging difference, seeking information and understanding, and finessing questions of identity. Since the audience is positioned in the direct address sequences to "be" Smith, they are positioned to experience the activity of bridging, working with difference. This effect is the most radical element of Smith's work—it engages the spectator in radical political activity to the extent that the spectator grapples with this epistemological process. (p. 615)

Smith's work enacts this bridging in the performance of personal stories. Rather than use these stories as a mirror for a subject's or an audience's unexamined experience, Smith's solo performances "turn the mirror into a political tool" (Kalb, 2001, p. 23; see also Dolan, 2001a, p. 89; Kondo, 2000). Smith noted, "My project is about . . . the gap between . . . the performer and the other

and . . . the gap between the performer and the text" (quoted in Capo and Langellier, 1994, p. 68). By remaining critically present in her portrayal of others and their stories, Smith brings the performative to her performance. She eschews politically disengaged, reductive, and static *representation(s)* of events and participants in favor of work that *presents*—creates—a "generative engagement between performer and audience" in the negotiation among stories, selves, texts, and contexts (Salverson, 2001, p. 123). She moves through *mimesis* to *poiesis* and *kinesis*.

What happens when performers present their own stories? Solo performers often offer their personal stories as testimony about "real" events. Audiences witness such testimony and, as such, become implicated in the encounters. As Hughes and Román (1998) noted,

When we attend a solo piece it's knowing that there is a good chance the performer is also the writer and the stories we will hear "really happened." There is some level of safety that disappears for the audience; we can't hide behind "it's only art." (p. 4; see also Miller, 1995)

Personal narrative performances deny any easy distinction between "art" and "life." Such performances retain their performative, political power in and through the ways in which they foreground the constitutive and shifting nature of giving testimony and witnessing. Rather than present experience as authentic (true) and untouchable (immune to critical commentary), solo performers create intimate provocations in which they testify and audiences bear witness to their stories (Gray & Sinding, 2002).

Robbie McCauley is a performer who writes, directs, and performs personal narrative, making explicit the social conditions in which her stories are situated (Whyte, 1993, p. 282). In telling personal narratives, McCauley "intends that her onlookers . . . in witnessing the experiences she invokes in her performances, will begin to understand their own implication in the situations that she presents" (p. 282). In her work *Sally's Rape: The Whole Story*, McCauley explores how her own

story is shaped by the stories of others, including her "great-great-grandmother Sally, a slave on the Monticello estate of Thomas Jefferson" (p. 280).³⁰ The work includes a scene in which McCauley stands naked on an auction block. Her white partner Jeannie Hutchins³¹ instructs the audience to create the scene of a slave market by chanting "Bid 'em in, bid 'em in." McCauley performs a monologue in which the voice of Sally and her own voice are intertwined as her body is examined and violated. Whyte (1993) described her experience of this scene:

For the onlooker there is an awe-ful fascination in this representation of the slave auction, this scene of victimage. The pleasure of looking at the naked body of the black woman is . . . made guilty by the awareness of being inescapably positioned as a potential buyer in the slave market. . . . Similarly, whether or not you join the chanting you are trapped by the sympathetic magic of sound which reanimates the past, and no matter how much you tell yourself you had nothing to do with this scene, you are made vicariously complicit in the auction system that McCauley's staging represents. (p. 278)

McCauley's work illustrates the ways in which giving testimony and witnessing can and must be situated in larger contexts and shared histories. Her performances ask audiences and performers to come together differently and deeply "without collapsing either the 'I' or the 'other' into a totalizing 'we'" (Salverson, 2001, p. 120). McCauley taps into the vulnerability required to tell personal stories to move audiences past simple, essentialist identification and toward a generative engagement with their differences. She noted, "When you engage your vulnerability around . . . issues that are both political and personal, then you can have something powerful happen between people" (quoted in Becker, 2000, p. 530).

Where does bridging the political and personal in solo performance move (and leave) performers and audiences? Hughes and Román (1998) wrote,

"The personal is political" remain[s] a vital challenge for solo performers. . . . Consequently, few

performance artists—no matter how skilled or funny—intend to simply entertain; they mean to provoke, to raise questions, to implicate their audiences. (pp. 8–9)

Thus, the idea of being *on location* as a solo performer means using personal stories to create “calculated disturbances” in social, cultural, and political networks of power (Lane, 2002, p. 61). Writer, performer, and director Tim Miller commented on the exacting nature of these disturbances: “The whole reason for being an artist in this particular realm (performance) . . . is to respond quickly, effectively, and surgically to what you want to do” (quoted in Burnham, 1998, p. 35).

Miller’s solo performances focus on gay rights and identities as these issues are reflected in/through the critical lens of his personal experience. His recent work *Glory Box* protests the failure of immigration laws to recognize gay and lesbian relationships, using the experience of his own relationship with his Australian Scottish partner. Writing about his experience traveling in the United States and performing *Glory Box*, Miller (2002) noted,

I am trying to make my case to the communities I engage that this violence and injustice against lesbian and gay couples must stop. . . . I think theater is primarily a site for liberation stories and a sweaty laboratory to model possible strategies for empowerment. (para. 4)

For Miller, these strategies include explicit calls to action both within and outside of the performance. In each community in which he performs, Miller joins forces with national and local organizations invested in an issue, encourages community members to lobby their congressional representatives, asks audience members to sign petitions that support changes in legislation, and uses the performance as a catalyst for media coverage that will raise awareness about the issue (para. 7–11).

In addition to this “nuts-and-bolts activism,” Miller asks his audience to engage in the more individual work of consciousness raising, which he terms “emotional and psychic . . . adjustments.”

For example, Miller’s performance asks straight audience members to acknowledge their heterosexual privilege and asks gay and lesbian audience members to recognize the institutional and symbolic degradation of their lives (para. 12). In both its activist and consciousness-raising impulses, Miller’s work “retains a personal and political investment that blurs the borders between public and private” (Dolan, 2001a, p. 114).

By taking their stories on location and using the duplicity of artistry and journalism, expert testimony and witnessing, solo performers teach us how to create, enact, and incite performances full of possibilities.

Torch Stories

In my dream, I see my grandfather on my university campus. I am walking to the library when I see him. He is reading a newspaper in the coffee shop. I call to him, and he looks up from the pages. He stands and waves, and when I reach him we embrace. He buys me a cup of coffee, and we settle in for a long talk.

He says, “What are you writing about?”

“I’m writing about how we are called to participate in music, in texts. I’m writing about torch singing as a sounding of personal and political desire.”

He raises his eyebrows. “Really?”

“I guess what I’m really doing is writing a series of stories about torch singing.”

He nods. “That sounds like fun.”

“It is.”

We turn our attention to our coffee and other topics, although I keep the conversation about writing torch stories going in my head. They are stories about what happens in between binaries, stories about what occurs between participation and provocation, emotion and politics, subject and object, body and voice, intended meaning and literal meaning, form and function, monologue and dialogue, connection and distance, conclusions and possibilities. They are stories that begin with the idea that performance, because it is imbricated in a culture and vast spiral of relationships, is necessarily and thoroughly *political* (Colleran &

Spencer, 1998, p. 1). They are stories that look into the gaps and contradictions between a modernist/realist perspective on performance that imagines that "stable meanings can . . . be 'shared' between author and reader, actor and audience, stage and auditorium" and a postmodern/anti-realist approach that deconstructs the "process of meaning-making itself" (Kershaw, 1999, p. 12).

Because of this, torch stories are stories that ask what happens when I try to understand performance by straddling the fence—with one foot planted in the realm of uncovering and celebrating difference, multiple subject positions, and ideological and political pluralism and with the other foot firmly placed inside the possibility of a community experience, a shared sense of agency, and concerted action directed at social change. They are, just as important, stories that ask what happens when audiences engage with texts that are overtly resistant not in form or content but rather in their activity as a subtle and indirect voicing (Holderness, 1992, p. 10). They are stories that want to have it both ways, to say that it depends.

In the gaps and fissures of cultural production and politics, these stories create, to use theater scholar Kershaw's (1999) term, a source of *freedom*. This freedom is doubled—"not just freedom from: oppression, repression, [and] exploitation . . . but also freedom *to reach beyond* existing systems of formalized power, freedom to create currently unimaginable forms of association and action" (p. 18). The freedom found in performance—found in telling stories—creates a resistive and transgressive radicalism.

Kershaw (1999) preferred "radical" to "political" because "radical has no necessary ideological tendency. . . . It gestures . . . towards kinds of freedom that currently cannot be envisaged" (p. 18). These stories also "invite an ideological investment that it cannot itself determine"; they are a "performative process in need of direction" (p. 20). One direction that readers and audience members might take is to actively engage what Brecht (1957/1998) termed a "complex seeing" and hearing that allows for multiple perspectives within the tangle of identifications and difference

without forgetting the need to expose systems of oppression or the desire to find new ways of being in the world (p. 44). Even so, the source and object of these desires vary; they depend on readers' and audience members' perspectives and ideological investments. These stories promise a performative field of dreams—if you want to hear a critique, it will come.

Because these stories create an open and indeterminate space for interpretation and action, tracing their political efficacy is something like tracking the movement of an unspoken idea. The accounts, ideas, and explanations that these stories contain are points of contact, although they do not connect in a direct route or on a logical course. They are spaces of hope—*destinations* that can be arrived at from any number of locations.

"About these stories you're writing," my grandfather says, pulling me back into the conversation. "Does anything radical happen in them?"³²

"Well, I think so. Yes."

"Tell me."

■ PERFORMATIVE PRAXIS: AUTOETHNOGRAPHY AS A POLITICS (FULL) OF POSSIBILITY

I began this chapter asking you to consider how our autoethnographic texts do not stand, speak, or act alone; are not texts alone; and do not want to be left alone. I wanted to create a noisy and fractious dialogue on and about personal stories, performance, and social change. I wanted to stage this dialogue in and through the flesh and breath of my own experience. I wanted to create a text that shows—performs—a writing practice that tries to respond to the crisis of praxis. I wanted to engage you in a conversation that says and does something about autoethnography. I wanted to suggest how we make our personal accounts count.

I want to close by asking you to keep this conversation going in your own texts, contexts, and praxes. I want you to take this conversation into the next turn, crisis, and moment in autoethnography and to move your work, "without hesitation or encumbrance from the personal to the political"

(Denzin, 2000, p. 261). Drawing on the lessons that the turn toward personal narrative and performance has taught us, write your stories as they are constructed in and through the stories of others. Look at the intersections in the work of personal storytellers, performance ethnographers, and social protest performers described in this chapter and elsewhere as examples of how you might radically contextualize your texts and your subjectivity; embody personal and community accountability; attend to connection without collapsing or foreclosing debate, dialogue, and difference; move people to understand their world and its oppressions in new ways; and create the possibility of resistance, hope, and—yes—freedom (Denzin, 2003, pp. 33, 268). Ask how your texts can create and constitute social action—how your words can make a *difference* in and outside of individual processes of knowing and coming to know—and then *write* them and *share* them (B. Alexander, personal communication, August 2003). This, I believe, is the future of autoethnography. It is the challenge of telling and showing, to borrow from Ellis (2000), stories that are not only necessary but also full of possibilities (p. 275). In the spirit of moving into this future, I want to challenge you to do the following:

- *Recognize the power of the in-between.* Recognize the power of having it “both ways,” of insisting on the interaction of message and aesthetics, process and product, the individual and the social. Recall how the crises, turns, and movements in and toward narrative, performance, and social protest theater are generated in the radical possibilities that exist in these in-betweens. Make work that “struggles to open the space between analysis and action, and to pull the pin on the binary opposition between theory and practice” (Conquergood, 2002, p. 145).

- *Stage impossible encounters.* Create texts that stage what Cohen-Cruz (2001) termed “impossible encounters” in their “capacity to bring people in contact with ideas, situations, or others that appear to be totally different” (p. 105). Use these encounters as occasions to negotiate a debate and dialogue

about issues of importance to you and the world. Remember that, as McCauley stated, “Dialogue is an act. . . . It is not before or after the act. Saying the words, allowing the dialogue, making dialogue happen is an act, a useful act in the moment” (quoted in Mahone, 1994, p. 213).

- *Contextualize giving testimony and witnessing.* Perform the testimony and witnessing of personal stories in, through, and with larger social contexts. Consider that when we bring our texts to contexts, we can make work that constitutes a first step toward social change. Strive to make work that “might act as a doorway, an instrument of encounter, a place of public and private negotiations” (Salverson, 2001, p. 125) where the goal is to witness “within the context of the meeting with the person who testifies” (p. 121).

- *Create disturbances.* Value texts that “mean to provoke, to raise questions, [and] to implicate” authors and audiences, texts that create disturbances (Hughes & Román, 1998, p. 9). Capitalize on the complicity wrought in writing and reading autoethnographic texts—in how, when we place our lives and bodies in the texts that we create, engage, and perform, they are “no longer just our own; for better or worse they have become part of a community experience” (Nudd, Schriver, & Galloway, 2001, p. 113). Write texts that insist that to be there—on location—“is to be implicated” (p. 115).

- *Make texts of an explicit nature.* Respond to the need to be explicit in moving your readers and audiences intellectually, emotionally, and toward concerted social, cultural, and political action. Use your texts to “stage arguments, to embody knowledge and politics, to open a community to itself and the world in ways that are dangerous, visceral, compelling, and moving” (Dolan, 2001a, p. 62). Ask not only whether your texts are moving but also *how* they create movement and toward what *ends*? (Salverson, 2001, p. 122, emphasis added).

These are your challenges, and they are my own. In a handbook chapter that wants to move

theory and method to action, it is the charge to make the personal political in your work and in my own. Will the chapter on autoethnography in the next edition of this handbook ask whether there is a place for autoethnography in our conversations about a radical democratic politics, a poetics of change, or a performance of possibilities? Will this chapter end with this query, or will it constitute a beginning, an opening into a conversation about where we have been and how far we have come—in being willing and able to say that we are in a moment when the point of creating autoethnographic texts is to change the world?

■ EPILOGUE: THERE ARE LIVING FORCES IN POETRY

You deal in dangerous and intimate provocations.

Yelling "Change!" in crowded theaters, committing efficacy to writing believing that there are living forces in . . . poetry.³¹

You take your politics personally and make the personal political. You stake your life story on re-presenting, not imitating; bringing movement, not mirrors, to reality.

You understand how theater, art, text, experience is what we make of it and we are made by that making.³²

You play the imaginary line between artist and activist. You give flesh and breath to the theory that there are countless ways of making do . . . and getting through.³³

Is there a place for autoethnography in this poem?
You tell me.

■ NOTES

1. Titled "Communication Studies 298: Colloquium in Communication," this special topics course was designed and taught by my mentor, Nick Trujillo, as a team ethnography course that focuses on studies of organizational culture. Trujillo (2003) discussed this course and others in his essay, "Reflections on a Career in Academia." See also my essay, "What We Save: A Bricolage On/About Team Ethnography" (Holman Jones, 2003).

2. This text was published as "Fragments of Self at the Postmodern Bar" by *Communication Studies* 298 (1997).

3. This section has an obvious debt, and owes a sincere thanks, to Pelias's (1999) "Performance Is" (pp. 109–111).

4. For a discussion of how these questions anticipate the crises of representation, legitimation, and praxis, see Denzin (1997, pp. 3–14) and Lather (1993, pp. 673–674).

5. For a summary of these responses, see Denzin (1997, pp. 16–21).

6. The interest in personal narratives as auto/ethnographic texts owes a clear debt to the long-standing practice of telling personal stories among women anthropologists and the traditions and conventions of feminist ethnography. See, for example, Abu-Lughod (1990), Gordon (1988), Tedlock (2000), and Visweswaran (1997).

7. Paul Gray was the director of graduate studies and professor of performance studies at the University of Texas, Austin when I began my Ph.D. studies there in 1996. Reading and Performing was the first of several courses I took with him. Gray was the first (but certainly not the only) faculty member to encourage my interest in both performance and performing. He is an astute critic, powerful intellect, and enthusiastic mentor, and he is a teacher to whom I am happily indebted.

8. Ethnography is both a method for studying performance (projects that focus on the performance practices of particular individuals and cultures [Conquergood, 1992; Jackson, 1993; Jones, 2002; Madison, 1998a]) and a performance practice in its own right (a means of sharing the results of fieldwork [Gray, 2003; Mieniczakowski & Morgan, 1993; Paget 1995; Welker & Goedall, 1997]).

9. In Conquergood's (1991) essay, he explored four themes generated in and through the "deep epistemological, methodological, and ethical

self-questioning" of the crisis of representation and an increased emphasis on critical approaches and theory.

10. Conquergood and Turner are not alone here. Clifford Geertz, Dell Hymes, Erving Goffman, Richard Bauman, Kenneth Burke, and other anthropologists, sociologists, folklorists, and linguists all are interested and involved in the performative turn (Stucky & Wimmer, 2002, pp. 12–13; see also Denzin, 1997, pp. 102–104).

11. This is adapted from Conquergood (1991), who wrote, "I want to think about performance as a complement, alternative, supplement, and critique of inscribed texts" (p. 191).

12. Carpenter (1993, p. 125).

13. I am drawing on Conquergood's (1992) description of the "varying meanings of the key word 'performance' as it has emerged with increasing prominence in cultural studies. This critical genealogy can be traced from performance as mimesis to poesis to kinesis, performance as imitation, construction, dynamism" (pp. 83–84).

14. Joni Jones taught Performance Ethnography. Her work on performance and identity in the academy and her fieldwork with the Yoruba in Nigeria are central to the discussion and practice of performance ethnography and are an inspiration for my own work. Jones directed my dissertation, an ethnographic and performative study of lorch singing. This work bears the mark and trace of her thoughtful, sincere, and challenging guidance.

15. This performance was my response to the assignment designed by Joni Jones. This assignment asked us to create what Pineau (2002) described as the use of performance as methodology (p. 50). She wrote, "Performance methodology means learning by doing and might include any experiential approach that asks students to struggle bodily with course content" (p. 50; see also Alexander, 1999).

16. I am referencing Langellier's (1999) essay in which she wrote, "When personal narrative performance materializes performativity—when a narrator embodies identity and experience—there is always danger and risk" (p. 129).

17. I have found touchstones in Conquergood (1985, 1991, 2002), Denzin (1997), Lather (1993, 2001), Lincoln (1999), Pollock (1998), Richardson (2000), and Stewart (1996); see also Bochner (2000), Clough (2000), and Ellis (2000).

18. The conference was titled the Giant City Conference on Performative Writing and took place in April 2001 at Giant City Park in Makanda, Illinois. Each

writer presented his or her work "under a small window that opened to the green woods" (Miller & Peltas, 2001, p. v). In this passage, I make reference to the "green window" (as the conference proceedings came to be titled) and to the piece shared by Gingrich-Philbrook (2001) that began this work.

19. I had the pleasure of taking courses titled *Performing Autobiography and Writing and Performance Art* with Lynn Miller while I attended the University of Texas as well as of having her help on my dissertation committee. Miller's passion for and knowledge about autobiographical performance has influenced my work and informed my understanding of how and why personal narrative performance matters in autoethnography.

20. Scott (1996, p. xii).

21. Gordon (1997, p. 107).

22. Gordon (1997, p. 22).

23. Barthes (1977/1978).

24. Carver (2001) wrote, "It's possible, in a poem or short story, to write about commonplace things and objects using commonplace but precise language, and to endow those things—a chair, a window curtain, a fork, a stone, a woman's earring—with immense, even startling power" (p. 89).

25. Gordon (1997, p. 22).

26. The skills in form and process discussed here do not correspond neatly or entirely to chronological or sequential logic. The social protest theater strategies I describe (following Jan Cohen-Cruz) are not mutually exclusive, and all of these techniques are used in contemporary performance.

27. Kalb (2001) focused specifically on Brecht's notion of *Verfremdung* (alienation) in which audiences are encouraged to move beyond simple identification (empathy) with characters to a critical orientation in which actors are separate from characters and context is clearly connected to the text being presented.

28. See also Kalb's (2001) discussion of Marc Wolf, Danny Hoch, and Sarah Jones.

29. Reinelt (1996) was commenting on both the stage performance and video of *Fires in the Mirror*, produced for American Playhouse.

30. Whyte (1993) noted that McCauley's great-great-grandmother was not Sally Hemings, although Whyte pointed out that McCauley's performance "plays on the similarities between the lives of these two Sallies and those of other women slaves" (p. 292).

31. Portions of *Sally's Rape* were based on conversations with Hutchins about race, class, gender, history, and contexts. See Becker (2000, p. 520).

32. This is drawn from Kershaw (1999), who asserted that the questions we should ask about performance—and I would include stories—are “Has anything radical happened?” and “How was it done?” (p. 218).

33. Artaud (1958, p. 85).

34. Nudd, Schriver, and Galloway (2001, p. 15).

35. DeCerteau (1984, p. 29).

THE METHODS, POLITICS, AND ETHICS OF REPRESENTATION IN ONLINE ETHNOGRAPHY

Annette N. Markham

*in cyberspace, one dwells in language. and through language.
i exist as myself in language online . . . it feels more like being me than i sometimes
feel offline
. . . i think myself in language is more communicative of who i am.
and because i'm a good writer, eloquence makes me beautiful . . .*

—Sherie, online interview participant

*Here, I can edit what I think before I say it. This makes communication easier
between my friends and I. There are fewer errors in meaning when our thoughts
have been written clearly.*

—Robin, online interview participant

*My ambiguity makes you nervous. I can be many things at once here. Are they all
'me'? Who am I? 'He' . . . 'Her' . . . 'Per' . . . 'It' . . . 'We' . . . ? Can't you tell? Why
do you want to know???*

—DominOH!, online interview participant

Whether one studies the Internet as a social structure or utilizes Internet-based technologies as tools for research, Internet-based technologies change the research scenario. Computer mediation has a

significant influence on many aspects of communication practice and theory. The internet has similarities to many earlier media for communication, such as letter writing, telephone, telegraph, Post-It Notes, and so forth. At the same

time, the capacities and uses of Internet communication are unique in configuration and shape a user's (and thus the researcher's) perceptions and interactions. These influences extend beyond the interpersonal; outcomes of these communication processes have the potential to shift sensemaking practices at the cultural level. We are, as Gergen (1991) notes, saturated in technologies. The Internet and associated communication media permeate and alter interactions and the possible outcomes of these interactions at the dyadic, group, and cultural level.¹ Equally, Internet technologies have the potential to shift the ways in which qualitative researchers collect, make sense of, and represent data.

In technologically mediated environments, self, other, and social structures are constituted through interaction, negotiated in concert with others. The extent to which information and communication technology (ICT) can mediate one's identity and social relations should call us to epistemological attention. Whether or not we do research of physical or online cultures, new communication technologies highlight the dialogic features of social reality, compelling scholars to reexamine traditional assumptions and previously taken-for-granted rubrics of social research.

In the early 1990s, as the capacities of the Internet became more publicly known and accessed, the use of the Internet for the development of personal relationships and social structures grew, as did the study of computer-mediated subjectivity and community. Through a phone line, access to the Internet, and specialized software, people could meet and develop relationships with others from the privacy of their homes. People could do this anonymously if they chose, creating personae that were similar to or highly distinctive from what they perceived their physical personae to be. They could create or join communities based on like-mindedness rather than physical proximity.

During these early years when Internet and virtual reality technologies caught public and scholarly interest, the study of computer-mediated communication (CMC) worked from theoretical extremes: On the one hand, computer-mediated

communication was lauded as a means of transcending the limits associated with human embodiment. By erasing sociocultural markers such as race and gender or escaping the body altogether, virtual communication would lead to a utopian society whereby democratic participation in public discourse was unhindered by physicality and corresponding stereotypes. At the other extreme, skeptics critiqued CMC because it removed essential socioemotional or nonverbal cues and would result in impoverished, low-trust relationships at best and social withdrawal, at worst. Citizens would resemble hackers: pale, reclusive, and prone to eating pizza and Chinese take-out. As time passed, use grew, novelty diminished, and more measured accounts emerged based less on theoretical speculation and more on study of actual contexts.² It became clear that meaningful and significant relationships and social structures could thrive in text-only online environments. This capacity is now taken for granted. The past decade of communication has included forms new to many of us: email, mailing lists, Multi User Dimensions (MUDs or MOOs), real time chat-rooms, instant messaging, websites, blogs, and so forth. We are now familiar with the concepts of cybersex, online marriages, Friendster, and other creative uses of technology to enact identity and relationships through computer-mediation. Many of us can probably name close colleagues and friends whom we would not recognize in person.

The computer-mediated construction of self, other, and social structure constitutes a unique phenomenon for study. In online environments, the construction of identity is a process that must be initiated more deliberately or consciously. Offline, the body can simply walk around and be responded to by others, providing the looking glass with which one comes to know the self. Online, the first step toward existence is the production of discourse, whether in the form of words, graphic images, or sounds. But as many scholars have taught us (e.g., Buber, 1958; Bakhtin, 1981; Blumer, 1969; Laing, 1969), we understand our Self only in concert with Other, a continual dialogic process of negotiation and a great deal of faith in shared meaning (Rommetspelt, 1980).

In most computer-mediated environments, this process requires a more deliberate exchange of information because people are not co-present in the same physical space and the nonverbal aspects of the process are, for the most part, missing. The process is obfuscated because a person typically takes knowledge of self for granted with little reflection on the social, interactive process by which the self is negotiated with others in context. Mostly overlooked by users, the production of the message is only the first part of the process: Whether by receiving a reply message or by tracking a virtual footprint of a visitor to one's website, one can only know if one has been acknowledged through some sort of response. MacKinnon's insights in this matter (1995) warrant repeating here. He notes that the common phrase "I think, therefore I am" is woefully inadequate in cyberspace. Even "I speak, therefore I am" is not enough. In cyberspace, the more appropriate phrase is "I am perceived, therefore I am." (p. 119). Implied in this last phrase is the fact that online, perception of another's attention is only known by overt response. So we can usefully note this by adding the phrase "I am responded to, therefore I am." (Markham, 2003a).

The participant statements (from my previous research of Internet users) at the beginning of this chapter represent well the importance of text to a person's construction and negotiation of identity in online text-based environments. Sherie expresses a desire to be known solely as text (not through, but *as* text). For Sherie, computer-mediated communication is a way of being. Robin always uses correct punctuation and strives to make the meaning as clear as possible. Text is perceived as a powerful means of controlling, through editing and backspacing, the way the self is presented to others. DominOH!, unlike the other two, does not pay much attention to the textual, linguistic aspects of the medium. Rather, DominOH! uses the technology as an interaction space which protects anonymity and allows the social self to be less firmly attached to the body. Yet the text is vital to the researcher's understanding of DominOH!'s persona online.

For all three personae interviewed, text remains the means through which each performs and negotiates the self. None of these textual entities exists in isolation. Their existence is made possible by direct or perceived interaction with others. They are communicative through and through; their social being is initiated through a process of creating and sending a message and negotiated through a process of interaction.

Although we recognize that reality is socially negotiated through discursive practice, the dialogic nature of identity and culture is thrown into high relief in computer-mediated environments. This gives rise to many possibilities and paradoxes in social research. For any researcher studying life online, the traditional challenge of understanding other-in-context is complicated by the blatant interference of the researcher into the frame of the field and by the power of the researcher in representing the culture. Researchers have always interfered with the context in some way while conducting research. In the past three or more decades, scholars have problematized this feature of research, as well as highlighted the blurring of boundaries between researcher and researched. Still, these issues become startlingly apparent—and challenging—in the context of CMC environments.

These issues call not only for adjustment of traditional methods to online environments or the creation of new methods, but also for across-the-board reassessment and interrogation of the premises of qualitative inquiry in general. Interestingly, the specific logistic and analytic problems associated with the interpretive study of computer-mediated personae reveal many weaknesses in qualitative methods and epistemologies, generally. In the years I have spent trying to figure out how to make sense of participants whose gender, name, body type, age, ethnicity, class, and location remain inexplicable, I have been compelled to seriously examine certain practices of Othering which, despite efforts to be reflexive, hide in everyday, embodied ways of knowing. Put more positively, studying computer-mediated interactions allows and encourages exploration of what is happening in "the hyphen that both separates and

merges personal identities with our inventions of Others" (Fine, 1994, p. 70).

New communication technologies privilege and highlight certain features of interaction while obscuring others, confounding traditional methods of capturing and examining the formative elements of relationships, organizations, communities and cultures. Additionally, a person's conceptual framework of any new communication technology will predetermine, to a certain extent, that person's understanding of, response to, and interaction with the technology. This complicates the researcher's ability to assume commonalities among participants' communicative practices via CMC, or to presume that participants understand and use the technology in the same way the researcher does. The challenge for the qualitative researcher in the computer-mediated environment is to attend to the details of how one is going about the process of getting to know something about the context and the persons being studied.

At the same time, examining one's own influence in the shape of the outcome is a vital practice. Grappling with both the practical and the epistemological implications of this influence can help researchers make more socially responsible decisions. In a very real sense, every method decision is an ethics decision, in that these decisions have consequences for not just research design but also the identity of the participants, the outcomes of our studies, and the character of knowledge which inevitably grows from our work in the field.

In this chapter, I describe some of the tensions and complications that can arise in the qualitative study of Internet-mediated contexts when decisions must be made about (a) defining the boundaries of the field, (b) determining what constitutes data, (c) interpreting the other as text, (d) using embodied sensibilities to interpret textuality, and (e) representing the other ethically in research reports. My overall object in this discussion is to illustrate some of the challenges of doing research in computer-mediated environments and to display the significance of the researcher's choices on the field's structure, on the other's embodied or reported Being, and ultimately, on the social

knowledge derived from the research project. The discussion is intended to help researchers generate questions which can be used to interrogate their own epistemological and axiological assumptions throughout the design and enactment of the inquiry. In addition to this primary train of thought, I talk briefly about how the Internet is conceptualized, review some of the main shifts in thinking about qualitative Internet research, and discuss some of the major ethical considerations which are entwined with this type of inquiry.

To clarify what this chapter does and does not do: First, this chapter focuses on textuality. The examples throughout this chapter draw primarily on text-based computer-mediated discourse and interactions among participants or between participant and researcher. Although technologies facilitate visual and audio simulations and representations and the capacities of the traditional PC are moving to mobile or convenience devices, text remains a primary unit of analysis for the qualitative researcher. Put differently, the issues raised here apply equally to multi-media and mobile aspects of CMC because these are, for the most part, analyzed as texts, broadly speaking.

Second, even though this chapter focuses on computer-mediated contexts, the spirit of these arguments applies to other forms of interaction, both online and offline. The intriguing thing about CMC is that it calls attention to the ways we literally see and make sense of the world and points out many of the biases inherent in our traditional ways of seeing and knowing. Therefore, one should not dismiss the challenges discussed herein even if doing radically different types of qualitative research.

Third, this chapter does not seek to provide an overview of how qualitative research is conducted on or via the Internet, but rather, addresses key epistemological and methodological questions facing ethnographers researching in social spaces constituted in part or wholly through new communication technologies. Many sources exist to aid the researcher with specific procedures and methods for qualitative studies (this volume) and qualitative Internet studies (e.g., Johns, Chen, & Hall, 2003; Mann & Stewart, 2000).

Finally, this chapter focuses more on problems and challenges than opportunities and potential of CMC-related research environments. This imbalance is not indicative of my own or a general attitude toward qualitative Internet research. Here, however, I want to build a case for cautious, reflexive, and prepared research which, while celebrating those aspects of new communication technologies that make them well suited for qualitative inquiry, remains attentive to the consequences of one's research choices.

■ SHIFTING LENSES

The study of CMC spans virtually every academic discipline and methodological approach. Research objects and lenses have shifted rapidly in the past decade or so, commensurate with the rapid development and dissemination of information and communication technologies (ICT). Qualitative study of ICT in the past decade has tended to shift in two ways. First, though not a universal trend, research has tended to shift from strongly polarized depictions and predictions in the early 1990s, to more descriptive accounts in the mid-late 1990s and, in the new century, to more theoretically grounded, comparative, or theory-building studies.

Accounts of CMC, identity, and culture throughout the early 1990s were heavily influenced by pop culture descriptions of and personal experience with novel and exciting forms of interaction. Gibson's term *Cyberspace*, coined in his science fiction novel *Neuromancer*, offered the elusive but intriguing definition of online experience as "a consensual hallucination experienced daily by billions of legitimate operators, in every nation, by children being taught mathematical concepts. . . . A graphical representation of data abstracted from the banks of every computer in the human system. Unthinkable complexity. Lines of light ranged in the non-space of the mind, clusters and constellations of data. Like city lights, receding" (1984). About virtual reality, Rheingold (1991) told readers "*we have to decide fairly soon what it is we as humans ought to become, because*

we're on the brink of having the power of creating any experience we desire" (p. 386, emphasis in original). Wright (1994) told us simply that it would "deeply change politics, culture, and the fabric of society—if not, indeed, the very metaphysics of human existence" (p. 101). Barlow offered a vision of Cyberspace as the Wild West, a final frontier to be claimed: "Cyberspace . . . is presently inhabited almost exclusively by mountain men, desperadoes and vigilantes, kind of a rough bunch. . . . And as long as that's the case, it's gonna be the Law of the Wild in there" (cited in Woolley, 1992, pp. 122-123). Keep (1993) suggested that virtuality through computer mediated communication "announces the end of the body, the apocalypse of corporeal subjectivity" (p. 4).

These ideas caught the imagination of scholars and influenced significantly the tone of research. This is not surprising: With the invention or new use of every communication technology in the past century, claims regarding media effects tend to be overestimated and exaggerated as long as the technology remained novel. Although this period was not without empirically based and theoretically grounded research, there was a feeling of utopianism in descriptions of how technology might (or should) free us from the constraints of worldwide shackles like hierarchy, traditional social stereotypes, embodiment, and even death. Rheingold's *Virtual Community* (1993) and Benedikt's edited collection *Cyberspace: First Steps* (1991) represent this trend well. To give these authors credit, their ideas sparked the interest of many scholars whose work followed.

Simultaneously, research was influenced by news coverage, movies, and pop culture accounts that predicted negative, even dire consequences of this new Internet era. *Time Magazine* offered a cover story on "Cyberporn," wherein readers learned that the Internet threatened our children's safety (from adult sexual predators) and innocence (from easy access to pornography). Vastly exaggerated claims incited sound criticism; the magazine editors had relied exclusively on evidence supplied by an undergraduate student's non-peer-reviewed study. Critiqued or not, this issue of *Time* was quoted by legislators, parents,

and scholars. "Internet Addiction Disorder" entered the medical lexicon in 1996. Popular films spelled out the dangers of identity theft, hackers, and spending too much time in front of one's computer. Pundits predicted that face-to-face interactions would become impoverished as people forgot the intricacies and delicacies of human interaction in physical environments.

These swings have evened out in the last few years, resulting in published accounts which exhibit many of the more traditional characteristics of social research. Scholars are explaining their approach and methods more carefully, grounding their work in previous research more thoroughly, and attending more closely to the history of communication technologies as well as the history of qualitative inquiry. The targets of research continue to follow shifts in technological development. Herring (2004) aptly notes that researchers have tended to follow novelty; researchers quickly flock to each new technology. Research in the 1980s tended to focus on the use and impact of computers, email, and networking in the workplace (overviewed well by Sproull & Kiesler, 1991). In the 1990s, research waves moved progressively through various forms of CMC, such as Email, Usenet, MUDs and MOOs, the World Wide Web, IM (Instant Messaging), SMS (Short Messaging Service via mobile telephone), and Blogs.

Various social interaction practices and social structures received empirical attention over the past decade: flaming and other forms of emotionally charged or violent acts (e.g., Dery, 1994; Dibble, 1996; MacKinnon, 1998); the use of emoticons to compensate for the absence of non-verbals (Witmer & Katzman, 1998); the social construction of virtual communities via mailing lists (e.g., Baym, 2000; Bromseth, 2002; Sveningsson, 2001; Rheingold, 1993), MUDs or MOOs (e.g., Kendall, 1998; Reid, 1995) or websites (Johnson, 2003); the intersection of technology and identity (e.g., Lupton, 1995; Markham, 1998; Senft & Horn, 1996; Sondheim, 1996; Stone, 1996; Turkle, 1995); sexuality (e.g., Kiesler, 1997; Waskul, Douglass, & Edgley, 2000); gender and participation in CMC (e.g., Herring, 1993); and

race (Kolko, Nakamura, & Rodman, 2000). Ethnographically informed studies have focused on online groups (e.g., Baym, 2000; Eichhorn, 2001; Kendall, 1998; Orgad, 2002; Reid, 1995); use of Internet in traditional, physically based cultures (e.g., Miller & Slater, 2000); cultural formation around particular topics (e.g., Hine, 2000); and sensemaking in specialized environments such as virtual work teams (e.g., Shane, 2001).

Multiple anthologies offered accounts of cyberculture (e.g., *High Noon on the Electronic Frontier* [1996]; *the Cybertures Reader* [2000]). Utilizing both pop culture and academic accounts, these texts provide a useful overview of the 1990s viewpoints about computer-mediated communication and cultural practice. Few resources existed during the 1990s to specifically guide qualitative researchers. Although researchers offered context-specific discussions of research methods (represented well in *Internet Research*, edited by Jones, 1999), a comprehensive treatment did not appear until 2000, when Mann and Stewart's volume provided principles and practices for conducting qualitative inquiry using Internet communication as a tool of research.

As research in this evolving field grows more refined, the conceptualization of computer-mediated communication has shifted from sweeping universalized encapsulations to more specific, context-based definitions. As well, some have noted a move from exaggerated to mundane accounts. A recent article (Herring, 2004) entitled "Slouching Toward the Ordinary" notes the trend to minimize the impact of new communication technologies on identity, subjectivity, and social practices and structures. In this same vein, ethnographic inquiry appears to be shifting from the study of online-only environments and virtual identity to the intersection of computer-mediated communication with everyday life. Scholars are now calling for increased attention to the multiple uses and definitions of "Internet" in context, as well as increased attention to how the online and offline intersect (Baym, Zhang, & Lin, 2002; Orgad, 2002).

Overtly political analyses of computer mediated communication are diverse in scope and range. I mention just two areas: research in

developing countries and research interrogating the role of the researcher. Work exploring the use of Internet technologies in developing countries is important and increasing. Kolko conducted in-depth interviews in Uzbekistan as a means of grounding her NSF-funded study of how ICT affects life in central Asia (personal communication, October 15, 2002). Miller and Slater have conducted the most widely known ethnography of a developing country to date, exploring the ways in which the Internet is perceived and used in Trinidad (2000). Theresa Senft's recent work in Ghana illustrates a politically motivated effort to use interpretive participatory action research to help the cause of women and the poor in that region of the world (personal communication, October 2004).

Research exploring the researcher's role in Internet studies is also expanding. My own work was acknowledged as an explicitly reflexive discussion of the researcher's role in Internet ethnography (1998). Later works also discuss directly the ethical and political stance of the researcher and the relationship between researcher and participants (e.g., Ryan, 2002). Bromseth (2002, 2003) discusses in depth the ethical dilemmas of collecting data in groups where people are reluctant to be studied. Gajjala (2002) explores her own study of a group wherein the members were overtly and actively resistant to her intent as a researcher. Along different lines, Eichhorn's study of a virtual group (2001) astutely addresses the paradox of using offline interviews to understand online subjectivities. Orgad's work (2002) illustrates the opposite paradox: using only online interviews with women in a virtual support group to understand how these women make sense of their illness. In both cases, these researchers recognized during the course of their research that giving voice to the participants meant selecting the medium based on what was most appropriate for the participants, not the researcher.

A final note about the shifting trends in qualitative research over the past decade of Internet studies. Many studies have been labeled "ethnography" when the more appropriate term would be interview study, case study, phenomenology,

grounded theory, narrative analysis, biography or life history, and so forth. "Ethnography" seems to be a term that is applied by scholars who do not know what else to call their work or, in my case (1998), by scholars whose study of new forms of ethnography broadens the umbrella of what can be considered "ethnography." Closely related, the quality of work in Internet studies from an ethnographer's or qualitative methodologist's perspective has varied widely; some scholars come to the field of inquiry having been trained in qualitative methods, while others have topic- or technology-specific expertise or interest but no familiarity or training in the diversity of qualitative approaches (Mann, 2002, 2003).

■ CRITICAL JUNCTURES IN RESEARCH DESIGN AND PROCESS

The idea of studying the Internet or using Internet technologies to facilitate qualitative research is beguiling. A researcher's reach is potentially global, data collection is economical, and transcribing is no more difficult than cutting and pasting. But in the virtual field, as one interacts with anonymous participants, tracks disjointed, non-linear, multiple participant conversations, and analyzes hundreds of screens worth of cultural texts, one can begin to feel like the Internet might cause more headaches than it cures. Deceptive in its apparent simplicity, qualitative inquiry in this environment requires careful attention to the traditional means by which social life is interpreted and the adjustments that must be made to give value to the online experience and internal consistency to one's methods. The absence of visual information about the participant functions more paradoxically than one might realize. Socioeconomic markers such as body type, gender, race, and class are used consciously or unconsciously by researchers to make sense of participants in physical settings. Online, these frames are still used but without visual information, they function invisibly. This warrants close examination, both to consider how

this happens and to explore how the researcher's default premises and unconscious choices can influence the shape of the participant and the reality of the outcome.

This complexity of knowing anything certain about the other is paradoxical, yet to acknowledge the uncertainty or even impossibility of knowing Other is to risk paralysis in the research process, loss of authority in the presentation of research, and diminishment of one's academic role as observer/interpreter/archivist of social life. How, then, does one proceed? "With caution" is a trite yet reasonable response which calls for sensitivity to the context, interrogation of one's own presumptions, and flexible adaptation to a new era in social research, one in which we recognize the limitations bred by our traditional five senses and take the risks necessary to reconsider how and why we seek and create knowledge. Proceeding thus is a political move. It does not retreat from understanding Other on the grounds that the researcher cannot know anything except his or her own experiences. It also does not rest on the laurels of traditional methods, trying to shore up ways of knowing that are crumbling before our eyes as digital and convergent media saturate cultural practices and forms. It faces the complexity and interrogates the way we analyze people for purposes of academic inquiry. If one examines deeply the way new communication technologies influence the research project, one is likely to stumble into issues which question the fundamental reasons for doing research in the first place. Allowing oneself to explore those issues can vitally contribute to the creation of reflexive and socially responsible research practice.

At several junctures during the research project, we have the opportunity and responsibility to reflexively interrogate our roles, methods, ethical stances, and interpretations. When studying computer-mediated environments, this need is intensified because the traditional frames of reference we use to guide our premises and procedures are entrenched in physical foundations and modernist ontologies. Questions one might address include:

- What can we say we know about the Other when self, other, and the context may be constructed solely through the exchange of messages?
- In social situations derived from discursive interaction, is it possible to simply observe? Is it desirable?
- How does the researcher's participation in the medium affect the identity of the participant and the shape of the culture?
- How can one balance the traditional scientific impulse to uncover the "real" while interacting with people who may or may not have any correspondence to their physical counterparts?
- In what ways do one's research traditions delimit and limit the possibilities for sensemaking in environments which are not overly physical, visual, and aural?

Whether or not the researcher pays attention to them, the issues raised by these questions operate throughout any ethnographically based project. They identify logistic challenges but also display problematic working assumptions that must be addressed. Reflexive research practice requires a constant disruption of the seemingly placid surface of inquiry. Stopping to identify critical decision junctures and reflect on the consequences of specific actions constitutes an honest presence in the research process and active engagement in the ethical grounding of one's inquiry.³

Defining the boundaries of the field.

Determining what constitutes data.

Interpreting the other as text.

Using embodied sensibilities to interpret textuality.

Representing others ethically in research reports.

Each of these categories identifies a critical decision juncture within the research project. Neither exhaustive nor separate, these categories can be used as examples to help one think through some of the decisions made during the course of a study which have meaningful consequences for the identity of the participants, the representation of self and other in research reporting, and the

shape of the body of scientific knowledge built on multiple ethnographically informed studies. The actual questions one might ask are particular to the researcher and the project, as variable as one's worldviews and methodological approaches.

Defining the Boundaries of the Field

Drawing boundaries around the research context, or "identifying the field" involves a series of decisions that both presuppose and reveal the researcher's underlying ontological and epistemological assumptions. Obviously, reflecting on our own biases is not just useful but ethically necessary, even if our academic training did not identify the necessity for such reflection. When studying physically based cultures, the location of the field is typically predetermined, so the logistical challenges lie in gaining access and building rapport with informants. For the Internet ethnographer, the process of locating and defining sensible boundaries of the field can be convoluted and elusive.

Because the Internet is geographically dispersed, the researcher has the option to disregard location and distance to communicate instantaneously and inexpensively with people. Logistically, the distance-collapsing capacity of the Internet allows the researcher to connect to participants around the globe. The researcher can include people previously unavailable for study. This not only increases the pool of participants but also provides the potential for cross-cultural comparisons that were not readily available previously for practical and financial reasons. In a world where potential participants are only a keyboard click and fibre optic or wireless connection away, distance become almost meaningless as a pragmatic consideration in research design; the Internet serves as an extension of the researcher's and participant's bodies. Research can be designed around questions of interaction and social behavior unbound from the restrictions of proximity or geography. Participants can be selected on the basis of their appropriate fit within the research questions

rather than their physical location or convenience to the researcher.

From Geographic to Discursive Boundaries

As we shift from geographic to computer-mediated spaces, we are shifting focus from place to interaction, from location to locomotion (Markham, 2003a). Consequently, communities and culture are not neatly mapped before entering the field, but instead are created as part of the ethnographic process. Christine Hine (2000) argues that the ethnographer's notion of cultural boundary must be reconsidered given this capacity of the Internet. Rather than relying on traditional, geographically based means of encapsulating the culture under study, such as national boundaries or town limits, ethnographers might find more accuracy in using discourse patterns to find boundaries. "The ethnographer must read the texts and interactions of interest, much like trail signs, and make defensible decisions about which paths to follow, which paths to disregard, and thereby which boundaries to draw" (Markham, 2003b).

Seemingly mundane decisions become crucial criteria that are used, consciously or not, to create boundaries around the field of inquiry. Boundary markers are underwritten by the researcher's choice about how to find data sites, which search engine to use to sample, whom to interact with, what to say in interaction with participants, what language to speak, when to seek and conduct interviews (including both time of day and considering time zones), and so forth. Computer-mediated cultural contexts are shifting contexts. Their discursive construction occurs in global as well as local patterns. Membership can be transient. This becomes more meaningful when one realizes the boundary-forming work that is being accomplished when one contributes messages to a group, defines the boundaries of a cultural phenomenon through one's own surfing choices, and sifts or funnels the data set by using a particular search engine or set of databases. Each action taken by the researcher in this vast information

sphere contributes directly to the construction of the structures that eventually get labeled “field” or “data.”

Indeed, the global potential of this medium is often conflated with global reach, an achievement that relies on global access (Markham, 2004b). Arguably, people in industrialized countries tend to overestimate the degree to which the world has access to computers and electronic communication technologies. Access is not universal and those populations being studied via the Internet represent a very privileged and small portion of the world's population. In many ways, then, the boundaries may be flexible, seemingly arbitrary, and discursively constructed, but nonetheless remain within larger political and economic structures that are not universally experienced.

Participation in the Discursive Construction of the Field

As I have noted previously (Markham 1998), interacting with anyone formally or informally marks a significant shift from observer to participant, from archivist to accomplice. Online, as one participates in the context, one co-constructs the spaces under investigation. Interactions with participants are not simple events in these online spaces; they are organizing elements of these spaces.

By the very nature of their actions and interactions, researchers in any cultural environment are involved in the construction of what becomes the object of analysis. This is highlighted in technologically mediated environments because both the production and consumption of communication can be global, non-sequential, fragmented, disembodied, and decentered. In contexts where the boundaries of self, other, and social world are created and sustained solely through the exchange of information, being is therefore relational and dialectic. Social constructions are less connected to their physical properties. Boundaries are not so much determined by “location” as they are by “interaction.”

The boundaries of the field become more a matter of choice than in physically located spaces. Researchers are more obviously participative.

Addressing a seemingly simple question of “should I participate or observe” then, gives rise to an entirely more complicated set of issues that shape the research design and complicate our concepts of how media function socially. The deceptively easy act of choosing a particular community of websites creates an audience that previously did not exist and indicates to the larger academic community that this context is meaningful. Thus, choice of field becomes a politically charged process because of the inherent ethicality of one's decisions.

Ethnography that ignores these issues can remain at the edges of the cultural context and more importantly, can become mired in the now much critiqued notion that the researcher observes but does not interfere with or influence that which is studied. Moreover, the decisions that a researcher makes at this level directly influence the way the researcher later represents the context and the participants, which ultimately impacts our academic conversations of and knowledge about computer-mediated communication environments. These are issues laden with ethical responsibility, yet the questions themselves appear to be so straightforward they are often only addressed as simple logistics problems.

This discussion necessarily takes us forward to later stages of the research process. The effort or unconscious decision to absent oneself from the field will not remove the researcher from the process and product. Thinking ahead to the outcome of inquiry—the research report—one must acknowledge that the interpretation of culture will change depending on the form of the telling. Interpretative focus and the nature of the “findings” shift with the passage of time, the venue for publication, the credibility of the author or notoriety of the subject, and innumerable other factors. Frankly, whether or not the researcher participates or simply observes, the construction of the research report will present a particular reality of the object of analysis that is influenced by the identity and participation of the researcher. It may be more productive to acknowledge one's participative role early, so that every aspect of the research design can effectively incorporate the researcher's presence in the construction of the

field under study. As Internet Studies evolves as an interdisciplinary field of inquiry, further research depth and credibility will be gained through realistic and contemporary conceptualizations of the ways in which the researcher, reader, and object of analysis intersect.

Determining What Constitutes Data

A researcher's representation of others is inextricably bound up with the way data are collected and distinguished as meaningful versus meaningless. Computer-mediated communication contexts complicate the researcher's decisions, not only because the contexts are constructed interactively, comprised of mostly disembodied participants, or because the researcher has little access to typical sensemaking devices used to identify and collect data. The researcher's decisions are further complicated because we are always and constantly struck with stimuli in any research environment; stimuli that must be filtered in and out in order to create sensible categories for interpretation. Interacting in text-only online environments diminishes the most prominent of our senses: vision. CMC separates more obviously the wholeness of a person's being into component parts; that which was previously made sense of as a whole is consequently made sense of at different points of time using different combinations of senses. This feature of technology promotes highly focused and divided attention on the content, the producer, the carrier, and the meaning of discursive activity in context. Even in more overtly visual research environments, where the researcher may have access to photos, webcams, websites, hyperlink behavior, and blogs, the issue is not resolved because traditional research training is designed for physically co-present environments.

Methodologically, one must reflect carefully on what collected information is considered as "data." Just as interaction constructs and reflects the shape of the phenomena being studied, interaction also delineates the being doing the research in the field. Obviously, we cannot pay attention to everything—our analytical lens is limited by what we are drawn to, what we are trained to attend to, and what we want to find. Borrowing from

Goffman (1959), our understanding is determined as much by our own frames of reference as the frames supplied by the context. Our selection of data and rejection of non-data presents a critical juncture within which to interrogate the possible consequences of our choices on the representation of others through our research.

An example of online discourse from prior research (Markham, 1998) illustrates the implications of this point. Matthew, as with all the participants in my study, is a self-described "heavy user" of the Internet. The interview occurred in a MOO, an online environment which is designed to facilitate the enactment and appearance of particular forms of communication. By writing different commands or using particular punctuation, one can speak, exclaim, question, whisper, emot, or think, so that dialogue appears as a verbal statement (Annette says, "Hi." Annette exclaims, "Hi!" Annette asks "Hi?") a cartoon-like thought bubble . o O (Annette wonders if the reader sees that this is a thought bubble), a description of one's nonverbal behaviors or thoughts (Annette scratches her head thoughtfully), and so forth.

Initially archiving Matthew's interview, I included the entire log of the conversation. As I began the analysis process, I removed extraneous, repetitive, or system-specific commands in order to minimize distractions. The following sample is from this latter phase, where the commands are removed. From this log, I conducted the initial analysis of data:

Matthew: "Now madison, that's a nice town."

Markham: "okay here's some official stuff for you Matthew."

Markham: "I guarantee that I will not ever reveal your address/name/location."

Matthew: "Fine about the secrecy stuff."

Markham: "Matthew, I guarantee that I will delete any references that might give a reader clues about where you live, who you are, or where you work."

Markham: "do you mind that I archive this interview?"

- Matthew: "Log away, Annette" . . .
- Markham: "what do you do mostly when you're online? Where do you go?"
- Matthew: "Mostly I'm doing one of two things. Firstly I do research. If I'm looking for academic research in software engineering, my specialty, a lot of it is on the Web . . ."
- Matthew: "And a lot of tools to play with are there, too."
- Matthew: "Also, I use it for news and information, the way I used to use the radio. (I'm an unrepentant . . ."
- Matthew: "real-lifer). For instance, if I'm going to go run (or bike or do something else outside) . . ."
- Matthew: "I check the weather on the Web when in years past I would turn on the radio. Ditto for news" . . .
- Markham: "how would you compare your sense of self as a person online to your sense of self offline?"
- Matthew: "More confident online, because I'm a better editor than writer/speaker. I do well when I can backspace."
- Matthew: "But I'm the same me in both places. I guess I've been me too long to be anybody else without a lot more practice than I have time for."
- Markham: "hmmm . . . How would you describe your self?"
- Markham: "I mean, what's the 'me' you're talking about?"
- Matthew: "Kind of androgenous. Plenty of women for friends. But I was never good at dating or any of the romantic/sexual stuff."
- Matthew: "Also, somewhat intellectual."
- Matthew: has a delayed blushing reaction to the androgeny comment.
- Matthew: "And a fitness nut."
- Markham: o O (I wonder why Matthew is blushing . . .)
- Markham: "tell me about your most memorable online experience"
- Matthew: "OK, it was a couple years ago and I was just getting on the Web and starting to realize all"
- After conducting initial coding and analysis, I found that I was struggling with this interview. I returned to the original transcript and realized I had made an error in my delineation of "meaningful" from "nonessential" data. The following excerpt illustrates what I saw when I returned to the original interview (the pieces I had removed are underlined):
- Matthew says, "Now madison, that's a nice town,"
- Matthew spills popcorncrumbs into his keyboard :-)
- Markham says, "bummer, Matthew"
- Matthew says, "If you see me going away for a while, you know I went to make more popcorn :-)"
- Markham says, "okay here's some official stuff for you Matthew."
- Markham says, "I guarantee that I will not ever reveal your address/name/location."
- Matthew says, "Fine about the secrecy stuff."
- Markham says, "Matthew, I guarantee that I will delete any references that might give a reader clues about where you live, who you are, or where you work."
- Markham asks, "do you mind that I archive this interview?"
- Matthew salutes and says "Yes'm"
- Matthew says, "Log away, Annette"
- Markham says, "okay, I have a tendency to ask questions too quickly"

Matthew doesn't answer because he's too busy opening a box of rice cakes. . . .

Markham asks, "what do you do mostly when you're online? Where do you go?"

Matthew says, "Mostly I'm doing one of two things. Firstly I do research. If I'm looking for academic research in software engineering, my specialty, a lot of it is on the Web . . ."

Matthew says, "And a lot of tools to play with are there, too."

Matthew says, "Also, I use it for news and information, the way I used to use the radio. (I'm an unrepentant . . ."

Matthew says, "real-lifer). For instance, if I'm going to go run (or bike or do something else outside) . . ."

Matthew says, "I check the weather on the Web when in years past I would turn on the radio. Ditto for news" . . .

Markham asks, "how would you compare your sense of self as a person online to your sense of self offline?"

Matthew says, "More confident online, because I'm a better editor than writer/speaker. I do well when I can backspace."

Matthew says, "But I'm the same me in both places. I guess I've been me too long to be anybody else without a lot more practice than I have time for."

Markham asks, "hmm . . . How would you describe your self?"

Markham asks, "I mean, what's the 'me' you're talking about?"

Matthew says, "Kind of androgynous. Plenty of women for friends. But I was never good at dating or any of the romantic/sexual stuff"

Matthew says, "Also, somewhat intellectual."

Matthew says, has a delayed blushing reaction to the androgyny comment.

Matthew says, "And a fitness nut."

Markham . o O (I wonder why Matthew is blushing . . .)

Matthew does pushups.

Markham stares

Markham . o O (should I be doing something too?)

Matthew says, "You should be asking me questions (the interviewee becomes the interviewer)"

Markham sighs and refocuses

Markham says, "tell me about your most memorable online experience"

Matthew gets very jealous of people who have sleep.

Matthew enters state of deep thought.

Matthew goes to raid the nearby refrigerator while composing reply in head

Matthew says, "OK, it was a couple years ago and I was just getting on the Web and starting to realize all"

My interpretation shifted as I realized the extent to which Matthew made certain to include his embodied activities in the conversation. Regardless of the interpretation one elects to make about these underlined enactments (Matthew is hungry, bored, creative, using conventions learned in culture), the fact remains that the "data" are different from one transcript to the next.

One can elect to bracket or set aside the form and focus only on the content. This decision would be guided by the premise that the meaning of one's utterances is only understood in context and therefore the medium is less important than the content. On the other hand, to ignore the form in this interview could also be seen as a poor choice, given the well-founded premise that nonverbal behaviors function discursively in the presentation of self, negotiation of identity, and eventual symbolic construction of culture. In this case, my analysis would suffer without the inclusion of Matthew's delineation of his embodied activities. It also raises the question of what constitutes form and what constitutes content.

One's choice in this situation should be guided by the research questions or the overall goal of research, which in this case was to explore how people experience the Internet and how their identities are presented and negotiated. Yet, this edict is laden with ambiguity when put into practice. Multiple dilemmas present themselves: How much does text represent the reality of the person? Put more personally, how much would I want to be bound by what I wrote at any particular time? To

what extent does or should the researcher include spelling or typing ability as meaningful information in the understanding of identity or culture? How much are my own preconceptions and stereotypes influencing how I elect to categorize data from non-data?

One might wonder whether or not I ever asked Matthew to participate in the decision about what constituted "data," as this would seem a relatively easy way to answer some of the questions asked above. What would Matthew categorize as meaningful data from unessential non-data? On the other hand, why and under what circumstances would I want Matthew to determine what ought to be analyzed and what ought to be ignored?

These questions are important in that they directly shape what is examined by the researcher. This is not an unfamiliar point, as it raises the importance of interrogating the researcher's role in writing culture (Clifford and Marcus, 1986). In this case (and any, I would suggest), while the analysis may indeed emerge from the data, *the researcher determines a priori what constitutes data in the first place, making this decision point a crucial reflection point.*

Interpreting the Other Through Their Text

As one addresses these issues and shifts from data collection to analysis, another critical juncture arises, sponsored by the following question: To what extent is the Other defined by his or her texts? When the participant, researcher and context are nothing but text and everything beyond mere language, our perceptual filters must be adjusted to accommodate complexities of human expression. Discursive practices are the heart of our enterprise as ethnographic researchers. When the discourse is limited to the exchange of texts, one might think that the methods of analysis are likewise limited to what is seen in the text; but this is not the case. Rather, an array of interpretive tools are used to make sense of these texts and it becomes a worthwhile task to reflect on some of the more hidden or unacknowledged analytical methods being used to interpret the Other.

The following two examples usefully illustrate the extent to which participants can be judged in multiple ways by the form of their texts. The samples of discourse in these examples represent well the writing tendencies of two participants: Sheol and DominOHl.

<Sheol> I am intrested in talking to:) Could you be more specific about what questions you will ask? Just let me know when you want to talk, and I will try to accomidate! :)

<Sheol> I became a very popular (I know that sounds conseeded) figure on the line I called home. I am ruled by the right side of my brain so I liked the idea of being that personality.

In this interview with Sheol, it was impossible to bracket the spelling, use of graphic accents, tag lines, and so forth. From the beginning, I had been determined to conduct systematic analyses that remained close to the text. I was using a blend of content-oriented analytical tools to code, thematize, and make sense of the interactions with participants. Reflecting on my inability to ignore the form in my analysis of content jarred me out of the false stability granted by method-specific procedures and caused me to identify some of the ways I was putting Sheol into categories without noticing what I was doing.

For example, very early on, I categorized Sheol as female because a gendered language style was very evident in tags, qualifiers, expressions of emotion, and heavy use of graphic accents (Sheol turned out to be male). Sheol was also: Young (spelling was phonetic, attention to language misuse was not at all evident); Perhaps not very intelligent (multiple spelling errors, unreadable messages, apparent lack of ability to be a real hacker); and, of course, Caucasian (default characteristic because of mainstream cultural assumptions about use of the Internet as well as the tendency to make the online other look more like the self). Additionally and solely based on my own frame of reference, Sheol was heterosexual, middle class, and American.

In a different study, a participant called DominOHl also used phonetic spelling, but in a different way:

<DominOH!> Sumtymz i am lost in my online identiteez . . . well, the aktuel problem? i feel more 'found' in my online selvz . . . kicky, span out, reeler than real. More atooned to the energee and more atooned to those i'm talking with . . .

<DominOH!> . . . so much fun 2 play . . . YOU, and EVERYONE else, kannot rely no mee. And y do you feeeel that you need 2?! So, online i'm a nerdy college professor with a quirky sense of humor, or i'm a professional athlete with a career ending injuree, and sumtymz i'm handsum, or i'm beauteous . . . and if peepole wanna hang with mee, i'm alwaze up for play.

In my conversations with this persona, I found it easier to bracket the misspellings because they appeared obvious and deliberate. DominOH! seemed to revel in the ability to remain elusive during our various interactions. DominOH!'s discourse was marked with aggressive and challenging statements. I was cautious with this participant to not make assumptions about gender but found myself categorizing DominOH! as male, young, well-educated, and Caucasian.

As the researcher, I have numerous choices regarding the interpretation of these interviews. My choices will build cultural knowledge about Sheol and DominOH! as individuals and about how people interact in cyberspace. In interpretive inquiry, the integrity of one's interpretation is tied directly to reflexivity. Frequently, though, reflexivity happens *after* the analysis is in progress or the project is completed. I mentally attached a number of social labels to both these participants during the course of our conversations and long after, as I was interpreting the discourse. Some of the labels I did not recognize until others pointed them out. The importance is not in the accuracy of the labels, but in the type of evidence used to derive the category. Without reflection, I initially gave a negative attribution to Sheol's phonetic spelling (deficient abilities) while giving a positive attribution to DominOH!'s (cleverness). Without reflection, I categorized Sheol as female and DominOH! as male, based solely on their use of accommodating or aggressive language.

This example illustrates that one's interpretation is founded in the text but simultaneously not limited to the text. While systematic procedures of analysis are vital tools for the social scientist, they are not fail safe if followed to the letter. Procedures can actually blind one to the actual interpretive processes occurring. In Internet-based environments, the existence of the online persona being studied is often encapsulated by their pixels on a computer screen. The choices made to attend to, ignore, or edit these pixels has real consequences for the persons whose manifestations are being altered beyond and outside their control. If a subject types solely in lowercase and uses non-standard grammatical conventions the readers' correction of "errors" may inappropriately ignore and thus misrepresent a participant's deliberate presentation of self. ;) if someone spells atrociously or uniQueLY and the researcher corrects it in the research report for readability, alteration of a person's desired online identity may be the price of smooth reading (Markham, 2003a, 2003b).

On the other hand, Sheol may be working with a sticky keyboard, ignoring the errors in the interest of speed, or multi-tasking such that he is not devoted fully to our interaction. DominOH! may be more comfortable with phonetic spelling. Maybe she or he was aggressive in response to something I had said early on. Certainly, to make the interpretive task both easier and more grounded in the participant's experience, one could ask the participants to clarify their own writing tendencies. One could also gather additional demographic information. My point, however, is not to articulate how to make the interpretations more accurate or truthful, but to identify one of many moments in the research project when the researcher faces, consciously or not, certain decisions about what to include as part of the interpretive consideration, only some of which can be identified or controlled.

To make this task more difficult, the most ethically sensitive approach to analysis is complicated—and impeded—by academic conventions and training. Most social science approaches teach the researcher to distill the complexity of human experience into discrete variables that are

easily measured. Interpretive methods seek to ease these restrictions but involve ways of knowing that continually strive to simplify rather than complexify human experience. To shift the gaze from the subject of research to the gaze itself is one step in the evolution of human sciences. To stop there, however, is to risk losing sight of the larger goals of inquiry. Rather than seeking to describe or reflect reality, researchers must consider the political act of promoting, activating, or engendering realities.

The Search for Authenticity⁴

Particularly notable in disembodied research environments, the researcher's body continues to be privileged as the site of experience, the best measure of authenticity, and the residence of knowledge. This is sensible, literally, because we make sense of our world through our eyes, ears, noses, mouths, and sense of touch. We abstract our embodied knowledge to convey it through logic, language, and print, but as Ackerman (1995) notes, our primary level of understanding remains firmly entwined with our senses. "There is no way in which to understand the world without first detecting it through the radar-net of our senses. . . . The senses . . . tear reality apart into vibrant morsels and reassemble them into a meaningful pattern. . . . Reasoning we call it, as if it were a mental spice" (pp. xv-xvii).

The implications of this are significant in scientific research; in most traditions, the interpretive act is characterized as an analytical, logical, mental procedure. Separated from the body in theory, the embodied practice of interpretation lingers. Online, this underlying disjuncture is highlighted precisely because the body of the participant is *notably* absent.

Searching for the Body Behind the Text

The question often asked about participants in online contexts is "Who are they, really?" By this, one often means, who are they, as I can see, verify, and know them in a body? From students, reviewers, and publishers, I have heard the suggestion

many times: "You should have interviewed the participants offline as well as online. Then, you would have a better idea of who they are." Shifting one's perspective slightly, one might ask questions that get at the underlying issues: How much do we rely on our bodies and the bodies of participants to establish presence and know other? Is this reliance warranted or desirable? Will our picture of other, in person, make our understanding of them more whole? More directly: Does the embodiment of a participant gauge their authenticity?

The answers depend not only on the question one is seeking to address but also on the researcher's underlying epistemological assumptions. If one is simply using the Internet as a tool to expand one's reach to participants and interviewing them online is merely a convenience, one should consider the extent to which people can and do express themselves well, truly, or fully in text. But if one is studying Internet contexts as cultural formations or social interaction in computer-mediated communication contexts, the inclusion of embodied ways of knowing may be unwarranted and even counterproductive.

In chat rooms, on mobile phones, through personal websites, and other media, identity is produced and consumed in a form abstracted from actual presence. Cultural understanding is literally constructed discursively and interactively. We know from both popular press and scholarly studies that many people seek interaction and community on the Internet because it provides the perceived means to escape the confines of embodied social markers to engage in what many refer to as a "meeting of the minds." Whether or not this is truly possible (and some have argued (e.g., Ess, 2003; Kolko, Nakamura, & Rodman, 2000) that it is not), a user's desire to present and be perceived as a confluence of texts without body might best be read by researchers as a request for us to acknowledge text as ample and sufficient evidence of being and to study it as such (Markham, 2003a, 2004a).

Yet social scientists persist in seeking the authentic by privileging the concept of the body. The desire to add validity to findings often results in research design that holds up the textual representation of the participants next to their physical

personae. The goal is to see the extent to which the images match. Researchers deciding to interview participants both online and f2f (face to face) may claim that their efforts will add authenticity to their interpretation—by adding paralinguistic or nonverbal cues to the words people speak—and thereby add more credibility to their findings (Markham, 2003a).

For good biologically based reasons, researchers rely on and trust their traditional senses of sight, smell, touch, taste, and hearing to provide verification of concrete reality. We are conditioned to rely particularly on our visual sensibilities: "Seventy percent of the body's sense receptors cluster in the eyes, and it is mainly through seeing the world that we appraise and understand it" (Ackerman, 1995, p. 230). Ecologist and philosopher David Abram adds that perception is a reciprocity between the body and the entities that surround it. Considering Merleau-Ponty's idea that perception itself is embodied, Abram notes that "[P]erception] is a sort of silent conversation that I carry on with things, a continuous dialogue that unfolds far below my verbal awareness" (1997, p. 52). Although "we conceptually mobilize or objectify the phenomenon . . . by mentally absenting ourselves from this relation" (Abram, 1997, p. 56), our understanding of the world is sensual. While it makes sense that researchers use embodied sensibilities, this is not mentioned much, if at all, in methods textbooks. It therefore becomes a critical juncture to address in a very conscious manner.

Removing the Researcher's Body

In essentially disembodied relationships and cultures, one must wonder if the intrusion of certain embodied sense-making faculties bleeds integrity from the project of knowing the other in context. Yet, as mentioned above, perception always involves embodiment, and this cannot be set aside in the context of studying life online. Hence, a paradox emerges that may not be overcome but should be considered, acknowledged, or accounted for in the research design or research report.

Irony follows, however, when one notes the marked absence of the researcher's own embodiment in many studies of text-based cultural contexts. Although a researcher may give his or her participants' bodied forms and make sense of their identities through his or her own body, this sensibility is rarely noted in the published paper. Considerable privilege is given to the researcher to make his or her own embodiment a choice or even a non-issue while simultaneously questioning the authenticity of the participants' choices regarding their own embodiment. Ethically as well as epistemologically, it is vital to reflect carefully on the extent to which the research design privileges the researcher at the expense of both understanding the other and operating with a keen awareness of the context (Markham, 2003a, p. 152).

The online persona may be much more fluid and changeable than we imagine as we catch them in particular moments or only a fraction of the virtual venues they populate. Anonymity in text-based environments gives one more choices and control in the presentation of self, whether or not the presentation is perceived as intended. Understanding the potential for flexible, ad hoc negotiation of identity in technologically mediated social spaces may foster another critical juncture at which the researcher can ask an intriguing set of questions about the representation of other: "As researchers and members of various communities and cultures, what do we use to construct a sense of who the Other really is?" "In what ways do our methods of comprehending life as interwoven with new communication technologies ignore, deny, or validate shifting constructions of identity and social world?"

Interpreting Within Socioeconomic Comfort Zones

It makes sense that researchers visualize their participants even in non-visual text-based media. Yet, it is not only the visual bias that must be critically analyzed by researchers, but also the imagination with which one visualizes the participant. Pioneers on the research frontier of online ethnography continually juxtapose embodiment with

other modes of presentation and knowing. When we rely on our embodied sensibilities of knowing, we are not necessarily getting a better or more "accurate" picture of the subjects of our studies; we may be simply reflecting our own comfort zones of research. Critical reflection on the product of our gaze can reveal some of these comfort zones for introspection and interrogation. Researchers should be wary of the tendency to perceive the world in familiar, close-to-home categories. What do the participants look like in the mind's eye? How likely is the researcher to give the participant an ethnic category different from his or her own? What information is used to make judgments about the embodied person behind the screen?

Typing speed, spelling and grammar usage, choice of (nick)name, linear or fragmented progression of ideas: These all influence the way a participant is understood by the researcher. As the researcher visually appraises the discursive practices of the participants, the form wafts through the sense-making like an invisible but compelling scent on the breeze. Whether one notices that the text is idiosyncratic or not, either in its error or uniqueness or blandness or precision, the form influences meaning and helps give a bodied shape to the participant. Form composes new stereotypes that must be acknowledged and interrogated.

As researchers, we carry our own predilections concerning race, gender, and bodied appearance of virtual participants. For no obvious reasons, I identified the participant mentioned above, Sheol, as white, female, heterosexual, young, and average in body weight and height. After about two hours of the interview, Sheol mentioned "girlfriend," and I recognized that I had made an invisible (but obviously in operation) assumption that she was heterosexual. Forced to reconcile the contradiction between my *a priori* assumption and the use of the word "girlfriend," I began to look for clues of gender I must have missed earlier. I also began to wonder at my invisible use of sexuality and gender as categories.

I did not reflect on the fact that I was giving Sheol a body in my mind until this disjuncture occurred and I realized the body in my mind no

longer fit the body being presented by the participant. To note, Sheol was simply chatting with me, not presenting a body in any deliberate fashion. I had given shape to the person. A few minutes later, when Sheol referred to himself as a male, I realized she was not a lesbian but that 'he' had a 'girlfriend.' I had made yet another blunder. The form of the message had led me to an initial assumption that Sheol was female. The name, if read at a very surface level, hinted that Sheol was female (here, "Sheol" is a double-pseudonym but the original name was similar in that if read quickly, part of the spelling could be mistaken as an obviously female name or marker, like "Susaneer" or "21She132"). I also knew from previous research that women tend to use more tag lines, offer more caveats, and augment their texts with more emoticons and punctuation.

Recent inquiry of race in cyberspace contends that users transform online others into images of themselves but that these images are limited by media representations of identity, so that most visualizations will conform to mass media images of beauty, race, gender, ethnicity, and size (Nakamura, 1995). What impact does this have for qualitative researchers conducting ethnographically informed research in anonymous or virtual environments?

In teaching computer-mediated courses, my assumptions turn my students white and nondescript. If they use an interesting name, I find myself trying to find a body that suits what I perceive the name implies about the appearance of their persona. When I reflect on my visual images, I realize that even though race is supposedly absent from the research lens, it becomes a category which defaults to "white" (Nakamura, 2003). My experience is not atypical. It illustrates how much we rely on and use our own parameters to categorize others into something we can comfortably address. Scholarly discussion of race and the Internet is growing, particularly concerning how the Internet has been created and perceived naively as a raceless space (Kendall, 1998; Kolko, Nakamura, & Rodman, 2000; Poster, 1998). These discussions will help researchers better reflect on the spaces studied as well as the assumptions

made during the collection and interpretation phases of the project.

Again, traditional academic training complicates the issues of embodiment for researchers in that this training seeks to make the researcher invisible. Traditional academic training encourages the researcher to focus on the theory and method as the locus of control in the study. Good research design, in the scientific tradition, eliminates bias, allows the method to strictly guide the findings, and ignores non-scientific measures such as hunches. The researcher's senses should be removed from the analysis of data and researcher's voice should be removed from the final report. This training creates habits—even among strongly resistant researchers—to ignore or deny the impact of one's conscious or unconscious embodied sensibilities on the research outcome. It is difficult even in qualitative research to peel back one's own complicated layers of interpretation.

Considering Methods as Ethics

As mentioned early in this article, any method decision is an ethics decision. The political potential and consequences of our research should not be underestimated. Every choice we make about how to represent the self, participants, and the cultural context under study contributes to how these are understood, framed, and responded to by readers, future students, policy makers, and the like.

The process of studying culture is one of comprehension, encapsulation, and control. To say otherwise is to deny our impulses and roles as scholars and scientists. At a very basic level, we go there to learn something about Other and—when we think we have something figured out, to decide how to tell others what we think we know. To accomplish this goal, we must stop for a moment the flood of experience, extract a sample of it for inspection, and re-present it in academic terms with no small degree of abstraction. The researcher is afforded a tremendous degree of control in representing the realities of the people and contexts under study. This control need not be

characterized in a completely negative fashion, as we could also consider the image of a Möbius strip, where seemingly opposing sides are eventually realized as part of the same path. Our capacity to represent cultural knowledge is a great responsibility, with many traps and difficulties. But it is also a gift, well earned through education, well honed through experience, and well intended through ethical reflexivity.

Editing Choices

Consider the way research reports present, frame, and embody the people being studied: A person's very being has the potential to be literally reconfigured when edited by the researcher and put into a context of a research account rather than left in the context of experience.

This dilemma does not apply only to the study of virtual environments, but any study of human behavior, of course. But computer-mediated environments seem to highlight this dilemma of research reporting because it's so clear that text can be the primary, if not sole means of producing and negotiating self, other, body, and culture. Common practices of editing are rarely questioned. What happens when we transform the participant's utterances from disjunctive sentence fragments to smooth paragraphs? How are we presenting the social reality of these spaces when we correct grammar, spelling, and punctuation? How might we be changing their identities when we transform the appearance of their fonts to meet the acceptable standards for various publishing venues? Study participants can appear to be as smooth as movie characters after the writer has cleaned up everyday talk. Of course, the writer must make the report readable, but this need must be balanced with what is possibly silenced in this process. Online, this project takes a somewhat different form than in physically based research contexts. Highly disjunctive online conversations get reproduced as tidy exchanges of messages. A conversation developing over the course of six months can appear as a single paragraph in the written report. Deliberate fragmentation of ideas can be spliced into linear logic. Key

to the ethical representation of the participant is sensitivity to the context and the individual. Certain editing choices may not alter the meaning of the utterances, interaction, or identity of the textual being embodied through these utterances. Other editing choices can function to devalue, ignore, or silence a fundamental aspect of a persona (Markham, 2003a).

On the other side of the coin, when presenting dialogue with participants, how many writers present a version of reality wherein they themselves talk and think in a hyper-organized fashion? Researchers are not likely to do this deliberately. Rather, the habit is an ingrained part of our training; it goes along with other practices, such as using passive voice and third person in the traditional academic paper. In the search for understanding the discursive construction of reality in computer-mediated environments, overediting may be misleading and limiting. The reader may have difficulty reading non-linear, disjunctive, or seriously misspelled examples of dialogue, but just like the visual elements of a personal website, these features of discourse illustrate vividly how it is experienced.

Generally speaking, as soon as an interaction occurs, the study of it becomes an abstraction. This is a fact of research. Even so, simplification or dismissal of the challenge of representation is not warranted. The task is to design research which allows human subjects to retain their autonomy and identity—whether or not their uniqueness is intentional or unintentional.

In Whose Interests?

Shifting from ideas about re-presenting participants to ideas about advocacy, the political aspects of research become more visible. The question of advocacy can be asked in many ways: "Whose interests does the research serve?" "Why am I doing this research anyway?" "What groups need speaking for?" "How can my analysis help someone?" "How can my writing and publishing give voice to those who might remain otherwise silent?"

These are not simply political or ethical questions. These are methods questions that must be

embedded in design, in that they impact directly the way information is collected and analyzed and how research findings are written and distributed. Yet questions such as these are not typically included in research methods textbooks as a part of the primary methodological discussion. If included at all, these questions are relegated to a separate unit or chapter entitled "Ethics" or separated from the main text, along with other special, non-typical considerations.

Even if one's research goals do not include serving as an advocate for participants, I suggest that not only will research design be more ethically grounded and reflexive but also the results will have more integrity if these questions are considered throughout the course of the study. They serve as important reminders that researchers often take more than they give, that the researcher's choices are always privileged, and that even when wanting to give voice to participants, the researcher can unintentionally end up as the hidden ventriloquist, speaking for, rather than with, others (Fine, Weis, Wesen, & Wong, 2000).

Ethics and Institutional Review Boards

Ethical guidelines for Internet research vary sharply across disciplines and countries, depending on the premises and assumptions used to develop the criteria from which actions are judged as ethical or not. In this section, I've chosen to outline the features of Internet interaction that give rise to ethical controversies and to sketch the major distinctions between the "utilitarian" (predominant in the United States) and the "deontological" or "communitarian" stances (predominant in certain parts of the E.U., particularly Nordic countries). This discussion is intended to give researchers alternative ways of thinking about projects, so that decisions are made not just based on what is legally required but also on what constitutes the right course of action in particular research and social contexts.

For Internet researchers, ethical challenges and controversy arise in the following circumstances:

- Some users perceive publicly accessible discourse sites as private.

- Some users have a writing style that is readily identifiable in their online community, so that the researcher's use of a pseudonym does not guarantee anonymity.
- Online discussion sites can be highly transient. Researchers gaining access permission in June may not be studying the same population in July.
- Search engines are often capable of finding statements used in research reports, making anonymity in certain venues almost impossible to guarantee.
- Age is difficult if not impossible to verify in certain online environments.
- Vulnerable persons are difficult to identify in certain online environments.
- Informed consent of the actual participant (the persona corresponding to the driver's license) is difficult to attain in writing if the participant desires anonymity from the researcher.

Some of the above generate general ethical issues; others generate official red flags for institutional research boards, which govern research of human subjects at institutions of higher education.

Utilitarian and Communitarian Approaches

Are Institutional Review Boards (IRBs) in the United States more interested in protecting the institution than the human subject? Do the regulations really serve the interest of the human subject? Christians (2000) and Thomas (2003) argue that the system of regulation may be counterproductive, though it was designed to protect the participant, because these regulations are embedded in: positivist, capitalist, and utilitarian social structures.

Officially, IRBs require researchers to preserve the autonomy of human subjects (respect for persons), distribute fairly both the benefits and burdens of research (justice), and secure the well-being of subjects by avoiding or minimizing harm (beneficence). Pragmatically, to adhere to the general IRB regulations, a researcher would ask: First, does the research protect the autonomy of the human subject? Second, do the potential benefits of study outweigh the risks posed to the human subject? Operationalized in the United States, if the

potential benefit of the proposed research is "good" enough, the risk is acceptable, therefore making the second question a prioritized criterion.

Doing enough "good," according to Christians (2000), becomes a matter of determining what makes the majority of people happy. Combined with a strong tradition in positivism, which values neutrality and validity through scientifically verifiable measures, determinations of "happiness" are largely restricted to those domains that are extrinsic, observable, and measurable (p. 138-142). "In its conceptual structure, IRB policy is designed to produce the best ration of benefits to costs. IRBs ostensibly protect the subjects who fall under the protocols they approve. However, given the interlocking utilitarian functions of social science, the academy, and the state . . . , IRBs in reality protect their own institutions rather than subject populations in society at large" (see Vanderpool, 1996, chaps. 2-6). Thomas (2003) adds to this, noting: "Too often, [IRB] decisions seem driven not so much by protecting research subjects, but by following federally mandated bureaucratic procedures that will protect the institution from sanctions in the event of a federal audit" (p. 196). IRBs are designed to provide guidelines where they might otherwise be ignored; in that, the regulations are sensible. But when these guidelines are used as an exclusive means of defining the ethical boundaries of one's work, the spirit of the regulation has been replaced by unreflexive adherence to the letter of the law.

This stance gets turned upside down (or right side up, depending on how you look at it) when we examine the ethical sphere of other countries. Ess (2003) outlines a European perspective as one that is more deontological. Citizens enjoy a much greater protection of privacy regarding data collection and use. Research stresses the protection of individual rights, "first of all, the right to privacy—even at the cost of thereby losing what might be research that promises to benefit the larger whole" (Ess & AOIR working committee on ethics, 2002, p. 20).

If we take a look at the contrast between U.S. and European approaches to ethics in research, this recommendation takes shape as a viable and

proactive stance. The Association of Internet Researchers has addressed the issue of ethics in Internet research in some depth (2002). They offer key questions which can help guide researchers in making ethically grounded decisions regarding the particularities of online environments outlined above. Some of these questions include:

- What ethical expectations are established by the venue?
- When should one ask for informed consent?
- What medium for informed consent (email, fax, Instant Messaging) would best protect the human subject?
- In studying groups with a high turnover rate, is obtaining permission from the moderator/facilitator/list owner, etc., sufficient?
- What are the initial ethical expectations/assumptions of the authors/subjects being studied? For example: Do participants in this environment assume/believe that their communication is private?
- Will the material be referred to by direct quotation or paraphrased?
- Will the material be attributed to a specified person? Referred to by his/her real name? Pseudonym? "Double-pseudonym?" (i.e., a pseudonym for a frequently used pseudonym?)

Chris Mann (2002), a British sociologist specializing in the study of ethics, distills the issues into a set of three very simple questions:

- Are we seeking to magnify the good?
- Are we acting in ways that do not harm others?
- Do we recognize the autonomy of others and acknowledge that they are of equal worth to ourselves and should be treated so?

These criteria shift the focus away from utility and regulation and place the emphasis squarely on the purpose of the research, a point made clearly by Denzin (1997, 2003) in discussing a feminist communitarian stance. An example illustrating the difference between these stances and possible outcomes is the U.S. researcher asking:

"Am I working with human subjects or public documents?"

This question arises in a study wherein the scholar is using publicly accessed archives of online discourse. Many Internet scholars contend that publicly accessible online discourse does not require human subject approval because the domains in which these texts are produced are public (Walther, 2002). This determination is derived from arguments about the regulatory definitions of what constitutes human subjects research. Walther further notes that while participants might perceive that the space is private and therefore their texts are private, this perception is "extremely misplaced" (p. 3).

Posed to a colleague in Scandinavia, the question was not sensible (Bromseth, personal communication, February 19, 2004). She understood the question, but indicated that her colleagues would not frame the question in the same way. Among other things, Bromseth noted that the question focuses on the researcher's legalistic dilemma and not the participants in the study. The question polarizes the issue into an "either/or" false dichotomy to be solved by definition-based, legalistic clarification, rather than through the input of and interaction with the human subject(s).

To further clarify the distinction, note that the title of this current section of this chapter highlights ethics alongside their regulatory body for academics, the IRB. My choice in heading reflects a utilitarian stance. On the contrary, when describing the ethical issues facing Internet researchers, Bromseth (2003) never mentions a regulatory body at all, instead focusing on the respondent. She writes within the communitarian or deontological stance, "Researchers have been forced to rethink basic issues . . . to be able to develop and apply approaches that work for ourselves and our research goals and that would be ethically defensible in relation to our informants" (p. 68).

With deeply rooted standpoints and few universal principles, how should one treat texts and websites, which may or may not be vital to the subjectivity of the author; which may or may not be considered private by the author; which may or may not be important to our individual research

goals? There are no simple conclusions to be drawn in the arena of ethical Internet research. Institutional research boards will continue to regulate the activities of scholars. National, regional, and cultural principles will undoubtedly remain distinct: ethical guidelines are entrenched in larger socio-political-economic structures of meaning. Internet researchers will continue to argue the issues of publicly accessible documents; anonymity; copyright; presentation of other; and privacy. Excellent overviews of opposing positions can be found in various journals, online reports, and conference/workshop proceedings.⁵

Given the variations in ethical stances as well as the diversity of methodological choices, each researcher must explore and define research within their own integral frameworks. Thomas (2003) recommends a more proactive approach to ethical behavior than simply adhering to rules set out by IRBs. "In this view, we recognize the potential ambiguity of social situations in which most value decisions are made and commit ourselves not to rules, but to broad principles of justice and beneficence" (p. 197). As to how one might determine what these broad principles actually are, Stephen L. Carter (1996) reminds us of what it means to have integrity. It involves not only discerning what is right and what is wrong, but also acting on this discernment, even at personal cost, and publicly acknowledging and defending one's stance and choices. Acting with integrity, Carter adds, "demands that we take the time for genuine reflection to be certain that the [morality] we are pressing is right" (p. 204).

■ RETHINKING THE PURPOSE OF RESEARCH

My ten years of experience as an Internet researcher lead me to believe that it is time to reassess our priorities and processes as researchers. Instead of asking "how we can protect human subjects through various types of research design?" we will frame better questions and find richer answers by shifting our focus toward the participant. Putting the human subject squarely in the center of the research both shifts the ethical

considerations and allows for socially responsible research.

All ethnographically informed research, particularly in computer-mediated environments, includes decisions about how to draw boundaries around groups, what to leave in as meaningful data and what to dismiss as unimportant, and how to explain what we think we know to our audiences. These research design decisions, which are often dismissed as simple logistics and not often mentioned in methods texts or ethics discussions, influence the representation of research participants, highlight particular findings while dismissing others, create ideologically charged bases of knowledge and, ultimately, impact legislation and policy making. This chain of events requires astute, reflexive methodological attention. We make choices, either consciously or unconsciously, throughout the research process. Researchers must grapple with natural and necessary change engendered by vivid awareness of the constructed nature of science, knowledge, and culture.

One way to meet the future is to learn from but not rely on the past. Practically speaking, this involves a return to the fundamental question: Why are we doing research? Politically speaking, this involves taking risks that will productively stretch the academy's understanding of what inquiry intends to produce.

The Internet continues to provide a unique space for the construction of identity in that it offers anonymity in an exclusively discursive environment. The difficulty of observing and interviewing in these contexts is that our expectations remain rooted in embodied ways of collecting, analyzing and interpreting information. Simply put, our methods are still more suitable for research in physically proximal contexts. Moreover, although the technology of the Internet has afforded us greater reach to participants and provided a space for researchers to interact with participants in creative ways, our epistemological frameworks have not yet shifted to match this reality. It is necessary not only to accommodate the features of computer-mediated communication into our basic assumptions, but also to

interrogate and rework the underlying premises we use to make sense of the world.

Computer mediated communication highlights key paradoxes of social research in that personae being represented are already one step removed from their bodies when encountered by the researcher. Doing research of life online has compelled me to recognize that I have always taken for granted my ability to parse human experience by carefully paying attention to people's activities in context. Engaging in meaningful experiences with anonymous beings and interviewing people I cannot see face to face, I can identify many of the weaknesses of qualitative research processes in general. Interviewing or observing in natural settings, researchers rely on the ability to judge a face, looking for visual signs of authentic emotion and inauthentic pretense. We make immediate categorizing decisions based on first impressions, listening to the tenor of a voice on the phone or looking at body type, ethnic markers, hair style and color and clothing brands. Even the most astute and cautious researchers unconsciously rely on habitual patterns of sense making in everyday interactions with others.

We must directly engage the fact that the questions driving the research must change to accommodate the enduring partiality of scientific knowing. Political action is a sensible shift, therefore, in that it does not seek to find the truth, but to create the possibilities for people to enjoy a better life.

In whatever ways we utilize the potential of Internet-mediated communication to facilitate our social inquiry, ethically sensitive approaches are complicated, even impeded, by our methodological training. Depending on the academic discipline we find ourselves working within, we will be encouraged in varying degrees to oversimplify the complexity of human experience, transforming the mysteries of interaction into discrete variables that are easily measured. This is done for admirable reason and by no means am I recommending a complete dismissal of traditional means of collecting and analyzing data. At the same time, Internet contexts prompt us to reconsider the foundations of our methods and compel us to assess the extent to which our methods are

measuring what we think they are, or getting to the heart of what we have assumed they did. Through the Internet, we have the opportunity to observe how written discourse functions to construct meaning and how textual dialogue can form the basis of cultural understanding. The taken-for-granted methods we use to make sense of participants in our research projects need thorough reexamination in light of our growing comprehension of how intertextuality literally occurs.

Even within a contemporary framework of sociological inquiry—whereby the distinction between the researcher and researched is problematized, the researcher's role is acknowledged, and bias is accepted as a fundamental fact of interpretation—our obligation to the participant remains. We make decisions, conscious or unconscious, about what constitutes the virtual field and subject of study. Often dismissed as logistical, research design decisions, these choices make a great difference in what is studied, how it is studied, and eventually, how society defines and frames computer-mediated communication environments. Because Internet-based technologies for communication are still new and potentially changing the way people live their everyday professional and personal lives in a global society, it is essential to reflect carefully on the ethical frames influencing our studies and the political possibilities of our research.

■ NOTES

1. It is important to note that although this chapter focuses on computer-mediated communication, the capacities and consequences extend well beyond the desktop or laptop. For excellent discussions of the ways in which mobile telephones influence identity and cultural constructions, see Howard Rheingold (2002) or Katz and Aakhus (2002).

2. The trend is exaggerated here to illustrate the extremes. Speculative and exaggerated accounts are important to consider because they influenced research premises throughout the 1990s. This is not to say that empirical research was absent or unimportant. The impact of electronic technologies on individual communication practices and social structure has been explored for decades, most well represented by

scholars like Marshall McLuhan (1964), Harold Innis (1964), James Carey (1989), and Neil Postman (1986, 1993). Throughout the 1980s, significant empirical and theoretical research examined the impact of computers and information technology on the practices and structures of work. Sociological accounts (e.g., Turkle, 1984) studied important intersections of technology, self, and society. Crucial to the point is that many exciting but exaggerated texts appeared in the early 1990s, both in trade and academic presses, which fueled further speculative research and led to the publication of accounts that had more novel appeal than careful scholarship in an era of exciting new technological developments. As this field of inquiry evolves, it is vital to examine with a critical lens the foundations upon which current theoretical premises may be built.

3. A similar categorization of critical junctures was developed by the author for a keynote address at a Nordic conference on Ethics and Internet research and has been used subsequently in related publications (Markham, 2003a, 2003b).

4. The material in this section is being written concurrently for a chapter in an edited collection (Markham, 2003c).

5. *The Information Society*, for example, hosted a special issue in 1996 on the ethics of Internet research. The Association of Internet Researchers released a comprehensive report of various stances, comparative guidelines and an extensive list of resources (2002); a conference panel yielded a set of articles which lay out various perspectives in a special issue of *Ethics and Technology* (2002); the first Nordic conference and graduate seminar on ethics and Internet research yielded the edited volume *Applied ethics in Internet research*, containing keynote addresses and case studies by Scandinavian students (Thorseth, 2003); and an edited volume by Johns, Chen, and Hall, (2003) entitled *Online social research* offers various perspectives and cases. Many other sources discuss both general and specific issues related to Internet research and ethics. All of these resources offer both novice and experienced researchers valuable philosophical, practical, and legal information.

ANALYTIC PERSPECTIVES

Paul Atkinson and Sara Delamont

In this chapter, we examine a number of related themes under the aegis of analysis. The analysis of data derived from qualitative research strategies is a potentially vast field. It is not our intention to generate a comprehensive review of the history of analysis (Lincoln & Denzin, 2003) or of all its current manifestations (Hardy & Bryman, 2004). There are entire books that go some way in that direction, and virtually no textbook or handbook achieves complete coverage. Rather, through a selective review, we highlight what we think are some key issues confronting the research community. We do not, therefore, offer a prescriptive view on how data should be analyzed. Textbooks on methods themselves are the appropriate place for such practical guidance (e.g., Coffey & Atkinson, 1996; Silverman, 1997, 2004). Rather, we survey the methodological terrain selectively as we perceive it.

The extraordinary diffusion of qualitative research among the social and cultural disciplines is a welcome development, and it is one to which we have made modest contributions (Atkinson, Coffey, & Delamont, 2003; Delamont, 2002; Hanumersley & Atkinson, 1995). We are personally and professionally committed to disseminating further qualitative research methods and the published work that derives from them. On the other

hand, the very proliferation of qualitative research brings in its train some potential problems. The conduct of qualitative work has become fragmented. During an era of hyperspecialization in the academy and beyond, qualitative research has been subject to the same forces. The range of specialties and emphases can be gauged by inspecting, by way of example, the contents of recent and current edited collections (Denzin & Lincoln, 1994, 2001; Gubrium & Holstein, 2002b; Seale, Silverman, Gubrium, & Gobo, 2004; Silverman, 2004). As qualitative research has become increasingly professionalized and increasingly subject to explicit codification and reflection, it seems to have become increasingly fragmented.

In the section that follows, we review that process of fragmentation, identify some of its contours and consequences, and suggest some more positive ways of thinking about the proper relations between different methods. In particular, we affirm the rather unfashionable position that there are kinds of social activity and representation that have their indigenous modes of organization. Language and discourse, narratives, visual styles, and semiotic and cultural codes are culturally relative and arbitrary, but they nevertheless display orderliness that is relatively stable and predictable, observable, and describable. Although

strongly determinist forms of structuralism or semiotics might not prove to be tenable, that is no excuse for abandoning altogether disciplined attention to such intrinsic ordering principles. Qualitative research needs to remain faithful to that indigenous organization.

We then turn our attention to a different but related issue, that is, the fragmentation of justifications for qualitative analysis and the interpretation of the social world. We contrast a centripetal tendency, a tradition that has tended toward a convergence or consensus within the field (especially in sociology), with a centrifugal tendency that has celebrated and promoted diversity among analytic strategies. The former represents a canonical tradition within the intellectual field, whereas the latter represents a more radical and sometimes transgressive mode. Recent accounts of the history of qualitative research and its practices, with which our own views diverge, tend to locate these differences within a developmental framework, tracing an intellectual history for qualitative research away from a positivist stance toward carnivalesque postmodern diversity (e.g., Lincoln & Denzin, 1994, 2001). Although we recognize that such accounts are partially correct in describing some changes in the most visible thinking, we differ in how best to capture the underlying differences (Atkinson, Coffey, & Delamont, 1999, 2001, 2003). We recapitulate and explore some of these issues briefly. Our perspective is not, however, based on a rear-guard appeal to earlier versions of ethnographic or qualitative research and a return to the earlier certainties associated with the "classics" of methodological literature (cf. Atkinson et al., 2003). Our critical stance is, therefore, very different from that articulated by commentators such as Brewer (2002), who seemed to assert a rather vulgar form of realist analysis in distancing himself from postmodernist analytic strategies. Our critical stance also differs from those that embrace and endorse the claims of postmodernism.

We go on to discuss another major axis of contestation within the qualitative tradition and its current manifestations. We suggest that there is a major line of cleavage that separates disciplines

or subdisciplines and individual researchers from one another, although it is not always apparent to the main protagonists in the field. We suggest that this reflects differing emphases on experience and action. During recent years, a good deal of qualitative research has been justified, analyzed, and represented in terms of social actors' experiences of their own social worlds, that is, of changes over the life courses of biographical phenomena and disruptions such as mental and physical ill health (Ellis & Flaherty, 1992). In a parallel way, qualitative research has sometimes been transmuted from the biographical to the autobiographical and autoethnographic (Bochner & Ellis, 2001; Ellis, 2004; Reed-Danahay, 1997, 2001). We do not think, however, that this is derived from a self-evident reason for conducting qualitative research. The purpose of such research is not always to understand the world from the actor's or informant's own perspective or to gain access to his or her personal private realms of experience and feeling (Behar, 1996; Fernandez & Huber, 2001; Radstone, 2000). A great deal of the foundational work in ethnography and other qualitative research was concerned with the analysis of collective social action, that is, how members of society accomplish joint activity through language and other practical activities as well as how they align their activities through shared cultural resources. From this latter perspective, even motives, emotions, intentions, and the like are matters of collective action, expressed through the codes of shared idioms. These distinctions need to be made visible so that the analysis of ethnographic and other data does not become confused (Atkinson et al., 2003; Gubrium & Holstein, 2002a, 2002b).

We then consider another related but distinct issue, that is, the aestheticization of analysis and representation. As some analysts and commentators have moved toward various postmodernist positions, they have sought to free qualitative analysis from the conventions of academic textual writing (Ellis & Bochner, 1996; Goodall, 2000). We thoroughly endorse the principle of critical reflection on the conventions through which social worlds and social actions are reconstructed.

Just as we recommend paying attention to the conventional orders of culture and action, we also recommend paying attention to the conventions of textual production and reception. But we warn against the wholesale acceptance of aesthetic criteria in the reconstruction of social life. In many contexts, there is a danger of collapsing the various forms of social action into one aesthetic mode—that is, implicitly revalorizing the authorial voice of the social scientist—and of transforming socially shared and culturally shaped phenomena into the subject matter of an undifferentiated but esoteric literary genre. (For examples of work that we believe exemplify this trend, see Clough, 1998; Richardson, 1997, 2002.)

Finally, we consider the implications of our remarks for social critique. We suggest that an engaged social science should indeed remain faithful to the intrinsic order of social life. We need—more than ever before—principled, systematic, and disciplined ways of accounting for the social world and to the social world. We need to be able to produce accounts of the social that can recognize the conventions of: media representations, of fashion and consumer culture, of political and everyday discourse, of scientific knowledge, of cinematic and other visual codings. Accounts that reduce the social world to a domain of experience cannot generate faithful, let alone critical, analyses of culture and action.

■ ANALYTIC FRAGMENTATION

We have no quarrel with attempts to define and practice appropriate strategies for the analysis of particular kinds of data. Indeed, we want to insist on the proper disciplined approach to any and every type of data. In addition, we want data to be analyzed and not just reproduced and celebrated (as sometimes happens with life histories and visual materials). Our main message, however, is that the forms of data and analysis reflect the forms of culture and social action. For instance, we collect and analyze personal narratives and life histories because they are a collection of types or forms—spoken and written—through

which various kinds of social activity are accomplished. They are themselves forms of social action in which identities, biographies, and various other kinds of work get done (Orch & Capps, 2002; O'Dell, 2001; Patterson, 2002). Thus, we accord importance to narratives and narrative analysis because they address important kinds of social action (Atkinson, 1997; Bauman, 1986; Riessman, 2002). In the same spirit, we should pay serious attention to visual data insofar as culture and action have significant visual aspects that cannot be expressed and analyzed except by reference to visual materials. This is by no means equivalent to the assumption that ethnographic film or video constitutes an especially privileged approach to sociological or anthropological understanding (Ball & Smith, 2001; Banks & Morphy, 1997; Pink, 2001, 2004). The same can be said of other analytic approaches. Documentary analysis is significant insofar as a given social setting is self-documenting and important social actions are performed in that setting (Prior, 2003; Scott, 1990). Texts deserve attention because of their socially organized and conventional properties and because of the uses they are put to in their production, circulation, and consumption. The same is true of other material goods, artifacts, technologies, and so forth (Tilley, 1991, 1999, 2001). The analysis of dramaturgy, likewise, is important insofar as social actors and collectivities engage in significant performative activities (Denzin, 2003; Dyck & Archetti 2003; Gray & Sinding, 2002; Hughes-Freeland, 1998; Tulloch, 1999). But it should not be treated as a privileged way in which to approach all of social life.

We believe, therefore, that it is important to avoid reductionist views that treat one type of data or one approach to analysis as being the prime source of social and cultural interpretation. We should not, in other words, seek to render social life in terms of just one analytic strategy or just one cultural form. The forms of analysis should reflect the forms of social life, their diversity should mirror the diversity of cultural forms, and their significance should be in accordance with their social and cultural functions.

We identify these different analytic approaches not merely to celebrate diversity, that is, not to propose a vulgar version of "triangulation" through methodological pluralism and synthesis (Denzin, 1970; Janesick, 1994). Quite the reverse—we want to assert the importance of rendering the different facets of culture and social action and of reflecting their respective forms. We want, therefore, to affirm that aspects of culture and the mundane organization of social life have their intrinsic formal properties and that the analysis of social life should respect and explore those forms. In so doing, we react against some analytic tendencies that have undervalued anything that smacks of formal analysis. Such formalism seems to fly in the face of the most fashionable appeals to post-modernism. Yet discourse, narratives, performances, encounters, rhetoric, and poetics all have their intrinsic indigenous modes of organization. So too do visual, textual, material, and other cultural embodiments. It is not necessary to endorse a narrowly structuralist analytic perspective or endorse unduly restrictive analyses to recognize the formal properties of talk, the codes of cultural representation, the semiotic structures of visual materials, or the common properties of narratives and documents of life.

It is necessary, therefore, for ethnographers and other analysts of social life to pay attention to the analytic imperatives of such socially shared codes, conventions, and structures. The forms of social and cultural life call for equivalent analyses. These methodological principles give us a way of addressing some fundamental methodological precepts in a disciplined way. Herbert Blumer enunciated the principle that research should be "faithful" to the phenomena under investigation (Blumer, 1954; Hammersley, 1989). In its most general form, this methodological precept seems to beg all the important questions, seeming to imply that one can know the phenomena prior to their investigation. A naively naturalist interpretation is clearly inappropriate. Our formulation retrieves for Blumer's principle a more methodologically precise formulation—a more restricted but more fruitful approach. It implies that fidelity to the phenomena means paying attention to the

forms and media through which social actions, events, and representations are enacted, encoded, or embodied. It also gives a particular rendering of the notion of "thick description" (Denzin, 1994; Geertz, 1973, 1983). Our approach can be extended to a commentary on versions of "grounded theory" and cognate strategies such as "analytic induction" (Atkinson et al., 2003; Znaniecki, 1934). Again, there are multiple versions of grounded theory, and they have been thoroughly documented (Charmaz & Mitchell, 2001; Glaser, 1978, 1992; Glaser & Strauss, 1967; Strauss & Corbin, 1998). We do not, incidentally, advocate that all ethnographies should deploy every conceivable analytic procedure and examine every possible data type in the interests of a spurious kind of comprehensiveness or "holism." On the other hand, our insistence on attention to the forms of culture and social action gives particular force to notions such as holism. In our version of research methodology, this can refer not to the doomed attempt to document "everything" but rather to a principled respect for the multiplicity of cultural forms. Thus, holistic analysis would refer to *preserving* these forms that are indigenous to the culture in question rather than collapsing them into an undifferentiated plenum.

In the following sections, we elaborate on these general remarks. Before doing so, we outline a number of key analytic areas that demonstrate the force of our general argument. These are among the analytic strategies that can and should contribute to the systematic analysis of social settings, action, and organization.

■ ANALYTIC STRATEGIES

Narratives and Life Histories

We should not collect and document personal narratives because we believe them to have a privileged or special quality (Atkinson, 1997; Atkinson & Silverman, 1997; Conle, 2003; Cortazzi, 1993, 2001). Narrative is not a unique mode of organizing or reporting experience. In addition, narrative is an important genre of

spoken action and representation in everyday life and in many specialized contexts (Czarniawska, 1997, 1998; Riessman, 1993, 2002). We should, therefore, be studying narrative insofar as it is a particular feature of a given cultural milieu (e.g., Caplan, 1997; Cortazzi, 1991; Gardner, 2002; Lara, 1998; Myerhoff, 1978; Voysey, 1975). Furthermore, narratives are not independent of cultural conventions and shared formats (Holstein, 2000). They are not uniquely biographical or autobiographical materials, and they certainly do not convey unmediated private "experience." Likewise, they do not convey "memory" as a psychological phenomenon. Experiences, memories, emotions, and other apparently personal or private states are constructed and enacted through culturally shared narrative types, formats, and genres (Humphrey, Miller, & Zdravomyslova, 2003; Olney, 1998; Plummer, 1995, 2000, 2001; Tota, 2001; Wagner-Pacifici, 1996). They are related to story types more generally (Fine, 2001). There are affinities with other kinds of stories—of history, mythology, the mass media, and so forth. We need, therefore, to *analyze* narratives and life materials so as to treat them as instances of social action, that is, as speech acts or events with common properties, recurrent structures, cultural conventions, and recognizable genres. Therefore, we treat them as social phenomena like any others. Indeed, we need to treat narratives as performative acts (May, 2001) and treat them as forms of social action like any others.

Visual Data

The collection and analysis of visual materials tends, unfortunately, to be treated as the preserve of a specialist domain. The production of ethnographic film has a long history, although it has often been oddly divorced from the mainstream textual practices of the ethnographic monograph (Ball & Smith, 1992, 2001; Banks & Morphy, 1997). The use of photography for ethnographic purposes has also been relegated to a somewhat specialist subfield when it has not been relegated to mere illustration of the written monograph (Loizos, 1993). During recent years, the development of

small digital camcorders and the development of digital photography have created an enormous range of possibilities for ethnographers in the field. Consequently, visual anthropology and sociology should not be treated as separate genres or specialties. There are many aspects of culture that are intrinsically visual. Many cultural domains and artifacts can be grasped only through their visual representations and the structured properties of their visual codes (Ball & Smith, 2001).

There are many social phenomena that can and should be analyzed in terms of their appearances and performances that may be captured in visual terms. These are not, however, separable from the social settings in which such phenomena are generated and interpreted. They should not be explored purely as "visual" topics; rather, they should be explored as integral to a wide variety of ethnographic projects. Visual phenomena—the mundane as well as the self-consciously aesthetic—have their intrinsic modes of organization (Crouch & Lubbren, 2003). One does not need to endorse the most determinist versions of semiotics or structuralism to recognize that visual culture embodies conventions and codes of representation. There are culturally determined aesthetic and formal principles, and there are conventional forms of representation and expression.

Attention to visual culture also implies serious attention to the ethnoaesthetics of the producers, mediators, and consumers of visual materials. We need to not only "read" the visual but also understand ethnographically how it is read by members of the social world or culture in question (Grimshaw, 2001). In general terms, there has been insufficient attention to the aesthetic codes and judgments deployed by members of a given culture (Attfield, 2000). We know about specialized domains of aesthetic work such as the visual arts. We also know something about the aesthetics of everyday taste in clothes and fashion (Valis, 2003). In addition, there is research relating to the decoration and consumption of domestic spaces and objects (Henderson, 1998; Julier, 2000; Miller, 1987; Painter, 2002). In other contexts, there are studies of the visual cultures of advertising and other media of representation (Frosh, 2003).

However, there are still many cultural domains in which local aesthetic criteria are important, but their analysis remains poorly integrated within the general ethnographic tradition; for instance, see DeNora (2000, 2003) on music in everyday life as a topic for ethnographic investigation (cf. Bennett & Dawe, 2001; Whiteley, Bennett, & Hawkins, 2004).

Discourse and Spoken Action

The collection and analysis of spoken materials is one domain where overspecialization is a danger. The development of discourse analysis and conversation analysis has been one of the most egregiously successful domains of qualitative research. Its disciplinary bases have been varied, including linguistics, sociology, and psychology. The emergence of conversation analysis from the work of Harvey Sacks and other ethnomethodologists has been a remarkable contribution to the disciplined empirical study of social order and social action (Atkinson & Heritage, 1984; Moerman, 1988; Sacks, 1992). In the past, there has been a distinct tendency for these approaches to spoken language to become narrowly restricted specialties. Conversation analysis has, in particular, been unduly bounded and self-referential in some cases. There is no need to restrict our analysis of social worlds exclusively to those phenomena that are susceptible to recording for conversation—or discourse—analysis. We need, in contrast, to ensure that the analysis of spoken language remains firmly embedded in studies of organizational context, processes of socialization, routines of work, personal transformation, people processing, and so forth. During recent years, fortunately, the analysis of spoken discourse has engaged more explicitly and systematically with more generic issues of sociological research (e.g., Atkinson, 1995; Sarangi & Roberts, 1999; Silverman, 1987). Spoken language has its own intrinsic forms of organization. Indeed, it demonstrates a densely structured organization at every level, including the most finely grained. It is important, however, that

discourse analysis, conversation analysis, discursive psychology, and the like not be treated as analytic ends in their own right and not be intellectually divorced from other aspects of ethnographic inquiry. The expert knowledge required should not be regarded as a specialty in its own right and independent of wider sociological or anthropological competence. The conventions of language use need to be analyzed, therefore, in relation to more general issues of identity, the interaction order, moral work, and the organization of social encounters. In addition, it is important for analysts of spoken action to remain sensitive to wider issues of social analysis and critique and for practitioners of more general qualitative analysis to engage with and use the methods and findings of discourse and conversation analysis. Key discussions that identify the relationships between discourse/conversation analysis and central issues of social research include the accounts by Potter (1996, 2003), Hepburn and Potter (2004), and Potter and Wetherell (1987).

Material Assemblages and Technologies

The study of material goods and artifacts, technology, and other physical aspects of material culture deserves systematic attention in many ethnographic contexts (Tilley, 1991, 1999), but is too often relegated to specialized esoteric studies or to highly specific topics. The latter include studies of technology and inventions, of very particular kinds of physical display such as museums and art galleries, and of highly restricted kinds of artifacts such as religious, ritual, and artistic objects. But the detailed investigation of objects, assemblages, and inventions demands a place in the general ethnographic study of social and cultural forms (Appadurai, 1986; Bijker, 1995; Macdonald, 2002; Macdonald & Fyfe, 1996; Pinch & Trocco, 2002; Rabinow, 1996; Sandburg, 2003; Saunders, 2003).

It is vital that the study of physical objects, memorials, and technologies be thoroughly incorporated into more general field studies of work organizations, informal settings, cultural

production, domestic settings, and so forth (Filley, 2001). Artifacts and technologies are themselves understood, used, and interpreted by everyday social actors. They are used to document and record the past—and indeed to construct the past—and there is much to be learned from the local situated “ethnoarchaeology” of the material past (Dicks, 2000; Edwards, 2001; Gosden & Knowles, 2001). This includes the “monumental past” of places and their ethnohistories (cf. Herzfeld, 1991; Sciama, 2003; Yalour, 2001). Issues of practical utility and aesthetic value intersect. Ideas of authenticity may be brought to bear on artifacts and assemblages (Forty & Kuchler, 1999; Handler & Gable, 1997). They may be used to display and warrant individual and collective identities; for instance, the “collection” (whether personal or national) is expressive of taste, identity, commitment, and enthusiasm (Miller, 2001b; Painter, 2002; Quinn, 2002). The material goods of fashion and conspicuous consumption are likewise expressive of status and aspirations. The archaeology of the present, as it were, needs to be integrated with the ethnographic imagination and to enrich the ethnographic eye (cf. Attfield, 2000). Much contemporary ethnographic fieldwork is oddly lacking in material content and physical goods, whereas informants’ “voices” are transcribed from an apparent physical void. Field research needs to pay systematic attention to the physical embodiments of cultural values and codings.

More generally, this leads to a consideration of material culture. The material embodiment of culture and the cultural connotations of things have become prominent in recent cultural anthropological analyses (English-Lueck, 2002; Finn, 2001; Lury, 1996). Recent examples have included examinations of: home computers (Lally, 2000); mobile communications (Katz & Aakhus, 2002); photographs (Frush, 2003); cars (Miller, 2001a); and memorabilia (Kwint, Breward, & Aynsley, 1999). These accounts transcend and transform the mundane material world into domains of signification. We do not need to subscribe to unduly strict and rigid

formalisms to recognize that such phenomena can be analyzed in terms of their semiotic codes and conventions.

Places and Spaces

Most ethnographic reportage seems oddly lacking in physical location. Many sociological and anthropological accounts, for instance, have but sketchy descriptions of the built environment within which social events and encounters take place. The treatment of space is too often restricted to aspects of human geography, urban studies, and architecture (Darby, 2000). It also needs to be integrated within more general ethnographic accounts. But ethnoarchitecture is—as we know from some anthropological accounts—significant in defining the spaces and styles of everyday living (Dodds & Taverner, 2001). Built spaces provide symbolic boundaries as well as physical boundaries (Borden, 2002; Butler, 2003; Crowley & Reid, 2002). They physically enshrine collective memories as well as more personal biographical and emotional work (Bender & Winer, 2001). Homes are endowed with emotional and cultural value through the expression of taste and cultural capital, the celebration of historical authenticity, or the observance of modern minimalism (Jackson, Lowe, Miller, & Mort, 2000). Public spaces also embody tacit cultural assumptions—about the classification and processing of people and things, about commercial and professional transactions, about political processes and citizenship (Benjamin, 1999; Möller & Pehkonen, 2003). The ethnographic exploration of places and spaces includes the commercial transformation of them through tourism and heritage work, the transmutation of downtown areas and waterfronts, the recreation of industrial pasts into leisure and entertainment, and the construction of replicas and spaces for “experience” (Dicks, 2000).

These brief and partial observations are not intended to map out a comprehensive view of the current research literatures or of the general possibilities that they open up for ethnographic and

other qualitative social research. More important, these observations are not intended to be a list of actual or potential domains of specialization. On the contrary, the thrust of our argument so far is that these various aspects of culture and the specialized coteries of researchers who document them should not exist in mutual isolation. The goal of ethnographic accounts of everyday life, particularly cultural and organizational milieus, should be to use such analytic perspectives and to analyze such materials in constructing multilayered accounts of the social world.

These observations are not intended to be a comprehensive listing of all relevant domains and strategies of inquiry. On the contrary, our remarks have been highly selective. We have deliberately offered some remarks on a few key fields of research to illustrate and develop our more general argument concerning the treatment of qualitative data in the analysis of social organization and action, social identities and biographies, social contexts and institutions.

■ THE ORDERING OF THE SOCIAL WORLD

It would be easy to misrepresent our remarks. We are not simply suggesting a promiscuous series of analytic perspectives and strategies. We are not advocating simply putting data types and analytic types together in the interests of an ill-defined holism. The holistic ideal has, from time to time, been proposed as the goal of ethnographic and other qualitative research, although few social scientists nowadays would recognize the existence of phenomena such as “communities” that can be described holistically anyway. Such an ideal implies a degree of temporal, spatial, and cultural closure that is a chimera. We do recommend systematic attention to these data types and analytic perspectives because they reflect certain principles of intrinsic organization.

It is not altogether fashionable to invoke notions such as intrinsic organization in the analysis of social life (cf. Atkinson & Delamont 2004). During the era of poststructuralism and postmodernism, there is widespread rejection

of anything that suggests “structure” or stable patterning in social and cultural forms. We believe, on the other hand, that we should recognize that forms can be identified and that they can serve as the basis of an analytic approach to qualitative social and cultural data. Moreover, an approach such as this gives us principled ways of understanding data of different sorts as reflections of the codes of social order. It also gives us ways of reconciling a number of tensions within the current treatment of qualitative research.

It is not necessary to invoke completely determinate and invariant structures so as to identify indigenous principles of order in particular forms of social action. The most obvious starting point—and it is one where there is no room for dispute—lies in the organization of spoken discourse. Discourse analysis and conversation analysis are virtually interchangeable from this perspective, and the disciplinary differences between them are insignificant for our purposes. It is not necessary to recapitulate their major findings here. But the general principles need reaffirmation. From the current vantage point, it is perhaps hard to reconstruct the recentness of any attention to spoken discourse as an object of analysis (as opposed to hypothetical texts or written materials) and of any attention to utterances in their natural context (as opposed to decontextualized individual sentences). The recognition that there can be *order* beyond the syntax of the individual sentence or beyond the single utterance is a relatively recent one. It follows, to a considerable extent, the technology of permanent recording that has permitted the close scrutiny of such phenomena, transforming spoken discourse into an object of inquiry and transforming its features into a topic of sociological, psychological, and linguistic inquiry.

The emergence of discourse analysis has transformed our collective appreciation of the interaction order in ways foreshadowed by Goffman's pioneering remarks and the no less original observations by Sacks (Goffman, 1981; Sacks, 1992; Silverman, 1998). It establishes the fundamental and pervasive principles of order, not least at the micro level of organization. Order

in this sense displays itself through a remarkable array of socially shared devices, the operation of which produces and reproduces orderly conduct. The distinctive character of these devices is that they are used locally and recursively to generate strings of ordered interactions. The participants do not need to "know" the overall structure of the encounter to generate it in a predictable and stable way. They do not even need to be aware of the conventions they are using. Similar considerations apply to orderly conduct apart from spoken language. The recursive application of simple rules, in a practical way, generates orderly activity. To generate "structures" such as queues and turn-taking systems, for instance, each participant needs only to apply a simple chaining rule (i.e., "next participant follows the previous actor") and to know his or her relative position for the system to be self-replicating. Again, no actor needs to know the sequence of a complete queue for it to work smoothly, provided that each actor applies the same basic rule.

It is in this sense, therefore, that spoken and unspoken actions can display intrinsic orders that are in some sense independent of the actors' consciousness or intentions. In a similar vein, we can detect the interaction of physical and spoken actions. The capacity we now have to capture and inspect videotapes of human actions and processes of interaction already allows us to identify stable patterns of gesture in a way that was unavailable to earlier generations of observers. To this point, the social sciences have been relatively slow to fully explore the opportunities opened up by new digital technologies. We do know, however, that we can identify recurrent and interactionally functional patterns of movement and repertoires of gesture at a level of delicacy that only such permanent recordings render possible. As we have suggested, many of these analytic opportunities are dependent on contemporary recording technology. The important thing, however, is not the technology per se but rather the opportunity to pay close and systematic analytic attention to the *structures* of action. We can identify what Goffman (1983) referred to as an "interaction order" that displays ordering features that are

relatively independent of the individual social actors who bring them into being. We know that social actors notice when the interaction order breaks down and that they share devices that repair mistakes and restore orderly functioning. But they do so as matters of preconscious action. Order is achieved and repaired through the application of recipes of action in a serial fashion. Complex structures and extended chains of action can be generated in a stable and smooth fashion through the local application of simple generative rules applied in a stepwise fashion.

We can identify recurrent ordering principles at a level of organization even greater than turn-by-turn discourse. The close analysis of narratives and similar spoken performances shows them to have recurrent structures. There have been various successful attempts to describe large-scale ordering principles for narrative events. Labov's pioneering work is one key example. Labov's groundbreaking work on language in society was innovative in various ways, with his work on spoken narratives being one example (Labov, 1972). Labov documented a number of basic structural elements that were part of the "grammar" of personal stories and accounts. Although not all of the structural elements were absolutely necessary for the production of a competent narrative, they recognizably generated stories that are sequentially coherent, deliver the story content competently, and are suitably "pointed" to make the story intelligible to speaker and hearer alike (Labov, 1972). We do not need to regard these as "deep structures," or as exerting mysterious powers over social actors, to acknowledge the recurrent patterning of narratives. A similar vein of analysis has been undertaken by Hymes (1996). Hymes's treatment, perhaps less well known than that of Labov, is more subtly grounded in an appreciation of *ethnopoetics*, that is, the culturally specific conventions of aesthetics and rhetoric that inform the competent performance and reception of oral performances. Hymes demonstrated principles that create distinctive internal structures within narratives and other oral performances. From his treatment of the materials, it appears that it is not necessary to reorder actors' own words into

"poetic" reconstructions rather than to uncover the ethnopoetic structures and aesthetic principles that are indigenous to many narratives and other accounts.

Forms and functions of narratives and accounts are also identifiable from many analyses of respondents' accounting devices. Among these are the rhetorical repertoires or registers employed by natural scientists to express and reconcile recurrent features of scientific work. Gilbert and Mulkay (1984) demonstrated that natural scientists deploy alternating repertoires to account for scientific discoveries. Scientists proffer explanations that reflect the contingencies of personal and local characteristics while simultaneously attributing scientific discovery to the inexorable and impersonal revelation of nature. They reconcile any discursive or cognitive discrepancies by appealing to the mediating device that "the truth will out" in any event (Gilbert & Mulkay, 1984). A similar analysis of experts' accounts can be found in a subsequent analysis of the rhetorical work of health economists, whereas Atkinson and his colleagues have developed a similar analysis of a research group's accounts of its own scientific breakthrough (Atkinson, Batchelor, & Parsons, 1998). Accounting devices or registers are relatively stable features of these and similar accounts.

In a similar fashion, we have a large number of analyses of professionals' accounts of their work, including the formulation of phenomena such as "cases" and "findings." Occupations such as medicine and social work have narratives and accounts included in their stock-in-trade (Atkinson, 1995; Hunter, 1991; Pithouse, 1987). Their practitioners' routine work is constructed through various kinds of spoken performance. Practitioners persuade one another concerning diagnoses and assessments through the construction of cases that are, in turn, dependent on narrative structures; they use rhetorical devices to invoke evidence in support of their arguments. These are characterized by recurrent rhetorical features of their professional talk. They use characteristic devices to encode issues of evidence, competence, and responsibility in the course of collegial talk.

In a very similar vein, we can identify rhetorical features of legal discourse through which cases are constructed, evidence is assembled and presented, or judgments are justified. Again, the major issue here lies not in the local details of particular settings or occupational groups but rather in the presence of stable regular features of spoken actions that can be identified. They can, in turn, be examined in terms of the sort of work that they perform. In other words, analytic payoff resides not only in identifying the patterns, structures, and conventions that generate such activity but also in analyzing their moral and practical implications.

We can extend such analytic perspectives beyond the individual narrative. There are systems of *genre*. There are culturally defined and socially shared types of story formats. The existence of such generic types means that we should not regard narrative accounts as reflections of private and individual experiences. Although narratives and biographical accounts may be felt and expressed as if they were highly personal, they are constructed and received in terms of cultural idioms and formats. This is demonstrated well in Plummer's (1995) analysis of sexual stories. Although accounts of coming out or of being a rape victim might be thought of as extremely private—and indeed in one sense they are—Plummer's analysis showed that they are couched in terms of shared forms or genres. Culturally defined formats can be identified in many contexts of spoken and written performance. They prescribe the shape and content of many descriptions and accounts. Many of the forms with which we are entirely familiar, to the point of taking them for granted, are highly conventional—or even arbitrary—cultural impositions. The analyses of documentary types such as the scientific report demonstrate that there are historical and culturally prescribed conventions through which the "plain facts" of nature and its exploration are conveyed. The work of authors such as Myers (1990) is testimony to the significance of the genre of the scientific report.

If it is fairly self-evident that discourse, descriptions, and narratives display indigenous principles

of structure and order, we do not need to restrict such analyses to language. The general principles of semiotics can be applied to cultural systems of signification. Hence, visual and material data can be examined in terms of their intrinsic orders. The systems of fashion and clothing, for example, are not exhaustively defined in semiotic terms, but one can readily identify the basic structuring principles of such systems. The alternating and contrasting structuring principles that define the fashion system in recent Euro-American culture include the binary contrasts short/long, close/loose, structured/unstructured, full/narrow, colored/neutral, and plain/patterned. Although individual designers can develop their distinctive idiolects from within such systems, overall the semiotic principles help to define a "look" that is shared among many individual designers and houses in defining the distinctive style of a given season. In a similar vein, the "private" domain of fetishistic fantasy and pleasure is defined in terms of culturally defined, arbitrary features (e.g., leather, rubber, high heels, boots) that are themselves derivatives of and transform from the general system of clothing (Barthes, 1983; Hodgkinson, 2002; Manning, 2001; Storr, 2003; Troy, 2002).

Visual styles of many sorts display basic semiotic principles. The visual "languages" of advertising, for instance, use recurrent coding principles that are grounded in representations of gender relations, sexual fantasy, exotic settings, domestic settings, and so forth, with the precise selection and combination of semiotic elements reflecting the product being advertised and the genre of advertisement itself. Goffman's (1979) analysis of gender relations in advertisements in print media is but one example of how advertising forms can be "decoded" from a sociological perspective. In a similar vein, one can identify semiotic principles of style and space in representations of the domestic sphere and its ideals. In the multiplicity of lifestyle magazines and television programs, statements about actual or desired status and identity can be constructed from color schemes, furnishings, and fittings. Styles can be identified through assemblages of materials and objects, for example, defining art nouveau, Bauhaus, art deco,

or modernism. Such aesthetic principles may inhabit places of work as well as domestic environments. The visual and material language of the built environment is also susceptible to semiotic analysis. The use of space within and around buildings, the structures of buildings themselves, and the interior layouts of buildings simultaneously reflect the assemblage of cultural forms as well as the individual or corporate taste of the client and the aesthetic style of the architect.

Our general point here should not be lost in the various types and examples to which we have alluded. We are not trying to produce a comprehensive enumeration of all the cultural phenomena that can be analyzed. Rather, we are suggesting that whatever else these artifacts and activities might be, they display various arrays of structuring and semiotic principles. From the built environment, through domestic spaces, to individual self-presentations, biographies, narratives, and conversations, all of these social phenomena can be understood in terms of their intrinsic principles of structure and order. The collection of qualitative data certainly should not be confined to spoken materials, whether they are naturally occurring spoken interaction data or transcribed interview data. There are multiple media of inscription in which culture is enacted, and social action takes place through multiple embodiments.

■ CLASSIC PRINCIPLES

A systematic ethnography needs to take account of the intrinsic orderings through which social worlds are produced and reproduced. It is not necessary for any one ethnographic study to encompass systems of discourse, narrative, material culture, aesthetics, and performance to satisfy some notional criterion of completeness or adequacy. On the other hand, we should not ignore such structuring principles. There is no long-term benefit to the overall project of social research if styles of data collection and analysis remain fragmented. We certainly need some people to work on specialized technologies and techniques—digital

visualization, discourse structures, semiotic structures, and the like—but those analytic domains must not flourish only in mutual isolation. We do not want to see the social world represented as if it consisted only of transcribed talk, spoken narratives, visual artifacts, or material goods.

We have already referred to Blumer's (1954) recommendation that research should be "faithful to the phenomena." In various ways, adherence to that injunction can prove to be problematic. It is hard to know what should count as phenomena in the first place, and it seems dangerous to assume that they have an essence independent of the methods used to construe them. Clearly, perfect correspondence to an independently identifiable realm of social objects and actions is impossible. We cannot aspire to perfect or comprehensive fidelity or to capture all of the variations to be found among and between types of social actions and actors. But the upshot of our argument is that ethnographers should certainly be faithful to the *forms* of social phenomena. We should be attentive to the indigenous systems of action and representation. We should not think of ignoring the systems of, say, ethnoaesthetics more than we think of mangling the local language(s) of our chosen research setting. Fidelity to the social worlds in which we work requires a systematic analysis of the principles of order they display. At least to that extent, then, we can retain a sense of fidelity and representation that is firmly rooted in social forms and also retains a notion of rigor.

This is, moreover, a productive way of approaching some key implications of "thick description" (Geertz, 1973). Geertz's (1973) use of the term, derived from Gilbert Kyle's philosophy of mind, has been susceptible to many readings. The most vulgar of uses do little or no justice to Geertz's own inspiration. Thick description is too often used to convey the sense that ethnographic accounts are densely constructed with graphic and detailed cultural descriptions. Although this may be the case, it does not really capture the specific analytic force of Geertz's idea, which is clearly intended to capture the degree to which cultural matters are overdetermined in the sense that there are multiple codings that generate meaning. There

are, Geertz stressed, multiple perspectives or interpretive frameworks, that is, multiple motivational frames that inform social events and actions. Our own insistence on the intrinsic forms of culture and action gives a particular force to the notions of thick description. From our point of view, whatever else it might mean or be taken to mean, it should include analytic attention to the multiple codings and structuring principles through which social life is enacted and represented.

In these two senses, therefore, we can bring into close conjunction Blumer's precept and Geertz's insight. Both can find analytic force in the ethnographic analysis that is faithful to the contours of culture and the structures of action. We are mindful at this point to invoke yet a third idea derived from classic accounts of ethnographic analysis, that is, the notion of "triangulation" (Denzin, 1970). Like the first pair of terms we invoked, triangulation has been subject to multiple renderings and misrepresentations. Here, we do not wish to suppress or supersede all other connotations of triangulation, the fruitfulness of which lies partly in the multiplicity of inspirations that researchers can draw from it. Although it is not fruitful to assume, as in oversimplified versions, that research methods or data types can be aggregated to generate a more rounded or complete picture of a social world than would be generated by a single method alone, it might be productive to approach it in a way that is more congruent with our own approach: that is, to recognize that there can be a mode of triangulation derived from an explicit recognition of multiple social orders and principles of structuring. Triangulation thought of in this way has a very specific, if restricted, subset of meanings within the overall analytic strategy. Again, it recognizes the multiplicity and simultaneity of cultural frames of reference—spoken, performed, semiotic, material, and so forth—through which social events and institutions are possible. Consequently, a triangulated account depends not only on an opportunistic combination of methods and sources but also on a principled array of methodological strategies that reflect the indigenous principles of order and action.

Finally, our own approach here gives us some productive ways of recuperating significant aspects of "grounded theory" (Charmaz & Mitchell, 2001; Glaser & Strauss, 1967; Strauss & Corbin, 1998). We have already referred to the contested nature of this idea, or package of ideas, and we do not need to recapitulate the various definitions and applications of grounded theory. We simply reaffirm that grounded theory does not refer to some special order of theorizing *per se*. Rather, it seeks to capture some general principles of analysis, describing heuristic strategies that apply to any social inquiry independent of the particular kinds of data: indeed, it applies to the exploratory analysis of quantitative data as much as it does to qualitative inquiry. The idea derives directly from the pragmatist roots of interactionism. It captures the *abductive* logic through which analysts explore the social or natural world through practical engagements with it, derive working models and provisional understandings, and use such emergent ideas to guide further empirical explorations. It represents a compromise between the arid philosophy of purely deductive logic (which cannot account for the derivation of fruitful theories and hypotheses in the first place and admits of no place for *experience in the process of discovery*) and purely inductive logic (which never transcends the collection and aggregation of observations in generating generalizations). To a considerable extent, therefore, there is little to choose in practice between grounded theory and *analytic induction* as summary accounts of the practical work of social exploration and the derivation of ideas. Both formulations capture the need for systematic interactions between data and ideas as well as the emergent properties of research design and data analysis, which are in constant dialogue. Both formulations also emphasize the processual and iterative nature of the research process.

Too often, however, grounded theory is construed as a justification for the inductive retrospective inspection of volumes of field data, as if the research strategy were based on the accumulation of cases and the introspective derivation of categories—often through an inductive procedure

of data "coding." Some of the descriptions of grounded theory by its own advocates have inadvertently contributed to this impression. But if we take seriously some of the things we have already outlined and claimed, we can discern some possible strategies that suggest principled relationships between data and analysis in a grounded theory manner. In other words, we recognize that culture and action are ordered. Consequently, the work of data collection is not devoted to the accumulation of isolated cases or fragmentary materials, and analysis is not just a matter of sorting and classifying those materials.

Finally, in considering our classic principles, we can sum up several of our themes so far with reference to Schutz's (1973) discussion of first- and second-order constructs. In his development of *verstehen* sociological principles beyond Dilthey or Weber through social phenomenology, Schutz suggested that analytic forms, such as ideal types, are not the sole preserve of the sociological observer. Everyday social actors are engaged in practical interpretations of their own social worlds. They use first-order constructs such as the method of practical reasoning that uses *typifications*. Sociological analysis, therefore, involves a (second-order) meta-analysis of the first-order, everyday analyses of practical social actors. In the same way, everyday social life displays principles of order that the analyst explicates and systematizes. The everyday actor has an implicit grasp of ordering rules and conventions, and it is the task of the analyst to explicate such tacit knowledge (cf. Maso, 2001).

We believe, therefore, that the social world displays various indigenous principles of organization. There are multiple ordering principles—discursive, spatial, semiotic, narrative, and so forth—to which the analysis of qualitative data needs to be attentive. The social analyst develops second-order models of these indigenous codes, conventions, and orders. There should, therefore, be principled relations between the first-order and second-order constructs. There should also be systematic relations between the different second-order analyses and models. Although this formulation might seem to be unduly formalistic,

we believe it to be a salutary corrective to the unduly experiential perspectives currently brought to bear on qualitative data analysis. In the following section, we turn our attention to a parallel set of analytic preoccupations concerned with representation and aesthetics.

■ REPRESENTATION AND AESTHETICS

To this point, we have referred exclusively to the contours of culture, the semiotics of indigenous systems of representation, and the structures of social action. We now turn briefly to the analytic work of writing and other modes of ethnographic representation. We do not recapitulate the history of this particular domain, nor do we review all of the contributions that have been made to it. That work has been done elsewhere. Here, we note that there has been a marked tendency among the more innovative ethnographers to experiment with the textual conventions of ethnographic reportage (Faubion, 2001). The use of nontraditional literary forms or performance techniques has been well documented, and there is a growing corpus of published materials in those forms. Such experiments are usually represented as having radical connotations, and they are among the characteristics of ethnography associated with postmodernist ideas and with the most recent "moments" of Lincoln and Denzin's (1994, 2001) developmental model of qualitative research (for a critique of this particular formulation, see Delamont, Coffey, & Atkinson, 2000).

There is no doubt at all that writing ethnography is an important aspect of ethnographic analysis. The process of analysis stretches far beyond the mere manipulation of data and even of the work of grounded theorizing, thick description, and the like. It resides in the reconstruction of a given social world or some key features of it. Such reconstructions are rendered persuasive through the textual and other devices deployed by ethnographers in putting together the texts, films, and the like that constitute "the ethnography." In response to various interventions, all scholars recognize that this process is not innocent. There

is no transparent medium through which a social world can be represented. Language is not a transparent medium. The textual conventions to which we have become accustomed are just that—conventions. Photography, film, and video are not merely passive recording media; rather, they actively shape our reception of social and cultural phenomena.

In the pursuit of the experimental turn in ethnographic representation, however, we believe that there have been exaggerated and extravagant moves. In bracketing and transgressing the conventions of realist representations and the textual formats of scientific writing, networks of authors have chosen to assimilate sociological representation to literary forms such as poetry and fiction. In this there lies a danger. The representation of social phenomena through poetry, for instance, inscribes some major assumptions (rarely explicated in the course of this ethnographic genre). First, the focus of attention is shifted radically from the culture and actions of social actors toward the representational work of ethnographers themselves. In sharp contrast to analyses of culture that decenter the "authors," much experimental writing places individual authors firmly—and sometimes exclusively—center stage. Literary work such as poetry here does not necessarily create the "open" or "messy" texts that some critics had sought. Rather, they create closure by creating a new basis for authorial privilege. Moreover, the ability to construct plausible, let alone meritorious, poetry or autobiographical writing appears to rest on personal authorial qualities. The social world is aestheticized in the process. What counts as a good ethnographic account is, therefore, in danger of resting primarily on aesthetic criteria.

Moreover, the assimilation of cultural and social phenomena to first-person-dominated texts, whether prose or poetry, can do violence to the phenomena themselves. We have already alluded to Blumer's (1954) aphorism concerning fidelity to the phenomena, and we invoke it once more here. We do not think that we are in any possible sense of the term *faithful* to the phenomena if we recast them into forms that derive from quite other cultural domains. We risk losing the

intrinsic aesthetic, and other formal characteristics of the original meanings, events, and actions. We have already referred to the principle of ethnopoetics in recognizing that there are indigenous canons of rhetoric and construction in cultural performances. Analysts distort or obliterate the cultures they seek to account for if they translate everything into their own culture-bound aesthetics. First-person autobiographical writing and experientially derived poetry do not enjoy universal value. They are, if anything, among the more culturally specific and limited of expressive forms. There is little or no warrant for elevating them to being the preferred vehicle for cross-cultural or culturally sensitive social research.

Similar reservations can be entertained concerning performance ethnography in general. It is now permissible in some academic contexts to use our ethnographic data and the insights gleaned from ethnographic fieldwork to create various types of performative and aesthetic texts or artifacts. Denzin's (2003) recent volume is a key exemplar and discussion of this perspective. Mieniczakowski (2001) also provided an overview of performed ethnography and ethnodrama. We do not seek to detract from these approaches in general except perhaps to suggest that performance ethnographers might engage more fully and systematically with the now wide-ranging ethnographic study of performance (Atkinson, 2004). We do, however, wish to assert something more in keeping with the general thrust of this chapter, namely that we should be very careful indeed of imposing "our" performative and aesthetic criteria and competences in the representation of settings, cultures, and actors while neglecting the indigenous local forms of performance through which culture, organization, and action are actually maintained in everyday life.

Social Action, Social Organization

In framing our argument as such, we are clearly stressing one particular array of emphases and preferences. We do so partly to redress what we see as a misleading tendency within many contemporary versions of qualitative research. We

believe that too much emphasis is currently placed on the identification and documentation of social actors' *experiences* or *perceptions* at the expense of *social action* and *social organization* (cf. Silverman, 2004).

In part, we recapitulate arguments to which we have contributed elsewhere, and here we seek to generalize them further. We stress that among the goals of ethnographic research is to analyze *social action*, *social order*, and *social organization* as well as to analyze the forms and contents of *culture*. We need to pay serious and systematic attention to the recurrent phenomena of anthropology, sociology, and cognate disciplines such as discursive psychology, linguistics, and semiotics. This means that ethnographic and other qualitative research is much more than the sympathetic description and reportage of informants' experiences. We have argued elsewhere to the effect that qualitative research needs to transcend the culturally pervasive influence of the interview and what Atkinson and Silverman (1997) called the "interview society." We do not subscribe to the view that qualitative research is justified primarily by representing social affairs from the point of view of individual social actors or even from the perspectives of social aggregates.

This does not imply a return to the old methodological contestation between the merits of observation and those of interviewing—between what people *do* and what people *say* (Atkinson et al., 2003). The reverse is true. Instead, we stress that what people say is itself a form of action. We need to analyze social actors' accounts or narratives as types of speech acts. Likewise, we need to recognize that even such "experiences" as memories or emotions are not merely psychological states but also are performed social enactments (cf. Tota, 2001; Wagner-Pacifici, 1996). Moreover, in line with Mills (1940), we need to see motives as socially shared, culturally defined frames of justification or rationalization (Atkinson & Coffey, 2002). So, social action includes the work of representation. Likewise, social action includes the use and circulation of other modes of representation such as material goods and cultural artifacts (Vinck, 2003).

It follows, therefore, that we are recommending a particular approach to the analysis of social life under the aegis of ethnographic or qualitative research. We believe that there is a need for the reevaluation of analytic strategies that avoid the kind of fragmented reductionism to which we referred at the beginning of this chapter. We do not believe that it is productive for analysts to represent the social world primarily or exclusively through the lens of just one analytic strategy or data type. The different types of qualitative research—discourse analysis, visual analysis, narrative analysis, and the like—are not paradigms or disciplines in their own right; rather, they are analytic strategies that reflect and respect the intrinsic complexity of social organization, the forms of social action, and the conventions of social representation. This is not just a matter of juxtaposing different “methods,” and it is not just an appeal to rather vague notions of “context” or “holistic” ethnography; rather, it means paying attention to the systemic relations among the interaction order, orders of talk, representational orders, and organized properties of material culture. In this way, our analytic perspectives can and should reaffirm certain kinds of rigor, some of which we believe have been lost to view in recent methodological writing. We stress, therefore, the disciplined approach to technical issues such as discourse analysis, narrative analysis, and semiotic analysis. We seek *principled* relationships between the various contributory disciplines and subdisciplines. The analysis of social phenomena is not well served by the kind of fragmentation that equates types of data (e.g., spoken, visual, textual, material) with disciplines or specialties working in relative isolation.

FOUCAULT'S METHODOLOGIES

Archaeology and Genealogy

James Joseph Scheurich and Kathryn Bell McKenzie

This chapter is not a true or accurate representation of Foucault's work.¹ No such representation exists or is possible, in our view. There are, consequently, many other possible readings of Foucault's work that are just as defensible as this one. Indeed, this reading, like Foucault's *savoir* (defined and discussed later), is messy, ruptured, often erroneous, broken, discontinuous, originless, fabricated, even a falsification. In other words, as Magritte wrote on his painting of a pipe, "this is not a pipe" (Foucault, 1973b); this is not Foucault.

Moreover, what we intended to accomplish here in our early conceptualizations of this project and what actually emerged are significantly different. Indeed, we might question ourselves as we think our critics will question us, and just as Foucault did at the end of his "Introduction" to *The Archaeology of Knowledge* (1969/1972).² We might say,

"Aren't you sure of what you're saying? Are you going to change yet again, shift your position according to the questions that are put to you, and

say that the objections are not really directed at the place from which you are speaking? Are you going to declare yet again that you have never been what you have been reproached with being? Are you already preparing the way out that will enable you in your next book to spring up somewhere else and declare as you're now doing: no, no, I'm not where you are lying in wait for me, but over here, laughing at you?" (p. 17, quotes in original)

Although our only laughter is about our own pretensions, what we intended when we started this project was to try to show how archaeology and genealogy might be used as critical "qualitative" (defined broadly) methodologies. We also wanted to illustrate briefly how each of these methods might be applied to education issues, as this is our discipline. Finally, we also envisioned a critical survey of the uses and abuses of Foucault's work in education.

However, some of this happened and much did not. For us, what changed what we did here was our review of Foucault's *oeuvre* (just the books and the order in which they were published) from

the “beginning” through his genealogical work (we never thought we would cover what many consider the last phase of his work, the “care of self” or ethics period) and our review of articles and books in education that use Foucault’s ideas in a central way. Neither of us had read through Foucault’s work in such a systematic, focused, concentrated way, nor had we systematically surveyed the applications of Foucault in education. It was these systematic surveys, then, and the effects they had on our own understandings of Foucault and his use by education scholars that changed what we were doing in this chapter. For example, one change that emerged was our decision to discuss briefly the importance of Georges Canguilhem, arguably Foucault’s most influential mentor. It almost seemed to us that to education scholars and, even more broadly, to scholars across the social sciences, Foucault and his ideas had emerged full grown from the forehead of Zeus. Consequently, we decided to provide a subsection within the “Archaeology” section that briefly discusses Foucault’s view of Canguilhem and the latter’s role in the French intellectual and philosophical context.

The rest of this essay, then, is divided into four parts. First, we discuss Foucault’s archaeological method, which includes the Canguilhem discussion. Second, we discuss a particularly important essay, “Nietzsche, Genealogy, History” (Foucault, 1977, in *Language, Counter-Memory, Practice: Selected Essays and Interviews*) that was first published after his last archaeological work and before his first genealogical work, which we see as thematically bridging between or connecting the two methodologies. Third, we present his genealogical method. While our discussions of his archaeology or genealogy is not comprehensive enough so that a reader could assume that she or he is ready to use either of Foucault’s methods after only reading this chapter, we do believe that what we have written was done in a way to help those who are not familiar with Foucault take some beginning steps toward using archaeology and genealogy. We also hope, though, that our coverage of the two is provocative of further reflections for those more experienced in their uses of Foucault’s methods.

We accomplish our discussion of his archaeological method by addressing two archaeological concepts in some depth, *savoir* and *connaissance*, and then allude to what the other key archaeological concepts are. To present his genealogies, we discuss in some depth one of them, *Discipline and Punish* (Foucault, 1975/1979). However, in this work, he deploys so many provocative, useful critical tools that we can cover only some of them, let alone cover all of the other critical tools he adds with his second genealogy, *The History of Sexuality, Volume 1: An Introduction* (1976/1980a).³ For the latter, however, we do point out some particularly excellent sections.

Fourth, our conclusion includes a brief overview of what we think some the critical goals of both his archaeologies and his genealogies were. We summarize some of the points about archaeology and genealogy that we make. We enthusiastically praise a new collection of Foucault’s work. We also provide some brief critical remarks on the uses—and abuses—of Foucault in education in particular and in the social sciences in general, although we do not provide a comprehensive or detailed review of this material. (We do try to provide a somewhat comprehensive list of such work in education in our bibliography along with some books on Foucault from outside of education that we think are either useful or influential; indeed, our bibliography is intended to be a resource for those interested in Foucault.) In general, we might forewarn by saying we are somewhat grumpy and surly, dissatisfied, about how Foucault has most frequently been read and used to date in education and the social sciences. In addition, our conclusion contains—and this was a surprise even to us—some substantive critique that we have of Foucault’s work that we did not have when we started this chapter. In other words, by the end of our read of all of his books, we arrived at a critique of Foucault that we did not have when we began this read. We expect this critique will upset some advocates of Foucault and will gratify some critics. Our only defense is that we did not intend or desire this critique, although to be intellectually honest, we felt we needed to include it.

Our assumption, at this point, is that by the end of this essay we will leave a jangle, bangle, and tangle among some experienced Foucaultians, but hopefully some useful beginnings to those who have not yet tried on Foucault. Maybe, though, just maybe, some of the former will appreciate and find provocative our efforts to "think" Foucault both comprehensively and critically. Maybe we are all coming to a point, even among those of us who have been enthusiastic advocates of Foucault, at which it is possible to consider his work in a more balanced way, that is, without defensiveness. Perhaps. Perhaps not.

■ ARCHAEOLOGY

Many scholars who survey the entire *oeuvre* of Foucault have discerned three sequential phases or periods—archaeology, genealogy, and the care of the self—that represent, it is thought, significant shifts in his philosophical thought, although some would add to this list Foucault's focus on governmentality.⁴ Nonetheless, of the three periods, genealogy is the one that has captured the most attention of scholars to date, although one of us (Scheurich, 1997, pp. 94–118, "Policy Archaeology" chapter) has found archaeology useful, and recently Lather (2004) has written about "positivities," a key concept in archaeology. Care of the self, the last of the three periods, has generally received the least attention, although St. Pierre (2004) has recently found it to be fertile territory for her meditations on "the subject and freedom."

Our intent here, however, because this is a chapter in a book on methodology, is to focus on archaeology and genealogy, which could be broadly construed as "qualitative" methods, as Foucault always used texts as his data or, what he sometimes called, the archive. It is not that we think Foucault's care of the self period or focus is unimportant. Nor do we think someone like St. Pierre could not creatively interpret the latter period as a methodology. Our aim is simpler than that. We want to provide a kind of beginner's introduction to the two Foucaultian methodologies

that have received the most attention among U.S. scholars and that those interested in Foucault's perspective might use as a starting place of further exploration. What we cannot provide, though, due to space limitations, is some sort of "complete" course on how to use either methodology so that on finishing this essay, someone could move directly to applying either one. There is simply not sufficient space for accomplishing this for even one of Foucault's methods.

Canguilhem

As we suggested in our introduction to this chapter, it is our judgment that there is a general lack of understanding of the philosophical context and influences within which Foucault worked in France. A good example of the latter is a lack of knowledge about Georges Canguilhem, arguably Foucault's main intellectual mentor and teacher. In general, our view is that Canguilhem's influence on Foucault, especially Canguilhem's influence on Foucault's archaeologies, is unacknowledged, underestimated, or even unknown. Indeed, even among philosophers who know Foucault deeply and use him well, there is much more fascination with Foucault and his relationships with Kant, Nietzsche, and Heidegger (see, e.g., the work of poststructuralist philosophers such as Elizabeth Grosz in *Volatile Bodies* [1994]). In response, we briefly discuss Canguilhem's influence on Foucault and Foucault's own view of Canguilhem's role in French philosophy with the hope that this will spur others to read more deeply into Foucault and his social and intellectual context. However, we are aware that our Canguilhem is but another author function⁵ and that the relationship among Foucault, his mentor, and their social, historical, and intellectual "context" is complex, contradictory, and ambiguous.

One excellent example of Foucault's own discussion of Canguilhem and his influences, particularly as a historian of the sciences, is available in *Aesthetics, Method, and Epistemology* (1994a) and is called "Life Experience and Science," which originally appeared in a French-language journal but was modified to appear as

Foucault's introduction to the 1989 English translation of Canguilhem's *The Normal and the Pathological* (p. 465). As Foucault says, there has been less awareness "of the significance and impact of a work like that of Georges Canguilhem, extending as it has over the past twenty or thirty years" (p. 465). Foucault also says that when "the sociology of the French intellectual milieu" is considered for "those strange years, the sixties," nearly all French philosophers "were affected directly or indirectly by the teaching or books of Canguilhem" (p. 465), which were primarily focused on critiquing overly rationalistic views of the history of the sciences in a much more thoughtful and complex way than Kuhn ever did in *The Structure of Scientific Revolutions* (1962).² Indeed, Foucault suggests that without Canguilhem, the French Marxists like Bourdieu, Castel, Passeron, and Lacan, would have less meaning for us (pp. 465–466)—a hefty claim on Foucault's part. In addition, Foucault suggests that Canguilhem (and others) played the same role in France that the Frankfurt School played elsewhere (p. 469)—another strong claim. Thus, both of these claims indicate how significant Foucault thinks Canguilhem's intellectual role was for him and others in France.

Foucault (1994a) argues that both Canguilhem and the Frankfurt School were raising "the same kind of questions" (p. 469), that is,

questions that must be addressed to a rationality [the rationality of science] that aspires to be universal while developing within contingency, [a rationality] that asserts its unity and yet proceeds only through partial modifications, [a rationality]³ that validates itself by its own supremacy but that cannot be dissociated in its history from the inertias, the dullness, or the coercions that subjugate it. In the history of the sciences in France, as in German Critical Theory, what is to be examined, basically, is a reason [a rationality] whose structural autonomy carries the history of dogmatisms and despotisms along with it—a reason [rationality], therefore, that has a liberating effect only provided it manages to liberate itself. (p. 469)

For those who know of Foucault's archaologies and his genealogies, these are central themes, and

he is saying here that these themes come directly from the work of Canguilhem.

Foucault (1994a) suggests that in taking up these questions, Canguilhem "did not just broaden the field of the history of the sciences; he reshaped the discipline itself on a number of essential points" (p. 470). To accomplish this, Foucault relates that Canguilhem "first took up the theme of 'discontinuity'" (p. 470), a theme that many who use Foucault in education and the social sciences think came from Foucault himself. Second, Canguilhem developed the idea that "whoever says 'history of discourse' is also saying recursive method . . . in the sense in which successive transformations of this truthful discourse constantly produce reworkings in their own history" (p. 472). In other words, science or universal reason, contrary to the typical or dominant portrayal of these, has constantly, in a recursive fashion, rewritten its own story, although leaving that rewriting unmentioned (which is another idea that many think came from Foucault himself). Third, Canguilhem places the "sciences of life back into [the] historico-epistemological perspective, [thus bringing] to light a certain number of essential traits that make their development [i.e., the development of the sciences of life] different from that of the other sciences and present historians [of the sciences and, thus, of reason] with specific problems" (p. 475) because all sciences are, in the dominant portrayal, supposed to be unified or the same.

And fourth, Foucault (1994a) said that Canguilhem raised "in a peculiar way, the philosophical question of knowledge" (p. 474). That is, at the center of this philosophical question of the nature of the knowledge of science and universal reason,

one finds that of error. For, at the most basic level of life, the processes of coding and decoding give way to a chance occurrence [such as the random play of genes] that, before becoming a disease, a deficiency, or a monstrosity, is something like a disturbance in the informative system, something like a "mistake" . . . [and] that "error" [or mistake] constitutes not a neglect or a delay of the promised fulfillment [of life] but the dimension peculiar to the life of human beings and indispensable to the duration of the species. (p. 476)

That is, Canguilhem and Foucault are raising to a philosophical level their contention that, at the physical level of life itself, there is random error that is integral to life itself, a point that is intended, as are the other points previously noted, to undermine the dominant portrayal of science and reason.⁹ As Foucault (1994a), then, suggests at the end of this chapter, in recognition of the importance of his mentor's work, especially for Foucault's own work, "Should not the whole theory of the subject be reformulated, seeing that knowledge, rather than opening onto the truth of the world, is deeply rooted in the 'errors' of life?"¹⁰ Thus, once it is understood that it was Canguilhem who developed these four "essential points," it is obvious from whom Foucault himself drew some of his richest intellectual resources, especially for his archaeological method. Consequently, in our view, those who use Foucault throughout the social sciences need to increase their understandings of the French intellectual context in which Foucault thought and wrote and of Canguilhem in particular (see, e.g., Canguilhem, 1988, 1989).

The Archaeological Method

The first point that is important to understand about Foucault's archaeological method is that it is *not* directly related to the academic discipline of archaeology, that is, the study of past cultures. It is not even particularly useful to be reminded of the iconic picture of the archaeologist using a brush to uncover old bones or artifacts embedded in dirt. As Foucault (1969/1972) says on this subject in *The Archaeology of Knowledge*, his archaeology "does not relate analysis to geological excavation" (p. 131). In fact, we would recommend that you begin to understand Foucault's archaeology by assuming that his archaeology has only the faintest allusion to the academic discipline of archaeology. It is not that there are not connections between the two; it is just that thinking of the academic discipline as a lens through which one might understand the shape and meaning of Foucault's archaeology will generally get in your way.

A second point is that there is simply not enough space here to describe archaeology in a comprehensive way. Foucault's archaeology is a complex set of concepts, including *savoir*, *connaissance*, positivity, enunciations, statements, archive, discursive formation, enunciative regularities, correlative spaces, enveloping theory, level, limit, periodization, division, event, discontinuity, and discursive practices. In addition, there is no book that we know of—and it would certainly take a book-length piece—that completely and thoroughly lays out how to use this method, although Foucault's "Introduction" in *The Archaeology of Knowledge*, which follows three of his archaeologies, is a good synopsis of what he is after with archaeology.¹¹ Consequently, the only way you can begin to understand archaeology is to study carefully and thoroughly Foucault's own uses and discussions of archaeology in his three archaeologies—*Madness and Civilization* (1961/1988), *The Birth of the Clinic* (1963/1994b), and *The Order of Things* (1966/1973a)—and in his reflexive discussion of archaeology as a method, *The Archaeology of Knowledge* (1969/1972). We would especially suggest—and this applies to reading all of Foucault—that getting an in-depth understanding of Foucault requires close, careful, and repeated readings. Indeed, in our view, reading most education or social science texts, even many of the most abstract theorists, is simple and easy compared with reading the density and complexity of Foucault's work, some of which is a function of his writing style, our lack of knowledge of the French philosophy context, our inexperience in reading philosophy of any kind, the depth at which he worked, and the complexity that he was trying to address, much of which is counter to both dominant thought and critical thought. Obviously, though, we think the time and effort needed is worth it. We want to repeat, however, that a substantive use of Foucault's archaeology, in particular, means developing an in-depth understanding of the complex interrelated set of the concepts listed previously.

Two of the more commonly cited of this set of concepts are *savoir* and *connaissance*. In an

interview (Foucault, 1994a) that appeared in French in 1966, after the publication of *Madness and Civilization*, *The Birth of the Clinic*, and *The Order of Things* but before that of *The Archaeology of Knowledge*. Foucault discussed how he defined archaeology:

By "archaeology," I would like to designate not exactly a discipline but a domain of research, which would be the following: in a society, different bodies of learning, philosophical ideas, everyday opinions, but also institutions, commercial practices and police activities, mores—all refer to a certain implicit knowledge [*savoir*] special to this society. This knowledge is profoundly different from the [formal] bodies of learning [*des connaissances*] that one can find in scientific books, philosophical theories, and religious justifications, but it [*savoir*] is what makes possible at a given moment the appearance of a theory, an opinion, a practice. (p. 261)

Thus, understanding these two arenas of knowledge, *savoir* and *connaissance*, is fundamental to understanding archaeology. *Savoir* includes formal knowledge such as "philosophical ideas" but also "institutions, commercial practices, and police activity,"¹² whereas *connaissance* includes only formal bodies of knowledge such as "scientific books, philosophical theories, and religious justifications." Similarly, Gutting (1989) suggests, "By *connaissance* he [Foucault] means . . . any particular body of knowledge such as nuclear physics, evolutionary biology, or Freudian psychoanalysis" (p. 251). In contrast, *savoir*, Gutting continues, "refers to the [broad] discursive conditions that are necessary for the development of *connaissance*" (p. 251).

Foucault provides an example of the difference between these two concepts in the sixth chapter of *The Archaeology of Knowledge* (1969/1972). He says,

The linch-pin of *Madness and Civilization* was the appearance at the beginning of the nineteenth century of a psychiatric discipline. This discipline had neither the same content, nor the same internal organization, nor the same place in medicine, nor the same practical function, nor the same methods as the traditional chapter on "diseases of the head" or "nervous diseases" to be found in eighteenth century medical treatises. (p. 179)

With this section, Foucault is comparing the psychiatric discipline that emerged at the beginning of the 1800s to the "diseases of the head" and "nervous diseases" of the 1700s because diseases of the head and nervous diseases during the 18th century were the closest comparison to the psychiatric discipline during the 19th century.¹³ Foucault (1969/1972) continues,

But on examining this new discipline, we discovered two things: what made it [i.e., the emerging discipline of psychiatry] possible at the time it appeared, what brought about this great change [i.e., changes from 18th-century diseases of the head to 19th-century psychiatry] in the economy of concepts, analyses, and demonstrations was a whole set of relations between [sic] hospitalization, internment, the conditions and procedures of social exclusion, the rules of jurisprudence, the norms of industrial labor and bourgeois morality, in short a whole group of relations that characterized for this discursive practice [i.e., psychiatry] the formation of its statements. (p. 179)

What made it possible, then, for psychiatry to appear as a formal discipline, as a *connaissance*, was a set of changes in concepts, practices, procedures, institutions, and norms, that is, a change in the much broader *savoir*. As Foucault (1969/1972) further elaborates,

But this [discursive] practice is not only manifested in a discipline [i.e., psychiatry] possessing a scientific status and scientific pretensions [*connaissance* or psychiatry as a formal discipline]; it is also found in the operation in legal texts, in literature, in philosophy, in political decisions, and in the statements made and the opinions expressed in daily life [*savoir*]. (p. 179)

Thus, whereas the history of psychiatry is typically written solely in terms of psychiatry as a formal discipline, "possessing a scientific status and scientific pretensions," Foucault is arguing that this is inadequate. To better understand the history of psychiatry as a formal academic discipline, it is also necessary to study a much broader array that includes relations among "hospitalization, internment, the conditions and procedures of social exclusion, the rules of jurisprudence, the

norms of industrial labor and bourgeois morality" as well as legal texts, literature, philosophy, political decisions, and the statements and opinions of daily life.

For Foucault (1994a), then, archaeology is focused on the study of *savoir*, which is "the condition of possibility" of [formal] knowledge [*connaissance*]" (p. 262) for the purpose of showing that psychiatry or other formal disciplines do not simply emerge out of the historical trajectory of those disciplines when that history is restricted solely to the formal discipline as a formal discipline. Instead, a history of a formal discipline must address both *connaissance*, the formal statements of a discipline, and *savoir*, the much broader and less rational array of practices, policies, procedures, institutions, politics, everyday life, and so on. However, Foucault's larger point is that, rather than the traditional view that formal knowledges (*connaissance*), such as psychiatry and economics, have their own formal rational trajectory of emergence, formal knowledges emerge more "irrationally" or not rationally from *savoir*, which includes not just the formal and rational but also the much broader "irrationality" of politics, institutional practices, popular opinions, and so on. In other words, formal knowledges emerge, substantially, from a broad array of complex irrational sources or conditions, and this more complex, messier, more ambiguous "condition[s] of possibility" undermines the modernist rational "story" or "meta-narrative" of formal knowledges.¹⁵

Accordingly, after understanding the meanings of *connaissance* and *savoir* and the fact that archaeology is the study of *savoir* as the "condition[s] of possibility" of *connaissance*, it is necessary to return to the larger context of Foucault's archaeological work. With archaeology, Foucault is drawing on the work of Canguilhem, whose work he compared to that of the Frankfurt School. And for both the Frankfurt School and Canguilhem, the nature of reason—"a rationality that aspires to be universal" (Foucault, 1994a, p. 469)—in modernity is their macro text. Furthermore, Foucault is suggesting that the myth or master narrative of modernist reason,

when examined carefully, is not just logical and rational but also complex, contradictory, and problematic and that it has embedded within it instances of what we might call "unreason."¹⁶ For example, Foucault says that this modernist reason "validates itself by its own supremacy but that cannot be dissociated in its history from the inertias, the dullness, or the coercions that subjugate it" (p. 469) and that it "is a reason whose structural autonomy carries the history of dogmatisms and despotisms along with it" (p. 469). Thus, according to Foucault, reason (i.e., formal knowledges), as it is typically portrayed within modernity, is not what it is made out to be; that is, the "archaeological" history of reason includes inertias, dullness, coercions, dogmatisms, and despotisms.

What Foucault is attempting, then, with his various archaeologies is to examine specific cases, particular examples, as in *Madness and Civilization*, *The Birth of the Clinic*, and *The Order of Things* (the human sciences), of the work of reason. And in carrying out these studies of specific cases of the work of reason, he has come to two insights. One is that the history of reason in these specific cases is "not wholly and entirely that of its progressive refinement, its continuously increasing rationality" (Foucault, 1969/1972, p. 4)¹⁷; that is, reason in these cases does not become progressively more refined, more rational, better, or more true. For example, in the psychiatry example cited previously, Foucault argues that there was no smooth, unbroken trajectory of psychiatry from the 1700s to the 1800s. Instead, he argues, during the 1700s, there was "the traditional chapter on 'diseases of the head' or 'nervous diseases' to be found in eighteenth century medical treatises," and then, at the beginning of the 1800s, there was the emergence of the "psychiatric discipline" (p. 179). However, and this is one of Foucault's key points about reason, the second did not emerge, rationally or logically, out of the first; the two—diseases of the head and nervous diseases, on the one hand, and the discipline of psychiatry, on the other—were separate and different, and the first did not lead logically and progressively to the second. There is, thus, a

"discontinuity (threshold, rupture, break, mutation, transformation)" (p. 2) between the two, which again means that reason is not nearly as rational as it has been portrayed within the metanarrative of modernity. Thus, rather than just critiquing this master narrative, in his archaeologies, Foucault is doing the hard work of providing research-based examples that the master narrative is wrong.

Foucault's second point is that disciplines, formal knowledges, or *connaissances* cannot be studied and understood in just their own formal terms. Rather, a *connaissance* emerges out of *savoir*, which includes formal knowledge, such as academic books, but also institutions, laws, processes and procedures, common opinions, norms, rules, morality, commercial practices, and so on. Thus, to understand a particular discipline means that not only must the formal treatises of that discipline be studied, but so too must the *savoir*, this much broader, more complex context that includes, say, institutions and commercial practices "on the same plane" as the formal aspects of the discipline. As a result, reason loses much of its elite exaltedness, its purity, its high status, its very rationality.

However, problematizing modernity's reason is not Foucault's only focus in his archaeologies. His "twin" focus is modernity's subject (Foucault, 1969/1972, p. 12). As he says,

Making historical analysis the discourse of the continuous [e.g., portraying formal knowledge, *connaissance*, as emerging through a rational, logical, continuous trajectory] and making human consciousness [i.e., the human subject or subjectivity] the original subject of all historical development and all action are the two sides of the same system of thought [i.e., modernity]. (p. 12, emphases added)

Thus, Foucault is arguing that the idea that "man" or the human subject is creating human history and creating, most importantly, formal knowledge (*connaissance*) in a logical, rational, continuous manner is but the ideology of modernity. This ideology, then, becomes a lens through which historians, philosophers, economists, linguists, social scientists, and so on fashion or construct a "picture" or representation of "reality" that is logical

and rational and that has the human subject as its main actor or at its privileged center. In addition, this central actor is contradictorily both the doer and the object of the doing, the researcher and the researched. To Foucault, then, this modernist ideology and its resultant representation of "reality" in works of history, philosophy, economy, psychiatry, language, and so on can be undermined by using his archaeological methodology to show that formal knowledges emerge from *savoir*, which is not logical or rational, and that this process of emergence does not have a guiding or agentic subject at its center (i.e., archaeology decenters the modernist subject). For example, near the end of his "Introduction" to *The Archaeology of Knowledge* (Foucault, 1969/1972)—again, the last of his archaeological works—he says that the aim of archaeology is "to define a method of historical analysis freed from the anthropological [i.e., human subject-centered] theme" and "a method purged of all anthropologism" (p. 16, emphasis added)—a method of historical analyses freed from "man" as its center.

However, despite Foucault's (1969/1972) view that problematizing reason and the agentic subject are "two sides of the same system of thought" (p. 12), for the most part, those who have used Foucault have been more interested in his undermining of modernist reason than in his undermining of the privileged or centered subject. Indeed, some feminists and critical theorists¹³ have rejected Foucault because, in their view, he destroys the agency of the subject, whereas others have appropriated parts of Foucault, such as his problematization of reason, while rejecting his decentering of the subject (e.g., Hartsock, 1998). However, other feminists, such as Butler (1993), have agreed with Foucault that the "two sides" are two parts of the "same system of thought." We agree, though, with Butler that the two cannot be separated, that it is not possible to appropriate the one from Foucault while rejecting the other. Indeed, we would argue that taking one side while rejecting the other indicates a fundamental misunderstanding of Foucault, similar to the general lack of understanding of Foucault's intellectual dependency on the work of Canguilhem and to the general lack of understanding of

archaeology as a method. Indeed, we would strongly suggest that to appropriate Foucault's critique of reason without simultaneously appropriating his antihumanism is simply wrong. Foucault's critique of reason cannot stand without his antihumanism; as he says, they are "two sides of the same system of thought" (p. 12).

Our advice, then, for those interested in pursuing archaeology—and we would urge this pursuit as we think that archaeology is generally underused and underappreciated—is this: Do not just "cherry pick" a concept here and a concept there and assume that you are doing archaeology or that you are using Foucault appropriately. To learn how to do archaeology, we would suggest reading all of the archaeologies in the order they were published. The first three are actual applications of archaeology, and the fourth, *The Archaeology of Knowledge* (1969/1972), is Foucault's reflexive effort to describe the methodology retrospectively. However, it is important to understand that, as Foucault says of *The Archaeology of Knowledge*, "This work is not an exact description of what can be read in *Madness and Civilization*, *Naissance de la clinique* [*The Birth of the Clinic*], or *The Order of Things*. It is different on many points. It also includes a number of corrections and internal criticisms" (p. 16). Despite these corrections and criticisms, *The Archaeology of Knowledge* is his best, and final, description of archaeology as a method. Unfortunately, we know of no book, or even article-length work (we doubt an article-length effort would be sufficient), that attempts to actually explain how to use archaeology as a method. There are, though, some works that, at least partially, focus on or critique archaeology, including Gutting's *Michel Foucault's Archaeology of Scientific Reason* (1989). Books like these are helpful, but reading Foucault's four archaeological texts carefully and thoroughly is by far the best approach.

■ CONNECTING ARCHAEOLOGY AND GENEALOGY

Is genealogy the successor to archaeology? Is genealogy the further development of archaeology?

Is genealogy superior to archaeology? Did Foucault decide that archaeology did not work, was flawed, so he moved on to genealogy, which he considered to be better? Are the two "methodologies" widely different, clearly separate, or are they closely connected, part of the same larger project? Answers to these questions are multiple and divergent among Foucault scholars, both critics and advocates. Our sense is that the dominant, but certainly not the only, conclusion among U.S. scholars of the social sciences, and more specifically among U.S. scholars of education, is that genealogy is superior to archaeology. Partially validating this conclusion is the fact that there are many more instances of these scholars claiming to do genealogies than there are of those claiming to do archaeologies. However, basing our perspective on that of Foucault, we would have to disagree with this conclusion.

In the first of Foucault's "Two Lectures" (1980, *Power/Knowledge*), which was given on January 7, 1976, and which is *after* Foucault had written his four archaeologies and *after* he had written his two genealogies (*Discipline and Punish* and *The History of Sexuality*, Volume 1: *An Introduction*), he says,

If we were to characterize it in two terms, then "archaeology" would be the appropriate methodology of this analysis of local discursivities, and "genealogy" would be the tactics whereby, on the basis of the descriptions of these local discursivities, the subjected knowledges which were thus released would be brought into play. (p. 85)

Also, in an interview just prior to his death on June 25, 1984, in Paris,¹⁹ Foucault hopes that other scholars will continue to use both archaeology and genealogy, as he continues to consider both of them equally useful. Most tellingly, though, is what Foucault says in *The History of Sexuality*, Volume 2: *The Use of Pleasure* (1984/1990), which was published the year he died. Three times in this "Introduction" (on pages 4–5, 5–6, and 11–12), Foucault divides his work into three "axes" (p. 4) or arenas of analyses; he also labels these three "theoretical shifts" that he had to make to study "the games of truth" (p. 6). The first is "the analysis of discursive practices [that] made it

possible to trace the formation of disciplines (*saviors*)" (p. 4), that is, archaeology. The second is "the analysis of power relations and their technologies" (p. 4), that is, genealogy. And the third is "the modes according to which individuals are given to recognize themselves as . . . subjects" (p. 5) or "the games of truth in the relationship of self with self and the forming of oneself as a subject" (p. 6), that is, the care of the self work. Then, at the end of this section, he calls these three the "archaeological dimension," the "genealogical dimension," and the "practices of the self," respectively (pp. 11–12).²⁰

Unquestionably, then, Foucault himself does not see archaeology as less than genealogy or as superseded by it. Instead, throughout his work, he sees both archaeology and genealogy as continuing to be important and valid. Where, then, does this conclusion that genealogy is a correction of archaeology come from for U.S. scholars? We would suggest that it comes mainly from Dreyfus and Rabinow in their highly influential *Michel Foucault: Beyond Structuralism and Hermeneutics*, first published in 1983 when U.S. scholars were just beginning to read Foucault.²¹ As a result, these two scholars, from early on, have been enormously influential in introducing both Foucault and his work to U.S. scholars; indeed, it could be said that they have been virtually canonical in their interpretations, at least for the U.S. audience. For example, that they think genealogy is the superior successor to archaeology is evident in their "Introduction" to their book. They say that they "will argue at length [about 40% of the book] that the project of *Archaeology* founder[ed]" (p. xxiv, emphasis in original) and that Foucault abandoned it (p. xxvi). They also say, at the end of their analysis of archaeology, that their "detailed study of the new archaeological method has revealed . . . that it suffers from several internal strains" (p. 90). In response, then, to the failure of archaeology, they assert that Foucault, based on "his reading of Nietzsche" (p. xxvii), developed genealogy, which Dreyfus and Rabinow claim is "his most original contribution" (p. xxvii). However, although Foucault never directly corrected them (as far as we can find), possibly

because Dreyfus and Rabinow were leading the charge in touting Foucault and his work to a large U.S. audience, Foucault persisted throughout his life in maintaining the equal value and validity of archaeology and genealogy. Thus, siding with Foucault, along with others such as Mahon (1992), we think that both of his methodologies—archaeology and genealogy—should continue to be seen as equally useful and valuable.

To further illustrate this point and to draw increased attention to what we think is a critically important essay, we now discuss "Nietzsche, Genealogy, History" (Foucault, 1977, 1994a), which we would suggest can be seen as a bridge between Foucault's archaeological period and his genealogical one. Although "Nietzsche, Genealogy, History" was published in English in 1977 in *Language, Counter-Memory, Practice: Selected Essays and Interviews*, it was actually first published in French in 1971 after Foucault finished publishing his four archaeologies but before he published his two genealogies. However, it is now available, in a better version in our view,²² in *Aesthetics, Method, and Epistemology*, Volume 2 (1998), and one of the improvements in this latter version is that it better connects this essay to his archaeological work, especially in the use of two key archaeological terms, *savoir* and *connaissance*. In this essay, Foucault provides his first description of his genealogical method, but throughout the essay he clearly maintains the connection of his second method, genealogy, to his first one, archaeology.

In "Nietzsche, Genealogy, History" (Foucault, 1994a), although his language is often literary and poetic, playing off of specific quotes and issues in Nietzsche's own works, particularly *The Genealogy of Morals*, Foucault makes four strong claims as to what a genealogist does (although it would be easy to argue that there are five, six, seven, or more such claims throughout the piece). One claim, drawn directly from Nietzsche, is that the genealogist "challenge[s] the pursuit of the origin" (p. 371). For Foucault and Nietzsche, "the pursuit of the origin" is the pursuit, largely in philosophy, history, and the social sciences, of the beginning of some phenomena or categories such

as "values, morality, asceticism, and knowledge" (p. 373). Foucault says that this pursuit is "an attempt to capture the exact essence of things, their purest possibilities, and their . . . original identity" (p. 371). Instead, by refusing "metaphysics" and by listening to "history," the genealogist finds that "there is 'something altogether different' behind things: not a timeless and essential secret but the secret that they [things] have no essence, or that their essence was fabricated in a piecemeal fashion from alien forms" (p. 371). Foucault also says, "What is found at the historical beginning of things is not inviolable identity of their origin, it is the dissension of other things. It is disparity" (pp. 371–372). It is the "vicissitudes of history" (p. 373). For example, he says that by

examining the history of reason, he [the genealogist] learns that it [reason] was born . . . from chance; [that] devotion to truth and the precision of scientific methods arose from the passion of scholars, their reciprocal hatred, their fanatical and unending discussions, and their spirit of competition—the personal conflicts that slowly forged the weapons of reason. (p. 371)

Thus, the target of Foucault's critique, his genealogy, much like with this archaeological work, is the foundational assumptions of Western modernity. In this case, his critical focus is on modernity's teleological assumption that history moves upward or forward from some origin. In contrast, he argues that the genealogist finds that there are no such origins and that origins are often fabricated. What the genealogist finds, instead, as she or he explores origins is randomness, piecemeal fabrications, dissension, disparity, passion, hatred, competition, "details and accidents" (Foucault, 1998, p. 373), "petty malice" (p. 373), "the minute deviations—or conversely, the complete reversals—the errors, the false appraisals, and the faulty calculations" (p. 374) (similar to *savoir*) mixed together with devotion to truth, precise methods, scientific discussions, and so on (similar to *connaissance*). In other words, Foucault is not denying that reason is a part of this history, but

it is only one player amid a much broader cast in the dramaturgy of modernity.

A second focus of the genealogist, one that becomes much more important in later works although not a large one in this essay, is the body. Foucault (1998) says, "The body is the inscribed surface of events (traced by language and dissolved by ideas), the locus of a dissociated Self (adopting the illusion of a substantial unity), and a volume in perpetual disintegration" (p. 375). He, then, indicates that "genealogy is . . . thus situated within the articulation of the body and history. Its task is to expose a body totally imprinted by history" (pp. 375–376). This last sentence is key; the "task" of genealogy is "to expose a body totally imprinted by history." However, these few remarks are the extent of Foucault's effort to connect genealogy to the body in this essay, but he returns to this particular focus in subsequent scholarship. For example, in *Discipline and Punish*, Foucault (1975/1979) says,

The body is also directly involved in the political field; power relations have an immediate hold upon it; they invest it, mark it, train it, torture it, force it to carry out tasks, to perform ceremonies, to emit signs. This political investment of the body is bound up, in accordance with complex reciprocal relations, with its economic use; it is largely as a force of production that the body is invested with relations of power and domination; but, on the other hand, its constitution as labour power is possible only if it is caught up in a system of subjection (in which need is also a political instrument system meticulously prepared, calculated, and used); the body becomes a useful force only if it is both a productive body and subjected body. (pp. 25–26)

This focus on the body has inspired numerous philosophers, especially feminists such as Elizabeth Grosz and Nancy Fraser, who assert that the body has been left out of philosophy. For example, Grosz (1994) says in *Volatile Bodies: Toward a Corporeal Feminism* that she intends to "explore the work of theorists of corporeal instruction, primarily Nietzsche, Foucault, and Deleuze and Guattari," because each "explores the position of the body as a site of the subject's social production" (p. xiii).

A third claim that Foucault (1998) makes for the genealogist is a focus on describing "the various systems of subjection" (p. 376) and "the endlessly repeated play of dominations" (p. 377). For example, he says that "the domination of certain men over others leads to the differentiation of values" and that "class domination generates the idea of liberty" (p. 377). He also says that domination

establishes marks of its power and engraves memories on things and even within bodies. It makes itself accountable for debts and gives rise to the universe of rules, which is by no means designed to temper violence, but rather to satisfy it. (p. 377)

Foucault is arguing here that the modernist rationale for debts, rules, laws, and the current social, economic, governmental, and legal arrangements diverts critical attention from its domination and subjection effects. For example, he says that

the law is a calculated and relentless pleasure, delight in promised blood, which permits the perpetual instigation of new dominations and the staging of meticulously repeated scenes of violence. The desire for peace, the serenity of compromise, and the tacit acceptance of the law, far from representing a major moral conversion or a utilitarian calculation that gave rise to the law, are but its result and, in point of fact, its perversion. (p. 378)

Foucault follows this with a direct quote from Nietzsche's *Genealogy of Morals*: "guilt, conscience, and duty had their threshold of emergence in the right to secure obligations and their inception, like that of any major event on earth, saturated in blood" (p. 378). Foucault then concludes that

humanity does not gradually progress from combat to combat until it arrives at universal reciprocity, where the rule of law finally replaces warfare; humanity installs each of its violences in a system of rules and thus proceeds from domination to domination. (p. 378)

Foucault thus contends that the rationales that support modernity as humane and as becoming more so are false and that, instead, modernity is but a new installation of domination and violence as a "system of rules." For example, schools, the

prison system, commerce, and so on are installations of domination and violence masquerading as systems of rules, and it is the work of the genealogist to describe and reveal this domination and violence.

The final focus of the genealogist that we take from this essay is drawn from what Foucault calls "effective history." Foucault's (1998) critique of traditional history or the "history of historians" (p. 380) is what he calls "effective history." This critique is "without [the] constants" of traditional history. Foucault argues,

The traditional devices for constructing a comprehensive view of history and for retracing the past as a patient and continuous development must be systematically dismantled. Necessarily, we must dismiss those tendencies which encourage the consoling play of recognitions. Knowledge [*savoir*], even under the banner of history, does not depend on "rediscovery of ourselves." (p. 380, brackets and emphasis in original)

Once again, the now familiar targets of Foucault's critique are the same foundational assumptions of modernity. The regime of traditional history is one that constructs "a comprehensive view of history," retraces "the past as a patient and continuous development," "encourages the consoling play of recognitions," dissolves "the singular event into an ideal continuity" (Foucault, 1998, p. 380), asserts that history is controlled by "destiny or regulative mechanisms" (p. 381), and "confirm[s] our belief that the present rests upon profound intentions and immutable necessities" (p. 381).

In response to this regime,

History becomes "effective" to the degree that it introduces discontinuity into our very being—as it divides our emotions, dramatizes our instincts, multiplies our body, and sets it against itself. Effective history leaves nothing around the self, deprives the self of the reassuring stability of life and nature, and it will not permit itself to be transported by a voiceless obstinacy toward a millennial ending. It will uproot its traditional foundations and relentlessly disrupt its pretended continuity. (Foucault, 1998, p. 380)

Also, "Effective" history differs from the history of historians in being without constants" (p. 380):

"Effective" history . . . deals with events in terms of their most unique characteristics; there most acute manifestations. An [historical] event, consequently, is not a decision, a treaty, a reign, or a battle, but the reversal of relationship of forces, the usurpation of power, the appropriation of vocabulary turned against those who had once used it, a domination that grows feeble, poisons itself, grows slack. (pp. 380–381)

This "effective" historical sense "confirms our existence among countless lost events, without a landmark or a point of reference" (Foucault, 1998, p. 381). Finally, it is an "affirmation of a perspectival knowledge [*savoir*]," as traditional "historians take unusual pains to erase the elements in their work which reveal their grounding in a particular time and place" (p. 382). In a sense, then, Foucault is making an argument that traditional (modernist) history is an effort to console ourselves with the assumptions that there is unity, continuity, teleology, meaning, destiny, and so on built into history itself, a view that makes us feel safe or that would make "history" our safe harbor. In critique of the latter modernist and humanist view, Foucault argues that this aspect of traditional history is predominantly dependent on a metaphysics (p. 381), a kind of modernist psychosis or spell, that hides the fact that history is "the luck of the battle," the "randomness of events," "a profusion of entangled events," "a host of errors and phantasms" [a quote from Nietzsche], and "countless lost events" (p. 381).

The work, then, of the genealogist in this bridging essay between archaeology and genealogy is fourfold. The genealogist is to critique the pursuit of origins by showing they are fabrications, to show that the body is "imprinted by history" (Foucault, 1998, p. 376), to describe "systems of subjection" (p. 376) and "the endlessly repeated play of dominations" (p. 377), and to do what Foucault calls "effective history." We now turn, after this explication of this bridging essay, to his two genealogies, which did immediately follow his "Nietzsche, Genealogy, History" (Foucault, 1977/1994a)

bridging essay. To accomplish this, we discuss his extensive comments on genealogy in the first of his two genealogies, *Discipline and Punish* (1975/1979), and then end the "Genealogy" section with some brief comments on his second and last genealogy, *The History of Sexuality*, Volume 1: *An Introduction* (1976/1980a).

Genealogy

Discipline and Punish first appeared in French in 1975, was translated into English by Alan Sheridan in 1977, and finally was published by Vintage Books in 1979, which is the version we are using. Although there is much in this book that is provocative and uncomfortable reading, such as Foucault's well-researched descriptions of torture used by the French penal system prior to the contemporary period,²³ we focus here primarily on what Foucault has to say about *doing* genealogy. As with his archaeologies, another of the many similarities between his archaeological work and his genealogical work,²⁴ Foucault is comparing one period with another period. For example, he says that during the second period, "in Europe and in the United States, the entire economy of punishment was redistributed. [There was] a new theory of law and crime, a new moral or political justification, old laws were abolished, old customs died out" (Foucault, 1975/1979, p. 7). "By the end of the eighteenth and the beginning of the nineteenth century" (p. 8), the old penal style was dying out.

During this new period, then, "punishment has become an economy of suspended rights. . . . As a result a . . . whole army of technicians took over from the executioner, the immediate anatomist of pain: warders, doctors, chaplains, psychiatrists, psychologists, educationalists" (Foucault, 1975/1979, p. 11). And the consequence of this change seemingly was a "reduction in the penal severity," "a phenomenon with which legal historians are well acquainted" (p. 16)—"less cruelty, less pain, more kindness, more respect, more 'humanity'" (p. 16). However, not surprisingly, Foucault is going to critique "the new tactics of power" (p. 23) of this liberal progressive view of less cruelty and pain. For example, he is going to argue that the

penal system had become “a strange scientifico-juridical complex,” the focus of which is now the soul rather than the body (p. 19), which, to some extent, Foucault considers a more oppressive focus than that of the old penal regime. He is also going to argue that the ultimate target of this complex “is not simply a judgment of guilt. . . . It bears within it an assessment of normality and a technical prescription for a possible normalization” (pp. 20–21), which applies throughout society rather than just to criminals. In other words, to Foucault, one effect of the new penal regime is not to punish the criminal but rather to normalize the larger population in terms of correct behavior.

Foucault (1975/1979), then, says that *Discipline and Punish* “is intended as a correlative history of the modern soul and of a new power to judge; a genealogy of the present scientifico-legal complex from which the power to punish derives its bases, justifications, and rules” (p. 23). “But from what point can such a history of the modern soul on trial be written?” (p. 23). First, he answers that this cannot be written

by studying only the general social forms, as Durkheim did, [because] one runs the risk of positing as the principle of greater leniency in punishment processes of individualization that are rather one of the effects of the new tactics of power, among which can be included the new penal mechanisms. (p. 23)

In other words, focusing on the “greater leniency in punishment” in this new penal regime, as if that were a causal principle of the new regime, would be a mistake; instead, this “greater leniency” should be seen as an “effect” of “the new tactics of power.”

Immediately thereafter, Foucault (1975/1979) lays out “four general rules” for his genealogical study. Although these four rules are focused specifically on this particular study, they highlight well several areas of possible work for the genealogist. What we do here, then, is present each of the rules, discuss its implications for the genealogist, and briefly speculate as to how it might be applied to some facet of public education. The following is his first rule:

Do not concentrate the study of the punitive mechanisms on their “repressive” effects alone, on their “punishment” aspects alone, but situate them in a whole series of their possible *positive* effects, even if these seem marginal at first sight. As a consequence, regard punishment as a complex social function. (p. 23, emphasis added)

Foucault wants us to look beyond the obvious “‘repressive’ effects” of punishment to examine “a whole series of their possible *positive* effects.” By positive, though, he does not mean an effect that we might like or approve of; he means something produced rather than something repressed or excluded. For example, as mentioned previously, one “positive” or produced effect of the new penal regime is the normalization of appropriate behavior among the general population. Indeed, one of Foucault’s favorite genealogical maneuvers is to focus not just on the negative or repressive effects of power but also on the positive or productive effects of power. To Foucault, power does just exclude or repress; power also produces. However, he is not saying that the repressive effects of power should be ignored by the genealogist; rather, he is arguing that the genealogist should regard “punishment as a complex *social* function” (emphasis added) that includes both the repressive and the productive. For instance, school discipline programs do not just punish (repress) certain student behaviors among a small group of students; they also, and perhaps more importantly, produce a normalization (a “positive” effect) of correct behavior among the rest of the students. Thus, to Foucault, these discipline programs could be said to be both negative (repressive) effects and positive (productive) effects.

Foucault’s (1975/1979) second rule is to “analyze punitive methods not simply as consequences of legislation or as indicators of social structures, but as techniques possessing their own specificity in the more general field of other ways of exercising power. Regard punishment as a political tactic” (p. 23). Thus, how social acts or policies get analyzed or thought about is critical to the genealogist. However, the norm of the mainstream social sciences is to see actions that are related to the government as the result of legislative policymakers

or other governmental actors, that is, a function of social actors or agents. In contrast, the norm of critical theorists and other structuralists is to see governmental actions as a function of the social structures. Foucault, though, wants us to turn our thinking in a different direction. He wants us—and this is a persistent point he made throughout his career—to see specific acts, procedures, or processes, such as “punitive methods” and school discipline programs, as having a kind of a quasi-independent standing or importance, a “specificity” within “the more general field of other ways of exercising power.” They are not just actions of individual agents, and they are not merely functions of something more important and larger, some social structure; these methods or programs need to be looked at by the genealogist as having their own specificity or independent standing. Moreover, by “ways of exercising power,” Foucault does not usually mean the power exercised by an intentional actor, although his view encompasses that; instead, he usually means that a procedure or process multiplies across a social field because of a complex set or collection of reasons or causes that are not entirely intentional or rational. Thus, these governmental acts, procedures, or processes are not only or simply a function of legislation or social structures; instead, to the genealogist, they are ways that power multiplies, without some agentic agent consciously accomplishing this, across a social field. For instance, the new emphasis on student-centered classrooms²³ should not be analyzed only as a new and better approach emerging from progressive educational theorists or only as a function of social structures; instead, it should also be analyzed as a practice of power that has emerged and circulates more broadly in society and as a practice of power that is, in many ways, actually more oppressive than teacher-centered classrooms. The reason why Foucault might offer that the new student-centered classrooms are more oppressive is because the work of this new tactic of power is to imprint the souls of the children rather than just their behaviors, as the old teacher-centered classrooms did.

The third rule, and a critically important one to those of us in the social sciences, is as follows:

Instead of treating the history of penal law and the history of the human sciences as two separate series whose overlapping appears to have had on one [penal law] or the other [the history of the human sciences], or perhaps on both, a disturbing or useful effect, according to one's point of view, see whether there is not some common matrix or whether they do not both derive from a single process of “epistemologico-juridical” formation; in short, make the technology of power the very principle both of the humanization of the penal system and of the knowledge of man. (Foucault, 1975/1979, p. 23)

Thus, the history of penal law, the public educational system, or nursing should not be examined just as a separate, albeit sometimes overlapping, series running parallel to the history of the social sciences but should also be examined as emerging from “some common matrix” or as deriving from a single “process of epistemologico-[fill in the blank with a juridical, educational, or medical] formation.” Again, as with the second rule, the principal focus of the genealogist should be on the technologies of power and the ways that the same technology of power spreads across and is enacted both within particular systems, such as those of prisons, schools, or hospitals, and in the social sciences. Thus, technologies of power, arising out of a “common matrix” or a “epistemologico-[fill in the blank]’ formation,” may multiply across both particular systems and social sciences in general, and this multiplication is likely to be both intentional and unintended, both rational and not rational. For example, we might find that contemporary public education—its practices, procedures, and policies—and the history of education scholarship, its research, and its theories have emerged from the same “common matrix” or the same epistemologico-educational formation. Although this seems to be a less radical assertion than Foucault's similar assertion about penal systems, it is important to understand that he does not simply mean that both contemporary public education and education scholarship share the same general assumptions about schools or education; instead, he means that there is a more primary matrix or

formation that is not necessarily intentionally or rationally created, and that is not necessarily education oriented, out of which both are emerging. For example, perhaps, on genealogical investigation, both the new movement emphasizing student-oriented classrooms and the growth of qualitative research methodologies arise out of the same "pastoral" matrix or formation (e.g., see Foucault's use of the concept of the pastoral in *The History of Sexuality*, Volume 1: *An Introduction* [1976/1980a]).

Foucault's (1975/1979) fourth rule is as follows:

Try to discover whether this entry of the soul on to the scene of penal justice, and with it the insertion in legal practice of a whole corpus of "scientific" knowledge, is not the effect of a transformation of the way in which the body itself is invested by power relations.

In short, try to study the metamorphosis of punitive methods on the basis of a political technology of the body in which might be read a common history of power relations and object relations. Thus, by an analysis of penal leniency as a technique of power, one might understand both how man, the soul, [and] the normal or abnormal individual have come to duplicate crime as objects of penal intervention and in what way a specific mode of subjection was able to give birth to man as an object of knowledge for a discourse with a "scientific" status. (p. 24)

By his use of the word "soul," Foucault means that the focus of the new penal system is "not only on what they [the criminals] *do* but also on what they *are, will be, may be*" (p. 18, emphases added); that is, the new focus is not on their behavior but rather on their being or their selves. The new penal perspective has "taken to judging something other than crimes, namely, the 'soul' of the criminal" (p. 19). Then, this new focus on the "soul" of the criminal is combined with a new "corpus of 'scientific' knowledge," both of which are the "effect of a transformation of the way in which the body itself is invested by power relations." It is, as Foucault says, "a political technology of the body." Thus, what is generally seen as more humane and more liberal (i.e., "penal leniency"), in this case, is argued by Foucault to be but "a new technique of

power," one in which "the body itself is invested by power relations." And he indicates that he sees this change as another example of the modernist social construction of "man [or the subject] as an object of knowledge for a discourse with 'scientific' status."²⁶ An example of this in education might be a consideration of "site-based management," "distributive leadership," and "community of learners," all of which are generally seen as more humane or more democratic approaches to school leadership or governance, as new "techniques of power" that are not just endemic to education but also part of a larger formation, the effect of which might be seen as a worse oppression at the level of the soul. In other words, these new techniques of power in education focus on controlling or managing the "soul" of educators rather than just their behaviors, which, to Foucault, is much more oppressive than techniques of power that seek to control only behaviors.

Although we find these four rules to be a particularly rich source for understanding the work of the Foucaultian genealogist, they certainly do not exhaust *Discipline and Punish* in terms of what the work of a genealogist is. For example, we find the entire last section of the same chapter that contains the four rules (Foucault, 1975/1979, pp. 16–31) to be a particularly exciting discussion of genealogy. We also have a strong appreciation for (a) the "The Composition of Forces" section (pp. 162–169) in the chapter, titled "Docile Bodies," which includes some direct statements about education; (b) the entire chapter titled "The Means of Correct Training," which includes sections on "Hierarchical Observation," "Normalizing Judgments," and "The Examination" as well as some direct comments on education; and (c) the last chapter, "The Carceral," which is another particularly rich and provocative section in *Discipline and Punish*. In contrast, we are not as enamored as many are with the chapter on "Panopticism," as we find it to be one of his more simplistic, more totalized, and more poorly developed concepts. Our point, though, is that this first genealogy is literally a panoply of critical tools and ideas that can be used to do Foucaultian genealogies.

Foucault's (1976/1980a) second and last genealogy was *The History of Sexuality*, Volume 1: *An Introduction*. What we do here, given space limitations, is provide just some brief comments and offer some suggestions about reading this volume. Provocatively, and one of the main reasons why we have used more space discussing *Discipline and Punish*, is that the *History of Sexuality* includes little direct discussion of genealogy as a method, whereas *Discipline and Punish* includes considerable discussion of the genealogical method. Indeed, through a systematic search of the text,²⁷ we found that in his second genealogy, he uses the word "genealogy" only five times (four times in the Introduction and once on p. 171).²⁸ Nonetheless, in general, in our view, *History of Sexuality* is the better genealogy of the two, more confident, smoother, better worked out, as if he had more deeply integrated the methodology of genealogy by the time he did this second one. It is as if he had worked out his genealogical method in *Discipline and Punish*, whereas in *History of Sexuality* he was applying what he had already worked out. In addition, we particularly recommend "Part Four: The Deployment of Sexuality" section. In many ways, this is the mature Foucault at his best. The writing is excellent, the organization is clear, and, the insights are powerful.²⁹ It is in this section that Foucault provides some extended discussion of how he thought power differently, what he calls an "analytics" of power (p. 82), as not just negative and repressive but also positive. Even more specifically, we recommend the "Objective" subsection (pp. 81–91) and his discussion at the beginning of the "Method" subsection of "Part Four" (pp. 92–97). Indeed, we would suggest that one of Foucault's greatest contributions to intellectual thought has been his reconceptualization of power, and a good discussion of this reconceptualization is abundantly available in *History of Sexuality*. Finally, however, what generally distinguishes his second method, genealogy, from his first one, archaeology, in our view, is that his archaeological method is dependent on a highly structured, highly interrelated set of constructs, all of which

need to be deployed together to actually do an archaeology, whereas his genealogical method is more like a set of critical tools that can be used in any sort of grouping. And it is this difference, we believe, that is one of the chief reasons why the latter is much more appealing to scholars.³⁰

■ CONCLUSION

Overall, it could be argued that Foucault's archaeological and genealogical work was mainly a critique of the modernist view of the human sciences and of "man" as simultaneously both the human scientist and the object of the human sciences. Then, in his conduct of any particular critique, whether archaeological or genealogical, he almost always takes up one "period" (although his "periods" often do not parallel those of mainstream history) prior to the one (the second period) he will critique and describes this first period to lay the basis for his description and critique of the subsequent period. However, his description of one period, his description of the change from one to the next, and his description of the second period move far beyond the territory typically covered in conventional history. For example, see our comparison of *connaissance* and *savoir* earlier, where *connaissance* covers the conventional territory, whereas *savoir*, which is what Foucault is focused on with both his archaeologies and his genealogies, is much broader, even including social phenomena that seem to have little direct connection to the particular *connaissance*. His point here is that the conventional or traditional view of the formal academic social sciences is but one part of an "effective history" and that when the *savoir* is considered, it becomes much more obvious that the human sciences are much less rational, much more ambiguous, much messier, much more filled with random error, and more driven by the petty jealousies and competitions of social scientists than is conventionally assumed. Thus, if you understand the difference between *connaissance* and *savoir*, and if you understand the fact that Foucault focused mostly on *savoir* as the territory of the archaeologist or

the genealogist, you understand a significant piece of what Foucault was up to with his critiques.

A second point he makes with these “period” comparisons is that, contrary to the self-story of modernity that the more recent is more humane, the “modernist” period is actually, when critiqued with an archaeology or a genealogy, worse, more oppressive, more demeaning. For example, whereas the prior penal system tortured bodies, the target of the subsequent one was the soul, not what people do but rather what they are. Thus, Foucault stands as a major critic of Western modernity, particularly calling into question a wide array of “progressive” assumptions that modernity is considerably better, more humane, and more rational than that which came before modernity.

A third focus for Foucault is to decenter “man” as the primary subject of modernity. To Foucault, modernity constructed man, the subject, the agent running the world. It was modernity that fashioned the whole of human life as constructed around and for man, the central subject, the central agentic actor. It was modernity that wrote a history of the progressive rational rise of the human sciences guided by and for man, the central subject. In contrast, Foucault suggests a different and effective history of the human sciences. Based on his critical examination of historical documents, he suggests that, although rationality is part of Western history, there is much, much more that is not rational and that is not guided by any central actor. Indeed, in both his archaeologies and his genealogies, history is not predominantly created by a subject, particularly a logical rational subject who has “his” hands on the guiding wheel of history. Instead, history is created by a complex array of processes, dispersions, procedures, accidents, hatreds, policies, desires, dominations, unintended or uncontrolled circulations of techniques of power, commercial practices, mores, analyses and demonstrations, the norms of industrial labor and bourgeois morality, the endlessly repeated play of dominations, literature, political decisions, discontinuities, opinions expressed in daily life, the fanatical and unending discussions

of scholars, randomness, dissensions, petty malice, precise scientific methods, subjected bodies, and faulty calculations, to name but just a few—and man, the subject, is not running this show called history. In addition, he repeatedly points out the contradiction within modernity of simultaneously having man as both the subject and object of history. However, given the dominance of our modernist romanticized view of ourselves as the center of our lives and our society and, given our deep ontological and epistemological attachment to this romanticized view, it is usually ignored or critiqued by scholars while they appropriate other aspects of Foucault’s critique of modernity. This, to us, is a serious mistake. His critique of modernity and his critique of the agentic subject at the center are deeply intertwined; thus, separating the two violates Foucault’s perspective at the most basic level of his thought.

There are other lesser abuses, and some erroneous readings, of Foucault that we have tried to address or correct. First, Foucault was, by his own words, enormously influenced by Canguilhem and saw Canguilhem and others as playing a role in French intellectual work similar to that which the Frankfurt School played in German intellectual work. Thus, we suggest that Canguilhem and others, such as Gaston Bachelard, should receive increased attention, as themes that Foucault draws from Canguilhem continue through his genealogies. Second, the amount of time and energy that Foucault gave to archaeology was much larger than that which he gave to genealogy. Thus, we suggest that much more attention be given to archaeology. Indeed, there is no legitimate doubt that Foucault continued throughout his life to highly value it as a method, despite what others concluded. Third, again by his own words, genealogy was not seen by Foucault as being superseded by or superior to archaeology. Thus, in comparing the two methods, more attention needs to be given to how Foucault saw the relationship of the two. Fourth, archaeology and genealogy are much less different than is often assumed, and this also could use more attention. Fifth, it was, in our opinion, Dreyfus and Rabinow who were largely responsible for

what we see as a distorted view of the relationship of archaeology and genealogy in the United States. Thus, we suggest more problematization of this contention. And sixth, in any considerations of the two methods, the essay on "Nietzsche, Genealogy, History" should receive increased attention, as it is a good bridge that directly connects the two methods.

In this conclusion, we also want to strongly recommend a relatively new collection of Foucault's work. The entire set is called *Essential Works of Foucault, 1954-1984*, and Paul Rabinow is the series editor.³¹ The first volume is *Ethics, Subjectivity, and Truth* (1994/1997) and was edited by Rabinow. The second volume is *Aesthetics, Method, and Epistemology* (1994a) and was edited by Faubion. The third volume is *Power* (1994c), and it too was edited by Faubion. In this set, when the English translations provided in it are compared with alternative ones, we consistently find that the translations in this set are superior. In addition, this set thematically groups parts of Foucault's books with some of his articles and interviews. We would suggest that, especially for beginners, this set is an excellent place to start reading Foucault, as it makes Foucault more accessible.

Undeniably, though, whichever books, articles, and interviews are considered, Foucault has left us with an impressive body of work and new methodologies and with a host of powerful analytic concepts, some of which we have tried to introduce to a broader range of readers. We want to end, then, with two more statements. The first is a very brief summary of our take on the use of Foucault in education scholarship. Unfortunately, we do not have space to comment in any detail on the use of Foucault in the social sciences generally or in education, our field, specifically. Indeed, commenting on the uses of Foucault across the social sciences in the United States alone is already probably too large for anything less than a book. Even just the use of Foucault as a primary focus by education scholars, as can be seen in one part of our bibliography, is rather large. However, after reviewing the scholarship in education using Foucault as the main theoretical resource, our

conclusion is that a very high percentage of this work engages Foucault's work at only a fairly superficial level.

Probably the most popular use, or abuse, is to cherry pick one concept, such as "panopticon" or "disciplinary society," and then use that one concept within a more traditional critical framework, even though there are epistemological contradictions between Foucault and most U.S. critical theory.³² In general, we would say this cherry picking is a mistake, as typically the single concept, in its Foucaultian meaning, does not really integrate with the rest of the assumptions in the article or book. Our point is that Foucault's concepts are but aspects of a general epistemological position that needs to be engaged with as a whole. Another similar error that we found in the uses of Foucault's work by U.S. education scholars, as well as by many social scientists, is to adopt his critique of modernity while ignoring his simultaneous critique of subjectivity itself. We are uncomfortable saying this because we sound like we are policing Foucault, but we think that it is simply undeniable that there is a tremendous amount of fairly superficial and ill-informed use of Foucault; in fact, we concluded that many have used his work without ever reading carefully through several volumes of it. Of course, the line between substantive engagements of Foucault and superficial ones can never be securely drawn. Thus, we are decidedly not arguing that we know and can define the canonical Foucault, but we would suggest that a supple use, or even an adequate use, of Foucault requires more than one close reading of any one book, article, or interview. Instead, we would suggest close readings of several books, along with articles and interviews, before trying to use or apply his work. When U.S. scholars do not engage in this kind of in-depth study of Foucault, we would remind them that their ignorance is fairly transparent to those who do study and use Foucault in a more substantive way.

Our second final point is what surprised us the most with our systematic review of Foucault's books. Also, we should say that we were reluctant to make this point, but we decided that we had to

for us to maintain the integrity of our recent rereading of all of Foucault's major works in the order that he published them. Before we did this review, we were strong advocates of Foucault's work and not too receptive to the many critiques of his work, as we saw most of them as conscious or unconscious defenses of the foundational assumptions of modernity. What emerged, though, for us is a new openness to one of the main critiques that has been made of Foucault's work. That is, there have been numerous complaints that in Foucault's consideration of the truth regimes of social life, such as those of prisons, the clinic, and sexuality, Foucault's descriptions of these regimes make them relentlessly oppressive, perhaps even totalized, with no way "out" (see, e.g., Hartsock, 1998). Clearly, we cannot go into a lengthy discussion of this critique, nor do we want to debate it at this point. What we can do, however, is strongly suggest that other advocates and persistent users of Foucault need to more openly and more carefully consider this critique. In other words, we would suggest that our experienced Foucault scholars need to engage this critique in a more balanced way and recognize that there is some "validity" to it.

After recently rereading straight through all of his books in the order that he published them, we were truly struck, unexpectedly struck, with how unrelenting Foucault is in his critique of the social forms in which we live. We began to understand what others have concluded about his totalizations of these social forms. We began, for example, to understand where others have concluded that, in his descriptions of penal institutions or the social sciences, there appears to be "no exit." His critique and the described oppression are powerfully unrelenting and do appear to approach a totalization. It is almost as if he has discovered that, for example, the new penal regime is not just a 6-sided cube of oppression and control but also a 500-sided cube and that, in brilliantly describing all of these sides, he leaves us with no recourse, no path for resistance or emancipation. What simultaneously reinforces this is the fact that in his major works, he rarely offers any alternative for resistance or emancipation from the oppression he so

thoroughly describes. (See, e.g., Grosz, 1994, who uses Foucault extensively but is simultaneously critical of how unrelenting his lack of alternative spaces and possibilities is; in fact, for us, Grosz exemplifies a balanced, in-depth use of Foucault that is both critical and appreciative.) Thus, for example, while Foucault provides an insightful characterization of the complexity of a discipline or regime, virtually every aspect, every facet, of the new complexity that Foucault describes becomes a critical moment for Foucault so that while he is opening up new perspectives on specific truth regimes, he is also foreclosing, through his totalized critique, the possibility that these new frontiers might become new possibilities or imaginaries.

Of course, we realize that the words "resistance" and "emancipation" are humanist ones arising out of modernity; thus, an advocate for Foucault might say that Foucault's unwillingness to offer any such alternative is simply his maintenance of a consistently anti-humanist-, anti-subject-centered epistemology. However, as Fraser (1989) pointed out some time ago, what is often ignored with Foucault is that much of his language, such as "systems of subjection" (Foucault, 1975/1979, p. 376) and "the endlessly repeated play of dominations" (p. 377), is itself language that is modernist and humanist and that the power Foucault's critiques have for us is a function of our immersion in and attachment to this modernist, humanist language. We would, thus, point out that what we have here is another modernist binary. Accordingly, whereas Foucault powerfully appropriates one side of this binary (e.g., subjection and domination), he largely avoids the other (e.g., resistance and emancipation). This, as Derrida³² has pointed out so well with his deconstructive methodology, does not mean that the other side of the binary, variously labeled resistance or emancipation, is not equally in play.

Thus, again, we want to suggest that scholars who are advocates of Foucault take this critique more seriously and approach Foucault more the way that Grosz (1994) generally does. However, we are not saying that Foucault never addresses some "positive" change possibilities. We are saying, though, that in all of the archaeologies he

overwhelmingly does not and that in *Discipline and Punish* (1975/1979) he largely does not. Also, for the most part in *The History of Sexuality, Volume 1: An Introduction* (1976/1980a) he does not, although in this latter work he does begin to talk about countering "the grips of power" with the "rallying point" being "bodies and pleasures" (p. 157). In *The History of Sexuality, Volume 1*, near the end, for example, he says,

We must not think that by saying yes to sex, one says no to power; on the contrary, one tracks along the course laid out by the general deployment of sexuality [when one says yes to sex]. It is the agency of sex that we must break away from if we aim—through a tactical reversal of the various mechanisms of sexuality—to counter the grips of power with the claims of bodies, pleasures, and knowledges, in their multiplicity and their possibility of resistance. The rallying point for the counterattack against the deployment of sexuality ought not to be sex-desire, but bodies and pleasures. (p. 157)

This is clearly an effort by Foucault to begin to explore resistance and a space of possible change, but this is by far the exception. In fact, some might argue that it is with this work that Foucault's interest in working on resistance and change emerges in the care of the self period that is said to follow the two genealogies. In addition, he was an activist, especially around prison issues, and in his interviews he supported activism while resisting critiques of the lack of activism in his books. For example, in an interview published in an Italian journal in 1978, he said (somewhat defensively, we would say), "I don't construct my analyses in order to say, 'This is the way things are, you are trapped.' I say these things only insofar as I believe it enables us to transform them" (Foucault, 1994c, pp. 295–295).

However, our point here is that through all of the archaeologies and the first genealogy and even most of the second genealogy, while Foucault is opening up new ways to think about our social world, his unrelenting, almost totalized, critique serves to foreclose how to use those new ways of thinking for resistance, for countering "the grips of power," and for developing spaces of valuable change. To us, this should be a major

concern because, in our view, his descriptive accounts of the complexities of disciplines, social arenas, and institutions could as well show that within these complexities, there are almost always spaces for resistance, "counterattack," appropriation, and construction, and this is also a point that Grosz (1994) makes. Similarly, Gubrium and Holstein (2000), in the second edition of this *Handbook*, drawing strongly on Foucault, have tried to develop "an interpretive practice [that] works against [the kind of Foucaultian] totalization that views all interpretations as artifacts of particular regimes of power/knowledge" (p. 501). By raising these criticisms of Foucault, though, we are not trying to be definitive, as that would require a more extended, in-depth discussion of the whole range of critiques of Foucault on this issue. Instead, we are more modestly suggesting, based on our recent systematic read of Foucault, that Foucault advocates, as we ourselves have been, need to take another, more careful, more balanced consideration of this critique of Foucault's work. Or, as Foucault himself said, "The only valid tribute to [anyone's] thought . . . is precisely to use it, to deform it, to make it groan and protest. And if commentators then say that I am being faithful or unfaithful . . . that is of absolutely no interest" (Foucault, 1980b, pp. 53–54).

Nonetheless, even with such reconsiderations, Foucault remains a powerful, innovative intellectual whose work has opened up insightful and provocative avenues of thought, critique, and understanding. Moreover, without a doubt, his work has become enormously influential worldwide. Deleuze (1990/1995), though, said this much more poetically:

When people follow Foucault, when they're fascinated by him, it's because they're doing something with him, in their own work, in their own independent lives. It's not just a question of [Foucault's] intellectual understanding or agreement, but of intensity, resonance, musical harmony. (p. 86)¹¹

Hopefully, our interpretations presented here will add to this influence by helping those who have not yet engaged Foucault to understand where they might begin. We also hope we have been useful and

provocative to those who are more experienced friends of Foucault, even if we may have disturbed them a bit with our critical remarks. Whatever the reads of our read, though, we want to *again* and *again* strongly emphasize that our interpretations of Foucault, our comments on the uses and abuses of Foucault in education and the social sciences, our critiques of Foucault and others, and our concluding remarks are not the correct, the best, the authoritative, or the canonical ones. Even if you forget everything else we have written here, do not forget this point. As we said at the beginning of this essay, the comments we offer here are not *true* interpretations of Foucault's work, nor are such interpretations possible in our view. The primary issue to us is how substantive the engagement is, not whether the engagement is the correct one. Thus, whether there is agreement or disagreement with what we have said here, we truly hope that all readers will see this essay as a substantive effort to engage primarily not only with Foucault but also, to a smaller extent, with his users and abusers, his advocates and critics.

■ NOTES

1. Despite the fact that this essay is not a "true" one, we want to thank our reviewers for their suggestions, comments, and criticisms. There is simply no question that this essay was substantively improved due to their responses even when we disagreed with those responses. Those reviewers were Jaber Gubrium, Patti Lather, Bill Black, Elizabeth St. Pierre, Norman Denzin, and Jack Bratich. However, none of them should be held responsible for anything we have written here as we used and abused, agreed and disagreed with, incorporated and ignored their words.

2. The American Psychological Association (APA) style format rule is that the original publication date for a publication in another language precedes the publication date in English, just as we have done it here. However, we wanted to make sure that everyone paid attention to these dates because they are part of a significant point that we are making in this essay.

3. Foucault himself actually calls his archaeologies and genealogies toolboxes: "All my books . . . are little toolboxes, if you will" (Halperin, 1993, p. 52). Thanks to Elizabeth St. Pierre for pointing out this quote.

4. See, for example, Burchell, Gordon, and Miller's *The Foucault Effect: Studies in Governmentality* (1991), Barry, Osborne, and Rose's *Foucault and Political Reason* (1996), and parts of Popkewitz and Brennan's *Foucault's Challenge* (1998).

5. Jaber Gubrium also suggests John Rajchman, Lisa King, and Lee Quimby as doing similar work. We would agree with the Rajchman suggestion, but we are not familiar with the other two. Nonetheless, we think Gubrium knows what he is talking about.

6. See Foucault's "What Is an author?" in *Language, Counter-Memory, Practice* (1977).

7. In other words, we are suggesting to those enamored of and influenced by Kuhn that they should read the work of Canguilhem because, in our view, Canguilhem's work with the history of sciences is much more impressive, much more substantive, than that of Kuhn.

8. Throughout this essay, when we quote Foucault, we add words or phrases in brackets to help readers follow his meaning. Foucault often writes in long sentences and is often not clear with his referents or words he substitutes for other words. Thus, reading Foucault typically requires paying very close attention to his meaning as a sentence or paragraph progresses. Our added brackets are intended, then, to help readers follow his meaning more easily.

9. It is certainly easy to imagine the good uses to which Lincoln and Guba could have put Canguilhem in their critique of science and reason in 1985 in *Naturalistic Inquiry* (1985).

10. It should not be assumed that Canguilhem was trying to totally undermine the history of the sciences or to destroy the value and importance of reason. He was not. In fact, it is clear that Canguilhem appreciates and values both science and reason. Instead, Canguilhem could be said to be trying to develop an approach to the study of the history of science and the history of reason that was much less hagiographic.

11. However, Gutting's *Michel Foucault's Archaeology of Scientific Reason* (1989) is a useful discussion of archaeology, though we disagree with some of his interpretations of Foucault.

12. It should be noted that for Foucault, practices and institutions, theories and disciplines, all exist at the same level. As he says, "I deal with practices, institutions, and theories on the same plane and according to the same isomorphisms" (Foucault, 1994c, p. 262).

13. Foucault always felt that to understand something, say a discursive formation, he needed another one to which to compare it. Comparison, then, is almost always a key part of his analytic work.

14. Foucault uses "possibility" because the process is not deterministic; that is, it is not deterministically inevitable that a *connaissance* will emerge out of a *savoir*.

15. This point is similar to points made by Canguilhem, as was already discussed.

16. Remember here how Canguilhem had asserted that "error" is an integral part of life at the biological level.

17. In the specific part of *The Archaeology of Knowledge* from which this cite is drawn (p. 4), Foucault (1969/1972) cites Canguilhem. Indeed, as we argued in an earlier section, much of archaeology comes from Foucault's use, interpretation, and transformation of his mentor's work.

18. Habermas would be an example of the latter.

19. Unfortunately, we cannot find this interview at this point, but we know we have read it. Our apologies to our readers. If someone comes across it, she or he should e-mail it so that we can add the citation to any future revisions of this essay.

20. One of the reviewers of this chapter argued that *The History of Sexuality, Volume 2: The Use of Pleasure* was clearly a genealogy, but it is our view that Foucault's own words in this text indicate that Volume 2 is not another genealogy. In the "Introduction" to Volume 2, Foucault discusses the genealogy he originally intended to do but then turns away from this. A good discussion of the three periods and Foucault's intentions with each can be found in Davidson (1986).

21. We would also suggest that because of their critique of archaeology, Dreyfus and Rabinow (1983) played a key role in the lack of attention to Canguilhem, as they mention him only once throughout *Beyond Structuralism and Hermeneutics*.

22. The reason why this more recent version is better, in our view, is that it clearly distinguishes knowledge as *connaissance* and knowledge as *savoir*, both of which we have discussed as key concepts of Foucault's archaeology.

23. It is hard not to conclude that Foucault actually either enjoyed writing about the torture or enjoyed shocking readers or both, given the extended detail in his descriptions.

24. Obviously, one of the points we are trying to make here is that there is less of a break between archaeology and genealogy than is commonly assumed.

25. Foucault would likely call the new focus on student-centered classrooms one of the effects of a "pastoral" approach.

26. This point is a good example of a concern that started with Canguilhem and continues from Foucault's archaeologies into his genealogies.

27. Amazon.com now allows anyone to do two-word or phrase searches of an entire book of any book that is contained in this system. It is a marvelous system, but any single person can do this only twice a month without buying the book.

28. One odd little note is that although Foucault's convention is to compare two periods in his various analyses, in *History of Sexuality* he compares three.

29. Contrary to what many assume, Foucault is exceedingly logical in his written presentations. He constantly divides an arena of focus into numbered parts and then proceeds to define those parts in an orderly fashion. Indeed, at this point, we have begun to wonder why there is all of this commentary as to how Foucault writes in some disrupted "postmodern" fashion. We find, after our lengthy review of his work, that he writes in a fairly conventional way for complex intellectual work. Actually, other than learning to think differently, which is really the hardest task in reading Foucault, what is required is to carefully follow the meaning in his long complex sentences, as it is sometimes difficult to follow to what he is referring. In other words, it takes a close reading to follow his meaning, but there is little that is "disrupted" in his texts, in our view.

30. One of our reviewers argued that the larger problem with the archaeological methodology is that very few areas of social life lend themselves to the kind of complex discursive structures that Foucault addresses in his archaeologies. We would clearly disagree. We would suggest that before Foucault's archaeological analyses, few would have seen the complex *savoir*-based discursive patterns that Foucault identified in *Madness and Civilization* (1961/1988), *The Birth of the Clinic* (1963/1994b), and *The Order of Things* (1966/1973a). For instance, we think education could definitely be a fertile arena for archaeological analyses.

31. There is a new comprehensive set of all of Foucault's work that has been published in French, called *Dits et Ecrits*. It is two volumes. *Dits et Ecrits, tome 1, 1954-1975* (2001a, 1,700 pages) and *Dits et Ecrits, tome 2, 1976-1988* (2001b, 1,976 pages). We certainly hope that some group will provide an English translation of the entire set.

32. There is no doubt that Foucault is part of a critical tradition in Western philosophy, but he had fundamental arguments with that part of the critical

tradition that has been labeled Marxist, neo-Marxist, or critical theory.

33. As Foucault scholars well know, Derrida was strongly critical of Foucault's work.

34. Thanks to Elizabeth St. Pierre for this delightful quote.

■ BIBLIOGRAPHY

Foucault Books

(This is an attempt to list all of Foucault's major books, but it is not intended to be comprehensive of all of Foucault's work in English. In addition, these are the books that we own and have studied.)

Foucault, M. (1972). *The archaeology of knowledge and the discourse on language* (A. M. Sheridan Smith, Trans.). New York: Pantheon Books. (Original work published in 1969)

Foucault, M. (1973a). *The order of things: An archaeology of the human sciences*. New York: Vintage Books. (Original work published in 1966)

Foucault, M. (1973b). *This is not a pipe* (J. Harkness, Trans.). Berkeley: University of California Press.

Foucault, M. (1977). *Language, counter-memory, practice. Selected essays and interviews by Michel Foucault* (D. F. Bouchard, Ed.; D. F. Bouchard & S. Simon, Trans.). Ithaca, NY: Cornell University Press.

Foucault, M. (1979). *Discipline and punish: The birth of the prison* (A. Sheridan, Trans.). New York: Vintage Books. (Original work published in 1975)

Foucault, M. (1980a). *The history of sexuality, Vol. 1: An introduction* (R. Hurley, Trans.). New York: Vintage Books. (Original work published in 1976)

Foucault, M. (1980b). *Power/Knowledge: Selected interviews and other writings, 1972–1977* (C. Gordon, Ed.; C. Gordon, L. Marshall, J. Mepham, & K. Soper, Trans.). New York: Pantheon Books.

Foucault, M. (1986). *The history of sexuality, Vol. 3: Care of the self* (R. Hurley, Trans.). New York: Pantheon Books. (Original work published in 1984)

Foucault, M. (1988). *Madness and civilization: A history of insanity in the age of reason* (R. Howard, Trans.). New York: Vintage Books. (Original work published in 1961)

Foucault, M. (1989). *Foucault live: Interviews, 1966–84* (S. Lotringer, Ed.; J. Johnston, Trans.). New York: Semiotext(e).

Foucault, M. (1990). *The history of sexuality, Vol. 2: The use of pleasure* (R. Hurley, Trans.). New York: Pantheon Books. (Original work published in 1984)

Foucault, M. (1994a). *Aesthetics, method, and epistemology* (J. D. Faubion, Ed.; R. Hurley & others, Trans.). New York: New Press.

Foucault, M. (1994b). *The birth of the clinic: An archaeology of medical perception* (A. M. Sheridan-Smith, Trans.). New York: Vintage Books. (Original work published in 1963)

Foucault, M. (1994c). *Power* (J. D. Faubion, Ed.; R. Hurley & others, Trans.). New York: New Press.

Foucault, M. (1997). *Ethics, subjectivity, and truth* (Vol. 1; P. Rabinow, Ed.; R. Hurley & others, Trans.). New York: New Press. (Original work published in 1994)

Foucault, M. (1998). *Aesthetics, method, and epistemology* (Vol. 2; J. D. Faubion, Ed.; R. Hurley and others, Trans.). New York: New Press.

Foucault, M. (2001a). *Dits et Ecrits, tome 1, 1954–1975*. Paris: Gallimard.

Foucault, M. (2001b). *Dits et Ecrits, tome 2, 1976–1988*. Paris: Gallimard.

Foucault, M. (2001c). *Fearless speech* (J. Pearson, Ed.). Los Angeles: Semiotext(e).

Foucault, M. (2003). "Society must be defended": *Lectures at the Collège de France, 1975–1976* (M. Bertani & A. Fontana, Eds.; D. Macey, Trans.). New York: Picador.

Rabinow, P. (Ed.). (1984). *Foucault reader*. New York: Pantheon Books.

Foucault-Oriented Education Books

(This list is meant to be comprehensive of all books in education that apply Foucault to education as their primary purpose. It does not include books that just use Foucault among many others; it includes only those that we could find that explicitly take Foucault as their main theoretical frame.)

Baker, B., & Heyning, K. (Eds.). (2004). *Dangerous coagulations? The uses of Foucault in the study of education*. New York: Peter Lang.

Ball, S. (Ed.). (1990). *Foucault and education: Disciplines and knowledge*. London: Routledge.

Ball, S., & Tamboukou, M. (2003). *Dangerous encounters: Genealogy and ethnography*. New York: Peter Lang.

Marshall, J. D. (1996). *Michel Foucault: Personal autonomy and education*. Dordrecht, Netherlands: Kluwer Academic.

- Peters, M. (1996). *Poststructuralism, politics, and education*. Westport, CT: Bergin & Garvey.
- Popkewitz, T. S., & Brennan, M. (1998). *Foucault's challenge: Discourse, knowledge, and power in education*. New York: Columbia University Teachers College Press.
- Scheurich, J. J. (1997). *Research method in the post-modern*. London: Falmer.
- Tamboukou, M., & Ball, S. J. (2003). Genealogy and ethnography: Fruitful encounters or dangerous liaisons? In M. Tamboukou & S. J. Ball (Eds.), *Dangerous encounters: Genealogy and ethnography* (pp. 1–36). New York: Peter Lang.
- General Foucault Books**
- (These are books on Foucault's work that we have found to be helpful and/or influential, but it is not meant to be a comprehensive list of all books in English on Foucault. These are books that we own and have studied.)
- Armstrong, T. J. (Trans.). (1992). *Michel Foucault: Philosopher*. New York: Routledge.
- Barker, P. (1998). *Michel Foucault: An introduction*. Edinburgh, UK: Edinburgh University Press.
- Barry, A., Osborne, T., & Rose, N. (Eds.). (1996). *Foucault and political reason: Liberalism, neo-liberalism, and the rationalities of government*. Chicago: University of Chicago Press.
- Bernauer, J., & Rasmussen, D. (Eds.). (1991). *The final Foucault*. Cambridge, MA: MIT Press. (Includes a biographical chronology of Foucault interspersed with some quotes from Foucault as he remembers different times in his life)
- Best, S., & Kellner, D. (1991). *Postmodern theory: Critical interrogations*. New York: Guilford.
- Burchell, G., Gordon, C., & Miller, P. (1991). *The Foucault effect: Studies in governmentality*. Chicago: University of Chicago Press.
- Rutler, J. (1993). *Bodies that matter: On the discursive limits of "sex"*. New York: Routledge.
- Canguilhem, G. (1988). *Ideology and rationality in the history of the life sciences*. Cambridge, MA: MIT Press.
- Canguilhem, G. (1989). *The normal and the pathological*. New York: Zone Books.
- Caputo, J., & Yount, M. (1993). *Foucault and the critique of institutions*. University Park: Pennsylvania State University Press.
- Davidson, A. I. (1986). Archaeology, genealogy, ethics. In D. Couzens Hoy (Ed.), *Foucault: A critical reader* (pp. 221–234). Oxford, UK: Basil Blackwell.
- Deleuze, G. (1995). *Negotiations: 1972–1990* (M. Joughin, Trans.). New York: Columbia University Press. (Original work published in 1990)
- Dreyfus, H. L., & Rabinow, P. (1983). *Michel Foucault: Beyond structuralism and hermeneutics* (2nd ed.). Chicago: University of Chicago Press.
- Eribon, D. (1991). *Michel Foucault* (B. Wing, Trans.). Cambridge, MA: Harvard University Press.
- Fraser, N. (1989). *Unruly practices: Power, discourse, and gender in contemporary social theory*. Minneapolis: University of Minnesota Press.
- Grosz, E. (1994). *Volatile bodies: Toward a corporeal feminism*. Bloomington: Indiana University Press.
- Gubrium, J. E., & Holstein, J. A. (2000). Analyzing interpretive practice. In N. K. Denzin & Y. S. Lincoln (Eds.), *Handbook of qualitative research* (2nd ed., pp. 487–508). Thousand Oaks, CA: Sage.
- Gutting, G. (1989). *Michel Foucault's archaeology of scientific reason*. Cambridge, UK: Cambridge University Press.
- Gutting, G. (Ed.). (1994). *The Cambridge companion to Foucault*. Cambridge, UK: Cambridge University Press.
- Halperin, D. M. (1995). *Saint Foucault: Towards a gay hagiography*. New York: Oxford University Press.

ANALYZING TALK AND TEXT

Anssi Peräkylä

There are two much used but distinctively different types of empirical materials in qualitative research: interviews and naturally occurring materials. Interviews consist of accounts given to the researcher about the issues in which he or she is interested. The topic of the research is not the interview itself but rather the issues discussed in the interview. In this sense, research that uses naturally occurring empirical material is different; in this type of research, the empirical materials themselves (e.g., the tape-recordings of mundane interactions, the written texts) constitute specimens of the topic of the research. Consequently, the researcher is in more direct touch with the very object that he or she is investigating.

Most qualitative research probably is based on interviews. There are good reasons for this. By using interviews, the researcher can reach areas of reality that would otherwise remain inaccessible such as people's subjective experiences and attitudes. The interview is also a very convenient way of overcoming distances both in space and in time; past events or faraway experiences can be studied by interviewing people who took part in them.

In other instances, it is possible to reach the object of research directly using naturally occurring empirical materials (Silverman, 2001). If the

researcher is interested in, say, strategies used by journalists in interviewing politicians (cf. Clayman & Heritage, 2002a), it might be advisable to tape-record broadcast interviews rather than to ask journalists to tell about their work. Or, if the researcher wants to study the historical evolution of medical conceptions regarding death and dying, it might be advisable to study medical textbooks rather than to ask doctors to tell what they know about these concepts.

The contrast between interviews and naturally occurring materials should not, however, be exaggerated (cf. Potter, 2004; Speer, 2002). There are types of research materials that are between these two pure types. For example, in *informal interviews that are part of ethnographic fieldwork*, and in *focus groups*, people describe their practices and ideas to the researcher in circumstances that are much closer to "naturally occurring" than are the circumstances in ordinary research interviews. Moreover, even "ordinary" interviews can be, and have been, analyzed as specimens of interaction and reasoning practices rather than as representations of facts or ideas outside the interview situation. As Speer (2002) recently put it, "The status of pieces of data as natural or not depends largely on what the researcher intends to 'do' with them" (p. 513). Wetherell and Potter (1992), for example, analyzed the ways in which

interviewees use different linguistic and cultural resources in constructing their relation to racial and racist discourses. On the other hand, as Silverman (2001) put it, no data—not even tape recordings—are “untouched by the researcher’s hands” (p. 159; see also Speer, 2002, p. 516); the researcher’s activity is needed, for example, in obtaining informed consent from the participants. The difference between researcher-instigated data and naturally occurring data should, therefore, be understood as a continuum rather than as a dichotomy.

This chapter focuses on one end of this continuum. It presents some methods that can be used in analyzing and interpreting tape-recorded interactions and written texts, which probably are the types of data that come closest to the idea of “naturally occurring.”

■ ANALYZING TEXTS

Uses of Texts and Variety of Methods of Text Analysis

As Smith (1974, 1990) and Atkinson and Coffey (1997) pointed out, much of social life in modern society is mediated by written texts of different kinds. For example, modern health care would not be possible without patient records; the legal system would not be possible without laws and other juridical texts; professional training would not be possible without manuals and professional journals; and leisure would not be possible without newspapers, magazines, and advertisements. Texts of this kind have provided an abundance of material for qualitative researchers.

In many cases, qualitative researchers who use written texts as their materials do not try to follow any predefined protocol in executing their analysis. By reading and rereading their empirical materials, they try to pin down their key themes and, thereby, to draw a picture of the presuppositions and meanings that constitute the cultural world of which the textual material is a specimen. An example of this kind of informal approach is Seale’s (1998) small but elegant case study on a

booklet based on a broadcast interview with the British playwright Dennis Potter (pp. 127–131). The interviewee was terminally ill at the time of the interview. Seale showed how the interview conveys a particular conception of death and dying, characterized by intensive awareness of the imminent death and special creativity arising from it.

An informal approach may, in many cases, be the best choice as a method in research focusing on written texts. Especially in research designs where the qualitative text analysis is not at the core of the research but instead is in a subsidiary or complementary role, no more sophisticated text analytical methods may be needed. That indeed was the case in Seale’s (1998) study, in which the qualitative text analysis complemented a larger study drawing mostly on interview and questionnaire materials as well as on theoretical work. In projects that use solely texts as empirical materials, however, the use of different kinds of analytical procedures may be considered.

There are indeed many methods of text analysis from which the researcher can choose. The degree to which they involve predefined sets of procedures varies; some of them do to a great extent, whereas in others the emphasis is more on theoretical presuppositions concerning the cultural and social worlds to which the texts belong. Moreover, some of these methods can be used in the research of both written and spoken discourse, whereas others are exclusively fitted to written texts. In what follows, I briefly mention a few text analytical methods and then discuss two a bit more thoroughly.

Semiotics is a broad field of study concerned with signs and their use. Many tools of text analysis have arisen from this field. The most prominent of them may be *semiotic narrative analysis*. The Russian ethnologist Propp (1968) and the French sociologist Greimas (1966) developed schemes for the analysis of narrative structures. Initially their schemes were developed in fairy tales, but later on they were applied to many other kinds of texts. For example, by using Greimas’s scheme, primordial structural relations (e.g., subject vs. object, sender vs. receiver, helper

vs. opponent) can be distilled from the texts. Törrönen (2000, 2003) used and developed further Greimasian concepts in analyzing newspaper editorials addressing alcohol policy, showing how these texts mobilize structural relations so as to encourage readers to take action to achieve particular political goals.

The term *discourse analysis* (DA) may refer, depending on context, to many different approaches of investigation of written texts (and of spoken discourse as well). In the context of linguistics, DA usually refers to research that aims at uncovering the features of text that maintain coherence in units larger than the sentence (Brown & Yule, 1983). In social psychology, DA (or *discursive psychology*, as it has been called more recently) involves research in which the language use (both written and spoken) underpinning mental realities, such as cognition and emotion, is investigated. Here, the key theoretical presupposition is that mental realities do not reside "inside" individual humans but rather are constructed linguistically (Edwards, 1997; Potter & Wetherell, 1987). *Critical discourse analysis* (CDA), developed by Fairclough (1989, 1995), constitutes yet another kind of discourse analytical approach in which some key concerns of linguistic and critical social research merge. Critical discourse analysts are interested in the ways in which texts of different kinds reproduce power and inequalities in society. Tainio's (1999) study on the language of self-help communication guidebooks for married couples is one example of a CDA study. Tainio showed, for example, how in these texts the woman is expected to change for the communication problems to be solved, whereas the man is treated as immutable.

Historical discourse analysis (HDA) constitutes yet another form of DA, and that is an approach I introduce a bit more thoroughly through a research example.

Historical Discourse Analysis: Armstrong's Work as an Example

Many scholars working with written texts have drawn insights and inspiration from the work of

Michel Foucault. (For examples of his own studies, see Foucault, 1973, 1977, 1978. For examples of accessible accounts of his theories and methods, see Kendall & Wickham, 1999; McHoul & Grace, 1993.) Foucault did not propose a definite set of methods for the analysis of texts; hence, the ways of analyzing and interpreting texts of scholars inspired by him vary. For all of them, however, a primary concern is, as Potter (2004) aptly put it, how a set of "statements" comes to constitute objects and subjects. The constitution of subjects and objects is explored in historical context—or, in Foucault's terms, through *archeology* and *genealogy*.

David Armstrong's work is a good example of the Foucaultian, or historical, approach in text analysis. In a string of studies (Armstrong, 1983, 1987, 1993, 1998, 2002; Gothill & Armstrong, 1999), he investigated medical textbooks and journal articles, showing how objects such as bodies, illnesses, and death, as well as subjects such as doctors, patients, and nurses, have been constituted in these texts during the past two centuries. Armstrong's approach is radically constructionistic; he argued that these objects and subjects—in the sense that we know them now—did not exist before they were constructed through textual and other practices. For example, it has always been the case that some people die at a very early age, but according to Armstrong (1986), "infant mortality" as a discrete social object came into being around 1875. Only after that did the Registrar-General's annual reports (in Britain) orient to such a fact.

Let us examine briefly Armstrong's (1993) article on "public health spaces" so as to understand his Foucaultian way of analyzing and interpreting texts. Basically, Armstrong was concerned about hygienic rules. Using textual material derived from medical and hygienic textbooks and instructions, Armstrong showed how the rules defining the difference between the dangerous and the safe, or between the pure and the dirty, have changed during the past two centuries. In and through examining the rules and their change, Armstrong explored evolution of the spaces in which individual identity is located.

Armstrong (1993) identified four phases, or "regimes," in the development of hygienic rules. During the *quarantine* phase (from the late Middle Ages until the first half of the 19th century), the dividing line between pure and dirty demarcated different geographic spaces. Ships carrying diseases, or towns and villages where infectious diseases were found, were separated from "clean" localities. During the *sanitary science* phase (ca. 1850–1900), the key boundary separated the human body (clean) and the substances outside the body such as (contaminated) air and water. During the *interpersonal hygiene* phase (early to mid-20th century), the dividing line went between individual bodies so as to prevent the spread of contagious diseases from one body to another. Finally, during the *new public health* phase, the danger arose from the incursion of the activities of human bodies into nature in the form of pollution of the environment. Armstrong pointed out that each hygienic regime incorporated practices of the formation of human identity. For example, the shift from quarantine to sanitary science involved dissection of the mass and recognition "of separable and calculable individuality" (p. 405), interpersonal hygiene constructed individual differences, and new public health outlined a reflective subject. Through his analysis, Armstrong also entered into discussion with sociological and anthropological writings of Durkheim (1948) and Douglas (1966), giving historical specification to their concepts and reformulating some of their assumptions regarding the social significance of the boundaries between the sacred and the profane or between the pure and the dirty.

Armstrong's results are impressive. How did he do it? How did he analyze his texts? He recently gave an illuminating account of his method (Armstrong, 2002, chap. 17). Independent of, but still in line with, his own account, I now point out a few things that appear as central in the context of this *Handbook*. In a technical sense, Armstrong's way of analyzing texts is not very different from what was referred to earlier as "the informal approach." He focused on the "propositional content" (not the linguistic forms) of the texts, trying to pin down the assumptions and

presuppositions that the texts incorporated. But there were at least three additional features. First, Armstrong was very sensitive about the time of the publication of the texts. A key aspect of his analysis was showing at which time each new hygienic regime arose, and he argued that quite exact times could be documented through an historical survey of texts. Second, Armstrong's analysis was informed by theory. Along with the Foucaultian concerns, Douglas's (1966) arguments presented in her modern classic *Purity and Danger* offered him a standpoint. For Douglas, the separation between the pure and the dangerous objects was the key issue. Third, for Armstrong (as for all Foucaultians), texts and *practices* are inseparable. The medical and hygienic texts that he read had a strong instructive component in them; they not only were establishing boundaries between "ideal" objects but also served as (and Armstrong read them as) guidelines for actual social practices where these boundaries were maintained.

Armstrong's historical and Foucaultian way of analyzing and interpreting texts offers one compact alternative for qualitative text analysis. We now turn to a quite different way of reading texts in qualitative research, that is, *membership categorization analysis* (MCA).

Membership Categorization Analysis

Whereas Armstrong's Foucaultian analysis was concerned with the propositional content and not the formal properties of texts, MCA can be said to focus more on the latter. However, MCA is not about grammatical forms but rather about the normative and cognitive forms concerning social relations that are involved in the production and understanding of texts. To put it another way, Armstrong's Foucaultian approach is concerned about the assumptions that underlie *what* is said (and what is not said) in the text, whereas MCA is concerned about *the descriptive apparatus* that makes it possible to say whatever is said.

Before we start to examine MCA, I want to remind the reader about the wide range of applications that this approach has. In addition to the analysis of written texts, it can be used in the

analysis of interviews (e.g., Baker, 1997) and in the analysis of naturally occurring talk (e.g., Cuff, 1994). In the following, however, I focus on the text analytical applications.

The idea of membership categorization came from the American sociologist Sacks (1974b, 1992). *Description* was a key analytical question for Sacks; he was concerned about the conditions of description, that is, what makes it possible for us to produce and understand descriptions of people and their activities. As Silverman (2001) aptly put it, Sacks was concerned about "the apparatus through which members' descriptions are properly produced" (p. 139). This interest led Sacks to examine categorization.

People are usually referred to by using categories. The point of departure for MCA is recognition of the fact that at any event, a person may be referred to by using many alternative categories. As the author of this chapter, I may also be referred to also as a man, as a middle-aged person, as a Finn, as a sociologist, as a professor, as the father of two children, as a husband, and so forth. MCA is about the selection of categories such as these and about the conditions and consequences of this selection.

Sacks's (1974b) famous example is the beginning of a story written by a child: *The baby cried. The mommy picked it up.* There are two key categories in this story: "baby" and "mommy." Why are these categories used, and what is achieved by them? If the mommy happened to be a biologist by profession, why would the story not go like this: *The baby cried. The scientist picked it up* (Jayyusi, 1991, p. 238)? Why do we hear the story being about a baby and its mother and not just about any baby and any mother? MCA provides answers to questions such as these and offers a toolkit for analyzing various kinds of texts.

Sacks (1992) noted that categories form sets, that is, collections of categories that go together. Family is one such collection, and "baby," "mother," and "father" are some categories of it. "Stage of life" is another collection; it consists of categories such as "baby," "toddler," "child," and "adult." Now, "baby" could in principle be heard as belonging to both collections, but in the preceding little story we hear it as belonging to the "family"

collection. This is because in hearing (or reading) descriptions where two or more categories are used, we orient to a rule according to which we hear them as being from the same collection if they indeed can be heard in that way. Therefore, in this case we hear "baby" and "mommy" being from the device "family" (p. 247).

Categories also go together with activities. Sacks used the term "category-bound activities" in referring to activities that members of a culture take to be "typical" of a category (or some categories) of people. "Crying" is a category-bound activity of a baby, just as "picking a (crying) baby up" is a category-bound activity of a mother. In a similar fashion, "lecturing" is a category-bound activity of a professor. Activities such as these can be normative; it is appropriate for the baby to cry and for the mother to pick it up, but it is not appropriate for an adult to cry (like a baby) or for a mother to fail to pick a crying baby up. *Standardized relational pairs* consist of two categories where incumbents of the categories have standardized rights and obligations in relation to each other, with "mother and baby" clearly being one pair, just as "husband and wife" and "doctor and patient" are common pairs. Moreover, the receivers of descriptions can and do infer from actions to categories and vice versa. By knowing actions, we infer the categories of the agents; by knowing categories of agents, we infer what they do.

Even on the basis of these fragments of Sacks's ideas (for more thorough accounts, see Hester & Eglin, 1997; Silverman, 1998), the reader may get an impression of the potential that this account offers for the analysis of texts. Sacks's ideas are resources for the analysis of texts as sites for the production and reproduction of social, moral, and political orders. Merely by bearing in mind that there is always more than one category available for the description of a given person, the analyst always asks "Why this categorization now?"

Let us examine a brief example of MCA. Eglin and Hester (1999) gave a thoughtful account of the local newspaper coverage of a tragic event, namely the killing of 13 female students and a data processing worker by a gunman at the Ecole Polytechnique in Montreal in December 1989. Their aim was to show how a "deviant act" was

constructed by members of culture. They did this by identifying the categorical resources that were drawn on in the newspaper coverage.

Eglin and Hester (1999) showed how the description of the tragic event was entirely dependent on the resources or the "apparatus" of categorization. The headlines of the first news about the event implicated an initial pair of categories employed in describing the event, namely "offender" and "victims," which Eglin and Hester (p. 200) considered to be a special kind of a standardized relational pair. In the body of the news, these categories got transformed (e.g., "offender" got transformed into "murder suspect") and new categories, such as "police," "witnesses," "relatives," and "friends" of the victims, entered the scene. As Eglin and Hester put it,

These categories and category pairs . . . provide, then, some of the procedural resources that news writer and news reader may use to produce and recognize, respectively, the relevance of the variety of actors and actions that appeared in the text of the articles. (p. 202)

Categories are not, however, neutral resources of description. Eglin and Hester (1999) went on to analyze how the use of categorical resources made possible an *embedded commentary*, or *assessment*, of the events. They distinguished among several different "stories" in the news coverage, with each being based on particular operations with categories. For example, *the horror story* arose from the *disjuncture* between the membership categories made relevant by *the setting* and those made relevant by *the event*. On a university campus, the setting made relevant categories such as "student," "teacher," and "staff member." The horror story involved the transformation of these category identities into those of "offender," "victims," "witnesses," and so forth. This disjuncture was encapsulated in reports such as the following: *I was doing a presentation in front of the class, and suddenly a guy came in with what I think was a semi-automatic rifle* (Canadian Press, 1989, cited in Eglin & Hester, 1999, p. 204). Another kind of commentary was involved in the *story of the tragedy*. This story drew on two categorical resources: *the stage of life device* and what Sacks

(1974b) called the *R-collection*, that is, the collection of standardized relational pairs relevant for a search for help. In terms of the stage of life, the victims were young people who had their futures ahead of them: *Fourteen young women [are] brutally mowed down in the beauty of their youth when everything seemed to assure them of a brilliant future* (Malarek, 1989, cited in Eglin & Hester, 1999, p. 205). With respect to the *R-collection*, the tragedy arose from the loss experienced by the incumbents of the categorical "pair parts"—parents, brothers/sisters, and friends. Yet another commentary involved *the story about the killing of women*. The victims were women who were purposefully chosen by the gunman on the basis of their gender, and the categories "man" and "woman" ran through much of the news coverage. In subsequent articles, the massacre was linked with broader issues of male violence against women and with gender relations in general.

Because all description draws on categorization, it is obvious that MCA has wide applicability in the analysis of texts. The analysis of categorization gives the researcher access to the cultural worlds and moral orders on which the texts hinge. Importantly, however, categorization analysis is not *only* about specific cultures or moralities. In developing his concepts, Sacks was not primarily concerned about the "contents" of the categorizations; rather, he was concerned about the ways in which we use them (Atkinson, 1978, p. 194). Therefore, at the end of the day, membership categorization analysis invites the qualitative researcher to explore the conditions of action of description in itself.

■ ANALYZING TALK

Face-to-face social interaction (or other live interaction mediated by phones and other technological media) is the most immediate and the most frequently experienced social reality. The heart of our social and personal being lies in the immediate contact with other humans. Even though ethnographic observation of face-to-face social interaction has been done successfully by

sociologists and social psychologists, video and audio recordings are what provide the richest possible data for the study of talk and interaction today. Such recordings have been analyzed using the same methods that were discussed previously in the context of interpretation of written texts. CDA, MCA, and even Foucaultian DA have all of their applications in researching transcripts based on video and/or audio recordings. However, as Goffman (1983) pointed out, to be fully appreciated, the face-to-face social interaction also requires its own specific methods. The interplay of utterances and actions in live social interaction involves a complex organization that cannot be found in written texts. *Conversation analysis* (CA) is presented as a method specialized for analyzing that organization.

Origins of Conversation Analysis

CA is a method for investigating the structure and process of social interaction between humans. As their empirical materials, CA studies use video and/or audio recordings made from naturally occurring interactions. As their results, these studies offer qualitative (and sometimes quantitative) descriptions of interactional structures (e.g., turn taking, relations between adjacent utterances) and practices (e.g., telling and receiving news, making assessments).

CA was started by Sacks and his coworkers, especially Emanuel Schegloff and Gail Jefferson, at the University of California during the 1960s. At the time of its birth, CA was something quite different from the rest of social science. The predominant way of investigating human social interaction was quantitative, based on coding and counting distinct, theoretically defined actions (see especially Bales, 1950). Goffman (e.g., 1955) and Garfinkel (1967) had challenged this way of understanding interaction with their studies that focused on the moral and inferential underpinnings of social interaction. Drawing part of his inspiration from them, Sacks started to study qualitatively the real-time sequential ordering of actions—the rules, patterns, and structures in the relations between consecutive actions (Silverman, 1998). Schegloff (1992a) argued that Sacks made a radical shift in the perspective of social scientific inquiry

into social interaction; instead of treating social interaction as a screen on which other processes (Balesian categories or moral and inferential processes) were projected, Sacks started to study the very structures of the interaction itself (p. xviii).

Basic Theoretical Assumptions

In the first place, CA is not a theoretical enterprise but rather a very concretely empirical one. Conversation analysts make video and/or audio recordings of naturally occurring interactions, and they transcribe these recordings using a detailed notation system (see appendix). They search, in the recordings and transcripts, for recurrent distinct interactive practices that then become their research topics. These practices can involve, for example, specific sequences (e.g., news delivery [Maynard, 2003]) or specific ways of designing utterances (e.g., “oh”-prefaced answers to questions [Heritage, 1998]). Then, through careful listening, comparison of instances, and exploration of the context of them, conversation analysts describe in detail the properties and tasks that the practices have.

However, through empirical studies—in an “inductive” way—a body of theoretical knowledge about the organization of conversation has been accumulated. The actual “techniques” in doing CA can be understood and appreciated only against the backdrop of these basic theoretical assumptions of CA. In what follows, I try to sketch some of the basic assumptions concerning the organization of conversation that arise from these studies. There are perhaps three most fundamental assumptions of this kind (cf. Heritage, 1984, chap. 8; Hutchby & Wooffitt, 1998), namely that (a) talk is action, (b) action is structurally organized, and (c) talk creates and maintains intersubjective reality.

Talk is action. As in some other philosophical and social scientific approaches, in CA talk is understood first and foremost as a vehicle of human action (Schegloff, 1991). The capacity of language to convey ideas is seen as being derived from this more fundamental task. In accomplishing actions, talk is seamlessly intertwined with (other) corporeal means of action such as gaze and gesture (Goodwin, 1981). Some CA studies

have as their topics the organization of actions that are recognizable as distinct actions even from a vernacular point of view. Thus, conversation analysts have studied, for example, openings (Schegloff, 1968) and closings (Schegloff & Sacks, 1973) of conversations, assessments and ways in which the recipients agree or disagree with them (Goodwin & Goodwin, 1992; Pomerantz, 1984), storytelling (Mandelbaum, 1992; Sachs, 1974a), complaints (Drew & Holt, 1988), telling and receiving news (Maynard, 2003), and laughter (Haakana, 2001; Jefferson, 1984). Many CA studies have as their topic actions that are typical in some institutional environment. Examples include diagnosis (Heath, 1992; Maynard, 1991, 1992; Peräkylä, 1998, 2002; ten Have, 1995) and physical examination (Heritage & Stivers, 1999) in medical consultations, questioning and answering practices in cross-examinations (Drew, 1992), ways of managing disagreements in news interviews (Greatbatch, 1992), and advice giving in a number of different environments (Heritage & Sefi, 1992; Silverman, 1997; Vehviläinen, 2001). Finally, many important CA studies focus on fundamental aspects of conversational organization that make any action possible. These include turn taking (Sacks, Schegloff, & Jefferson, 1974), repair (Schegloff, Jefferson, & Sacks, 1977; Schegloff, 1992c), and the general ways in which sequences of action are built (Schegloff, 1995).

Action is structurally organized. In the CA view, the practical actions that comprise the heart of social life are thoroughly structured and organized. In pursuing their goals, the actors have to orient themselves to rules and structures that only make their actions possible. These rules and structures concern mostly the relations between actions. Single acts are parts of larger, structurally organized entities. These entities may be called "sequences" (Schegloff, 1995).

The most basic and the most important sequence is called the "adjacency pair" (Schegloff & Sacks, 1973). It is a sequence of two actions in which the first action ("first pair part"), performed by one interactant, invites a particular type of second action ("second pair part") to

be performed by another interactant. Typical examples of adjacency pairs include question-answer, greeting-greeting, request-grant/refusal, and invitation-acceptance/declination. The relation between the first and second pair parts is strict and normative; if the second pair part does not come forth, the first speaker can, for example, repeat the first action or seek explanations for the fact that the second action is missing (Atkinson & Drew, 1979, pp. 52–57; Merritt, 1976, p. 329).

Adjacency pairs often serve as a core around which even larger sequences are built (Schegloff, 1995). So, a *preexpansion* can precede an adjacency pair, for example, in cases where the speaker first asks about the other's plans for the evening and only thereafter (if it turns out that the other is not otherwise engaged) issues an invitation. An *insert expansion* involves actions that occur between the first and second pair parts and makes possible the production of the latter, for example, in cases where the speaker requests specification of an offer or a request before responding to it. Finally, in *postexpansion*, the speakers produce actions that somehow follow from the basic adjacency pair, with the simplest example being "okay" or "thank you" to close a sequence of a question and an answer or of a request and a grant (Schegloff, 1995).

Talk creates and maintains the intersubjective reality. CA has sometimes been criticized for neglecting the "meaning" of talk at the expense of the "form" of talk (cf. Alexander, 1988, p. 243; Taylor & Cameron, 1987, pp. 99–107). This is, however, a misunderstanding, perhaps arising from the impression created by technical exactness of CA studies. Closer reading of CA studies reveals that in such studies, talk and interaction are examined as a site where intersubjective understanding about the participants' intentions is created and maintained (Heritage & Atkinson, 1984, p. 11). As such, CA gives access to the construction of meaning in real time. But it is important to notice that the conversation analytical "gaze" focuses exclusively on meanings and understandings that are made public through conversational action and that it remains

"agnostic" regarding people's intrapsychological experience (Heritage, 1984).

The most fundamental level of intersubjective understanding—which in fact constitutes the basis for any other type of intersubjective understanding—concerns *the understanding of the preceding turn displayed by the current speaker*. Just like any turn of talk that is produced in the context shaped by the previous turn, it also displays its speaker's understanding of that previous turn (Atkinson & Drew, 1979, p. 48). Thus, in simple cases, when producing a turn of talk that is hearable as an answer, the speaker also shows that he or she understood the preceding turn as a question. Sometimes these choices can be crucial for the unfolding of the interaction and the social relation of its participants, for example, in cases where a turn of talk is potentially hearable in two ways (e.g., as an announcement or a request, as an informing or a complaint) and the recipient makes the choice in the next turn. In case the first speaker considers the understanding concerning his talk to be incorrect or problematic, as displayed in the second speaker's utterance, the first speaker has an opportunity to correct this understanding in the "third position" (Schegloff, 1992c), for example, by saying "I didn't mean to criticize you; I just meant to tell you about the problem."

Another important level of intersubjective understanding concerns the *context* of the talk. This is particularly salient in institutional interaction, that is, in interaction that takes place to accomplish some institutionally ascribed tasks of the participants (e.g., psychotherapy, medical consultations, news interviews) (Drew & Heritage, 1992). The participants' understanding of the institutional context of their talk is documented in their actions. As Schegloff (1991, 1992b) and Drew and Heritage (1992) pointed out, if the "institutional context" is relevant for interaction, it can be observed in the details of the participants' actions—in their ways of giving and receiving information, asking and answering questions, presenting arguments, and so forth. CA research that focuses on institutional interactions explores the exact ways in which the performers of different institutional tasks shape their actions to achieve their goals.

Research Example

After these rather abstract considerations, let us consider a concrete example of CA research. In my own work on AIDS counseling (Peräkylä, 1995), one of the topics was a practice called "circular questioning" in therapeutic theory. The clients in these sessions were HIV-positive patients and their family members or other significant others. In circular questions, the counselor asked one client to describe the thoughts or experiences of another person; for example, the counselor might ask the mother of an HIV-positive patient to describe what her (copresent) son's greatest concern is. In my analysis, I showed how such questioning involves a powerful practice to incite the clients to talk about matters that they otherwise would be reluctant to discuss. In circular questions, it was not only the counselors who encouraged the clients to talk about their fears and worries. A local interactional context where the clients encouraged each other to talk was built.

One type of evidence for this "function" of the circular questions comes from the structure of such questioning sequences. Without exception, each circular question was followed by the person whose experience was described ("the owner of the experience") himself or herself giving an account of the experience in question. Often the counselor asked the "owner's" view directly after hearing the coparticipant's version, and sometimes the owner volunteered his or her view. In both cases, the pattern of questioning made the owner of the experience speak about his or her fears and worries. In what follows, Extract 1 provides an example of such a sequence. The participants are an HIV-positive patient (P), his boyfriend (BF), and the counselor (C). Arrows 1 to 4 stand for the initiation of key utterances: 1 for the counselor's circular question, 2 for the boyfriend's answer, 3 for the follow-up question to the owner of the experience, and 4 for his response. Here, as in many other cases that I analyzed, the circular question leads the owner of the experience to disclose his deep worries (see especially lines 45–61). For transcription symbols, see the appendix.

Extract 1 (AIDS Counselling (Peräkylä, 1995, p. 110)):

- 01 C:(1) → What are some of things that you think Edward might
 02 have to do.=He says he doesn't know where to go
 03 from here maybe; and awaiting results and things.
 04 (0.6)
 05 C: What d'you think's worrying him.
 06 (0.4)
 07 B:(2) → Uh:m hhh:hh I think it's just fear of the unknown.
 08 P: Mm:
 09 C: (Okay.
 10 BF: (At- at the present time. (0.2) Uh:m (.) once
 11 he's (0.5) got a better understanding of (0.2) what
 12 could happen
 13 C: Mm:
 14 BF: uh:m how ,hh this will progress then: I think (.)
 15 things will be a little more [settled in his
 16 C: [Mm
 17 B: =own mind.
 18 C: Mm:
 19 (.)
 20 P: Mm:
 21 C:(3) → [Edward (.) from what you know: (0.5) wha- what
 22 what do you think could happen. (0.8) I mean we're
 23 talking hypothetically [now because I know
 24 P: (Mm: (well)-
 25 C: =no [more than you do about your actual state of=
 26 P: [uh:
 27 C: =health except that we do know,=
 28 P: =uh:
 29 C: ,hhh you're carrying the virus: (0.6) as far as-
 30 (0.3) the- that first text is concerned.
 31 P: Uh:h
 32 (.)
 33 P:(4) → (Well I feel) I see like two different extremes.=[
 34 see [that I can just- (0.8) carry on (in an)
 35 C: [umh
 36 P: incubation state: [for many years [and (up)
 37 C: [umh [umh
 38 P: ,hhh you know just being very careful about (it)
 39 [sexually,
 40 C: [uh:m
 41 (0.4)
 42 P: (and: or (0.3) can go on with a normal life.
 43 C: [umh
 44 C: umh
 45 P: And then I get my greatest fears: that- (0.2) you
 46 know just when I've got my life going: you know a
 47 good job=
 48 C: =um.h=
 49 P: things going very well.
 50 C: uh:m:
 51 (0.3)
 52 P: that (I :c) er: (0.2) my immunity will collapse,
 53 C: [umh
 54 C: umh
 55 P: [you know: (and I will) become very ill: (0.2)
 56 >quickly?<
 57 (1.0)
 58 P: ,hhh[hh and] lose control of th- the situation,
 59 C: [umh:
 60 C: umh:
 61 P: That's my greatest fear actually.

The frequent sequence structure in circular questioning posed a kind of a puzzle for the researcher: Why do the owners of the experience always give their authoritative versions after their experience has been described by somebody else, often even without the counselor asking for it? By examining the minute aspects of the recordings, I started to grasp how the owners' special status vis-à-vis these descriptions, and thereby the relevance of their eventual utterance, was collaboratively and consistently built up in these sequences. *Response tokens* and *postural orientation* were among the means of this buildup.

Response tokens are little particles through which the receivers of an utterance can "receipt" what they have heard and, among other things, indicate that they have no need to ask for clarification or to initiate any other kind of repair, thereby "passing back" the turn of talk to the initial speaker (Schegloff, 1982; Sorjonen, 2001). Usually in question-answer sequences, response tokens would be produced by the questioners. However, in circular questions, the owners of the experience regularly produced response tokens when their significant others were describing the owners' minds and circumstances. As such, the owners indicated their special involvement in the matters that were discussed. That was also the case in Extract 1; in

lines 8 and 20, P responded to BF's answer to C's questions with "Mm:"s. He showed his ownership of the matters that were spoken about, thereby also building up the relevance of his own description of them.

The same orientation was shown by the participants through their body posture. The clients who answered the circular question regularly shifted their gaze to the owner at the beginning of the answer, and only toward the end of it did they gaze at the counselor (to whom the answer is given). This organization of gaze contributes to the relevancy of the owner's utterance where he or she eventually describes his or her concerns. A segment from Extract 1 (see below) shows this pattern:

At the beginning of his answer, BF was not oriented to the questioner (the counselor); rather, he was oriented to the person whose mind he was describing (P). Likewise, P was gazing at BF; thus, they are in a mutual gaze contact. BF, the speaker, turned his gaze to the counselor at the end of the first sentence of his answer, and shortly after that P withdrew his gaze from the speaker and also turned to the counselor. Through these actions, P's special status vis-à-vis the things spoken about was collaboratively recognized.

The analysis of circular questioning led me to conclude that in this way of asking questions, a special context was created for the clients' talk

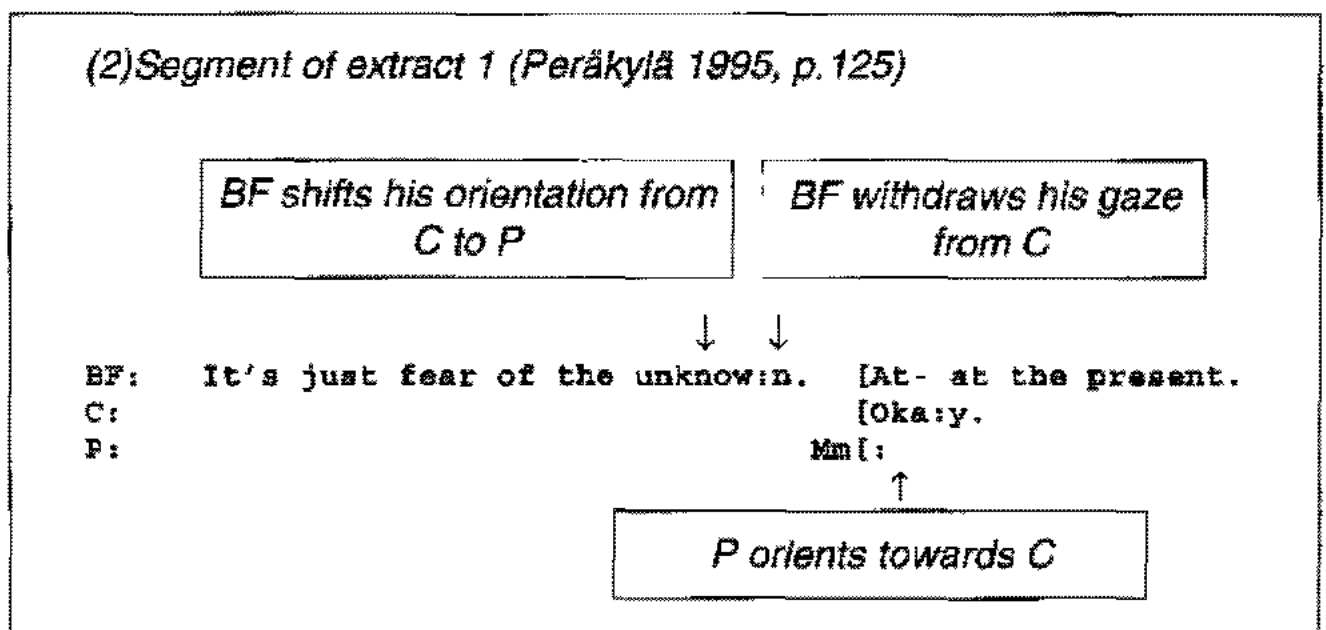

Figure 34.1.

about sensitive issues. Unlike "direct" questions, circular questions mobilize *the clients* in the work of eliciting and encouraging each other's talk. CA as a method for analyzing talk made it possible to examine this elicitation in detail.

■ CONCLUSION

It is a special concern of the third edition of this *Handbook* to be explicit politically, that is, to advance a democratic project committed to social justice. To conclude this chapter, therefore, I compare some of the methods discussed in terms of their relation to issues of *power* and *social change*. I focus on the three methods discussed most thoroughly: HDA, MCA, and CA.

The HDA exemplified in the chapter by Armstrong's work is most directly a method for investigating social change. Armstrong showed us the evolvment of hygienic regimes. At the same time, his analysis of texts was about power—about the discourses and practices through which the boundary between pure and dirty had been established and, in relation to that, through which human identities had been formed. Armstrong, like all Foucaultians, treated power here as a productive force—as something that calls realities into being rather than suppresses them.

The potential of MCA in dealing with questions pertaining to power and social change is well shown in a key text by Sacks (1992), "Hotrodders' as a Revolutionary Category" (pp. 169–174; see also Sacks, 1979). There are at least two relevant aspects of categorization involved here. The more obvious one is the linkage between categorization and racial and other prejudice. By identifying the actors who have committed crimes or other "evils" by racial or other categories, we can create a link between *all* members of the category and the evil that was done by an individual. Thus, categorization, which is an inherent property of language and thought, is a central resource for racism. However, as Silverman (1998) pointed out, the categorical references can also be used in "benign" ways, for example, in invoking and maintaining institutional identities such as "doctor" (p. 18). The

other relevant aspect to categorization is more subtle. Sacks (1992) argued that categories can be *owned*, *resisted*, and *enforced* (p. 172). Following his examples, young persons may be categorized as "teenagers." In (contemporary Western) society, this category is owned by those who are not teenagers, that is, those who are called "adults." It is adults who enforce and administer this categorization. Those who are categorized as "teenagers" can, however, resist this categorization by constructing their own categorizations and by deciding themselves to whom it will be applied. In Sacks's environment, one such categorization was "hotrodders"; it was a category set up by young people themselves, the incumbency of which they controlled. So far as the "others" (e.g., adults) adopted this new categorization, the revolution in categorization was successful. As a whole, Sacks's examples showed how categorization is a field of changing power relations. Analyzing texts using MCA offers one way in which to analyze them.

The relation of CA to questions of power and social change is more complex. CA that focuses on generic practices and structures of mundane everyday talk might seem irrelevant in terms of power and social change. Billig (1998) argued that this irrelevance may, in fact, imply politically conservative choices. Even in researching institutional interaction, the fact that conversation analysts often focus on small details of video- or audio-recorded talk might seem to render their studies impotent for the analysis of social relations and processes *not* incorporated in talk (cf. Hak, 1999).

From the CA point of view, two responses can be given to these criticisms. First, the significance of orderly organization of face-to-face (or other "live") interaction for *all* social life needs to be restated. No "larger scale" social institutions could operate without the substratum of the interaction order. It is largely through questions, answers, assessments, accusations, accounts, interpretations, and the like that these institutions operate. Hence, even when not focusing on hot social and political issues that we read about in the newspapers, CA is providing knowledge about the basic organizations of social life that make these issues,

as well as their possible solutions and the debate about them, possible in the first place.

There is, however, also CA research that is more directly relevant for political and social concerns. For example, many CA studies have contributed to our understanding of the ways in which specific interactional practices contribute to the maintenance or change of the *gender system*. Work by West (1979) and Zimmerman (Zimmerman & West, 1975) on male-female interruptions is widely cited. More recently, Kitzinger (2000) explored the implications of preference organization for the politics of rape prevention and turn-taking organization for the practices of "coming out" as gay or lesbian. In a somewhat more linguistic CA study, Tainio (2002) explored how syntactical and semantic properties of utterances are used in the construction of heterosexual identities in elderly couples' talk. Studies such as these (for a fresh overview, see McIlvenny, 2002) also amply demonstrate the *critical* potential of CA. Yet a different CA study on social change was offered in Clayman and Heritage's (2002b) work on question design in U.S. presidential press conferences. By combining qualitative and quantitative techniques, they showed how the relative proportions of different types of journalist questions, exhibiting different degrees of "adversarialness," have changed over time. As such, they explored the historical change in the U.S. presidential institution and media.

The "dissection" of practices of talk may, therefore, lead to insights that may have some political significance. As a final note, consider again the analysis of circular questioning briefly presented in the preceding section. I sought to show how the

recurrent structure of the questioning sequence, as well as the use of discourse particles and the postural orientation, contributed to a context where the patients and their significant others were *incited to speak* about their fears and worries. Now, as scholars working with the methods of historical text analysis have shown (Armstrong, 1984; Arney & Bergen, 1984), a clinic that incites patients to talk about their experience is a relatively new development that evolved during the latter half of the 20th century. Prior to that, Western medicine was not concerned about patients' subjective experience and focused on the body only. AIDS was arguably an illness that was more penetrated by this new medical gaze than was any other illness previously (Peräkylä, 1995, p. 340). Therefore, in observing the skillful practices through which AIDS counselors encourage their clients to talk about their subjective experiences, we were also observing the operation of an institution, involving power relations and bodies of knowledge, at a particular moment in its historical development.

In analyzing AIDS counseling, the results of historical text analysis provided a context for the understanding of the significance of the results of CA. Here, different methods of analyzing and interpreting talk and text complemented each other. This does not mean, however, that these methods could or should merge; the research object and the procedures of analysis in CA and HDA remain different. So, rather than combining different methods (which might be what, e.g., Wetherell, 1998, would propose), we should perhaps let each method do its job in its own way and on its own field and then, only at the end of that, let their results cross-illuminate each other.

APPENDIX

■ TRANSCRIPTION SYMBOLS IN CA

	Starting point of overlapping speech.
	End point of overlapping speech.
(2.4)	Silence measured in seconds
(.)	Pause of less than 0.2 seconds
↑	Upward shift in pitch
↓	Downward shift in pitch
word	Emphasis
wo:rd	Prolongation of sound
°word°	Section of talk produced in lower volume than the surrounding talk
WORD	Section of talk produced in higher volume than the surrounding talk
w#ord#	Creaky voice
£word£	Smile voice
wo(h)rd	Laugh particle inserted within a word
wo-	Cut off in the middle of a word
word<	Abruptly completed word
>word<	Section of talk uttered in a quicker pace than the surrounding talk
<word>	Section of talk uttered in a slower pace than the surround talk
(word)	Section of talk that is difficult to hear but is likely as transcribed
()	Inaudible word
.hhh	Inhalation
hhh	Exhalation
.	Falling intonation at the end of an utterance
?	Rising intonation at the end of an utterance
,	Flat intonation at the end of an utterance
word.=word	"Rush through" without the normal gap into a new utterance
((word))	Transcriber's comments

FOCUS GROUPS

Strategic Articulations of Pedagogy, Politics, and Inquiry

George Kamberelis and Greg Dimitriadis

Our goal in this chapter is primarily conceptual and transdisciplinary as we explore the complex and multifaceted phenomena of focus group research. At the broadest possible level, focus groups are collective conversations or group interviews. They can be small or large, directed or nondirected. As Table 35.1 indicates, focus groups have been used for a wide range of purposes over the past century or so. The U.S. military (e.g., Merton, 1987), multinational corporations, Marxist revolutionaries (e.g., Freire), literacy activists (e.g., Kozol, 1985), and three waves of radical feminist scholar-activists, among others, all have used focus groups to help advance their concerns and causes. These different uses of focus groups have overlapped in both distinct and disjunctive ways, and all have been strategic articulations of pedagogy, politics, and inquiry.

Given our primary goal in this chapter, we discuss only occasionally and in passing procedural and practical issues related to selecting focus group members, facilitating focus group discussion, and analyzing focus group transcripts. There are many texts available for readers who are looking for this kind of treatment

(e.g., Bloor, Frankland, Thomas, & Robson, 2001; Krueger, 1994; Morgan, 1998; Schensul, LeCompte, Nastasi, & Borgatti, 1999). Instead, we both explore and attempt to move beyond historical and theoretical treatments of focus groups as "instruments" of qualitative research. More specifically, we try to show how focus groups, independent of their intended purposes, are nearly always complex and multivalent articulations of instructional, political, and empirical practices and effects. As such, focus groups offer unique insights into the possibilities of or for critical inquiry as a deliberative, dialogic, and democratic practice that is always already engaged in and with real-world problems and asymmetries in the distribution of economic and social capital (Bourdieu & Wacquant, 1992).

We begin with a very basic insight. Focus groups are little more than quasi-formal or formal instances of many of the kinds of everyday speech acts that are the part and parcel of unmarked social life—conversations, group discussions, negotiations, and the like (Bakhtin, 1986). Although their appropriation for the strategic purposes of teaching, challenging hegemonies,

Table 35.1. Discursive Formations and the Deployment of Focus Groups Over Time

Second-wave feminism		X	X	
Third-wave feminism			X	X

and conducting research makes sense, the kinds of interactions and purposes that constitute focus groups were there all along. Taking such an approach allows us to expand and challenge the conscribed parameters of focus group work within qualitative inquiry. Thus, we highlight here three overlapping domains in which focus groups have proliferated: pedagogy, politics, and qualitative research practice. Or, perhaps these terms represent the three primary and overlapping functions of focus groups rather than the three separate domains in which such groups typically operate. We suggest this alternative distinction because all three functions may be (and often are) present when focus groups are enacted in any domain.

Through our analyses of converging and diverging methods and uses of focus groups in these three domains or functions, we conclude that focus groups are unique and important formations of collective inquiry where theory, research, pedagogy, and politics converge. As such, they provide us with important insights and strategies for better understanding and working through the practices and effects signaled by the “seventh moment” of qualitative inquiry (Lincoln & Denzin, 2000) with its emphasis on praxis, methodological syncretism, dialogic relations in the field, the production of polyvocal texts, and the cultivation of sacredness in our daily lives.

In writing this chapter, we are also working out a broader project within which to read the history of qualitative inquiry against the grain

(Kamberelis & Dimitriadis, 2005). Here, we focus on methodological practices in general, and on focus groups in particular, with an eye toward revisiting their histories in ways that will open them to new and creative uses. As Lincoln and Denzin (2000) suggested, qualitative researchers no longer have recourse to the kinds of linear histories that have so typically (if tacitly) informed mostly “procedural” discussions of research methods. Instead, we find ourselves always already enmeshed within complex and transversing social-material spaces where we must act as *bricoleurs*, using whatever we find at hand to create whatever effects we believe are possible and desirable. So, if researchers in the seventh moment have an approach at all, it must be something like what Foucault (1984) called a genealogical approach. Basically, a genealogical approach attempts to understand how any “subject” (e.g., a person, a social formation, a social movement, an institution) has been constituted out of particular intersections of forces and systems of forces. A genealogy maps the complex, contingent, and (often) contradictory ways in which these forces and systems of force came together to produce the formation in a particular way. Importantly, because of the complexity and contingency involved, the production of such formations cannot be predicted with any accuracy but can readily be “read” after the fact. Also important here is the fact that genealogies are not histories of causes but rather histories of effects, and their value lies not so much in what they tell us about

the past as in what they enable us to do. From the perspective of genealogy,

history becomes "effective" to the degree that it introduces discontinuity into our very being—as it divides our emotions, dramatizes our instincts, multiplies our body and sets it against itself. "Effective" history deprives the self of the reassuring stability of life and nature, and it will not permit itself to be transported by a voiceless obstinacy toward a millennial ending. It will uproot its traditional foundations and relentlessly disrupt its pretended continuity. This is because knowledge is not made for understanding; it is made for cutting. (Foucault, 1984, p. 88)

In this spirit, we place three histories or genealogies of focus group activity in dialogue with each other: dialogic focus groups as critical pedagogical practice, focus groups as political practice, and focus groups as research practice. These three histories represent three different ways of thinking about the nature and functions of focus groups. We think that this dialogic juxtaposition begins to decenter the more popularly available treatments of focus groups within qualitative inquiry—suggesting new contexts, uses, and potentials—and begins to disclose the "effectivity" that affords the "cutting" that Foucault regarded as so important.

■ DIALOGIC FOCUS GROUPS AS CRITICAL PEDAGOGICAL PRACTICE

In this section, we highlight how focus groups have been important pedagogical sites or instruments in the work of Paulo Freire in Brazil and Jonathan Kozol in New York. Through analyses of these exemplars, we show how collective critical literacy practices were used to address local politics and concerns about social justice. Among other things, we foreground the ways in which Freire and Kozol worked *with* people and not *on* them, thereby modeling an important praxis disposition for contemporary educators and qualitative researchers (e.g., Barbour & Kitzinger, 1999). As we show in what follows, Freire and Kozol used

focus groups in ways that were very different from those used by people for propaganda and market research. The latter used focus groups to "extract" information from participants, that is, to figure out how to manipulate them more effectively. In contrast, Freire and Kozol used focus groups for imagining and enacting the emancipatory political possibilities of collective work, that is, as useful tools for accomplishing seventh moment imperatives.

Freire's (1970/1993) most famous book, *Pedagogy of the Oppressed*, can be read as equal parts social theory, philosophy, and pedagogical method. His claims about education are foundational, rooted both in his devout Christian beliefs and also in his Marxism. Throughout *Pedagogy of the Oppressed*, Freire argued that the goal of education is to begin to name the world and to recognize that we all are "subjects" of our own lives and narratives, not "objects" in the stories of others. We must acknowledge the ways in which we, as humans, are fundamentally charged with producing and transforming reality together. Those who do not acknowledge this, or those who want to control and oppress, are committing a kind of epistemic "violence":

To surmount the situation of oppression, people must first critically recognize its causes, so that through transforming action they can create a new situation, one that makes possible the pursuit of a fuller humanity. But the struggle to be more fully human has already begun in the authentic struggle to transform the situation. (Foucault, 1984, p. 29)

Freire often referred to these situations as "limit situations," that is, situations that people cannot imagine themselves beyond. Limit situations naturalize people's sense of oppression, giving it a kind of obviousness and immutability.

To help people imagine lives beyond these "limit situations," Freire spent long periods of time in communities trying to understand community members' interests, investments, and concerns so as to elicit comprehensive sets of "generative words." These words were used as starting points for literacy learning, and literacy learning was deployed in the service of social and political

activism. More specifically, generative words were paired with pictures that represented them and then were interrogated by people in the community for both what they revealed and what they concealed with respect to the circulation of multiple forms of capital. Freire encouraged the people both to explore how the meanings and effects of these words functioned in their lives and to conduct research on how their meanings and effects did function, or could function, in a variety of ways in different social and political contexts. The primary goals of these activities were to help people feel in control of their words and to be able to use them to exercise power over the material and ideological conditions of their own lives. Thus, Freire's literacy programs were designed not so much to teach functional literacy as to raise people's critical consciousness (or *conscientization*) and to encourage them to engage in "praxis" or critical reflection inextricably linked to political action in the real world. Freire underscored the fact that praxis is never easy and always involves power struggles—often violent ones.

As this description of Freire's pedagogies for the oppressed suggests, he believed that humans live both "in" the world and "with" the world and, thus, can be active participants in making history. In fact, he argued that a fundamental possibility of the human condition is to be able to change the material, economic, and spiritual conditions of life itself through *conscientization* and praxis. He posited human agency, then, as situated or embodied freedom—a kind of limited but quite powerful agency that makes it possible to change oneself and one's situation for the better. To enact such agency, he argued, people need to emerge from their unconscious engagements with the world, reflect on them, and work to change them. Viewed in this way, the enactment of freedom is an "unfinalizable" process. In constantly transforming their engagements in and with the world, people are simultaneously shaping the conditions of their lives and are constantly recreating themselves.

Freire's insistence that the unending process of emancipation must be a collective effort is far from trivial. Central to this process is a faith

in the power of dialogue. Importantly, for Freire, dialogue is defined as collective reflection or action. He believed that dialogue, fellowship, and solidarity are essential to human liberation and transformation:

We can legitimately say that in the process of oppression, someone oppresses someone else; we cannot legitimately say that in the process of revolution, someone liberates someone else, nor yet that that someone liberates himself, but rather that men in communion liberate each other. (Freire, 1970/1993, p. 103)

Within Freirean pedagogies, the development and use of generative words and phrases and the cultivation of *conscientization* are enacted in the context of locally situated "study circles" (or focus groups). The goal for the educator or facilitator within these study circles is to engage with people in their lived realities, producing and transforming them. Again, for Freire (1970/1993), pedagogical activity is always already grounded in larger philosophical and social projects concerned with how people might "narrate" their own lives more effectively:

The starting point for organizing the program content of education or political action must be the present, existential, concrete situation, reflecting the aspirations of the people. Utilizing certain basic contradictions, we must pose the existential, concrete, present situation to the people as a problem which challenges them and requires a response—not just at the intellectual level, but [also] at the level of action. . . . The task of the dialogical teacher in an interdisciplinary team working on the thematic universe revealed by [the team's] investigation is to "re-present" that universe to the people from whom she or he first received it—and "re-present" it not as a lecture, but as a problem. (pp. 76–90)

To illustrate this kind of problem-posing education rooted in people's lived realities and contradictions, Freire discussed a research program designed around the question of alcoholism. Because alcoholism was a serious problem in the city, a researcher showed an assembled group a photograph of a drunken man walking past three

other men talking on the corner. The group responded, in effect, by saying that the drunken man was a hard worker—the only hard worker in the photograph—and that he was probably worried about his low wages and having to support his family. In the group members' words, "He is a decent worker and a souse like us" (Freire, 1970/1993, p. 99). The men in the study circle seemed to recognize themselves in this man, noting that he was a "souse" and situating his drinking in a politicized context. In this situation, alcoholism was "read" as a response to oppression and exploitation. The goal was to "decode" images and language in ways that eventually led to questioning and transforming the material and social conditions of existence. Freire offered other examples as well, including showing people different (and contradictory) news stories covering the same event. In each case, the goal was to help people understand the contradictions they live and to use these understandings to change their worlds.

Freire's pedagogical framework could not be readily contained within traditional educational contexts where the historical weight of the "banking model" imposed powerful and pervasive constraints. His work inspired a wide range of important social movements within education, and the activities of these movements have provided yet more models for how intensive group activity—the kinds realized in focus groups—can be imagined and enacted in innovative ways to produce "effective histories" within which knowledge is made not for understanding but rather for cutting (Foucault, 1984, p. 88). Freire exerted a particularly strong influence on the work of critical pedagogues such as Henry Giroux, Peter McLaren, and Jonathan Kozol, all of whom helped to reimagine Freire's work within a U.S. context.

Freire's work has been influential outside the field of education as well. Augusto Boal, for example, developed the "theater of the oppressed," which is grounded in the liberation impulses of Freire, and used theater to blur the line between the actors on-stage and the audience off-stage. The theater of the oppressed is a public, improvisational, and highly interactive form of theater with strong transformative and pedagogical impulses

and potentials (Casali, 2002). In addition, Freire profoundly influenced the participatory action research (PAR) movement led by Orlando Fals Borda, among others. Here, researchers work with subordinated populations around the world to solve unique local problems with local funds of knowledge. The PAR movement is profoundly Freirean in its impulses (Fals Borda, 1985).

Freire was an especially powerful influence on several educationally oriented social movements in the United States. Kozol, perhaps best known for his groundbreaking book *Savage Inequalities* (1991), drew on Freire's emancipatory work to research and write another book, *Illiterate America*. In this book, Kozol (1985) wrote, "Paulo Freire's work among the people of northeast Brazil during the early 1960s is one instance of a government campaign which takes its energies from the illiterates themselves" (p. 95). Like Freire, Kozol grounded his own literacy programs in New York City in the actual lives of the people with whom he worked to create dialogic collectives with horizontal leadership:

There is a tremendous difference between knocking on a door to tell somebody of a program that has been devised already and which they are given the choice, at most, to join or else ignore—and, on the other hand, to ask them to assist in the creation of that plan. . . . Some of the best ideas that I have heard have come out of discussions held within the neighborhoods themselves. People, moreover, are far more likely to participate in something which they or their neighbors have been invited to assist in planning—and something in which ideas they have offered have been more than "heard" but given application. (p. 106)

In practice, Kozol advocated working in study circles or focus groups in much the same way as did Freire—as key pedagogical instruments or sites:

I have come to be convinced that groups of six or seven learners and one literacy worker represent an ideal unit of instruction for this plan. The presence of a circle of [a] half-dozen friends or neighbors helps to generate a sense of common cause and to arouse a sense of optimistic ferment that is seldom present in the one-to-one encounter. (p. 108)

Groups with such a composition allow for the emergence of dynamics that open up possibilities for constructing effective histories. They also function as spawning grounds for the emergence of locally situated and effective leadership:

Learning in groups, people at length will generate group leaders; because these leaders will emerge out of their ranks, they will remain susceptible to criticism and correction. At the same time, because of their point of origin and their proximity to pain, they may be in an ideal position to discover and encourage others. (p. 109)

Taking his cues from Freire, Kozol also advocated the elicitation and use of generative words or phrases that are likely to lead to discussion, reflection, *conscientization*, and praxis. Extending the work of Freire, he argued that for both pedagogical and political reasons, these generative words or phrases should necessarily be complex because more complex words provide more access to the common phoneme-grapheme relations in any particular natural language (e.g., Spanish, English) and, thus, facilitate “reading the word” (Freire, 1970/1993). More complex words also have richer meaning potentials than do simpler words, and their precise meanings vary more as a function of their specific contexts and purposes of use, thereby facilitating “reading the world” (Freire, 1970/1993) in more critical ways. Collective discussions of complex words or phrases typically result in “unpacking” their structures, meaning potentials, and various “effectivities” within and across different social and political contexts. Kozol noted,

The word “revolutionary,” for example, might appear to be the paradigm of active language in a literacy struggle that is rooted in the anguish of impoverished people. Here is a single adjective which dominates the public dialogue of hope and fear, are all five vowels of the English language, four of the more common consonants, the difficult suffix “tion” which is used in several dozen common words, as well as the occasional vowel *y*. (Kozol, 1985, p. 136)

The lexical and syntactic complexity embodied in this word facilitates literacy learning or reading the

word. The word also has an extraordinary surplus of meanings, and its meanings vary tremendously both within and across the different contexts in which it is commonly used. This complexity facilitates reading the world. For example, in lieu of its emancipatory political connotations, the word “revolutionary” is often diluted and domesticated in all kinds of ways, for example, the phrase “a revolutionary new detergent” or, more recently, “revolutionary technology.” This word has also been used by the political right to “name” particular groups as dangerous and to strike fear in the hearts of patriotic (and even not so patriotic) citizens. Furthermore, the word has been appropriated by resistance and counterresistance groups as an emblematic indicator of their collective identities and to motivate and legitimate their struggles.

Kozol also noted the importance of *space* as a dimension of the decentering activity that occurs in relation to the pedagogically oriented study circles (or focus groups). These study circles seldom take place in “official” spaces such as public schools and other public institutions. Instead, they take place in church basements, people’s apartments, recreation centers, and so forth. Like generative words and phrases, these spaces mark intellectual workers as committed to working with and within marginalized communities for the purpose of helping these communities to take over responsibility for their own struggles and their own existences. These spaces also become emblematic indicators of or for the collective identities of the communities themselves, and they create the kind of overdetermined solidarity that seems to be necessary for producing effective histories with forward momentum.

Summary

Dialogic focus groups have always been central to the kinds of radical pedagogies that have been advocated and fought for by intellectual workers such as Freire and Kozol. Organized around “generative” words and phrases, and usually located within unofficial spaces, focus groups become sites of or for collective struggle and social transformation. As problem-posing formations, they operate locally to identify, interrogate, and change specific

lived contradictions that have been rendered invisible by hegemonic power/knowledge regimes. Their operation also functions to reroute the circulation of power within hegemonic struggles and even to redefine what power is and how it works. Perhaps most important for our purposes here, the impulses that motivate focus groups in pedagogical domains or for pedagogical functions have important implications for imagining and using focus groups as resources for constructing "effective histories" within qualitative research endeavors in the "seventh moment" (We return to this issue in the final section of the chapter.)

Importantly, these histories are largely situated and context dependent. For Freire and Kozol, as well as for Giroux and McLaren, one could not predict *a priori* what might be involved in emancipating political and educative agendas. Whereas both Freire and Kozol shared progressive roots and impulses, the next movement we explore more explicitly placed focus groups at the center of an explicitly defined political agenda—feminism.

■ FOCUS GROUPS AS POLITICAL

PRACTICE: FEMINIST CONSCIOUSNESS-RAISING GROUPS AS EXEMPLARS

In this section, we offer descriptions and interpretations of focus groups in the service of radical political work designed within social justice agendas. In particular, we focus on how consciousness-raising groups (CRGs) of second- and third-wave feminism have been deployed to mobilize empowerment agendas and to enact social change. This work provides important insights relevant for reimagining the possibilities of focus group activity within qualitative research endeavors. Whereas the primary goal of Freire and Kozol was to use literacy (albeit broadly defined) to mobilize oppressed groups to work against their oppression through praxis, the primary goal of the CRGs of second- and third-wave feminism was to build "theory" from the lived experiences of women that could contribute to their emancipation.

In our discussion of CRGs, we draw heavily on Esther Madriz's retrospective analyses of

second-wave feminist work as well as on her own third-wave empirical work. In both of these endeavors, Madriz focused on political (and politicized) uses of focus groups within qualitative inquiry. As Madriz (2000) demonstrated, there is a long history of deploying focus groups in consciousness-raising activities and of promoting social justice agendas within feminist and womanist traditions. Importantly, as a form of collective testimony, focus group participation has often been empowering for women, especially women of color (p. 843). There are several reasons why this is the case. Focus groups decenter the authority of the researcher, providing women with safe spaces to talk about their own lives and struggles. These groups also allow women to connect with each other collectively, share their own experiences, and "reclaim their humanity" in a nurturing context (p. 843). Madriz noted that women themselves often take over these groups, reconceptualizing them in fundamental ways and with simple yet far-reaching political and practical consequences. In this regard, Madriz argued,

Focus groups can be an important element in the advancement of an agenda of social justice for women, because they can serve to expose and validate women's everyday experiences of subjugation and their individual and collective survival and resistance strategies. . . . Group interviews are particularly suited for uncovering women's daily experience through collective stories and resistance narratives that are filled with cultural symbols, words, signs, and ideological representations that reflect different dimensions of power and domination that frame women's quotidian experiences. (p. 836–839)

As such, these groups constitute spaces for generating collective "testimonies," and these testimonies help both individual women and groups of women to find or produce their own unique and powerful "voices."

As Madriz and others have noted, focus groups have multiple histories within feminist lines of thought and action. Soon after slavery ended, for example, churchwomen and teachers gathered to organize political work in the South (e.g., Gilkes, 1994). Similarly, turn-of-the-century

"book clubs" were key sites for intellectual nourishment and political work (e.g., Gere, 1997). Mexican women have always gathered in kitchens and at family gatherings to commiserate and work together to better their lives (e.g., Behar, 1993; Dill, 1994). And in 1927, Chinese women working in the San Francisco garment industry held focus group discussions to organize against their exploitation, eventually leading to a successful strike (e.g., Espiritu, 1997). Although we do not unpack these and other complex histories in this chapter, we do offer general accounts of the nature and function of focus groups within second- and third-wave feminism in the United States. These accounts pivot on the examination of several key, original, manifesto-like texts generated within the movement that we offer as synecdoches of the contributions of a much richer, more complex, contradictory, and intellectually and politically "effective" set of histories.

Perhaps the most striking realization that emerges from examining some of the original texts of second-wave feminism is the explicitly self-conscious ways in which women used focus groups as "research" to build "theory" about their everyday experiences and to deploy theory to enact political change. Interestingly but not surprisingly, this praxis-oriented work was dismissed by male radicals at the time as little more than "gossip" in the context of "coffee klatches." Ironically, this dismissal mirrors the ways in which qualitative inquiry is periodically dismissed for being "soft," "subjective," or "non-scientific." Nevertheless, second-wave feminists persisted in building theory from the "standpoint" of women's lived experiences and eventually became a powerful social force in the struggle for equal rights.

In response to claims that feminist theory was nonscientific, Sarachild (1978) argued,

The decision to emphasize our own feelings and experiences as women and to test all generalizations and reading we did by our own experiences was actually the scientific method of research. We were in effect repeating the 17th century challenge of science to scholasticism: "study nature, not books," and put all theories to the test of living practice and action. (p. 145)

Sarachild continued, noting that the goal of CRGs was not simply for women to share atomized experiences, to express themselves, or to confess before the groups:

The idea of consciousness-raising was never to end generalizations. It was to produce truer ones. The idea was to take our own feelings and experience more seriously than any theories which did not satisfactorily clarify them, and to devise new theories which did reflect the actual experience and necessities of women. (p. 148)

In other words, a primary imperative of these groups was to use power in productive ways (e.g., Foucault, 1977, 1980), that is, to experiment with and intervene in reality itself (Deleuze & Guattari, 1987). This imperative went beyond representation toward reinvention. Attending to the current realities of women was a means toward the end of remapping those realities and connecting them to strategic political interests.

Despite this poststructural imperative, these discussions were often peppered with the language of "truth" and "science," making them seem decidedly postpositivist by today's standards. In many respects, this is not surprising because these women were working out of an essentialist, foundationalist perspective and also needed to inflect their arguments in ways that would allow them to be heard within a social and political climate that was unquestionably Euro-American, male dominated, and heterosexist. Yet they also seemed to realize that building political agendas around women's experiences is an inexhaustible and unfinalizable activity. In this regard, Sarachild (1978) contrasted "consciousness-raising groups" with "study groups" and "rap groups." She referred to CRGs as "revolutionary" and to the latter two kinds of groups as products of "left liberalism error" and "right liberalism error," respectively (p. 150). These contrasts are fascinating for many reasons. In a discussion with a Freirean subtext, she noted that the errors introduced by both the right liberalism and the left liberalism did not really investigate things. Instead, they began with a priori conclusions and then attempted to justify them with dogma or some semblance of empiricism. More specifically, she saw left-leaning study groups as

cognatists and saw right-leaning groups as post hoc empiricist. In contrast, she saw evolutionary CRGs as rooted in "investigation and discovery" and saw their political agendas as radical. Importantly, Sarachild was playing with the polysemic and heteroglossic meanings of "root" and "radical" here. She noted, "We were interested in getting to the roots of problems in society. You might say we wanted to pull up weeds in the garden by their roots, not just pick off the leaves at the top to make things look good momentarily" (p. 144). So, although these CRGs were intensely personal, the personal was always deployed in the service of larger theoretical and political agendas.

In many respects, the CRGs of second-wave feminism helped set the agenda for a whole generation of feminist activism. As Eisenstein (1984) noted, these groups helped to bring personal issues in women's lives to the forefront of political discourse. Issues such as abortion, incest, sexual molestation, and domestic and physical abuse emerged from these groups as pressing social issues around which public policy and legislation had to be enacted. Importantly, these issues had previously been considered to be too personal and too intensely idiosyncratic to be taken seriously by men at the time, whether they were scholars, political activists, politicians, or the like. By finding out which issues were most pressing in women's lives, CRGs were able to advance what had previously been considered individual, psychological, and private matters to the agendas of local collectives and eventually to social and political agendas at regional and national levels.

Like the work of Freire and Kozol, most focus group work within second-wave feminist qualitative inquiry has recognized the constitutive power of *space* and *place*. Groups are typically held in familiar settings such as kitchens, church basements, senior citizens' dining or living rooms, and women's shelters. Madriz (2000) noted, "Using participants' familiar spaces further diffuses the power of the researcher, decreasing the possibilities of 'otherization'" (p. 841).

In addition to the second-wave feminist work that was primarily theoretical and political, there was a large body of work that was quite practical, focusing largely on how to conduct CRGs. In other

words, discourses on method were part and parcel of the movement. Not surprisingly, these discourses nearly always displayed a praxis orientation—the articulation of theory and practice for social and political change. Moreover, careful attention was paid to issues of power, especially with respect to micropolitical power relations that seemed to represent *internal* threats to the potential for second-wave feminists to produce effective histories. The ideal composition of CRGs, for example, was heavily debated. How homogeneous or heterogeneous should they be? How large should the groups be to be maximally effective? How centralized or decentralized should group leadership be? Should the groups be "single-sexed," with sympathetic men doing other kinds of work in other contexts?

Much thought and effort were also devoted to developing "manuals" for women who wanted to develop and maintain CRGs from the ground up. The Cape Cod Women's Liberation Movement (1972), for example, distributed a pamphlet that advised the following:

- I. You might start by discussing something everyone has read, to get over the initial awkwardness.
- II. Try talking about what each woman imagines feminism to be. Or what each expects—hopes and/or fears—to get out of the group.
- III. Personal histories can be shared, what each woman does, her living situation, how long she has been interested, and how each found out about the group.
- IV. Each woman can briefly describe her background. We all have childhoods: they influenced us but are less threatening to discuss than recent events.
- V. Whatever we start with, one simple method is to "go around the room." Each woman talks in turn. That way no one is passed over. It is vitally important that every woman speak.
- VI. After the first meeting, you might want to choose topics in advance. Some groups do; some do not. You might proceed by "going around" and seeing what people need to discuss that evening. You might discuss some external event that relates to women.

This pamphlet also discussed several obstacles and ways of overcoming them such as what to do when some women dominate the group or threaten each other and how to protect each other's privacy. The overall goals of pamphlets and flyers such as this were to build theory from the women's lived experiences and to articulate this theory with contemporary political agendas in ways that would promote equal rights for women under the law.

Like many collective efforts, the CRGs of second-wave feminism had some limitations. As Eisenstein (1984) noted, for example, these groups often operated under the constraints of what she called "false universalism." In other words, these groups often purported to speak for all women in unproblematic ways as if the experiences of white middle-class women were universal. This limitation is common among most social movements where members tend to be "alike" in many ways and where collective identities need to be overdetermined to amass any political weight. In the case of second-wave feminism, a primary goal was "to enable the participants to deemphasize their differences and to focus on the experiences they had in common. The generalizations, of course, only describe the experiences of those women who participated. By and large, these were college-educated white women" (p. 133).

These universalist tendencies alienated many women of color who saw feminism as a "middle-class white thing." As Madriz (2000) emphasized, however, many of the insights and strategies generated within the CRGs of second-wave feminism could be easily adapted to be relevant to the desires, needs, and hopes of women of color and other multiply marginalized groups of women. Indeed, if we map the trajectory from second-wave to third-wave feminism, we see both continuities and discontinuities.

The next generation of feminist scholars and researchers did indeed build on and extend the agendas of second-wave feminism while also stressing the differences within and between "groups" of women. The standpoint positions of African American, Latina, and gay women, for example, all became pronounced during this

time period. Working within the movement(s) of third-wave feminism, Madriz (1997) used focus groups in powerful ways, some of which are evidenced in her book, *Nothing Bad Happens to Good Girls*. In this book, Madriz discussed the many ways in which the fear of crime works to produce an insidious form of social control over women's lives. Fear of crime produces certain ideas about what women "should" and "should not" do in public to protect themselves, enabling debilitating ideas about what constitutes "good girls" versus "bad girls" and severely constraining the range of everyday practices available to women.

With respect to research methods, Madriz called attention to the fact that most research findings on women's fear of crime had previously been generated from large survey studies of both men and women. This approach, she argued, severely limits the range of thought and experience that participants are willing to share and, thus, leads to unnecessarily partial and inaccurate accounts of the phenomenon. In other words, it is hard to get people—women in particular—to talk about sensitive topics, such as their own fears of assault or rape, in uninhibited and honest ways in the context of oral or written surveys completed alone or in relation to a single social scientist interviewer. This general problem is further complicated by differences in power relations between researchers and research participants that are a function of age, social class, occupation, language proficiency, race, and so forth.

To work against the various alienating forces that seem inherent in survey research and to collect richer and more voluminous accounts of experience with greater verisimilitude, Madriz used focus groups, noting that these groups provided a context where women could support each other in discussing their experiences of crime as well as their fears and concerns about crime. Indeed, these groups do mitigate against the intimidation, fear, and suspicion with which many women approach the one-on-one interview. In the words of one of Madriz's (1997) participants, "When I am alone with an interviewer, I feel intimidated, scared. And if they call me over the telephone, I never answer their questions. How do

"I know what they really want or who they are?" (p. 165). In contrast, focus groups afford women much safer and more supportive contexts within which they may explore their lived experiences and the consequences of these experiences with other women who will understand what they are saying intellectually, emotionally, and viscerally.

This idea of safe and supportive spaces ushers in another important dimension of focus group work within third-wave feminist research, namely the importance of constituting groups in ways that mitigate against alienation, create solidarity, and enhance community building. To achieve such ends, Madriz emphasized the importance of creating homogeneous groups in terms of race, class, age, specific life experiences, and so forth—all of which are hallmarks of third-wave feminism.

Both in her own work and in her efforts to be a spokesperson for third-wave feminist approaches to qualitative inquiry, Madriz (1997) outlined a set of attitudes and practices that built on and extended the work of the second wave. Among other things, she acknowledged a long history of feminist approaches to qualitative work grounded within a long history of "no name" feminist and womanist practices—"exchanges with mothers, sisters, neighbors, friends" (p. 166). She also revisioned focus groups as vehicles for collective testimony, which offer affordances that help women to get beyond the social isolation that has historically characterized their lives (p. 166). These affordances clearly grew out of the initiatives and imperatives of second-wave CRGs already discussed, but they extended the CRGs as well. In particular, Madriz argued that the nonessentialist, social constructionist, and (often) postcolonial nature of third-wave feminist research projects accounts more fully for the extraordinary variability that often exists between and among women's experiences depending on social positioning with respect to race, class, region, age, sexual orientation, and so forth. Third-wave feminist researchers, thus, refracted and multiplied the standpoints from which testimonies might flow and voices might be produced. Although researchers such as

Madriz held onto the postpositivist ideal of building theory from lived experiences, they also pushed for theory that accounted more fully for the local, complex, and nuanced nature of lived experiences that are always already constructed within power relations produced at the intersections of multiple social categories.

In the end, a primary goal of focus group activity within third-wave feminist research is not to offer prescriptive conclusions but rather to highlight the productive potentials (both oppressive and emancipatory) of particular social contexts (with their historically produced and durable power relations) within which such prescriptions typically unfold. In this regard, the work of Madriz is a synecdoche for third-wave feminist work more broadly conceived, particularly by women of color such as Dorinne Kondo, Smadar Lavie, Ruth Behar, Aiwa Ong, and Lila Abu-Lughod.

Summary

The nature and functions of CRGs within second- and third-wave feminism offer many important insights into the potential of focus groups to function in the service of the key imperatives of "seventh moment" qualitative inquiry. Building on Madriz's political reading of focus groups, and more specifically on the constructs of "testimony" and "voice," we highlight some of these possibilities here.

One key function of focus groups within feminist work has been to elicit and validate collective testimonies and group resistance narratives. These testimonies and narratives have been used by women—and could be used by any subjugated group—"to unveil specific and little-researched aspects of women's daily existences, their feelings, attitudes, hopes, and dreams" (Madriz, 2000, p. 836). Another key emphasis of focus groups within feminist and womanist traditions has been the discovery or production of voice. Because focus groups often result in the sharing of similar stories of everyday experiences of struggle, rage, and the like, they often end up validating individual voices that had previously been constructed within and through mainstream discourses as

idiosyncratic, selfish, and even evil. Because focus groups foreground and exploit the power of testimony and voice, they can become sites for the overdetermination of collective identity as strategic political practice. This overdetermination creates a critical mass of visible solidarity that seems to be a necessary first step toward social and political change.

A major concern of feminist researchers has been the moral dilemmas inherent in interviewing and the researcher's role in these dilemmas. Focus groups mitigate against these dilemmas by creating multiple lines of communication that help to create "safe spaces" for dialogue in the company of others who have had similar life experiences and who are struggling with similar issues. In relation to this point, focus groups can allow for unique forms of access to the "natural" interaction that can occur between and among participants. Because focus groups privilege "horizontal interaction" over "vertical interaction," they are also constituted as social spaces that tend to decrease the influence of the researcher in controlling the topics and flow of interaction. Among other things, this horizontality increases the potential for rearticulating power dynamics within focus group interactions in ways that can lead to the collection of especially rich information (i.e., high-quality data) that will eventually result in accounts that are replete with "thick description" and rich in verisimilitude.

Focus groups within feminist and womanist traditions have also mitigated against the Western tendency to separate thinking and feeling, thereby opening up possibilities for reimagining knowledge as distributed, relational, embodied, and sensuous. Viewing knowledge in this light brings into view the complexities and contradictions that are always a part of fieldwork. It also illuminates the relations between power and knowledge and, thus, insists that qualitative research is always already political—implicated in social critique and social change.

Either out of necessity or for strategic purposes, feminist work has always taken into account the constitutive power of *space*. To further work against asymmetrical power relations and the

processes of "othering," focus group meetings are nearly always held in safe spaces where women feel comfortable, important, and validated. This is a particularly important consideration when working with women who have much to lose from their participation, for example, undocumented immigrants and so-called deviant youths.

Finally, the break from second-wave to third-wave feminism called into question the monolithic treatment of difference under the sign of "woman" that characterized much of second-wave thinking and also highlighted the importance of creating focus groups that are relatively homogeneous in terms of life histories, perceived needs, desire, race, social class, region, age, and so forth because such groups are more likely to achieve the kind of solidarity and collective identity that are necessary for producing "effective histories." Although coalition building across such relatively homogeneous groups of women may be important in some instances, focused intellectual and political work is often most successful when it is enacted by people with similar needs, desires, struggles, and investments.

Together, the various insights and practices of CRGs within feminist work have been invaluable in propelling us toward the seventh moment and in helping us to imagine and enact (a) a commitment to morally sound, praxis-oriented research; (b) the strategic use of eclectic constellations of theories, methods, and research strategies; (c) the cultivation of dialogic relationships in the field; (d) the production of polyvocal nonrepresentational texts; and (e) the conduct of mindful inquiry attuned to what is sacred in and about life and text.

■ FOCUS GROUPS AS RESEARCH PRACTICE

Interest in focus groups in the social sciences has ebbed and flowed over the course of the past 60 years or so. In many respects, the first really visible use of focus groups for conducting social science research may be traced back to the work of Paul Lazarsfeld and Robert Merton. Their focus group approach emerged in 1941 as the pair

embarked on a government-sponsored project to assess media effects on attitudes toward America's involvement in World War II. As part of their research at the Columbia University Office of Radio Research, Lazarsfeld and Merton recruited groups of people to listen and respond to radio programs designed to boost morale for the war effort (Merton, 1987, p. 552). Originally, the researchers asked participants to push buttons to indicate their positive or negative responses to the radio programs. Because the data yielded from this work could help them to answer "what" questions but not "why" questions about participants' choices, the researchers used focus groups as forums for getting participants to explain why they responded in the ways they did. Importantly, Lazarsfeld and Merton's use of focus groups as a qualitative research strategy was always secondary (and less legitimate) than the various quantitative methods of data collection and analysis the researchers deployed. They used focus groups in exploratory ways to generate new questions that could be used to develop new quantitative strategies or simply to complement or annotate the more quantitative findings of their research. Lunt (1996) observed that Merton saw "the role of the focus groups as identifying the salient dimensions of complex social stimuli as [a] precursor to further quantitative tests" (p. 81). Two dimensions of Lazarsfeld and Merton's research efforts constitute part of the legacy of using focus groups within qualitative research: (a) capturing people's responses in real space and time in the context of face-to-face interactions and (b) strategically "focusing" interview prompts based on themes that are generated in these face-to-face interactions and that are considered particularly important to the researchers.

In philosophy of science terms, the early use of focus groups as resources for conducting research was quite conservative in nature. This is not at all surprising given that the work of Lazarsfeld and Merton was funded by the military and included "interviewing groups of soldiers in Army camps about their responses to specific training films and so-called morale films" (Merton, 1987, p. 554). Their research also included studies of why people

made war bond pledges. The goal of much of this work was to better understand people's beliefs and decision-making processes so as to develop increasingly effective forms of propaganda.

The kind of focus group research conducted by scholars such as Lazarsfeld and Merton all but disappeared within the field of sociology during the middle part of the 20th century, only to reemerge in the early 1980s, particularly around "audience analysis" work (Morley, 1980). When it did reemerge, it was no longer wed to—or used in the service of—predominantly quantitative-oriented research, a fact that Merton (1987) bemoaned:

I gather that much of the focus-group research today as a growing type of market research does not involve this composite of both qualitative and quantitative inquiry. One gains the impression that focus-group research is being mercilessly misused as quick-and-easy claims for the validity of the research [that] are not subjected to further quantitative tests. . . . For us, qualitative focused group interviews were taken as sources of new ideas and new hypotheses, not as demonstrated findings with regard to the extent and distribution of the provisionally identified qualitative patterns of response. (pp. 557–558)

Criticisms such as these notwithstanding, audience analysis research was decidedly interpretive. Its primary goal was to understand the complexities involved in how people understood and interpreted media texts; its methods were nearly exclusively qualitative. In contrast to Lazarsfeld and Merton's work, which focused on expressed content, audience analysis researchers focused on group dynamics themselves, believing that the meanings constructed within groups of viewers were largely socially constructed.

Janice Radway, for example, used focus groups to great effect in her pioneering research on the reading practices of romance novel enthusiasts that resulted in her book, *Reading the Romance*. Radway's (1991) research took place in and around a local bookstore, and her participants included the store owner and a group of 42 women who frequented the store and were

regular romance readers. Radway developed a mixed-method research design that included text analysis and focus group interviews. Assisted by the store owner ("Dot"), Radway was able to tap into the activity dynamics of the existing networks of women who were avid romance novel readers. These women depended heavily on the store owner for advice about the latest novels, and they interacted with each other as well. Radway simply "formalized" some of these ongoing social activities to generate a systematic and rich store of information about the social circumstances, specific reading practices, attitudes, reading preferences, and multiple and contradictory functions of romance reading among the women she studied. In this regard, only days after meeting Dot for the first time, Radway "conducted two four-hour discussion sessions with a total of 16 of Dot's most regular customers" (p. 47). Radway's involvement with romance novels and romance readers further intensified as the study progressed. She read all of the books that her participants were reading. She talked with many of the participants informally whenever she saw them at the bookstore. She took her cues about what books to read and what issues to focus discussions on from Dot and the other participants.

Radway (1991) noted, among other things, the importance of group dynamics in how different romance novels were interpreted and used. She also underscored the importance of belonging to a reading group in mitigating the stigma often associated with the practice of reading romance novels. Through their collective involvement, Dot and her customers (i.e., Radway's participants) created a kind of solidarity with political potential. Radway used her knowledge of the political potential of collective activity strategically in her research:

Because I knew beforehand that many women are afraid to admit their preference for romantic novels for fear of being scorned as illiterate or immoral, I suspected that the strength of numbers might make my informants less reluctant about discussing their obsession. (p. 252)

Finally, the ways in which Radway positioned herself within the reading groups were crucial.

She noted, for example, that when she gently encouraged participants and backgrounded her own involvement, "the conversation flowed more naturally as the participants disagreed among themselves, contradicted one another, and delightfully discovered that they still agreed about many things" (p. 48).

All of the strategies that Radway deployed helped to mobilize the collective energy of the group and to generate kinds and amounts of data that are often difficult, if not impossible, to generate through individual interviews and even observations. In addition, these strategies—and participation in the focus groups themselves—helped to build a stronger and more effective collective with at least local political teeth. In this regard, Radway (1991) noted that the women used romance reading for two primary purposes: *combative* and *compensatory*. Each purpose is political in its own way, and each became understood more fully by the women in the context of their conversations and focus group discussions:

It is *combative* in the sense that it enables them to refuse the other-directed social role prescribed for them within the institution of marriage. In picking up a book, as they have so eloquently told us, they are refusing temporarily their famil[ies'] otherwise constant demand that they attend to the wants of others even as they act deliberately to do something for their own private pleasure. Their activity is *compensatory*, then, in that it permits them to focus on themselves and to carve out a solitary space within an arena where their self-interest is usually identified with the interests of others and where they are defined as a public resource to be mined at will by the family. (p. 211)

These two political functions were clearly in tension at the end of *Reading the Romance*, and how this tension might work itself out over time was left unresolved. However, Radway concluded her book with a hopeful call for praxis: "It is absolutely essential that we who are committed to social change learn not to overlook this minimal but nonetheless legitimate form of protest . . . and to learn how best to encourage it and bring it to fruition" (p. 222).

If the work of Radway began to outline the political, ethical, and praxis potential of focus groups within qualitative inquiry, the work of Patti Lather has pushed the "limit conditions" of focus groups about as far as has the work of anyone in the field of qualitative research today, especially with respect to how focus groups can bring postfoundational possibilities for research "into the clearing" (Heidegger, 1975). In their book *Troubling the Angels*, for example, Lather and Smithies (1997) explored the lives, experiences, and narratives of 25 women living with HIV/AIDS. *Troubling the Angels* is a book filled with overlapping and contradictory voices that grew out of 5 years of focus group interviews conducted in the context of "support groups" in five major cities in Ohio:

In the autumn of 1992, we met with one of the support groups to explore what questions we should use in the interviews. The women attending this meeting were spilling over with excitement and ideas; their talk became a dialogue of issues and feelings and insights. Group process was producing a form and level of collaboration that could not be remotely duplicated in one-on-one interviews, so the decision was made to maintain the group format for most of the data collection. (p. xix)

Lather and Smithies also met and talked with these women at birthday parties and holiday get-togethers, hospital rooms and funerals, baby showers and picnics. The participation frameworks for interaction changed constantly across the project. Smithies, for example, noted that group dynamics were quite unpredictable and that the women often became upset or annoyed with each other (p. 194).

Although much of this book is devoted to troubling the waters of ethnographic representation, the lived experience of conducting fieldwork primarily through focus groups also troubles the waters of research practice. In this regard, Lather and Smithies integrated sociological, political, historical, therapeutic, political, and pedagogical practices and discourses in their work with the women they studied. In Lather's (2001) "postbook," for example, she claimed to have looked constantly

for "the breaks and jagged edges of methodological practices from which we might draw useful knowledge for shaping present practices of a feminist ethnography in excess of our codes but, still, always already: forces already active in the present" (pp. 200–201). She continued,

The task becomes to throw ourselves against the stubborn materiality of others, willing to risk loss, relishing the power of others to constrain our interpretive "will to know," saving us from the narcissism and its melancholy through the very positivities that cannot be exhausted by us, the otherness that always exceeds us. . . . Ethnography becomes a kind of self-wounding laboratory for discovering the rules by which truth is produced. Attempting to be accountable to complexity, thinking the limit becomes the task, and much opens up in terms of ways to proceed for those who know both too much and too little. (pp. 202–203)

In this regard, Lather elaborated on times when her experiences with the HIV/AIDS-afflicted women or their stories brought her to tears. She realized, in working with these women, that she had to negotiate her own relationship to loss. She wondered whether and how she could ever do it, and she sometimes doubted whether she could even go on with the project. In the most real sense, Lather came to realize the ways in which knowledge is always already embodied—bodily, viscerally, and materially—and the consequences that such a realization has for fieldwork and writing.

One of the most interesting sections of Lather and Smithies's (1997) book, for our purposes in this chapter, is one where the researchers cultivated a "methodology of getting lost":

At some level, the book is about getting lost across the various layers and registers, about not finding one's way into making a sense that maps easily onto our usual ways of making sense. Here we all get lost: the women, the researchers, the readers, [and] the angels, in order to open up present frames of knowing to the possibilities of thinking differently. (p. 52)

Although these reflections refer to the book itself rather than to the process of conducting the

research that led to the writing of the book, in the sense that the reflections index the political and ethical dimensions of all practices and all knowledge, they apply equally well to working with research participants in the field. For example, Lather and Smithies refused to position themselves as grand theorists and to interpret or explain the women's lives to them. Instead, they granted

weight to lived experience and practical consciousness by situating both researcher and researched as bearers of knowledge while simultaneously attending to the "price" we pay for speaking out of discourses of truth, forms of rationality, effects of knowledge, and relations of power. (Lather, 2001, p. 215)

Through their tactical positioning, Lather and Smithies challenged the researcher's right to know and interpret the experiences of others while, at the same time, interrupting and getting in the way of their participants' attempts to narrate their lives through a kind of innocent ethnographic realism of voices speaking for themselves that included, among other things, the construction of AIDS as the work of God's will. In this regard, Lather and Smithies acknowledged their impositions and admitted that a different kind of book—a book that may, for example, be sold at Kmart—might have pleased their participants more. But such a book would not have served the researchers' own desires and goals to problematize the practice of qualitative inquiry. In the end, the book had to "please" both researchers and research participants—if only in partial and not completely satisfying ways.

These various relational and rhetorical tactics bring to light the very complicated and sometimes troubling micropolitics that are part and parcel of research practice in the "seventh moment," whether or not we are willing to "see" these micropolitics and enact them in our own work. The work of Lather and Smithies constantly reminds us that there are no easy separations between the researcher and the researched and that research itself is always already relational, political, and ethical work. There is no privileged place from which to experience and report on

experiences objectively—only positions in dialogue. The key point here is that, more than most other research of which we are aware, the work of Lather and Smithies offers us ways in which to think about research that transcends and transforms the potentials of using focus groups for revisioning epistemology, interrogating the relative purchase of both lived experience and theory, reimagining ethics within research practice, and enacting fieldwork in ways that are more attuned to its sacred dimensions. This is difficult and dangerous work indeed:

The danger is to steal knowledge from others, particularly those who have little else, and to use it for the interests of power. This is so even when the intended goal is to extend the reach of the very counter-knowledge [on which] the [work] is based, the stories entrusted to those "who enter [such alliances] from the side of privilege" (Fiske, 1996, p. 211) in order to transform the ubiquitous injustices of history into a readable place. (Lather, 2001, p. 221)

Summary

As we have demonstrated, focus groups have been used as instruments of qualitative inquiry within several distinct epistemological moments—Merton's positivism, second-wave critical feminism, and poststructural feminism. And although focus groups have always been a critical part of qualitative research practice, their use seems to be expanding (e.g., Bloor et al., 2001; Fontana & Frey, 2000; Morgan, 2000). Among other things, the use of focus groups has allowed scholars to move away from the dyad of the clinical interview and to explore group characteristics and dynamics as relevant constitutive forces in the construction of meaning and the practice of social life. Focus groups have also allowed researchers to explore the nature and effects of ongoing social discourse in ways that are not possible through individual interviews or observations. Individual interviews strip away the critical interactional dynamics that constitute much of social practice and collective meaning making. Observations are a bit of a "crap

shoot" in terms of capturing the focused activity in which researchers may be interested. In contrast to observations, focus groups can be used strategically to cultivate new kinds of interactional dynamics and, thus, access to new kinds of information.

For example, as Radway (1991) and Lather and Smithies (1997) showed, focus groups can be used strategically to inhibit the authority of researchers and to allow participants to "take over" and "own" the interview space. Focus groups are also invaluable for promoting among participants synergy that often leads to the unearthing of information that is seldom easy to reach in individual memory. Focus groups also facilitate the exploration of collective memories and shared stocks of knowledge that might seem trivial and unimportant to individuals but that come to the fore as crucial when like-minded groups begin to reveal in the everyday. In addition, as was demonstrated especially in the work of Radway (1991) and Lather and Smithies (1997), focus groups can become sites for local political work. Finally, and perhaps most important, the work of Lather and Smithies brings to light the fact that focus groups are rife with multiple affordances for conducting "seventh moment" qualitative inquiry that will help it move through (and perhaps beyond) the triple crisis of representation, legitimation, and praxis that has haunted qualitative work for the past two decades. In this regard, focus groups can lead to the kinds of "breakdowns" that Lather (2001) described and that Heidegger (1927/1962) argued are essential to genuine understanding. They can also serve as constant reminders that researchers should cultivate productive relations among description, interpretation, and explanation in their work. And perhaps most important, the dialogic possibilities afforded by focus groups help researchers to work against premature consolidation of their understandings and explanations, thereby signaling the limits of reflexivity and the importance of intellectual/empirical modesty as forms of ethics and praxis. Such modesty allows us to engage in "doubled practices" where we listen to the attempts of others as they make sense of their

lives. It also allows us to resist the seductive qualities of "too easy" constructs such as "voice" as we trouble experience itself, which is always already constituted within one "grand narrative" or another (Lather, 2001, p. 218). In the end, the strategic development of focus group activity for conducting qualitative inquiry foregrounds the possibility that focus groups can be key democratic spaces during an age when such spaces are becoming increasingly eclipsed and atomized (Giroux, 2001; Henaff & Strong, 2001).

■ A CRITICAL SUMMARY OF FOCUS GROUPS IN RESEARCH PRACTICE

Focus group research is a key site or activity where pedagogy, politics, and interpretive inquiry intersect and interanimate each other. On a practical level, focus groups are efficient in the sense that they generate large quantities of material from relatively large numbers of people in a relatively short time. In addition, because of their synergistic potentials, focus groups often produce data that are seldom produced through individual interviewing and observation and that result in especially powerful interpretive insights. In particular, the synergy and dynamism generated within homogeneous collectives often reveal unarticulated norms and normative assumptions. They also take the interpretive process beyond the bounds of individual memory and expression to mine the historically sedimented collective memories and desires. This is one of the reasons why focus group work has been so well suited to the kinds of "problem-posing" and "problem-solving" pedagogies highlighted by Freire and Kozol. "Real-world" problems cannot be solved by individuals alone; instead, they require rich and complex funds of communal knowledge and practice.

In addition to enhancing the kinds and amounts of empirical material yielded from qualitative studies, focus groups foreground the importance not only of content, but also of expression, because they capitalize on the richness and complexity of group dynamics. Acting somewhat

like magnifying glasses, focus groups induce social interactions akin to those that occur in everyday life but with greater focus. Focus groups, to a greater extent than observations and individual interviews, afford researchers access to the kinds of social interactional dynamics that produce particular memories, positions, ideologies, practices, and desires among specific groups of people.

As “staged conversations,” focus groups are especially useful to researchers who want to conduct various kinds of discourse analyses such as those that we discussed earlier in relation to audience analysis. Focus groups allow researchers to see the complex ways in which people position themselves in relation to each other as they process questions, issues, and topics in focused ways. These dynamics themselves become relevant “units of analysis” for study.

In addition to inducing simulations of naturally occurring talk and social interaction, focus groups function to decenter the role of the researcher. As such, focus groups can facilitate the democratization of the research process, providing participants with more ownership over it, promoting more dialogic interactions and the joint construction of more polyvocal texts. These social facts were brought to light by the feminist work conducted by Madriz, Radway, and Lather and Smithies that we discussed earlier.

Focus groups, while functioning as sites for consolidating collective identities and enacting political work, also allow for the proliferation of multiple meanings and perspectives as well as for interactions between and among them. Because focus groups put multiple perspectives “on the table,” they help researchers and research participants alike to realize that both the interpretations of individuals and the norms and rules of groups are inherently situated, provisional, contingent, unstable, and changeable. In this regard, focus groups help us to move toward constructing a “methodology of getting lost” and toward enacting “doubled practices” (Lather, 2001), which seem to be necessary first steps toward conducting “seventh moment” qualitative research.

■ RETROSPECT AND PROSPECT: FOCUS GROUPS AS STRATEGIC ARTICULATIONS OF PEDAGOGY, POLITICS, AND INQUIRY

We conclude with some conceptual musings on focus group methodology as negotiated accomplishment and performative pedagogy rooted in local activism. Focus groups, we maintain, are sites where pedagogy, politics, and interpretive methodology converge, providing a way in which to think about new horizons in qualitative inquiry as praxis-oriented and ethically grounded relational work.

Importantly, opening up focus groups to genealogical analysis allows us to decenter our understanding of this method and to imagine and enact new uses and functions. Indeed, if linear or procedural methodological narratives have buttressed positivist and postpositivist approaches to research, the search for different origins makes us realize that there are no such safe spaces. If nothing else, Foucault’s notion of genealogy makes us responsible for the discourses we inhabit and for the histories we evoke. Broadening the range of focus group “referents” allows us to think through contemporary research praxis in more expansive ways.

But there are no ready-made answers here. Ethics and responsibility must guide such a discussion, one that wholly implicates researchers every step of the way. This includes the ways in which researchers are positioned within and against the groups with which they work. To echo Fine (1994), researchers today must “work the hyphen” in their different roles (e.g., participant-observer) and responsibilities, always acknowledging the roles we inhabit, including what they allow and what they deny. Indeed, according to Fine, researchers must actively work against “othering” in fieldwork (i.e., objectively creating neatly bounded subjects on which to report) while also resisting self-reflexivity or navel gazing (i.e., the danger of looking inward as a way of avoiding the ethical responsibility of acting in the world). Fine challenged us to avoid what Haraway (1991) called the “god-tricks” of “relativism” and “totalization.” As Haraway wrote, “Relativism is the perfect twin

of totalization in the ideologies of objectivity; both deny the stakes in location, embodiment, and partial perspective" (p. 191). Location, embodiment, and partial perspective are critical to the project of fieldwork, according to Fine.

More recently, Fine and Weis (1998) extended these concerns to explicitly address the complexities of political activism and policymaking. They argued, for example, that we must try to "*meld writing about and working with*" politically invested actors in more compelling and constitutive ways (p. 277, *emphases in original*). Ultimately, Fine, Weis, Wessen, and Weng (2000) demanded that we "think through the power, obligations, and responsibilities of social research" on multiple levels, accounting for multiple social contexts and concerns (p. 108). Self-reflexivity means increasing kinds of responsibility for such questions in social contexts that are always difficult to prefigure. As Fine and Weis (1998) argued,

our obligation is to come clean "at the hyphen," meaning that we interrogate in our writings who we are as we co-produce the narratives we presume to "collect." . . . As part of this discussion, we want, here, to try to explain how we, as researchers, work with communities to capture and build upon community and social movements. (pp. 277–278, *emphases in original*)

This means expanding the range of roles that we play as researchers, field-workers, and authors to include political activism and policymaking—roles that do not always map easily onto each other. There are, in short, no safe spaces for qualitative researchers today. The notion of an objective and neutral qualitative inquiry has been decentered, leaving researchers with, to echo Bakhtin (1993), no alibis for their effectivity in the field. In the absence of foundational claims and clear splits between researchers and research participants, what is left is an uncertain landscape that asks us—no, demands us—to work with our participants to help make their situations better than they were when we found them. "The moral imperative of such work cannot be ignored," Lincoln and Denzin (2000) argued. They added, "We face a choice . . . of declaring ourselves

committed to detachment or solidarity with the human community" (p. 1062).

Echoing Gramsci, we conclude that the "we" enabled by focus groups has "no guarantees." With no guarantees, focus groups must operate according to a "hermeneutics of vulnerability" (Clifford, 1988). Clifford developed the construct of a hermeneutics of vulnerability to discuss the constitutive effects of relationships between researchers and research participants on research practice and research findings. A hermeneutics of vulnerability foregrounds the ruptures of fieldwork, the multiple and contradictory positionings of all participants, the imperfect control of researchers, and the partial and perspectival nature of all knowledge. Among the primary tactics for achieving a hermeneutics of vulnerability, according to Clifford, is the tactic of self-reflexivity, which may be understood in at least two senses. In the first sense, self-reflexivity involves making transparent the rhetorical and poetic work of researchers in representing the objects of their studies. In the second (and, we think, more important) sense, self-reflexivity refers to the efforts of researchers and research participants to engage in acts of self-defamiliarization in relation to each other.

In this regard, Probyn (1993) discussed how the fieldwork experience can engender a virtual transformation of the identities of both researchers and research participants even as they are paradoxically engaged in the practice of consolidating them. This is important theoretically because it allows for the possibility of constructing a mutual ground between researchers and research participants even while recognizing that the ground is unstable and fragile. Self-reflexivity in this second sense is also important because it encourages reflection on interpretive research as the dual practice of knowledge gathering and self-transformation through self-reflection and mutual reflection with the other. Finally, as Lather (2001) showed, even self-reflexivity has serious limits with respect to working against the triple crisis of representation, legitimation, and praxis. Indeterminacies always remain. And allowing ourselves to dwell in (and perhaps even celebrate) these

indeterminacies might be the best way of traveling down the roads of qualitative research practice and theory building at this particular historical juncture. Again, opening up to the unfinalizable complexity and heterogeneity of "others" within focus group interactions is at least one way of traveling down these roads.

Part V

THE ART AND PRACTICES OF INTERPRETATION, EVALUATION, AND REPRESENTATION

In conventional terms, Part V of the *Handbook* signals the terminal phase of qualitative inquiry. The researcher or evaluator now assesses, analyzes, and interprets the empirical materials that have been collected. This process, conventionally conceived, implements a set of analytic procedures that produce interpretations, which are then integrated into a theory or put forward as a set of policy recommendations. The resulting interpretations are assessed in terms of a set of criteria, from the positivist or postpositivist tradition, including validity, reliability, and objectivity. Those interpretations that stand up to scrutiny are put forward as the findings of the research.

The contributors to Part V explore the art, practices, and politics of interpretation, evaluation, and representation. In so doing, they return to the themes of Part I—that is, asking *how the discourses of qualitative research can be used to help create and imagine a free democratic society*. In returning to this question, it is understood that the processes of analysis, evaluation, and interpretation are neither terminal nor mechanical. They are like a dance, to invoke the metaphor used by Valerie Janesick. This dance is informed at every step of the way by a commitment to this civic agenda. The processes that define the practices of interpretation and representation are always ongoing, emergent, unpredictable, and unfinished. They are always embedded in an ongoing historical and political context. As argued throughout this volume, in the United States, neoconservative discourse in the educational arena (e.g., No Child Left Behind, National Research Council) privileges experimental criteria in the funding, implementation, and evaluation of scientific inquiry. Many of the authors in this volume observe that this creates a chilling climate for qualitative inquiry. We begin by assessing a number of criteria that have been traditionally (as well as recently) used to judge the adequacy of qualitative research. These criteria flow from the major paradigms now operating in this field.

■ RELATIVISM, CRITERIA, AND POLITICS

John Smith and Phil Hodgkinson (Chapter 36) remind us that we live in an age of relativism. In the social sciences today, there is no longer a God's-eye view that guarantees absolute methodological certainty; to assert such is to court embarrassment. Indeed, as Guba and Lincoln discuss in detail in Chapter 8 (Part II), there is considerable debate over what constitutes good interpretation in qualitative research. Nonetheless, there seems to be an emerging consensus that all inquiry reflects the standpoint of the inquirer, that all observation is theory laden, and that there is no possibility of theory-free knowledge. We can no longer think of ourselves as neutral spectators of the social world.

Consequently, as Smith and Hodgkinson observe, until quite recently few spoke in terms of foundational epistemologies and ontological realism. Before the assault of methodological conservatism, relativists would calmly assert that no method is a neutral tool of inquiry, hence the notion of procedural objectivity could not be sustained. Anti-foundationalists thought that the days of naïve realism and naïve positivism were over. In their place stand critical and historical realism and various versions of relativism. The criteria for evaluating research had become relative, moral, and political.

However, events during the past 5 years, including governmental attempts to mandate research criteria in the United States and the United Kingdom, have disturbed this situation. Power and politics now play a major part in discussions of criteria.

Extending Smith and Hodgkinson, there are three basic positions on the issue of evaluative criteria: foundational, quasi-foundational, and nonfoundational. There are still those who think in terms of a *foundational* epistemology. They would apply the same criteria to qualitative research as are employed in quantitative inquiry, contending that there is nothing special about qualitative research that demands a special set of evaluative criteria. As indicated in our introduction to Part II, the positivist and postpositivist paradigms apply four standard criteria to disciplined inquiry: internal validity, external validity, reliability, and objectivity. The use of these criteria, or their variants, is consistent with the foundational position.

In contrast, *quasi-foundationalists* approach the criteria issue from the standpoint of a non-naïve, neo-, or subtle realism. They contend that the discussion of criteria must take place within the context of an ontological neorealism and a constructivist epistemology. They believe in a real world that is independent of our fallible knowledge of it. Their constructivism commits them to the position that there can be no theory-free knowledge. Proponents of the quasi-foundational position argue that a set of criteria unique to qualitative research needs to be developed. Hammersley (1992, p. 64; 1995, p. 18; see also Wolcott, 1999, p. 194) is a leading proponent of this position. He wants to maintain the correspondence theory of truth while suggesting that researchers assess a study in terms its ability to (a) generate generic/formal theory, (b) be empirically grounded and scientifically credible, (c) produce findings that can be generalized or transferred to other settings, and (d) be internally reflexive in terms of taking account of the effects of the researcher and the research strategy on the findings that have been produced.

Hammersley reduces his criteria to three essential terms: plausibility (is the claim plausible?), credibility (is the claim based on credible evidence?), and relevance (what is the claim's relevance for knowledge about the world?). Of course, these terms require social judgments. They cannot be assessed in terms of any set of external or foundational criteria. Their meanings are arrived at through consensus and discussion in the scientific

community. Within Hammersley's model, there is no satisfactory method for resolving this issue of how to evaluate an empirical claim.

For the *nonfoundationalists*, relativism is not an issue. They accept the argument that there is no theory-free knowledge. Relativism or uncertainty is the inevitable consequence of the fact that, as humans, we have finite knowledge of ourselves and the world in which we live. Nonfoundationalists contend that the injunction to pursue knowledge cannot be given epistemologically; rather, the injunction is moral and political. Accordingly, the criteria for evaluating qualitative work are also moral and fitted to the pragmatic, ethical, and political contingencies of concrete situations. Good or bad inquiry in any given context is assessed in terms of criteria such as those outlined by Greenwood and Levin (Chapter 2), Fine and Weis (Chapter 3), Smith (Chapter 4), Bishop (Chapter 5), and Christians (Chapter 6) in Part I; Guba and Lincoln (Chapter 8 in Part II); Kemmis and McTaggart (Chapter 23 in Part III); and Angrosino (Chapter 28 in Part IV). These are the criteria that flow from a feminist, communitarian moral ethic of empowerment, community, and moral solidarity. Returning to Christians (Chapter 6), this moral ethic calls for research rooted in the concepts of care, shared governance, neighborliness, love, and kindness. Furthermore, this work should provide the foundations for social criticism and social action.

In an ideal world, the anti- or nonfoundational narrative would be uncontested. But today in the United States and the United Kingdom, as Smith and Hodgkinson observe, opponents are embracing "more crudely empiricist procedures, even the experimental or quasi-experimental procedures common to the natural sciences." There is a concerted effort by governmental regimes to reform research. This is disconcerting, all the more so when social scientists collaborate in the project. Dark days are ahead of us.

■ EMANCIPATORY DISCOURSES AND THE ETHICS AND POLITICS OF INTERPRETATION

Norman Denzin's (Chapter 37) contribution invites indigenous and nonindigenous qualitative researchers to take up an emancipatory discourse, connecting indigenous epistemologies and theories of decolonization with critical pedagogy, and a global decolonizing discourse. Advocating the use of critical personal narratives, Denzin encourages the development of a postcolonial indigenous participatory theater focused on racism, inequality, memory, and cultural loss.

■ WRITING: A METHOD OF INQUIRY

Writers interpret as they write, so writing is a form of inquiry, a way of making sense of the world. Laurel Richardson and Elizabeth Adams St. Pierre (Chapter 38) explore new writing and interpretive styles that follow from the narrative literary turn in the social sciences. They call these different forms of writing CAP (creative analytical processes) ethnography. Their chapter is divided into three parts. Part 1, authored by Richardson, explores these forms. In Part 2, St. Pierre provides an analysis of how writing as a method of inquiry coheres with the development of ethical selves. In Part 3, Richardson provides some writing practices and exercises for the qualitative writer.

New forms include autoethnography, fiction stories, poetry, drama, performance texts, polyvocal texts, readers' theater, responsive readings, aphorisms, comedy and satire, visual presentations, conversation, layered accounts, writing stories, and mixed genres. Richardson discusses in detail one class of experimental genre that she calls evocative representations. Work in this genre includes narratives of the self, writing stories, ethnographic fictional representations, poetic representation, ethnographic drama, and mixed genres.

The crystal is a central image in Richardson's text, and she contrasts it with the triangle. Traditional postpositivist research has relied on triangulation, including the use of multiple methods, as a method of validation. The model implies a fixed point of reference that can be triangulated. Richardson illustrates the crystallization process with excerpts from her recent book with Ernest Lockridge.

Mixed genre texts do not triangulate. The central image is the crystal, which "combines symmetry and substance with an infinite variety of shapes, substances, transmutations, . . . and angles of approach." Crystals are prisms that reflect and refract, creating ever-changing images and pictures of reality. Crystallization deconstructs the traditional idea of validity, for now there can be no single or triangulated truth.

Richardson offers five criteria for evaluating CAP ethnography: substantive contribution, aesthetic merit, reflexivity, impactfulness, and ability to evoke lived experience. She concludes with a list of writing practices—ways of using writing as a method of knowing.

St. Pierre troubles conventional understandings of ethics. Drawing on Derrida and Deleuze, she places ethics under deconstruction: "What happens when we cannot apply the rules?" We must not be unworthy of what happens to us. We struggle to be worthy, to be willing to be worthy.

■ ANTHROPOLOGICAL POETICS

Anthropologists have been writing experimental, literary, and poetic ethnographic texts for at least 40 years. In this part, three different forms of poetics are represented. Ivan Brady (Chapter 39) writes poetically about method, about a way of getting to know places by their effects on our personal experience. He invokes the environmental poets, offering a prolegomena to a poetics of place.

Using the literary poetic form, Brady enacts a moral aesthetic, an aesthetic that allows him to say new things about place, space, wild spaces, beings, self, nature, identity, meaning, and life on this threatened planet. In so doing, he pushes the boundaries of artful discourse. Thus are the boundaries between the humanities and the human sciences blurred. In this blurring, our moral sensibilities are enlivened. We are able to imagine new ways of being ourselves in this bewilderingly complex world called the present.

■ CULTURAL POESIS

In a chapter that defies description, Kate Stewart (Chapter 40) offers a piece of imaginative writing grounded in the poetics of ordinary things. She gives us provocations, glimpses out of the corner of the eye, a montage, a fractured text, cultural poesis during times of violence, chaos and loss in U.S. public culture, a roller-coaster ride through somebody's

dreamland, ordinary life somewhere, games, eating in, walking the dog, shopping, raking the yard, political posters in the front yard, a plastic Jesus, a shrine, yellow ribbons, surging bodies, the train screaming out a warning, nothing adding up to anything except some of us starting to lose hope yesterday.

■ INVESTIGATIVE POETICS

Stephen Hartnett and Jeremy Engels (Chapter 41) offer a poetics of witnessing, an aria in time of war. In so doing, they respond to the call of Ralph Waldo Emerson, who demanded that a poet should strive toward becoming “the knower, the doer, and the sayer.” Building on Emerson, they advocate an investigative poetics, a “combination of serious scholarship, passionate activism, and experimental representation.”

Hartnett and Engels write to offer a poetry that problematizes politics, that bears witness to the ways in which social structures are embodied in lived experience, a poetic that functions as a genealogical critique of power. Their essay unfolds in four movements, going from the political poetry of Carolyn Forché and Edward Sanders to a discussion of social justice discourse in the humanities. They then criticize the movement known as ethnopoetics, concluding with a positive discussion of the political poetics of John Dos Passos, Carolyn Forché, and Peter Dale Scott.

■ QUALITATIVE EVALUATION AND CHANGING SOCIAL POLICY

Program evaluation, of course, is a major site of qualitative research. (Earlier *Handbook* chapters by Greenwood & Levin [Chapter 2] in Part I and by Stake [Chapter 17], Kemmis & McTaggart [Chapter 23], and Miller & Crabtree [Chapter 24] in Part III established this fact.) Evaluators are interpreters. Their texts tell stories. These stories are inherently moral and political. Starting in 1965 and moving to the present, House (Chapter 42) offers a sobering historical analysis of qualitative evaluation and changing social policy. He observes that the field has moved from faddish experimental and quantitative evaluation studies (1960s), to small-scale qualitative studies, to meta-analyses and program theory. A move from a model of value-free inquiry to committed social justice projects, and back again, is also part of this history. During the 1980s, evaluation moved away from “quantitative methods and value-free studies toward multiple methodologies and qualitative studies focused on stakeholders, social justice issues, and participatory techniques.”

Neoconservatives viewed such work as too permissive and argued against it. Since September 11, 2001, a neoconservative fundamentalism has taken hold of federal policy—from foreign affairs, to domestic affairs, to evaluation itself. President George W. Bush’s neofundamentalism has taken the form of methodological fundamentalism in the field of evaluation. As argued previously, federal agencies that sponsor evaluation have “aggressively pushed the concept of ‘evidence-based’ progress, policies, and programs.”

The core of this belief is the argument that research and evaluation must be scientific, that is, based on randomized experimental designs. This method of inquiry is written into federal legislation! The Bush educational policy thus implements four concepts: accountability, options for parents, local control, and evidence-based instruction.

The use of the medical model of evidence-based inquiry is predicated on the belief that education is a field of fads; the failure of our schools reflects this. In contrast, medicine, with its randomized field trials, has made significant progress in improving human health. Education should do the same. Of course, many of the fads in education have been inspired by conservatives—vouchers, charter schools, accountability through test scores. Medicine's progress can be attributed to breakthroughs in allied fields, not randomized trials.

And so the field comes full circle. We are back to the experimental models of the 1960s. Do we have the courage to stand up to this conservative assault?

■ CONCLUSIONS

The chapters in Part V affirm our position that qualitative research has come of age. Multiple discourses now surround topics that during earlier historical moments were contained within the broad grasp ways of the positivist and postpositivist epistemologies. There are now many in which to write, read, assess, evaluate, and apply qualitative research texts. Even so, there are pressures to turn back the clock. This complex field invites reflexive appraisal, hence the topic of Part VI—the future of qualitative research.

RELATIVISM, CRITERIA, AND POLITICS

John K. Smith and Phil Hodgkinson

In a chapter that one of the authors (John Smith) wrote with Deborah Deemer on criteria for judging social and educational research for the second edition of this *Handbook*, the issue of power and criteria was briefly mentioned. Smith and Deemer (2000) said that they were not so naïve as to claim that power, and by extension (but unmentioned) politics, could ever be eliminated from judgments about the quality of research as these judgments are played out in a social context. Citing Hazelrigg (1989), they added that there was no point in embracing some sort of a romanticized "intellectualized flight from power" (Smith & Deemer, 2000, p. 202). In fact, although they did not say so, they certainly could have added that there is nothing wrong with politics and the exercise of power *per se* in this instance or in other instances. The central issue has been, and remains, about how the political process operates, how power is exercised, and what goals those participating in the process desire.

Because of certain events over the past few years, including governmental attempts to mandate research criteria in both the United States and the United Kingdom, it is clear that the relationship of power, politics, and criteria must be

discussed at much greater length. In this chapter, we elaborate on these issues.

The starting point for our discussion is a reiteration of the main conclusion that Smith and Deemer (2000) reached in the second edition of the *Handbook*: We have come to the end of our attempts to secure an epistemological foundation for our knowledge and must acknowledge that we are in the era of relativism.

We pursue this reiteration in two parts. First, we discuss the well-known and frequently argued point that individual researchers cannot step outside their own social and historical standpoints. Because there is no possibility of theory-free observation and knowledge, the subject-object dualism of empiricism is untenable and the claim to objectivity is a chimera. Second, we discuss the condition that the conduct of research, and especially the judgments about its worth, represents social activities. In the absence of an epistemological foundation, which is essential to any claim that criteria can be neutral and objective, decisions about what the criteria for research are or should be, as well as decisions about how criteria are put into practice, result from complex social interactions. And, as with all such social interactions,

individuals and groups work to further their own interests, both legitimately and (occasionally) illegitimately, although it must be added that judgments about what is legitimate versus illegitimate are themselves socially determined at any given time and place. These conditions make the process of determining research criteria and how they are to be applied unavoidably contestable and, hence, political.

Following this revisiting, we then briefly note two common responses to the demise of empiricism and the end of the pretense to objectivity, define relativism, and discuss what the latter means for the issue of criteria. Finally, we examine the role that politics plays, both generally and in the specific U.S. and U.K. contexts at the time when this chapter was being written, in the making of judgments about the quality of social and educational research. This examination, in particular, focuses on the political pressures that are being brought to bear in the attempt to reestablish or reassert that the broadly empiricist understandings about research and criteria are the only understandings that can, or should, be accepted. We find in play here both a politics of avoidance of the compelling arguments advanced against empiricism by relativist researchers and a politics directed at marginalizing the messengers.

Two basic definitions are needed before we begin. First, we define politics in a conventional sense as the process of allocating scarce resources. Any desired resource that is not totally abundant—be it money, social prestige, recognition, research grants, or whatever—must be divided up through a political process with some people getting more and others getting less of whatever is desired. Judgments about research quality and what counts as research are central to the allocation of such scarce resources for researchers. It is here that the political dimensions of research activity are most significant. Power is the ability of individuals or groups to realize their will even if others are opposed. If one knows the distribution of access to power in a group, an organization, or a society, one can understand the distribution of scarce resources and vice versa.

■ CRITERIA AS METHOD

The point of research as traditionally, and thus conventionally, understood has long been thought of as a matter of discovering the truth. Within the empiricist epistemological perspective that has dominated our understanding of research, truth is defined as the accurate representation of an independently existing reality. The accumulation of knowledge is thereby considered to be the accumulation of accurate representations of what is (independently) outside of us. The paradigmatic example of what also is called the spectator theory of knowledge, with the accompanying definition of truth in correspondence terms, involves the cat and the mat. If one says the cat is on the mat and, in fact, we observe that the cat is actually on the mat, then words correspond to reality and the truth has been spoken.

The central problem with this empiricist perspective on inquiry is that of making good on this idea of correspondence. Making good in this context means somehow connecting that which empiricism separated—the knowing subject from the object of knowing—and doing so in such a way that the activities of the former would not distort the reality of the latter. The solution of choice to cash in this correspondence theory, as has long been noted in our social and educational research textbooks, is a methodical one. The point is quite straightforward: If the proper procedures are applied, the subjectivities (e.g., opinions, ideologies) of the knowing subject would be constrained and the knower could thereby gain an accurate and objective depiction of reality. Those researchers who adhered to method would thereby possess, in contrast to all others, what one might call the well-polished Cartesian mirror of the mind. Kerlinger (1979) put it bluntly:

The procedures of science are objective—not the scientists. Scientists, like all men and women, are opinionated, dogmatic, [and] ideological. . . . That is the very reason for insisting on procedural objectivity: to get the whole business outside of ourselves. (p. 264)

Method is thereby *the* crucial factor in any judgment made about the quality of research.

Over the course of the past half century, empiricism as a theory of knowledge with the claims of objectivity, neutrality, and so forth has come on hard times; as a result, the methodical solution to the problem of criteria has been very seriously undermined. Philosophers of science, and especially philosophers of social science, have noted numerous intractable problems associated with this methodical solution to reconnect what empiricism had separated—the dualism of the knowing subject and the object of knowing. Because this territory has been covered with frequency (for a brief recounting of this history, see Smith, 1989), we need to mention only a few key points.

Within Anglo-American philosophical circles, a good case can be made that Hanson and Kuhn were central among those who brought the subject-object dualism issue to the forefront. At the core of Hanson's (1958) arguments was the now seemingly obvious point that "the theory, hypothesis, framework, or background held by an investigator can strongly influence what is observed" (p. 7). A few years later, Kuhn (1962) followed up on this line of reasoning with his talk about incommensurable paradigms, paradigm shifts, the fact that all knowledge is framework dependent, and so forth. By the mid- to late 1980s, the work of numerous other people left little doubt that the claim that theory-free knowledge and observation is possible is intellectually untenable (e.g., see Bernstein, 1983; Gadamer, 1995; Goodman, 1978; Nagel, 1986; Putnam, 1981; Taylor, 1971).

The arguments made by these philosophers combined with another series of arguments that focused directly on the claim that method itself was neutral or that it could be the repository of procedural objectivity. The fact that such a claim could not be sustained is the central message that can be taken from the work of Cherryholmes (1988), Giddens (1976), Hesse (1980), MacKenzie (1981), Smith (1985), and others. The result of all this intellectual ferment was the elaboration of a number of points of great consequence for any

discussion of criteria, namely that: there is no possibility of theory-free observation and knowledge, the claim of the duality of subject and object cannot be made good, no special epistemic privilege can be attached to any particular method or set of methods, and we cannot have the kind access to an external extralinguistic referent that would allow us to claim the discovery of truth in accurate representation or correspondence terms.

Based on these points, the only conclusion that can be reached is that we no longer can talk in terms of a foundational epistemology and a direct contact with reality. There is no possibility of the objective stance or view—often called the "God's eye" point of view—and all we can have are "the various points of view of actual persons reflecting various interests and purposes that their descriptions and theories subserve" (Putnam, 1981, p. 50). With the demise of empiricism and the methodical stance on criteria, social and educational research must be seen for what it has always been—a practical and moral activity, not an epistemological one. And because we have no epistemological foundation for our practical and moral activities, any discussion of criteria must come to terms with, in one form or another, the issue of relativism.

■ RESPONSES

Over the recent past, there have been at least two general responses, with the usual numerous variations on theme, to those who have argued that epistemological foundationalism is over and that the criteria for judging research cannot be "fixed" but rather are the product of time- and place-contingent social processes. In the first instance, some people have advanced various lines of argument that can be labeled, albeit loosely, as neorealist (e.g., see Bhaskar, 1979; Hammersley, 1990; Manicas, 1987; Manicas & Secord, 1983; Phillips & Burbules, 2000; Pring, 2000; see also Popper, 1959, 1972, arguably the intellectual precursor of all neorealists). Second, other people recently have attempted to reassert empiricism and criteria as method (e.g., so far as educational research

is concerned, see Oakley, 2000; Shavelson & Towne, 2002; Slavin, 2002; Tooley & Darby, 1998).

Other than a brief summary, we do not discuss or critique the neorealist and reassertive positions and their respective approaches to criteria. In the past, we have written such "attempt to persuade" or "conversion" pieces, as we now have come to call them, and these are readily available to interested readers (Garratt & Hodgkinson, 1998; Hodgkinson, 1998, 2004; Hodgkinson & Smith, 2004; Smith, 1993). Although we think that the philosophical exchanges we have engaged in have been intriguing and are important to keep a conversion going, conversion by way of persuasive argument seems to occur rather rarely. Thus, in this chapter, we forgo such attempts and only summarize briefly the previously noted positions, with very limited comments, and then elaborate on our take on relativism, criteria, and politics.

There is little question that non-naïve realists or neorealists have made numerous sophisticated attempts to address the issue of criteria. These neorealist responses share in common a commitment to an ontological realism, on the one side, and a constructivist epistemology, on the other. The former means that these neorealists are committed to the proposition that there is a real world out there independent of our interest in or knowledge of that world. The latter announces their commitment to the idea that we can never know for sure whether we have depicted that reality as it really is. Although the line of argument varies, these non-naïve realists or neorealists "assert a belief in a real world independent of our knowledge while also making it clear that our knowledge of this metacognitive world is quite fallible" (Leary, 1984, p. 918).

Given these dual commitments, the neorealists then argue that criteria that are not strictly contingent on time and place can be developed. Hammersley (1990), for example, attempted to elaborate criteria to hold off the contingent nature of judgment or, put differently, to prevent a slide into what is, for him, the void of relativism. His criteria of choice, or the two key elements necessary for judging the validity of a study, are what he called *plausibility* and *credibility*. In the former

instance, to say that a claim is plausible is to say that it is "likely to be true given our existing knowledge" (p. 61). He argued that some claims are so plausible that we can immediately accept them at face value, whereas other claims require the presentation of evidence. In the latter case, a judgment about credibility must be undertaken "given the nature of the phenomena concerned, the circumstances of the research" (p. 61), and so forth. And, as with plausibility, when a claim lacks face credibility, evidence is required. However, Hammersley further recognized that the particular evidence presented by a researcher in support of the plausibility and credibility of a study must itself be assessed for its own plausibility and credibility. And, as he continued, "we may require further evidence to support that evidence, which we shall judge in terms of plausibility and credibility" (p. 62).

For us, Hammersley's (1990) argument became deeply entangled in an infinite regress—if not a hermeneutic circle. It is at this point where it was necessary for him to call on his neorealism to do some work—in particular, the work of making contact with reality in such a way as to blunt this infinite regress or get one out of the hermeneutic circle of interpretation. Or, put differently, it was time for him to call on his version of realism to prevent the relativism that would seem to lie at the end of it all. This was not the case, however, and any notions about correspondence and realism, no matter how subtle, played no role of consequence for the balance of Hammersley's discussion. His arguments ultimately ended up at the only place they could go—with a discussion of the norms that *should* govern discourse among members of a scientific community as they attempt to make judgments about plausibility and credibility. These are norms because they refer to what "should be" and thereby yield to no final or foundational answers that are contestable and inevitably influenced by political processes.

A similar situation can be pointed out with reference to the work of Manicas and Secord (1983) and the well-known idea of warranted assertability. Their version of neorealism led them to note

that "knowledge is a social and historical product" (p. 401), there is "no preinterpreted 'given,' and the test of truth cannot be 'correspondence.' Epistemologically, there can be nothing known to which our ideas (sentences, theories) can correspond" (p. 401). Based on these points, Manicas and Secord then addressed the issue of how to connect experiences, which are always—and can only—be culturally and historically mediated, with reality independent from experience. Their response was the negative assertion that although there is no theory-free observation, this "does not eliminate the possibility of objectivity, construed here as warranted assertability" (p. 410). For us, this placed them in the same situation as was faced by Hammersley (1990) because the warrants that one brings to judgments are themselves socially and historically conditioned—as are the warrants that warrant the warrants, and so forth. Again, they were caught in a hermeneutic circle or an infinite regress and were unable to offer a way in which to access an external referent that would allow them out of the former or to stop the latter.

A second line of response, recently asserted with vigor in both the United States and the United Kingdom, holds that social and educational inquiry should strongly embrace more crudely empiricist procedures, even the experimental or quasi-experimental procedures common in the natural sciences. In the United States, this position has been most widely advanced by the report from the National Research Council Committee (Shavelson & Towne, 2002). This report was supported by a contract between the National Research Council and the U.S. Department of Education's National Educational Research Policy and Priorities Board. In the United Kingdom, a similar but less harshly experimental position has been advanced with the critiques of the quality of British educational research at the hands of Tooley with Darby (1998) and Hillage, Pearson, Anderson, and Tamkin (1998). The former report was commissioned by the Office for Standards in Education (OFSTED), the government-established national inspection agency for schools, whereas the latter report was sponsored by the government department directly responsible for education.

In Chapter 3 of the Shavelson and Towne (2002) report, the principles of scientific inquiry were set forth. These guiding principles for educational research, not surprisingly, are very much like those that have been central to standard, empiricist-inspired, introductory research texts. The terms of discourse, for example, are those of replicate, generalize, random assignment, and so forth. In Chapter 5 of the report, the committee fleshed out these principles with a discussion of the designs for conducting scientific educational research. What they referred to as "more rigorous studies" are those that are of an experimental nature with well-defined hypotheses and so forth in place before data collection and analysis. At this point, it is clear that the methods or procedures employed by researchers are the crucial factor in any judgment of their research as good or bad.

Placed between these two chapters in the Shavelson and Towne (2002) report was one in which they addressed some of the unique features of educational inquiry—and, again by extension, social inquiry—that they argued set this inquiry apart from other fields of inquiry. They noted factors such as human volition, the central role of ethics that limits control group possibilities, rapid changes in educational programs, and so forth. These and other conditions mean that educational and social researchers are not able to exercise the same degree of control over their subject matter as are, for example, physical scientists. The committee's response to this diminution of control was to say that educational and social researchers must "pay close attention to context" when pursuing and interpreting the results of their research. Exactly what they meant by paying close attention to context was not clearly discussed. What is clear, and what is most important, is that they did not include the researcher as part of the context. This position runs counter to the now generally accepted idea that we, even as researchers, cannot undertake theory-free observation and produce theory-free knowledge.

Finally, Shavelson and Towne's (2002) comments about qualitative research and the relationship of qualitative and quantitative approaches to inquiry are difficult to interpret in

that there appeared to be some ambiguity present. They declared, with citations but without argument, that the two approaches are “epistemologically quite similar” and that “we do not distinguish between them as being different forms of inquiry” (p. 19). That said, they also noted that “sharp distinctions between qualitative and quantitative inquiry have divided the field” (p. 19). This comment was followed by a concern that “the current trend of schools of education to favor qualitative methods, often at the expense of quantitative methods, has invited criticism” (p. 19). This statement was not supported by citations, and the nature of the criticism was not mentioned. Not surprisingly, one is then left to wonder about what the problem is here. If both approaches are similar and we cannot distinguish between them, then what is the reason for the concern and criticism?

In Chapter 5 of Shavelson and Towne’s (2002) report, however, their take on the position of qualitative inquiry relative to quantitative inquiry could be noted more clearly. They stated that all scientific studies must begin with clear questions that can be researched empirically. They added,

More rigorous studies will begin with more precise statements of the underlying theory driving the inquiry and will generally have a well-specified hypothesis before [the] data collection and testing phase is begun. Studies that do not start with clear conceptual frameworks and hypotheses may still be scientific, although they are obviously at a more rudimentary level and will generally require follow-on study to contribute significantly to scientific knowledge. (p. 101)

Because qualitative studies are more loosely defined before data gathering begins, they are more rudimentary than quantitative studies—the lack of epistemological distinction between them notwithstanding—and are primarily valuable for generating hypotheses for studies that are more rigorous. (As an aside, we must note that this may have taken us “full circle,” so to speak. See Abel’s [1948] comments about how interpretive inquiry is valuable for generating hypotheses to be turned over to real researchers

for rigorous testing with their empiricist or scientific methods.)

The position taken by Shavelson and Towne (2002) is paralleled in the discussions of research quality in the United Kingdom, as advanced by Tooley and Darby (1998) and Hillage and colleagues (1998). Tooley and Darby’s approach was to analyze the quality of educational research articles that appeared in four high-status U.K. academic journals. They declared that the overall standard of inquiry was far too low and their sponsor concluded that “much [educational research] that is published is, on this analysis, at best no more than an irrelevance or distraction” (p. 1). They found two main problems with a significant portion of educational research. First, there was the issue of the increasing prominence of qualitative research. About this greater increase, they stated, “The key problem lies in the subjectivity of qualitative research” (p. 43) because of the lack, most particularly, of triangulation. In addition, they were very critical of the large amount of research—overwhelmingly of a qualitative approach—that uses broad sociological theorizing and/or focuses on the lives of disadvantaged people and groups in society. Thus, Tooley and Darby chose for as an example of particular strident criticism an article by Sparkes (1994) in which he argued that the oppressions faced by a lesbian physical education teacher were a social issue rather than an individual one.

Hillage and colleagues (1998), following Tooley and Darby (1998), also took an approach similar to that of Shavelson and Towne (2002). Hillage and colleagues stated that not enough educational research was of sufficient quality and relevance to serve the needs of practitioners and policymakers. The essence of their critique was that educational research in the United Kingdom was too small scale, was not cumulative, was too often of low standard, and (most interesting) was biased toward qualitative case studies. The solution was obvious: What was needed was more large-scale, cumulative research based on a scientific approach—in other words, an increase in quantitative research and/or research using mixed methods.

Although there are certainly many variations among them, in the end, Shavelson and Towne (2002), Tooley and Darby (1998), and Hillage and colleagues (1998) broadly shared three things. First, they all wrote reports sponsored or funded by government educational agencies that had decided to get into the business of sponsoring certain criteria for judging research in a way that has no precedent of which we are aware. Second, as they defined high-quality research, they all reiterated—to one degree or another—Kerlinger's (1979) approach and embraced a continuation of the so thoroughly undermined empiricist or spectator theory of knowledge and favored the definition of criteria as a certain set of methods. Finally, they all expressed a great deal of ambiguity, at least in what they wrote, about the value or standing of qualitative inquiry when compared with the supposedly more rigorous, methodologically driven approaches to research. This led all of them to conclude that whereas qualitative researchers can be part of the educational research club, they cannot be rigorous members.

■ RELATIVISM

For us, as critics of these responses to the demise of empiricism and the realization that adherence to method will not lead to theory-free knowledge and so forth, the idea is to move past the epistemological project, to change our metaphors and imageries of research from those of discovery and finding to those of constructing and making, and to accept that relativism is our inescapable condition as finite humans. However, to make such statements and employ the term *relativism* is deeply problematic for many people. Even the mention of relativism provokes strongly negative intellectual and emotional reactions.

For many writers, "relativism" is equated with some illogical and irrational abyss where every claim to knowledge has equal validity and credibility with every other claim. They argue that such a position is not only nonsensical but also dangerous in that it can lead only to a form of

research anarchy and, for that matter, cultural anarchy. But to say that relativism means "anything goes" is nonsense for one simple reason: No one believes that all things are equal, and no one could lead his or her life guided by that belief. We all have preferences for some things over other things, and we make choices accordingly. This process of preferring some things to other things and making judgments accordingly has been going on since time immemorial and will continue for as far as can be seen into the future. Put differently, it is impossible to imagine a human life without judgment and discriminations. Taylor (1989) expressed the situation as follows: "To know who you are is to be oriented in moral space, a space in which questions arise about what is good or bad, what is worth doing and what not, what has meaning and importance for you and what is trivial and secondary" (p. 28). To not make judgments is to lose sight of one's orientation in such a moral space, that is, to lose one's grounding as a human.

We must also briefly address another long-standing canard, namely that relativism is self-refuting. The argument is well known: To say that all things are relative is to make a nonrelative or absolute statement and thereby to contradict oneself and so forth. Both Rorty (1985) and Gadamer (1995) addressed this issue of self-refuting. The latter agreed that relativism is self-refuting but then maintained that to make this point is to make a point of no interest because it "does not express any superior insight of value" (p. 334). Rorty (1985), on the other hand, argued that it is a mistake to think of relativism as a theory of knowledge to compete with other theories of knowledge. He dispensed with the self-refuting issue by stating that because his type of pragmatist is not interested in advancing any "epistemology, a fortiori, he does not have a relativist one" (p. 6).

We agree with these perspectives and hold that relativism, as we understand the condition, is not a theory of knowledge and advances no pretense that we can escape our finite—or time- and place-constrained—condition of being in the world. Taking a page from Godel's idea of incompleteness (Hofstadter, 1979), this situation is only

what we should expect from any human (i.e., socially and historically influenced) construction. As such, relativism stands for nothing more or less than recognition of our human finitude. It is not something to be transcended; rather, it is merely something with which we, as finite beings, must learn to live.

Schwandt (1996) summarized this nonfoundational situation quite succinctly:

We must learn to live with uncertainty, with the absence of final vindications, without the hope of solutions in the form of epistemological guarantees. Contingency, fallibilism, dialogue, and deliberation mark our way of being in the world. But these ontological conditions are not equivalent to eternal ambiguity, the lack of commitment, [and] the inability to act in the face of uncertainty. (p. 59)

As such, our problem as inquirers is that of how to make and defend judgments when there can be no appeal to foundations, to methods, or to something outside of the time- and place-constrained social processes of knowledge construction. This immediately engages us in complex social processes with obvious political implications.

■ CRITERIA

The end of the epistemological project, the shift in metaphors from discovery to constructing, and the realization that social and educational inquiry is a practical and moral affair all mean that criteria must be thought of not as abstract standards but rather as socially constructed lists of characteristics. As we approach judgment in any given case, we have in mind a list of characteristics that we use to judge the quality of that production. This is not a well-defined and precisely specified list; to the contrary, this list of characteristics is always open-ended, in part unarticulated, and always subject to constant interpretation and reinterpretation. Moreover, the items on the list can never be the distillation of some abstracted epistemology, as has been attempted in the case of empiricism and method as criteria. Our lists are inevitably rooted in our standpoints and are elaborated

through social interactions—or, in Gadamer's (1995) terms, they must evolve out of and reflect our "effective history [or histories]" (pp. 301–302).

The lists that we bring to judgment are open-ended in that we have the capacity to add items to and subtract items from the lists. The limits for recasting our lists derive not primarily from theoretical labor but rather from the practical use to which the lists are put as well as from the social, cultural, and historical contexts in which they are used. The limits on modification are worked and reworked within the context of actual practices or applications. Also, any lists that we bring to judgment are only partly articulated and only partly rational. Some items can be more or less specified, whereas others seem to resist such specification. Polanyi's (1962) concern about tacit knowledge applies very well in this case. We make what Beckett and Hager (2002) termed "embodied judgments" about research quality and value, that is, judgments that are practical and emotional as well as discursively considered. When we make judgments, we generally can specify some of the reasons, but other things seem to be out there—what might be called a surplus of meaning that seems to stand just beyond our grasp, just beyond our ability to completely specify or articulate. This does not mean that we should not, and do not, attempt to bring this surplus to fuller articulation; it only means that this can never be done completely.

Furthermore, the lists that people think characterize good versus bad research studies are often contested, overlap one another, and partly contradict one another (Garratt & Hodgkinson, 1998). Any list can be challenged, changed, and/or modified not primarily through abstracted discussions of the items themselves but rather in application to actual inquiries. For example, something "new" is presented to us. This was the case with qualitative inquiry in the recent past. Qualitative work did not fit well with the empiricist list of methodical characteristics (e.g., sampling, null hypotheses) that were the basis for distinguishing good research studies from bad research studies. To accept qualitative inquiry meant that one had to reformulate one's list of

characteristics and replace the exemplars that are always called on in the never-ending process of making judgments. However, the key here is "accept" because people may choose, as many have done, to preserve and reassert the existing list of characteristics that distinguish the good from the bad and thereby reject the "new" as something that does not even qualify to be considered as research. This, of course, is a comment that has been, and is still, offered up about qualitative research.

■ MAKING JUDGMENTS ABOUT RESEARCH

The various conditions noted in the previous section, in that they constrain all human activity—including social and educational research and thus judgments about the quality of such research—mean that politics and power are part of that complex process by which we sort out the good from the bad and the indifferent. The hope that method would allow us to make judgments about the quality of research "untainted" by our opinions, emotions, and self-interests has been a false hope. Politics and power are part of the process of judgment and always have been. At times, of course, when there is a more general agreement among researchers about how research is conceptualized and how the activity should be conducted, the politics and power aspects of judgment do not reveal themselves to any great extent. At other times, such as when there are challenges to conventional empiricist forms of inquiry as has recently been the case with qualitative research—especially when such inquiry draws on postmodernist understandings, philosophical hermeneutics, and so forth—political and power factors are much more obvious at both a micro level (i.e., within the research profession) and a macro level (i.e., a situation where outside elements, such as government officials, enter into the process). However, we must immediately note that the line between micro and macro is often very blurry indeed.

In a groundbreaking study of the school as an organization, Hoyle (1982, 1986) coined the

phrase "micropolitics," an idea later expanded by Ball (1987). Hoyle (1982) described micropolitics as including "those strategies by which individuals and groups in organizational contexts seek to use their resources of power and influence to further their interests" (p. 88). One way of understanding issues of research judgment is as a micropolitical process, even if the context is wider and more complex than that of a particular organization. Hodkinson (2004) argued that educational research can be seen as a field in the sense described by Bourdieu (e.g., Bourdieu & Wacquant, 1992). That is, academics strive for distinction in that field, using whatever capital (resources) they have at their disposal. One of the major activities in such a field is that people work to support, preserve, or strengthen those rules (or lists of characteristics) that they approve of or are in their interests and/or to change the rules (or lists) in a direction that favors their interests.

This drive to promote self-interest is not the only motivation for people. The politics of research judgment is driven by deeply held and sincere beliefs about what determines research quality and the role that research should play, for example, in relation to policy and practice. That is, people may defend method as the criterion for judgment because they truly believe that methodically driven inquiry or the application of the "scientific method" is the best way in which to solve educational and social problems, to help educate children, to bring greater equity to society, and so forth. But then, this is also the case for those who critique methodically driven inquiry and insist that we must change our metaphors. However, this does not render the process any less political. Such beliefs strengthen the resolve to assert particular approaches, that is, to win the political struggles over allocation of resources. The careers and self-interests of those concerned are intimately locked into those processes and struggles.

In short, academics strive explicitly and implicitly to influence those criteria (or lists of characteristics) that determine research quality as well as to perform well against them. In Hoyle's (1982, 1986) terms, academics are micropolitical. Aspects of these rules are codified and written,

Those who fund research have criteria against which bids will be judged, and journals have criteria against which submitted articles can be evaluated. However, such written codes take us only so far. Many of the rules of academic research are uncodified, having developed through custom and practice, as we have already argued. Part of the micropolitics lies in the selection and use of codes, contexts, and informal practices that best fit with the interests of a researcher or a group of researchers. Academics are, both as laypeople and as researchers, finite beings living during the era of relativism.

Although we strongly suspect that none of this is news to those who, over the years, have had research articles published and rejected, it will help to illustrate the pervasive presence of micropolitical activity with two brief examples. The first example concerns the allocation of scarce publication space in a high-status journal, the *Educational Researcher* (*ER*), and the refreshing—but all too rare—musings of an editor about the decision-making process. A few years ago, Donmoyer (1996) talked about his “gatekeeping” role as editor of *ER* during a time of what many called “paradigm proliferation.” Donmoyer did an excellent job of noting that he, as a gatekeeper, could not “widen the gates [he] monitors; [he] simply gets to decide which sorts of people can walk through them” (p. 20). He also went on to note that although different approaches to inquiry might be incommensurable, he agreed with Bernstein (1983) that this did not mean they were necessarily logically incompatible. That said, Donmoyer (1996) then acknowledged that when one moves away from the conceptual to the actual practice of publishing some papers and rejecting others, and when one is in the “realm of action . . . where resources are often scarce and hard choices consequently have to be made, a sort of pragmatic incommensurability will inevitably come into play” (p. 20).

It is precisely at this point of scarcity and hard choices, in light of philosophical differences and disputes concerning the nature of inquiry, that power and politics become very visible as part of the quality judgment process. This does not

mean that the process is necessarily venal or somehow tainted, although it certainly can be and can often be judged as such—depending, of course, on how “venal” and “tainted” are defined. All we wish to convey here is that this is the way things are because we all are, at least in part, political beings with a desire to advance our respective self-interests.

Our second example illustrates the current interest in reasserting empiricism as the philosophical basis for social and educational inquiry and, in so doing, blurs the line between macro and micro. For reasons that will be made clear later, the U.K. government’s Department for Education and Employment, now the Department for Education and Skills (DfES), funded the Evidence for Policy and Practice Information and Coordinating Centre (EPPI Centre) for 5 years beginning in 2000. The remit was to support groups of researchers and others in carrying out systematic reviews of existing research findings. It was based on earlier systematic review work in medical research under what has become known as the “Cochrane Collaboration.” The founder of the EPPI Centre, Ann Oakley, is a determined advocate of scientific research and the primacy of the controlled experiment (Oakley, 2000, 2003). Within the center’s approach, a systematic review must meet various criteria:

means of specifying a particular answerable research question; criteria about what kinds of studies . . . will be included in, and excluded from, the domain of literature to be surveyed; making explicit, justifiable decisions about the methodological quality of studies regarded as generating reliable findings; . . . [and] has involved input from research users at all stages in the review process. (Oakley, 2003, p. 24)

The first two of the criteria demonstrate unashamedly empiricist underpinnings. The research question comes first and stands apart from and prior to the research that is to be surveyed in the review, and the quality of any research to be considered is determined by the methods used by the researchers and how clearly they are described. Also of note is the fact that

although user involvement in the review process is specified, prior academic knowledge of the field to be surveyed is not. This implies that the review process is seen as a technical operation that does not require sophisticated research understanding.

As Oakley (2000, 2003) described them, the EPPI processes appear to be designed to maximize objectivity and minimize subjectivity. Part of that objectivity is the claim that "the basic principle behind EPPI Centre reviews is transparency of methods, which allows replication and updating" (Gough & Elbourne, 2002, p. 229). The reality is less clear-cut. Each EPPI group has to determine its own chosen set of criteria—clearly a social and micropolitical process. In a training event for these procedures attended by a colleague in June 2003, David Gough, deputy director of the EPPI Centre, stressed the fact that during all stages of the process, skilled interpretation was necessary. Groups would need to debate what their review questions were, what criteria should be applied, and how those criteria were to be applied in respect of individual research papers. In a group exercise, the significance of this sort of judgment making became apparent. Within one group, some participants claimed that qualitative case study research did not contain any empirical data and, therefore, always should be excluded. Others disagreed. Toward the end of this session, Gough shared a list of criteria for judging qualitative research. This is not an official EPPI list, but he claimed that it was a list with which no one will disagree:

an explicit account of theoretical framework and/or inclusion of literature review; clearly stated aims and objectives; a clear description of context; a clear description of sample; a clear description of fieldwork methods including systematic data collection; an analysis of data by more than one researcher; and sufficient original data to mediate between evidence and interpretation.

This list is actually deeply controversial, and many high-quality research papers would be rejected if all of these criteria were seriously enforced. For example, the list sits very

uncomfortably with Wolcott's (1999) claim that ethnography is research with no method—or, at least, often lacks what Gough termed "systematic data collection" or "a clear sample." It is "a way of seeing," and any aims may be general rather than specific. Becker's (1971) seminal work on becoming a marijuana user would have failed on several of these criteria, as would Wolcott's (2002) own work on the "sneaky kid." The implication: that two (or more) poor interpretations are better than one good one is common but is logically bizarre. More seriously, what does "clear" mean in this context, and at what point does, for example, a description of the sample become clear as opposed to unclear? The suspicion is that clear stands for the very precise—exactly how many interviews were conducted with how many people of what categories and so forth. There is also no recognition in this list that in a short journal article, meeting every one of these criteria fully might leave little space to actually present any findings.

Far from being scientific, transparent, and replicable, every aspect of the EPPI procedures is shot through with subjective judgment making, and there is a micropolitical purpose to the work. Oakley and her colleagues are strongly promoting one approach to research and judgment-making processes about research, as Oakley's (2000) book makes clear. In so doing, life for researchers in the field who do not agree is being made much more difficult. The potential seriousness of this situation was apparent in a conversation between one of the authors (Hodkinson) and the director of a research program of which he is a part. The director stressed the need to ensure that books reporting the research contain full accounts of the method, including "the precise dates of the fieldwork," lest the books be excluded by some future EPPI groups, whose criteria are not yet even known. The sorts of nonempiricist ways of judging qualitative research described by Sparkes (2002) are so far off the agenda as to be denied existence. The fact that the EPPI Centre is funded by the U.K. government illustrates the link between the micropolitics of judgment and the more recently obvious macropolitics of research judgment.

■ MACRO-LEVEL POLITICS

The most interesting turn of events regarding criteria for judging inquiry has involved political moves at what we have defined as the macro level. By this, we mean that concerns over the issue of criteria are no longer the virtually exclusive province of researchers themselves. In both the United States and the United Kingdom, there have been moves to governmentally establish, if not impose, certain criteria not only to judge the quality of research but also to distinguish what qualifies as research and what does not.

In the United States, the most significant move has been the 2002 legislative reauthorization of the Elementary and Secondary School Act of 1965 known as No Child Left Behind (NCLB). In the United Kingdom, there have been a number of governmental moves to influence or even establish criteria for judging the quality of inquiry. Among the more important of these are the just-discussed funding by the DfES of the EPPI Centre and the government-funded and -led National Educational Research Forum (NERF). In both countries, the idea has been to set out the kinds of things that researchers must do to have a quality study and then restrict research funding to those researchers who follow the rules or the prescribed methods.

In the NCLB legislation, the criteria for judging the quality of research studies are elaborated in the definition of what is called scientifically based research. The standards or criteria (i.e., list of characteristics in our language) are that the study be systematic and empirical, involve rigorous data analysis (i.e., statistical analysis), employ reliable and valid data collection procedures (e.g., repeated measures), possess a strong research design (i.e., experimental or quasi-experimental), allow for the possibility of replication, and invoke expert scrutiny of results.

These elements, not surprisingly, have been translated into a hierarchy of approaches. The randomized control group approach is referred to as the "gold standard" for research. Quasi-experimental designs are second in order in the hierarchy and are referred to as the "silver standard." Correlational studies, descriptive

studies, case studies, and the like are further down the list. The question, of course, is where qualitative inquiry fits into the picture. Because it does not meet the standards as noted in the legislation, so far as NCLB is concerned, qualitative inquiry is not research—or, if it is accepted as research, it must be thought of as quite rudimentary indeed.

Why this elimination of qualitative research from the status of scientific? At one level, it is very likely the case that many people, including researchers, believe philosophically or for epistemological reasons that qualitative inquiry is not "real" research. This is a feeling that has been maintained by many empiricist-oriented researchers since the 1980s, when qualitative inquiry began to gain increasing attention. For them, qualitative approaches have been, at worst, a useless distraction or, at best, a way of generating possible research questions for much more "rigorous" scientific investigations with control groups, statistical analysis, and so forth.

Be this as it may, we suspect that there is a major reason for this desire to impose criteria by way of governmental intervention that pushes qualitative inquiry to the sidelines of acceptable inquiry. This reason centers on what we refer to as the subversive nature—with regard to empiricism—of qualitative inquiry. There is a great deal to be gained by social and educational researchers in terms of social prestige and economic advantage by claiming to be scientists, on par with natural scientists, and convincing others to honor this claim. The problem is that much of qualitative inquiry was nurtured by philosophical arguments that undermined the claims, and even the hopes, that a science of the social was possible (on our inability to find law-like generalizations and why this is important, see Smith, 1993; on the systematic unpredictability of human affairs and the like, see Cziko, 1989, and MacIntyre, 1984). And, of course, it must be noted that if there is no science of the social, there can be no scientists of the social. It bears repeating; there is a great deal at stake here for many people.

In a very similar sense, when qualitative inquiry was subversive of the supposedly scientific

approach to inquiry, it also was subversive of the claims to neutrality and objectivity—that comfortable image of the researcher as a “neutral broker” of information for policymakers. Many versions of qualitative inquiry offered the challenge that research must have a direct ameliorative intent and effect. In an echo of Marx, many people—although not necessarily being Marxists—have argued that research is not just about studying the world but also about changing it. As such, qualitative inquiry is very often driven by social purpose to improve the lives of marginalized and oppressed peoples. This is why qualitative research is often driven by perspectives that go under labels such as postcolonialist, feminist, gay/lesbian, and disablist. We suspect that for many conventional researchers, and certainly for many officials in the government, this idea of research as direct social engagement poses an unacceptable situation and must be controlled.

Finally, a speculative comment about what NCLB might mean for the American Educational Research Association (AERA) and why Shavelson and Towne (2002) discussed qualitative inquiry with such ambiguity (as noted previously) is in order. A significant number of AERA members now think of themselves as qualitative researchers. Certainly, some would accept methodical constraints and act accordingly, even though obeying methods is unlikely to gain them significant respect from the scientific types. Others, however, have adopted an ameliorative agenda and are doing readers' theater, autoethnographies, postmodernist approaches, artistic approaches, and so forth. Because the nonmethodical are considered not to be doing research at all, and the methodically oriented qualitative researchers—their adherence to method notwithstanding—are considered not to be doing really rigorous research, does this mean that the AERA should divide itself into the research members, the sort of research members, and the nonresearch members? Or, perhaps, should people go their own different ways and form different associations? We suspect that the thought of this is unacceptable, maybe not to those who wrote the NCLB definition of

research but possibly to Shavelson and Towne (2002) and the members of the National Research Council Committee. We can think of no other explanation for their wavering comments about the status of qualitative research—yes it is research, no it really isn't research, maybe it is sort of research, and so forth. Maybe the report itself is a political document; any beliefs the authors may have really had about the status of qualitative research aside, they had to temper those beliefs in the face of the fact that there are a whole lot of qualitative educational researchers around. The politics of criteria is inescapable.

In the United Kingdom in the year 2000, the then secretary of state for education argued that the research community had to do much more to meet the needs of policymakers and practitioners (Blunkett, 2000). This statement was followed by a raft of government-led and -supported initiatives to ensure that this happened. The funding of Oakley's EPPI Centre was described earlier. Others included the establishment of the government-funded and -led NERF, whose role was to coordinate and direct educational research efforts, bringing together all major research funders, major journal editors, and key users of research. Membership in this group is by invitation, and during its early days a simplistic empiricist stance, if not a positivist one, was adopted. It was originally suggested that the NERF would draw up “agreed criteria” that would be universally used by all funders and journals to ensure that only high-quality educational research survived (NERF, 2000). The NERF later backed off, in the face of arguments that such an approach would undermine academic freedom. The NERF was paralleled and predated by a major new research program, the Teaching and Learning Research Programme (TLRP). Although it was administered by an independent government-funded agency, the Economic and Social Research Council (ESRC), funding came from other government sources. The remit was to produce high-quality scientific educational research that would lead directly to improvements in teaching and learning. Projects were to be relatively large, with few under £300,000 and several over £800,000.

Mixed qualitative and quantitative methods were to be preferred over qualitative research alone. Money was also to be devoted to research capacity building, but initially for experimental and quantitative educational research. More recently, this program has widened its approaches but still retains a broadly empiricist rationale.

This concerted and government-driven movement to reform research in ways that make it more "rigorous" and more useful to policymakers does not apply only to education. In the U.K./English government structure (we need to specify England because recent partial devolution means that practices in Scotland, Wales, and Northern Ireland are becoming increasingly different), major departments, such as the DfES, are separate fiefdoms. Since the Labour Party came to power in 1996, there has been significant growth of more centralized control through the Cabinet Office, which answers directly to the prime minister. In 2003, the Cabinet Office published a major report on the criteria that should be used to judge the worth of qualitative research (Spencer, Ritchie, Lewis, & Dillon, 2003).

The ostensible purpose of this report is to aid policymakers and others in judging the quality of government-funded and -sponsored evaluation reports, which contained mainly or partly qualitative data. However, the size and form of the report suggest wider unarticulated motives. The report sets out what is claimed to be "a comprehensive and systematic review of the research literature relating to standards in qualitative research" (Spencer et al., 2003, p. 6). Through this approach and other approaches, including "a review of existing frameworks for reviewing quality in qualitative research" (p. 17), the authors produced their own framework. This is, they claimed, suitable for judging "qualitative research more generally [than just evaluations]" (p. 17), especially research that uses "interviews, focus groups, observation, and documentary analysis" (p. 19). The resulting framework consists of 18 "appraisal questions," each of which is accompanied by a series of "quality indicators." These items are "recurrently cited as markers of quality in the literature, in pre-existing

frameworks, and in the interviews [with some researchers and policymakers] conducted for this study" (p. 19). According to the authors, these questions entail interpretation in their use; not all will apply in every circumstance, and additional questions will sometimes be needed. Above all, the authors claimed that because their framework is not "procedural," it is not subject to previous criticisms of predetermined and universal sets of research criteria, which we discussed earlier in the chapter.

Thus, despite disclaimers, the framework is being set up as something approaching a definitive tool that pulls together the accumulated wisdom of the current times. Therefore, it becomes the touchstone against which other frameworks and most, if not all, qualitative research outputs can be judged. This view is reinforced when we examine those types of qualitative research that Spencer and colleagues (2003) claimed are not covered. In addition to research not using interviews, focus groups, observations, or documentary analysis, other research that is "out of scope" includes a set of extreme alternatives to which few researchers, if any, could sign up. There is space here for only a couple of examples: "An external reality exists independently of human constructors and is accessible directly or exactly . . . OR there is no (shared) reality, only alternative individual human constructions" (p. 50). Also out of scope are studies where either "it is possible to produce accurate accounts which one knows with certainty correspond directly with reality OR . . . there are no privileged accounts, only alternative understandings" (p. 50). The force of these sorts of supposed qualification is that nearly all reasonable research perspectives are easily included. In these ways, what starts as an attempt to help policymakers use their own evaluations ends up as a government-sponsored framework to judge nearly all qualitative research.

This all-encompassing and flexible framework has clear epistemological underpinnings that were never critically acknowledged by Spencer and colleagues (2003). The report claimed, "For the purposes of this framework, the quality of the qualitative research that generates the evidence

... is seen as lying at the heart of any assessment [of an evaluation output]" (p. 16); method is the prime determinant of truth. Thus, to identify the extent to which a research report contributes to knowledge, it is not necessary to know much about the substantive area to which the contribution is made. Rather, it is more important to check whether there is a literature review, whether the research design was "set in the context of existing knowledge/understanding" (p. 22), whether there is a "credible/clear discussion of how findings have contributed to knowledge and understanding [and] findings [are] presented or conceptualized in a way that offer[s] new insights" (p. 22), and whether there is "discussion of limitations of evidence and what remains unknown/unclear" (p. 22).

This approach was presented as uncontroversial despite detailed, if superficial, attention to the paradigm debates in the report. Furthermore, there is something very odd about this approach when it is set alongside the exclusionary categories described previously. From the neorealist perspective of Spencer and colleagues (2003), what does it mean to claim that research based on what they called "naïve realism" or "radical constructivism" is "out of scope"? This implies that issues of ontology and epistemology are matters of personal belief (relativist in our terms) and that the beliefs and values of either the researcher or the research reader should determine the criteria that are applied. Unsurprisingly, the implications of such a stance are not acknowledged or addressed because the political and rhetorical purpose of these "out of scope" exclusions is to legitimize the universality of the framework despite explicit claims that this is not the case.

Other than raising further and ongoing debates, it is the political context and purpose of the report that makes this logical paradox significant. This framework is explicitly and implicitly intended as a means of judging the worth of qualitative research, with clear and obvious implications for the allocation of scarce research resources—both the cultural capital of esteem and recognition and the economic capital of future research contract success. In effect,

through this report, the government was striving once more to establish universal criteria for the control of social and educational research that the NERF set as its early goal before backing off in response to charges that it was curtailing academic freedom. The detailed and complex articulation of a wide range of literature, the tone of self-evident reasonableness, and the arguments that are advanced to demonstrate the credibility and applicability of this framework will nullify any such simplistic response this time around. If a few of us are foolish enough to adopt one of the extreme positions that are "out of scope," we are free to do so, and the framework acknowledges our existence outside its frame. Of course, those of us who do so should not expect either funding or esteem to follow. If this framework infiltrates indirect forms of U.K. government research funding, such as the award of ESRC research contracts or the evaluation of outputs used in the Research Assessment Exercise, political control over research will become nearly universal.

Taken collectively, these initiatives amount to a deliberate and powerful U.K. government intervention into the conduct and nature of educational research, ostensibly to improve its quality and make it more relevant to policymakers and policy implementers. As these initiatives changed the educational research map of the United Kingdom, researchers themselves became engaged in a high-stakes political process. Some celebrated the new climate and worked hard to reinforce and strengthen it while no doubt looking for opportunities to further their own work and careers. Others worked to oppose and resist the changes, trying to preserve spaces for alternative research approaches, including the sorts of work that they wanted to do. Still others worked to play the new regime by describing research in ways that might attract TLRP funding but without subscribing to its original hardline philosophy.

■ INTERESTING TIMES

We close with two comments about the increasingly evident political nature of research and

criteria. First, we have argued that the major macropolitical interventions of both the U.S. and U.K. governments into social and educational research are framed around softer or harder versions of empiricism and neorealism. This link, of course, is not coincidental. There are strong relations between governments' desires to predict and control complex social and economic processes and the well-known role that prediction and control of phenomena and processes plays within empiricism. Put differently, current approaches are dominated by what Habermas (1972) termed "technical interests" and are also part of the much wider social and political growth of an audit society (Power, 1997) or an audit culture (Strathern, 1997, 2000). The audit culture is dominated by attempts to measure the success and value of everything. Thus, in both the United States and the United Kingdom, education establishments are increasingly judged comparatively against measures such as the retention of students, the proportions of students who complete the courses, the levels of eventual qualification that students attain, and standardized test scores. In this context, it is hardly surprising that there are strong government pressures for similar measured and supposedly objective performance criteria for research. It is this audit culture, and its nearly universal assumptions of measured value, that lies behind Shavelson and Towne's (2002) report in the United States and the Cabinet Office's report (Spencer et al., 2003) in the United Kingdom. In this audit climate, the view that research judgment is a matter of embodied interpretation, and that lists of criteria are fluid and changing, is alien self-indulgence at best.

As Habermas (1972) argued, this link among empiricism, positivism, and government interests is more than just technical. Such technical approaches deflect attention away from deeper issues of value and purpose. They make radical critiques much more difficult to mount and, as we have seen, render largely invisible partisan approaches to research under the politically useful pretence that judgments are about objective

quality only. As Bourdieu (1998) wrote, empiricism and positivism are tools of the powerful:

The dominants, technocrats, and epistocrats of the right or the left are hand in glove with reason and the universal: one makes one's way through universes in which more and more technical, rational justifications will be necessary in order to dominate and in which the dominated can and must also use reason to defend themselves against domination, because the dominants must increasingly invoke reason, and science, to exert their domination. (p. 90)

Second, we think that governmental intervention into the politics of criteria is an announcement that the "culture wars" have come to educational and social research. Since the 1960s, more strongly in the United States and less so in the United Kingdom, there have been ongoing battles over the shape of our societies and cultures. These disputes over issues have ranged from abortion, to gay/lesbian marriages, to the content of history and sociology and other courses in our schools, to the content of television shows. It seems that it was only a matter of time until these types of divisions would become a prominent part of our judgments about acceptable versus unacceptable social and educational research. And just as the social discourse has become more strident, so might the discussions of research quality in the future. Of course, we can only wait and see.

For us, the conclusion to all of this is very clear. There is no point in pretending that power and politics, at both the micro level and the macro level, are not a part of the process by which we make judgments about the quality of research. We live in the era of relativism, and there can be no time- and place-independent criteria for judgment—that is, criteria that are "untainted" by our various opinions, ideologies, emotions, and self-interests. Power and politics are with us, and the only issues are how power is used and how the political process is played out. And of course, the answers will not be found in epistemology; instead, they will be found in our reasoning as finite practical and moral beings.

EMANCIPATORY DISCOURSES AND THE ETHICS AND POLITICS OF INTERPRETATION

Norman K. Denzin

From the vantage point of the colonized, a position from which I write, and choose to privilege, the term "research" is inextricably linked to European imperialism and colonialism. The word itself, "research," is probably one of the dirtiest words in the indigenous world's vocabulary. (Smith, 1999, p. 1)

A story grows from the inside out and the inside of Navajoland is something I know little of. But I do know myself if I begin traveling with an awareness of my own ignorance, trusting my instincts, I can look for my own stories embedded in the landscapes I travel through. . . .

I am not suggesting we emulate Native Peoples—in this case, the Navajo. We can't. We are not Navajo. Besides their traditional stories don't work for us. It's like drinking another man's medicine. Their stories hold meaning for us only as examples. They can teach us what is possible. We must create and find our own stories, our own myths. (Williams, 1984, pp. 3, 5)

This chapter, in the form of a manifesto, invites indigenous and nonindigenous qualitative researchers to think through the implications of a practical, progressive politics of performative inquiry, an emancipatory discourse connecting indigenous epistemologies (Rains, Archibald, &

Deyhle, 2000, p. 338) and theories of decolonization and the postcolonial (Soto, 2004, p. ix; Swadener & Mutua, 2004, p. 255) with critical pedagogy, with new ways of reading, writing, and performing culture in the first decade of a new century (Kincheloe & McLaren, 2000, p. 285).¹ I believe the performance-based human disciplines can contribute to radical social change, to economic justice, to a utopian cultural politics that extends localized critical (race) theory and the principles of a radical democracy to all aspects of decolonizing, indigenous societies (Giroux, 2000a, pp. x, 25; Kaomea, 2004, p. 31; L. T. Smith, 2000, p. 228; Swadener & Mutua, 2004, p. 257).

I advocate change that "envision[s] a democracy founded in a social justice that is 'not yet'" (Weems, 2002, p. 3). I believe that nonindigenous interpretive scholars should be part of this project (see Denzin, 2004a, 2004b, in press). How this endeavor is implemented in specific indigenous contexts should be determined by the indigenous peoples involved. I also believe that this initiative should be part of a larger conversation—namely, the global decolonizing discourse connected to the works of anticolonialist scholars, including

those of First Nations, Native American, Alaskan, Australian Aboriginal, New Zealand Maori, and Native Hawaiian heritage (see in this volume Smith, Chapter 4; Bishop, Chapter 5; see also Mutua & Swadener, 2004; Smith, 1999).²

A postcolonial, indigenous participatory theater is central to this discourse (Balme & Carstensen, 2001; Greenwood, 2001).³ Contemporary indigenous playwrights and performers revisit and make a mockery of 19th-century racist practices. They interrogate and turn the tables on blackface minstrelsy and the global colonial theater that reproduced racist politics through specific cross-race and cross-gender performances. The show how these performances used whiteface and blackface in the construction of colonial models of whiteness, blackness, gender, and national identity (Kondo, 2000, p. 83; Gilbert, 2003).

Indigenous theater nurtures a critical transnational yet historically specific critical race consciousness. It uses indigenous performance as means of political representation (Magowan, 2000, p. 311). Through the reflexive use of historical restagings, masquerade, ventriloquism, and doubly inverted performances involving male and female impersonators, this subversive theater undermines colonial racial representations (Bean, 2001, pp. 187–188). It incorporates traditional indigenous and nonindigenous cultural texts into frameworks that disrupt colonial models of race relations. This theater takes up key diasporic concerns, including those of memory, cultural loss, disorientation, violence, and exploitation (Balme & Carstensen, 2001, p. 45). This is a utopian theater that addresses issues of equity, healing, and social justice.⁴

Consider the following:

- In her play *House Arrest* (2003), Anna Deavere Smith offers “an epic view of slavery, sexual misconduct, and the American presidency. Twelve actors, some in blackface, play across lines of race, age and gender to ‘become’ Bill Clinton, Thomas Jefferson, Sally Hemings . . . and a vast

array of historical and contemporary figures” (Kondo, 2000, p. 81).

- In Native Canadian Daniel David Moses’s play *Almighty Voice and His Wife* (1992), Native performers, wearing whiteface minstrel masks, mock such historical figures as Wild Bill Cody, Sitting Bull, and young Indian maidens called Sweet Sioux (Gilbert, 2003, p. 692).
- In Sydney, Australia, Aboriginal theater groups perform statements of their indigenous rights, demanding that politicians participate in these performance events “as co-producers of meaning rather than as tacit consumers” (Magowan, 2000, pp. 317–318).

Thus do indigenous performances function as strategies of critique and empowerment.

The “Decade of the World’s Indigenous Peoples” (1994–2004; Henderson, 2000, p. 168) has ended. Nonindigenous scholars have yet to learn from it, to learn that it is time to dismantle, deconstruct, and decolonize Western epistemologies from within, to learn that research does not have to be a dirty word, to learn that research is always already both moral and political.

Shaped by the sociological imagination (Mills, 1959), building on George Herbert Mead’s (1938) discursive, performative model of the act, critical qualitative research imagines and explores the multiple ways in which performance can be understood, including as imitation, or *mimesis*; as construction, or *poiesis*; and as motion or movement, or *kinesis* (Conquergood, 1998, p. 31). The researcher-as-performer moves from a view of performance as imitation, or dramaturgical staging (Goffman, 1959), to an emphasis on performance as liminality and construction (McLaren, 1999), then to a view of performance as struggle, as intervention, as breaking and remaking, as kinesis, as a sociopolitical act (Conquergood, 1998, p. 32).

Viewed as struggles and interventions, performances and performance events become transgressive achievements, political accomplishments that break through “sedimented meanings and normative traditions” (Conquergood, 1998, p. 32).

It is this performative model of emancipatory decolonized indigenous research that I develop here (Garoian, 1999; Gilbert, 2003; Kondo, 2000; Madison, 1999). Drawing on Garoian (1999), Du Bois (1926), Gilbert (2003), Madison (1998), Magowan (2000), and Smith (2003), this model enacts a utopian performative politics of resistance (see below). Extending indigenous initiatives, this model is committed to a form of revolutionary political theater that performs pedagogies of dissent for the new millennium (McLaren, 1997b).

My argument in this chapter unfolds in several parts. Drawing throughout from an ongoing performance text, I begin with a set of obstacles that confront the nonindigenous critical theorist. I then briefly discuss race, the call to performance, and the history of indigenous theater. I next address a group of concepts and the arguments associated with them; these include the concepts of indigenous epistemology, pedagogy, discourses of resistance, politics as performance, and counter-narratives as critical inquiry. I briefly discuss a variety of indigenous pedagogies as well as the concept of indigenous research as localized critical theory. I elaborate variations within the personal narrative approach to decolonized inquiry, extending Richardson's (2000) model of "creative analytic practices," or CAP ethnography (p. 929). Then, after outlining a politics of resistance, I conclude the chapter with a discussion of indigenous models of power, truth, ethics, and social justice.

In the spirit of Du Bois, Dewey, Mead, Blumer, hooks, and West, I intend to create a dialogue between indigenous and nonindigenous members of the qualitative research community. I want to move our discourse more fully into the spaces of a global yet localized progressive, performative pragmatism. I want to extend those political impulses within the feminist pragmatist tradition that imagine a radical, democratic utopia. Following Du Bois, hooks, and West, I see these impulses as constantly interrogating the relevance of pragmatism and critical theory for race

relations and inequality in the global neoliberal capitalist state.

■ OBSTACLES CONFRONTING THE NONINDIGENOUS CRITICAL THEORIST

In proposing a conversation between indigenous and nonindigenous scholars, I am mindful of several difficulties. First, scholars must resist the legacy of the Western colonizing other. As Smith (1999) observes of the Western colonizers, "They came, they saw, they named, they claimed" (p. 80). As agents of colonial power, Western scientists discovered, extracted, appropriated, commodified, and distributed knowledge about the indigenous other. Many indigenous critics contend that these practices have placed control over research in the hands of Western scholars. This means, for example, that Māori are excluded from discussions concerning who has control over the initiation of research about Maori, the methodologies used, the evaluations and assessments made, the resulting representations, and the distribution of the newly defined knowledge (see Bishop, Chapter 5, this volume). The decolonization project challenges research practices that perpetuate Western power by misrepresenting and essentializing indigenous persons, often denying them voice or identity.

A second difficulty is that critical, interpretive performance theory and critical race theory will not work within indigenous settings without modification. The criticisms of Graham Smith (2000), Linda Tuhiwai Smith (1999, 2000), Bishop (1994, 1998), Battiste (2000a, 2000b), Churchill (1996), Cook-Lynn (1998), and others make this very clear. Critical theory's criteria for self-determination and empowerment perpetuate neocolonial sentiments while turning the indigenous person into an essentialized "other" who is spoken for (Bishop, Chapter 5, this volume). The categories of race, gender, and racialized identities cannot be turned into frozen, essential terms, nor is racial identity a free-floating signifier (Grande, 2000, p. 348). Critical theory must be localized, grounded in the specific meanings,

traditions, customs, and community relations that operate in each indigenous setting. Localized critical theory can work if the goals of critique, resistance, struggle, and emancipation are not treated as if they have “universal characteristics that are independent of history, context, and agency” (L. T. Smith, 2000, p. 229).

A third difficulty lies in the pressing need for scholars to decolonize and deconstruct those structures within the Western academy that privilege Western knowledge systems and their epistemologies (Mutua & Swadener, 2004, p. 10; Semali & Kincheloe, 1999). Indigenous knowledge systems are too frequently made into objects of study, treated as if they were instances of quaint folk theory held by the members of primitive cultures. The decolonizing project reverses this equation, making Western systems of knowledge the object of inquiry.

A fourth difficulty is that the nonindigenous scholar must carefully and cautiously articulate the spaces between decolonizing research practices and indigenous communities (to paraphrase Smith's comments in Chapter 4, this volume). These spaces are fraught with uncertainty. Neoliberal and neoconservative political economies turn knowledge about indigenous peoples into a commodity. Conflicts exist between competing epistemological and ethical frameworks, including in the area of institutional regulations concerning human subject research. Currently, research is regulated by positivist epistemologies. Indigenous scholars and intellectuals are pressed to produce technical knowledge that conforms to Western standards of truth and validity. Conflicts over who initiates and who benefits from such research are especially problematic. Scholars must develop culturally responsive research practices that locate power within indigenous communities, so that these communities determine and define what constitutes acceptable research. Such work encourages self-determination and empowerment (see Bishop, Chapter 5, this volume).

In arguing for a dialogue between critical and indigenous theorists, I must acknowledge my position as an outsider to the indigenous colonized

experience. I write as a privileged Westerner. At the same time, however, I seek to be an “allied other” (Kaomea, 2004, p. 32; Mutua & Swadener, 2004, p. 4), a fellow traveler of sorts, an antipositivist, an insider who wishes to deconstruct the Western academy and its positivist epistemologies from within. I endorse a critical epistemology that contests notions of objectivity and neutrality. I believe that all inquiry is moral and political. I value autoethnographic, insider, participatory, collaborative methodologies (Fine et al., 2003). These are narrative, performative methodologies, research practices that are reflexively consequential, ethical, critical, respectful, and humble. These practices require that scholars live with the consequences of their research actions (Smith, 1999, pp. 137–139).

In proposing a dialogue between indigenous and nonindigenous qualitative researchers, in positioning myself as an “allied other,” I am mindful of Terry Tempest Williams's cautious advice about borrowing stories and narratives from indigenous peoples. In her autoethnography *Pieces of White Shell: A Journey to Navajoland* (1984), she praises the wisdom of Navajo storytellers and the stories they tell (pp. 3–4). But she also warns her nonindigenous readers: We cannot emulate native peoples. “We are not Navajo . . . their traditional stories don't work for us. . . . Their stories hold meaning for us only as examples. They can teach us what is possible. We must create and find our own stories” (p. 5).

As a nonindigenous scholar seeking a dialogue with indigenous scholars, I must construct stories that are embedded in the landscapes I travel through. These will be dialogical counternarratives, stories of resistance, of struggle, of hope, stories that create spaces for multicultural conversations, stories embedded in the critical democratic imagination. I briefly sample below from *Searching for Yellowstone* (Denzin, in press), a work in progress.

Searching for Yellowstone consists of a series of copformance texts and plays, each with multiple speaking parts. Drawing on verbatim theater, I quote from interviews, letters, books, and other documents written by historical and contemporary figures; in some cases, I present material that was originally written as prose in the format of poetry. "Indians in the Park" (excerpted below) is a four-act play of sorts. It can be performed on a simple set, around a seminar table, or on a stage in front of an audience. Overhead, a series of images should be projected on a full-size screen. To one side, a large roving spotlight, the "Camera Eye," should stand, with its light moving from speaker to speaker, returning always to the narrator.⁵ More than 35 individuals speak or are quoted, some more than once. Audience members are asked to participate in the performance by assuming speaking parts.

■ ■ ■

■ PROLOGUE

"Indians in the Park" (Denzin, 2004a) enacts a critical cultural politics concerning the representations of Native Americans and their historical presence in Yellowstone National Park. Beginning with the sting of childhood memory (Ulmer, 1989, pp. 209, 211), I follow Ulmer's (1989) and Benjamin's (1983–1984, p. 24) advice concerning history; that is, to write history means to quote history, and to quote history means to rip the historical object out of its context. In so doing, I expose the contradictions, cracks, and seams in official ideology. The intent is to rediscover the past as a series of scenes, inventions, emotions, images, and stories (Benjamin, 1969, p. 257; Ulmer, 1989, p. 112). In bringing the past into the autobiographical present, I insert myself into the past and create the conditions for rewriting and hence reexperiencing it.

The history at hand is the history of Native Americans in two cultural and symbolic landscapes, mid-central Iowa in the 1940s and 1950s and Yellowstone National Park in the 1870s. I read Yellowstone, America's first national park,

metaphorically. In and across the discourses that historically define the park are deeply entrenched meanings concerning nature, culture, violence, gender, wilderness, parks, whites, and Native Americans (see Schullery, 1997).

I situate these voices and discourses in my own biography. The place of Native Americans in the collective white imagination is almost entirely a matter of racist myth, shifting meanings of the color line, the "Veil of Color" (Du Bois, 1903/1989, pp. xxxi, 2–3), theatricality, and minstrelsy (Spindel, 2000).

■ ■ ■

For example:

Author's Aside to Audience:

As a child I lived inside this white imaginary. I played a dress-up game called "cowboys and Indians." I watched *Red Rider* and *Little Beaver* and *The Lone Ranger* on Saturday-morning television. On Saturday nights my grandfather took me to see western movies—*Shane*, *Stagecoach*, *Broken Arrow*, *The Searchers*—at the Strand Theater in Iowa City, Iowa. (see Denzin, 2003, p. 175)

■ ■ ■

In challenging the cultural representations of Native Americans, I follow Hall (1996a) and Smith (1997), who argue that it is not enough to replace negative representations with positive representations.⁶ The positive-negative debate essentializes racial identity and denies its "dynamic relation to constructions of class, gender, sexuality [and] region" (Smith, 1997, p. 4). It takes two parties to do racial minstrelsy. Stereotypes of whiteness are tangled up in racial myth, in minstrel shows that replay the Wild West, leading whites to look like cowboys and Native Americans to look like Indians (Dorst, 1999). I employ this critical race theory and critical pedagogy to confront Yellowstone National Park and its histories.

Here are some excerpts from "Indians in the Park":

■ ■ ■

Second Author's Aside to Audience:

I wanted to be a cowboy when I grew up. So did Mark, my brother. On Saturday mornings, while Grandma made hot doughnuts for us in the new deep-fat fryer in her big country kitchen, we watched "cowboy and Indian" television shows: *The Lone Ranger*, *Red Rider* and *Little Beaver*, *The Roy Rogers Show*, *Hopalong Cassidy*. Mark and I had cowboy outfits—wide-brimmed hats, leather vests, chaps, and spurs, along with toy pistols and holsters. Grandpa bought us a horse. I have a photograph of Mark and me in our cowboy outfits on the back of swaybacked Sonny, who was deaf in his right ear. We'd ride Sonny around and around the corral, waving at Grandpa and Grandma. When I was in fourth grade, I was Squanto in the Thanksgiving play about the pilgrims. My skin was painted brown.

■ ACT I

Scene 1: Sacagawea and Other Myths

Newsreel 1

Voice 1: Horton:

Keeping the Legacy Alive

Two hundred years ago the Corps of Discovery, led by captains Meriwether Lewis and William Clark, struck out from the Falls of Ohio, near Louisville, Kentucky, to explore the newly acquired territory of the Louisiana Purchase. Their 8,000 mile trek took them through perilous, forbidding country by canoe, horseback, and foot. Lewis, the party's scientist, and Clark, its surveyor, mapped geological features and fixed the longitudes and latitudes of the rivers and plains. Lewis described or preserved specimens of some 178 plants and 122 animals—the majority as-yet unknown to science. . . .

None of this, of course,
would have been possible
without the aid and assistance
of the Native Americans they met
[nearly 50 tribes in all]
along the way.

Their Shoshone guide,

Sacagawea, a 15-year-old girl,

proved indispensable. (Horton, 2003, p. 90)

■ ■ ■

Voice 2: Skeptic: This is revisionist white history!

■ ■ ■

Voice 3: Slaughter:
Sacagawea is elusive,
Ective,
mythic
and real.

She is the Indian princess
required by myths
of discovery and conquest.
(Slaughter, 2003, p. 86)

■ ■ ■

Voice 4: Spindel:

If we do a census of the population in
our collective imagination,
Imaginary Indians are one of the
largest demographic groups.

They dance, they drum; they go on
the warpath;

they are always young men who wear
trailing feather bonnets.

Symbolic servants, they serve as
mascots,

metaphors. We rely on these images
to anchor us

to the land and verify our account of
our own past. But these Indians exist
only

in our imaginations. (Spindel, 2000,
p. 8)

■ ■ ■

Scene 2: Park Performances

The Camera Eye (2)

Narrator: Staged performances based on lore and myth from Hollywood westerns and Wild West shows represent and connect Indians with war bonnets, horses, western landscapes, parks, wilderness, tourism, nature, and danger (see Spindel, 2000, p. 8). These representations simultaneously place Native Americans within and outside white culture, hence the phrase "Indians in the park." Parks are safe places, sites carved out of the wilderness, and other spaces where whites go to view and experience nature and the natural world. Indians are not part of this cultural landscape. The "natural world" they inhabit is outside the park. It is a wild, violent, and uncivilized world.

■ ■ ■

"Remembering to Forget" is a second coperformance text. It continues my interrogation of the cultural politics surrounding the Lewis and Clark expedition of 1804–1806. It is also fractured, revisionist, personal history, an attempt at a personal mythology that contests the rhetorical uses of nature, discovery, and science for political, patriotic purposes. This play is woven in, through, and around memories of blankets, families, Native Americans, illness, and Lewis and Clark in the greater Yellowstone region. The following excerpt is from Act 1, Scenes 1 and 2.

■ ACT 1

Scene 1: Getting Started

Course Announcement, Yellowstone Association Institute, Summer 2003

"Along the Yellowstone River with Lewis & Clark"

July 25–27, Limit 19

Location: Mammoth Hot Springs/Three Forks, and Dillon, Montana; *Credit Pending;* *Instructor:* Jim Garry, M.S.

\$180 (member's fee \$170)

In the summer of 1805, Lewis and Clark passed through the Yellowstone region en route to the Pacific Ocean. They came up the Missouri River from the Great Falls and camped in the Three Forks area before following the Jefferson River west to the headwaters of the Missouri system at Lemhi Pass.

Almost 200 years later, we will walk in their footsteps, see what they saw, read their journals, and speculate on what they would think of this country today. We'll journey to Three Forks and from there to Dillon and Lemhi Pass where we will look at some of the impacts on the country since the days of Lewis and Clark.

(pause)

It was something like the Lewis and Clark [traveling] Medicine Show. (Ronda, 1984, p. 18; see also Ambrose, 1996, p. 157)

(pause)

But the park did not exist in 1805. What kind of history is this?

(pause)

Our image of [history] is indissolubly bound up with the image of redemption. (Benjamin, 1969, p. 256)

Scene 2: Canadian Blankets

Voice 2: **Narrator (to audience, explaining project):** On July 5, 1955, my father returned to our little house on Third Street in Indianola, Iowa, from a fishing trip in Ontario, Canada. Mother

greeted him at the door. Slightly drunk, Dad handed her a Hudson's Bay wool blanket as a present and promptly left for the office. I still have that blanket. In this family we value such blankets and exchange them as gifts. This exchange system gives me a somewhat indirect historical connection to Lewis and Clark, Canada, Hudson's Bay Company blankets, the fur trade, 19th-century British and French traders, and Native Americans. This connection takes me right into the myths about Yellowstone Park, Lewis and Clark, the Corps of Discovery, and Sacagawea. Lewis and Clark, it appears, also traded blankets for goodwill on their expedition. But this was a tainted exchange, for in many instances these blankets were carriers of smallpox. Likewise, the blanket my father gave to my mother was embedded within a disease exchange system, in this case alcoholism. Although Dad's alcoholism was not full-blown in 1955, it would become so within 2 years of his return from that fishing trip.

Read together, the above excerpts model a form of writing that moves back and forth between personal and official history. Using the language of the colonizer, they quote history back to itself, refusing to treat Lewis and Clark and the past as if they are things that can be fixed in time, as performances that can be unproblematically staged in the present. Indeed, the historical reenactment of Lewis and Clark's expedition is endowed with special powers. It stands outside time. Performers benevolently re-create the past, performing and remembering it "the way it really was" (Benjamin, 1969, p. 257).

There is great danger in such historical masquerades. The past is frozen in time. Particular versions of whiteness and white history are

performed. The sins of the past are ignored, and a peaceful bond is forged between the imagined past and the present. In this nostalgic space, the benign pastness of Lewis and Clark's expedition comes alive. Their historic journey of conquest is celebrated. A territorial and cultural politic is signified. The white community owns this land, this river, this park, this place, these meanings. The white community and its city fathers have the right to re-create on this land, and in these cultural spaces, their version of the past, their version of how these two men helped win the West for Thomas Jefferson and White America (Williams, 1997). In such a utopian scenario, redemption for the handful of sins committed by the explorers is sought and easily achieved (see Grossman, 2003, pp. 2–5). Indeed, redemption gives way to celebration, to a displacement, a shift from conquest to ecoenvironmentalism, to nature, the joy of floating the Yellowstone or the Missouri River under the banner of Lewis and Clark.

■ RACE, INDIGENOUS OTHERS, AND THE CALL TO PERFORMANCE

Many qualitative researchers and interpretive ethnographers are in the seventh moment, performing culture as they write it, understanding that the dividing line between performativity (doing) and performance (done) has disappeared (Conquergood, 1998, p. 25). But even as this disappearance occurs, matters of racial injustice remain. The indigenous other is a racialized other.

On this W. E. B. Du Bois (1901/1978), reminds us that "the problem of the twenty-first century, on a global scale, will be the problem of the color line" (p. 281) and that "modern democracy cannot succeed unless peoples of different races and religions are also integrated into the democratic whole" (p. 288). This integration cannot be imposed by one culture or nation on another; it must come from within the cultures involved.

Du Bois addressed race from a performance standpoint. He understood that "from the arrival of the first African slaves on American soil . . . the definitions and meanings of blackness have been intricately linked to issues of theater and performance"

(Elam, 2001, p. 4).⁷ In his manifesto for an all-black, indigenous theater, Du Bois (1926) imagined a site for pedagogical performances that articulate positive black "social and cultural agency" (Elam, 2001, p. 6). His radical theater (Du Bois, 1926, p. 134), like that of Anna Deavere Smith (2003), is a political theater about blacks, written by blacks, for blacks, performed by blacks in local theaters. Radical indigenous theater is a weapon for fighting racism and white privilege. Gilbert (2003) elaborates on this topic, showing how indigenous whiteface performances unsettle fixed racial categories based on skin color: "Such acts . . . remind us of the historical role played by theatre in negotiating suppressed fears and fantasies of colonizing nations" (p. 680).

A Brief History of Indigenous Theater

Lhamon (1998) traces the origins of blackface minstrelsy in the United States to the early 1800s and marketplace transactions in New York City. By the 1840s, white performers in blackface were using blackness as a way to represent the color of nonwhite persons, including African Americans, Asian Americans, and Native Americans (Bean, 2001, p. 173). According to Bean (2001), the "first black minstrels . . . existed as early as 1850" (p. 177), and within a short time African American male and female impersonators were engaged in satiric, subversive performances that were critical of white stereotypes of blacks (p. 187). Ellison (1964) observes that such black performers were tricksters, playing a joke on the white audience, laughing at the audience among themselves, understanding that blackface was a "counterfeiting of the black American's identity" (p. 53). Thus by the mid-19th century a subversive theater was born within the racist institution of minstrelsy.

Gilbert (2003) describes blackface minstrelsy as the "symptomatic nineteenth-century stage form for an era of territorial expansion, not just in the United States but also in other settler colonies with growing non-indigenous populations" (p. 683). From the 1850s forward, minstrelsy had a transnational presence in the performances of touring groups that performed in Australia, New Zealand, Canada, the United States, Britain,

Germany, France, Italy, India, Jamaica, Nigeria, and South Africa. The American minstrel show traveled to the popular stage in the Canadian West, where its subject matter included narratives about runaway slaves and Native Canadians (Gilbert, 2003, p. 683). When William Cody's Wild West show toured Europe, it offered audiences a Far East section called the "Dream of the Orient" (Reddin, 1999, p. 158). In every geographic location where the minstrel show appeared, it validated racism and imperialism.

At the same time, indigenous performance companies were contributing to a counterdiscourse that embodied the critical race consciousness identified by Ellison (1964). Indians playing Indians for whites and blacks playing blacks for whites were engaged in reflexive, doubly inverted performances that mocked and ridiculed white racist stereotypes. In this way, indigenous theater criticizes the racial masquerade behind blackface. In such performances the performativity of race is revealed. The indigenous performer in whiteface (or blackface) peels back, as in penitence, the colors and shades of whiteness, showing that "white is a color that exists only because some of us get told we're black or yellow or Indians" (Gilbert, 2003, p. 689).

Using a ventriloquized discourse, the whiteface performer forces spectators to confront themselves "mirrored/parodied in the whiteface minstrel mask" (Gilbert, 2003, p. 693). Native Canadian whiteface performers in Daniel David Moses's play *Almighty Voice and His Wife* (1992) deploy ventriloquism to turn the tables on whites. In the stand-up section of the play, just before the finale, the Interlocutor, dressed in top hat and tails along with white gloves and studded white boots taunts the audience:

You're that redskin! You're that wagon burner! That feather head, Chief Bullshit. No, Chief Shitting Bull! Oh, no, no. Bloodthirsty savage. Yes, you're primitive, uncivilized, a cantankerous cannibal. Unruly redman, you lack human intelligence! Stupidly stoic, sick, demented, foaming at the maws! Weirdly mad and dangerous, alcoholic, diseased, dirty, filthy, stinking, ill fated degenerate race, vanishing, dying lazy, mortifying. (pp. 94–95; quoted in Gilbert, 2003, p. 693)

Through double coding, race and gender exchanges, and the deployment of minstrel tropes, Moses has Indians criticizing Indians playing Indians. In this way, Gilbert (2003) observes, Moses "critiques hegemonically defined Indian stereotypes" (p. 692) even as he reflexively stages a grotesque spectacle of "Native performers enacting their own objectification" (p. 693).

Such performances function as genealogies. As Gilbert (2003) notes, they document the "historical dissemination of particular performance practices across space and time" (p. 696). By manipulating the tropes of minstrelsy, indigenous performers use whiteface and blackface to critique specific colonial practices. Thus Aboriginal Australians in whiteface performances protest the colonial habit of poisoning Aborigines with flour, just as Moses uses Indians in whiteface in his reenactment of the massacre at Wounded Knee (Gilbert, 2003, p. 696). In these ways, Gilbert argues, whiteface "is continually subjected to processes of citation and appropriation that triangulate white, black, and indigenous performance traditions in complex ways" (p. 696). Indigenous theater thus exposes whiteness in its ordinary and extreme forms. Made visible as a repressive sign of violent racial domination, whiteness "is forced to show its colors" (p. 698).

Some African American authors, such as bell hooks, have elaborated the need for a black political performance aesthetic. Writing about her childhood, hooks (1990) has described how she and her sisters learned about race in America by watching

the Ed Sullivan show on Sunday nights. . . . seeing on that show the great Louis Armstrong, Daddy, who was usually silent, would talk about the music, the way Armstrong was being treated, and the political implications of his appearance. . . . responding to televised cultural production, black people could express rage about racism. . . . unfortunately . . . black folks were not engaged in writing a body of critical cultural analysis. (pp. 3–4)

■ INDIGENOUS VOICES, CRITICAL PEDAGOGY, AND EPISTEMOLOGIES OF RESISTANCE

Several scholars, such as Sandoval (2000), Collins (1998), Mutua and Swadener (2004), and Bishop (Chapter 5, this volume), have observed that we are in the midst of what Lopez (1998) calls "a large-scale social movement of anticolonialist discourse" (p. 226). This movement is evident in the emergence and proliferation of indigenous epistemologies and methodologies (Sandoval, 2000), including the arguments of African American, Chicana/o, Latina/o, Native American, First Nations, Native Hawaiian, and Māori scholars. These epistemologies are forms of critical pedagogy; that is, they embody a critical politics of representation that is embedded in the rituals of indigenous communities. Always already political, they are relentlessly critical of transnational capitalism and its destructive presence in the indigenous world (see Kincheloe & McLaren, 2000).

Epistemologies of Resistance

Indigenous pedagogies are grounded in an oppositional consciousness that resists "neocolonizing postmodern global formations" (Sandoval, 2000, pp. 1–2). These pedagogies fold theory, epistemology, methodology, and praxis into strategies of resistance that are unique to each indigenous community. Thus the oppositional consciousness of Kaupapa Māori research is both like and unlike black feminist epistemology (Collins, 1991, 1998), Chicana feminisms (Anzaldúa, 1987; Moraga, 1993), "red pedagogy" (Grande, 2000; Harjo & Bird, 1997), and Hawaiian epistemology (Meyer, 2003). Common to all is a commitment to indigenism, to an indigenist outlook, that assigns the highest priority to the rights of indigenous peoples, to the traditions, bodies of knowledge, and values that have "evolved over many thousands of years by native peoples the world over" (Churchill, 1996, p. 509).

Indigenist pedagogies are informed, in varying and contested ways, by decolonizing, revolutionary,

and socialist feminisms. Such feminisms, in turn, address issues of social justice, equal rights, and nationalisms of "every racial, ethnic, gender, sex, class, religion, or loyalist type" (Sandóval, 2000, p. 7). Underlying each indigenist formation is a commitment to moral praxis, to issues of self-determination, empowerment, healing, love, community solidarity, respect for the earth, and respect for elders.

Indigenists resist the positivist and postpositivist methodologies of Western science because nonindigenous scholars too frequently use these formations to validate colonizing knowledge about indigenous peoples. Indigenists deploy, instead, interpretive strategies and skills that fit the needs, languages, and traditions of their respective indigenous communities. These strategies emphasize personal performance narratives and *testimonios*.

A Māori Pedagogy

Māori scholar Russell Bishop (1994, 1998) presents a collaborative, participatory epistemological model of Kaupapa Māori research, which is characterized by the absence of a need to be in control and by a desire to be connected to and part of a moral community in which a primary goal is the compassionate understanding of another's moral position (see also Bishop, Chapter 5, this volume; Heshusius, 1994). The Māori indigenist researcher wants to participate in a collaborative, altruistic relationship in which, as Bishop (1998) puts it, nothing "is desired for the self" (p. 207). The research is evaluated against participant-driven criteria based in the cultural values and practices that circulate in Maori culture, including metaphors that stress self-determination, the sacredness of relationships, embodied understanding, and the priority of community over self. Researchers are led to develop new storylines and criteria of evaluation that reflect these understandings. These participant-driven criteria function as resources for resistance against positivist and neoconservative desires to "establish and maintain control of the criteria for evaluating Māori experience" (p. 212).

Sandóval (2000) observes that indigenists enact an ethically democratizing stance that is committed to "equalizing power differentials between humans" (p. 114). The goal "is to consolidate and extend . . . manifestos of liberation in order to better identify and specify a mode of emancipation that is effective within first world decolonizing global conditions during the twenty-first century" (p. 2).

Treaties as Pedagogy

Indigenist pedagogies confront and work through government treaties, ideological formations, historical documents, and broken promises that connect indigenist groups and their fates to the capitalist colonizers. For example, as Churchill (1996) notes, during the "first 90-odd years of its existence the United States entered into and ratified more than 370 separate treaties . . . [and] has . . . defaulted on its responsibilities under every single treaty obligation it ever incurred with regard to Indians" (pp. 516–517; see also Stirling, 1965). The aboriginal rights of First Nations tribes in Canada were not recognized in law until the Constitution Act of 1982 (Henderson, 2000, p. 165). In New Zealand, Māori debate the Treaty of Waitangi, which was signed between Māori chiefs and the British Crown in 1840. This treaty was defined as a charter for power sharing between Maori and *pakeha*, or white settlers, but in reality it subjugated Māori to the *pakeha* nation-state (Smith, 1999, p. 57; see also Bishop, Chapter 5, this volume).

Linda Smith (2000) observes that Maori attempts "to engage in the activities of the state through the mechanisms of the Treaty of Waitangi have won some space . . . [but] this space is severely limited . . . as it has had to be wrestled not only from the state, but also from the community of positivist scientists whose regard for Māori is not sympathetic" (p. 232). What is "now referred to as 'Kaupapa Māori research'" (p. 224) is an attempt to find a space and set of practices that honors Maori culture, convinces Māori people of the value of research for Māori, and shows the *pakeha* (white) research community the need for

greater Māori involvement in research. Kaupapa Māori research is culturally safe and relevant, and it involves the mentorship of Māori (p. 228).

A Red Pedagogy

Native American indigenous scholars thicken the argument by articulating a spoken indigenous epistemology “developed over *thousands* of years of *sustained* living on this Land” (Rains et al., 2000, p. 337). An American Indian or “red” pedagogy (Grande, 2000) criticizes simplistic readings of race, ethnicity, and identity. This pedagogy privileges personal identity performance narratives—that is, stories and poetry that emphasize self-determination and indigenous theory (Brayboy, 2000). Grande (2000) describes the four characteristics of a red pedagogy: (a) politically, it maintains “a quest for sovereignty, and the dismantling of global capitalism”; (b) epistemologically, it privileges indigenous knowledge; (c) the earth is its “spiritual center”; (d) socioculturally, it is grounded in “tribal and traditional ways of ways of life” (p. 355). The performance of such rituals validates traditional ways of life. The performance embodies the ritual. It is the ritual. In this sense the performance becomes a form of public pedagogy. It uses the aesthetic to foreground cultural meanings and to teach these meanings to performers and audience members alike.

A Hawaiian Pedagogy

Manulani Aluli Meyer’s (2003) discussion of Hawaiian epistemology complements the above description of a red pedagogy. As Meyer notes, a Hawaiian pedagogy resists colonial systems of knowing and educating; and it fights for an authentic Hawaiian identity (p. 192). It defines epistemology culturally; that is, it asserts that there are specific Hawaiian ways of knowing and being in the world (p. 187). According to Meyer, seven themes shape this epistemology: spirituality, physical space, the cultural nature of the senses, relational knowing, practical knowing, language as being, and the unity of mind and body (p. 193).

This framework stresses the place of morality in knowledge production. Culture restores culture. Culture is sacred. Culture is performed. Spirituality is basic to culture. It is sensuous and embodied, involving all the senses—taste, sight, smell, hearing, and touch. Knowledge is experienced and expressed in sensuous terms, in stories and critical personal narratives that focus on the importance of practice and repetition (p. 185). Knowledge is relational. The self knows itself through the other. Knowing the other and the self locates the person in a relational context. This involves harmony, balance, being generous, being responsible, being a good listener, and being kind.

Decolonizing the Academy

As I have argued above, critical indigenist pedagogies contest the complicity of the modern university with neocolonial forces (Battiste, 2000a). They encourage and empower indigenous peoples to make colonizers confront and be accountable for the traumas of colonization. In rethinking and radically transforming the colonizing encounter, these pedagogies imagine postcolonial societies that honor difference and promote healing. Indigenist pedagogies attempt to rebuild nations and their peoples through the use of restorative indigenous ecologies. These native ecologies celebrate survival, remembering, sharing, gendering, new forms of naming, networking, protecting, and democratizing daily life (Battiste, 2000b; Smith, 1999, pp. 142–162).

Theory, method, and epistemology are aligned in this project, anchored in the moral philosophies that are taken for granted in indigenous cultures and language communities (L. T. Smith, 2000, p. 225). This worldview endorses pedagogies of emancipation and empowerment, pedagogies that encourage struggles for autonomy, cultural well-being, cooperation, and collective responsibility. Such pedagogies demand that indigenous groups own the research process. They speak the truth “to people about the reality of their lives” (Collins, 1998, p. 198), equip them with the tools they need to resist oppression, and move them to struggle, to search for justice (Collins, 1998, pp. 198–199).

Indigenous Research as Localized Critical Theory

In their commitments, indigenous epistemologies overlap with critical theory. Indeed, Linda Smith (2000) connects her version of indigenous inquiry, Kaupapa Māori research, with critical theory and cultural studies, suggesting, with Graham Smith (2000), that Kaupapa Māori research is a "local theoretical position that is the modality through which the emancipatory goal of critical theory, in a specific historical, political and social context is practised" (L. T. Smith, 2000, p. 229; see also Bishop, Chapter 5, this volume). However, critical theory fits well with the Māori worldview, which asserts that Māori are connected to the universe and their place in it through the principle of *whakapapa*. This principle tells Māori that they are the seeds or direct descendants of the heavens. Through this principle, Māori trace their heritage to the very beginning of time (L. T. Smith, 2000, pp. 234–235).

Whakapapa turns the universe into a moral space where all things great and small are interconnected, including science and research. Smith (2000, p. 239) argues that this and related beliefs lead the Māori to ask eight questions about any research project, including those projects guided by critical theory:

1. What research do we want done?
2. Whom is it for?
3. What difference will it make?
4. Who will carry it out?
5. How do we want the research done?
6. How will we know it is worthwhile?
7. Who will own the research?
8. Who will benefit?

These questions are addressed to Māori and non-Māori alike. For research to be acceptable, each question must be answered in the affirmative; that is, Māori must conduct, own, and benefit from any research that is done on or for them.

These eight questions serve to interpret critical theory through a moral lens, through key Māori principles, including *whakapapa*. They shape the moral space that aligns Kaupapa Māori research with critical theory. Thus both formations are situated within the antipositivist debate. Both rest on antifoundational epistemologies. Each privileges performative issues of gender, race, class, equity, and social justice. Each develops its own understandings of community, critique, resistance, struggle, and emancipation (L. T. Smith, 2000, p. 228). Each understands that the outcome of a struggle can never be predicted in advance, that struggle is always local and contingent. It is never final (L. T. Smith, 2000, p. 229).

As Linda Smith (2000) observes, by localizing discourses of resistance, and by connecting these discourses to performance ethnography and critical pedagogy, Kaupapa Māori research enacts what critical theory "actually offers to oppressed, marginalized and silenced groups . . . [that is,] through emancipation groups such as the Māori would take greater control of their own lives and humanity" (p. 229). This requires that indigenous groups "take hold of the project of emancipation and attempt to make it a reality on their own terms" (p. 229). This means that inquiry is always political and moral, grounded in principles centered on autonomy, home, family, and kinship, on a collective community vision that requires that research not be a "purchased product . . . owned by the state" (p. 231).

Localized critical indigenous theory encourages indigenists to confront key challenges connected to the meanings of science, community, and democracy. Graham Smith (2000, pp. 212–215) and Linda Smith (2000) outlines these challenges, asking that indigenists do the following:

1. Be proactive; they should name the world for themselves. (Further, "being Māori is an essential criterion for carrying out Kaupapa Māori research"; L. T. Smith, 2000, pp. 229–230.)
2. Craft their own version of science, including how science and scientific understandings will be used in their world.

3. Develop a participatory model of democracy that goes beyond the "Westminster 'one person, one vote, majority rule'" (G. Smith, 2000, p. 212).
4. Use theory proactively, as an agent of change, but act in ways that are accountable to the indigenous community and not just the academy.
5. Resist new forms of colonization, such as the North American Free Trade Agreement, while contesting neocolonial efforts to commodify indigenous knowledge.

By proactively framing participatory views of science, democracy, and community, indigenous peoples take control of their own fates. They refuse to be sidetracked into always responding to nonindigenous others' attempts to define their life situations (G. Smith, 2000, p. 210).

Pedagogies of Hope and Liberation

Linda Smith (1999, pp. 142–162) outlines some 25 different indigenous projects that have been developed in response to the continuing pressures of colonialism and colonization, including projects that create, name, restore, democratize, reclaim, protect, remember, and celebrate lost histories and cultural practices.⁸ These indigenous projects embody a pedagogy of hope and freedom. They turn the pedagogies of oppression and colonization into pedagogies of liberation. They are not purely utopian, for they map concrete performances that can lead to positive social transformations. They embody ways of resisting the process of colonization.

Smith's moral agenda privileges four interpretive research processes. The first is *decolonization*, which reclaims indigenous cultural practices and reworks these practices at the political, social, spiritual, and psychological levels. *Healing*, the second process, also involves restorative physical, spiritual, psychological, and social practices. The third process, *transformation*, focuses on changes that move back and forth from the psychological level to the social, political, economic, and collective levels. *Mobilization*, at the local, national, regional, and global levels, is the fourth basic process. It speaks to collective efforts to change Māori society.

These four interdependent processes encompass issues of cultural survival and collective self-determination. In every instance they work to decolonize Western methods and forms of inquiry and to empower indigenous peoples. These are the states of "being through which indigenous communities are moving" (Smith, 1999, p. 116). These states involve spiritual and social practices. They are pedagogies of healing and hope, pedagogies of recovery, material practices that benefit indigenous peoples both materially and spiritually.

■ CRITICAL PERSONAL NARRATIVE AS COUNTERNARRATIVE

The move to performance has been accompanied by a shift in the meanings of ethnography and ethnographic writing. As Richardson (2000) observes, the narrative genres connected to ethnographic writing have "been blurred, enlarged, altered to include poetry [and] drama" (p. 929). She uses the term *creative analytic practice* (CAP) to describe these many different reflexive performance narrative forms, which include not only performance autoethnography but also short stories, conversations, fiction, personal narratives, creative nonfiction, photographic essays, personal essays, personal narratives of the self, writing-stories, self-stories, fragmented and layered texts, critical autobiographies, memoirs, personal histories, cultural criticism writings, co-constructed performance narratives, and performance writings that blur the edges between text, representation, and criticism.

Critical personal narratives are counternarratives, testimonies, autoethnographies, performance texts, stories, and accounts that disrupt and disturb discourse by exposing the complexities and contradictions that exist under official history (Mutua & Swadener, 2004). The critical personal narrative is a central genre of contemporary decolonizing writing. As a creative analytic practice, it is used to criticize "prevailing structures and relationships of power and inequity in a relational context" (Mutua & Swadener, 2004, p. 16).

Counternarratives such as those presented in *Guantánamo: "Honor Bound to Defend Freedom,"* "Indians in the Park," and "Remembering to Forget" explore the "intersections of gender and voice, border crossing, dual consciousness, multiple identities, and selfhood in a . . . post-colonial and postmodern world" (Mutua & Swadener, 2004, p. 16). The *testimonio* is another form of counternarrative. One of the purposes of the *testimonio* is to raise political consciousness by bearing witness to social injustices experienced at the group level (Mutua & Swadener, 2004, p. 18). Linda Smith (1999) begins her discussion of the *testimonio* with these lines from Menchú (1984): "My name is Rigoberta Menchú, I am twenty-three years old, and this is my testimony" (p. 1). The *testimonio* presents oral evidence to an audience, often in the form of a monologue. As Smith describes it, the indigenous *testimonio* is "a way of talking about an extremely painful event or series of events." The *testimonio* can be constructed as "a monologue and as a public performance" (p. 144).

Critics have contended that Menchú made up her story; they have concluded that it is not the truth because it cannot be verified through scientific methodology (Cook-Lynn, 2001, p. 203; see also Beverley, 2000). But, as Cook-Lynn (2001, p. 34) observes, respectfully, *testimonio* should be read as remembering and honoring the past, not as factual truthfulness. Further, Cook-Lynn notes, Menchú was appealing to nonindigenous audiences to respect the treaties of the past so that indigenous and nonindigenous peoples might build new and harmonious relationships based on mutual respect and cooperation. Menchú's critics have ignored the ethical tenets and utopian impulses behind her story (pp. 34–35).

The struggle of colonized indigenous peoples to tell their own stories is at stake in criticisms of the *testimonio*. Those who reject these stories because they do not exhibit so-called factual truthfulness are denying indigenous voices their rightful place in this political discourse (Cook-Lynn, 2001, p. 203).

The contemporary neocolonial world stages existential crises grounded in issues of race and gender. Following Turner (1986, p. 34), the

performance ethnographer enters these existential spaces, writing and performing personal narratives that make racial prejudice and oppression visible. Focusing on racial epiphanies, the writer imposes a utopian narrative on the text, imagining how situations of racial conflict and strife could be different. The utopian counternarrative offers hope, showing others how to engage in actions that decolonize, heal, and transform. In this way, critical personal narratives extend Linda Smith's project.

Poet and social activist Mary Weems (2002, p. xx) reads the sign below as she crosses the state line between Indiana and Illinois:

"The People of Illinois Welcome You"

comes right after the LYNCH ROAD sign
and the LYNCH ROAD sign comes right after
I see a thin road strung with the bodies
of black men like burned out lights
their backs twisting in the wind,
the road littered with try out ropes,
gleaned chicken parts, and cloth napkins
soiled wiping the lips of the audience.
I know roads don't hang,
but the welcome sandwiched between
the word like bread
cuts off my air
and I pull to the side of the road
loosen my collar
and search for bones.

Narratives such as Weems's embrace the critical democratic storytelling imagination. They are hopeful of peaceful, nonviolent change, understanding that hope, like freedom, is "an ontological need" (Freire, 1992/1999, p. 8). Hopeful stories are grounded in struggles and interventions that enact the sacred values of love, care, community,

trust, and well-being (Freire, 1992/1999, p. 9). Hopeful stories confront and interrogate cynicism, the belief that change is not possible.

The critical democratic storytelling imagination is pedagogical. As a form of instruction, it helps persons think critically, historically, and sociologically. It exposes the pedagogies of oppression that produce injustice (see Freire, 2001, p. 54). It contributes to reflective ethical self-consciousness. It gives people a language and a set of pedagogical practices that turn oppression into freedom, despair into hope, hatred into love, doubt into trust. This ethical self-consciousness shapes a critical racial self-awareness that contributes to utopian dreams of racial equality and racial justice.

■ PERFORMANCE, PEDAGOGY, AND POLITICS

Clearly, the current historical moment requires morally informed performance- and arts-based disciplines that will help indigenous and non-indigenous peoples recover meaning in the face of senseless, brutal violence, violence that produces voiceless screams of terror and insanity. Globally, cynicism and despair reign. Never have we had a greater need for a militant utopianism to help us imagine a world free of conflict, oppression, terror, and death. We need oppositional performance disciplines that will show us how to create radical utopian spaces within our public institutions.

"Performance-sensitive ways of knowing" (Conquergood, 1998, p. 26) contribute to an epistemological and political pluralism that challenges existing ways of knowing and representing the world. Such formations are more inclusionary and better suited than other ways for thinking about postcolonial or "subaltern" cultural practices (Conquergood, 1998, p. 26). Performance approaches to knowing insist on immediacy and involvement. They consist of partial, plural, incomplete, and contingent understandings, not analytic distance or detachment, the hallmarks of positivist paradigms (Conquergood, 1998, p. 26; Pelias, 1999, pp. ix, xi).

The interpretive methods, democratic politics, and feminist communitarian ethics of

performance (auto)ethnography offer progressives a series of tools for countering reactionary political discourse. At stake is an "insurgent cultural politics" (Giroux, 2000a, p. 127; see also Giroux, 2000b) that challenges neofascist state apparatuses.⁹ This cultural politics encourages a critical race consciousness that flourishes within the free and open spaces of a "vibrant democratic public culture and society" (Giroux, 2000a, p. 127).

Within the spaces of this new performative cultural politics, a radical democratic imagination redefines the concept of civic participation and public citizenship.¹⁰ Struggle, resistance, and dialogue are key features of its pedagogy. The rights of democratic citizenship are extended to all segments of public and private life, from the political to the economic, from the cultural to the personal. This pedagogy seeks to regulate market and economic relations in the name of social justice and environmental causes. A genuine democracy requires hope, dissent, and criticism.

These ideals embrace a democratic-socialist-feminist agenda. This agenda queers straight heterosexual democracy (Butler, 1997). It asserts capitalism's fundamental incompatibility with democracy while thinking its way into a model of critical citizenship that attempts to unthink whiteness and the cultural logics of white supremacy (McLaren, 1997a, 1997b, 1998a, 1998b, 1999, 2001; Roediger, 2002; West, 1993). It seeks a revolutionary multiculturalism that is grounded in relentless resistance to the structures of neoliberalism. It critiques the ways in which the media are used to manufacture consent (Chomsky, 1996). It sets as its goal transformations of global capital, so that individuals may begin to "truly live as liberated subjects of history" (McLaren, 1997b, p. 290).

A Moral Crisis

Indigenous discourse thickens the argument, for the central tensions in the world today go beyond the crises in capitalism and neoliberalism's version of democracy. The central crisis, as defined by Native Canadian, Native Hawaiian, Māori, and American Indian pedagogy, is spiritual, "rooted in the increasingly virulent relationship between

human beings and the rest of nature" (Grande, 2000, p. 354). Linda Smith (1999), discusses the concept of spirituality within Māori discourse, giving added meaning to the crisis at hand:

The essence of a person has a genealogy which could be traced back to an earth parent. . . . A human person does not stand alone, but shares with other animate . . . beings relationships based on a shared "essence" of life . . . [including] the significance of place, of land, of landscape, of other things in the universe. . . . Concepts of spirituality which Christianity attempted to destroy, and then to appropriate, and then to claim, are critical sites of resistance for indigenous peoples. The value, attitudes, concepts and language embedded in beliefs about spirituality represent . . . the clearest contrast and mark of difference between indigenous peoples and the West. It is one of the few parts of ourselves which the West cannot decipher, cannot understand and cannot control . . . yet. (p. 74)

A respectful performance pedagogy honors these views of spirituality. It works to construct a vision of the person and the environment that is compatible with these principles. This pedagogy demands a politics of hope, of loving, of caring nonviolence grounded in inclusive moral and spiritual terms.

Performance (Auto)Ethnography as a Pedagogy of Freedom

Within this framework, to extend Freire (1998) and elaborate Glass (2001, p. 17), performance autoethnography contributes to a conception of education and democracy as pedagogies of freedom. Dialogic performances enacting a performance-centered ethic provide materials for critical reflection on radical democratic educational practices. In so doing, performance ethnography enacts a theory of selfhood and being. This is an ethical, relational, and moral theory. The purpose of "the particular type of relationality we call research ought to be enhancing . . . moral agency" (Christians, 2002, p. 409; see also Lincoln, 1995, p. 287), moral discernment, critical consciousness, and a radical politics of resistance.

Indeed, performance ethnography enters the service of freedom by showing how, in concrete

situations, persons produce history and culture, "even as history and culture produce them" (Glass, 2001, p. 17). Performance texts provide the grounds for liberation practice by opening up concrete situations that are being transformed through acts of resistance. In this way, performance ethnography advances the causes of liberation.

■ CRITICAL PERFORMANCE PEDAGOGY

A commitment to critical performance pedagogy and critical race theory gives the human disciplines a valuable lever for militant utopian cultural criticism. In his book *Impure Acts*, Henry Giroux (2000a) calls for a practical, performative view of pedagogy, politics, and cultural studies. He seeks an interdisciplinary project that would enable theorists and educators to form a progressive alliance "connected to a broader notion of cultural politics designed to further racial, economic, and political democracy" (p. 128).

Such a project engages a militant utopianism, a provisional Marxism without guarantees, a cultural studies that is anticipatory, interventionist, and provisional. It does not back away from the contemporary world in its multiple global versions, including the West, the Third World, the moral, political, and geographic spaces occupied by First Nations and Fourth World persons, persons in marginal or liminal positions (Ladson-Billings, 2000, p. 263). Rather, it strategically engages this world in those liminal spaces where lives are bent and changed by the repressive structures of the new conservatism. This project pays particular attention to the dramatic increases around the world in domestic violence, rape, child abuse, hate crimes, and violence directed toward persons of color (Comaroff & Comaroff, 2001, pp. 1–2).

Critical Race Theory and Participatory, Performance Action Inquiry

Extending critical legal theory, critical race theory theorizes life in these liminal spaces, offering "pragmatic strategies for material and social transformation" (Ladson-Billings, 2000, p. 264). Critical race theory assumes that racism and

white supremacy are the norms in U.S. society. Critical race scholars use performative, story-telling autoethnographic methods to uncover the ways in which racism operates in daily life. Critical race theory challenges those neoliberals who argue that civil rights have been attained for persons of color. It also criticizes those who argue that the civil rights crusade is a long, slow struggle (Ladson-Billings, 2000, p. 264). Critical race theorists argue that the problem of racism requires radical social change and that neoliberalism and liberalism lack the mechanisms and imaginations to achieve such change (Ladson-Billings, 2000, p. 264). Critical race theorists contend that whites have been the main beneficiaries of civil rights legislation.

Strategically, critical race theory examines the ways in which race is performed, including the cultural logics and performative acts that inscribe and create whiteness and nonwhiteness (McLaren, 1997b, p. 278; Roediger, 2002, p. 17). In an age of globalization and diasporic, postnational identities, the color line should no longer be an issue, but, sadly, it is (McLaren, 1997b, p. 278).

Drawing on the complex traditions embedded in participatory action research (Fine et al., 2003; Kemmis & McTaggart, 2000), critical performance pedagogy implements a commitment to participation and performance *with*, not *for*, community members. Amplifying the work of Fine et al. (2003, pp. 176–177), this project builds on local knowledge and experience developed at the bottom of social hierarchies. Following Linda Smith's (1999) lead, participatory, performance work honors and respects local knowledge, customs, and practices and incorporates those values and beliefs into participatory, performance action inquiry (Fine et al., 2003, p. 176).

Work in this participatory, activist performance tradition gives back to the community, "creating a legacy of inquiry, a process of change, and material resources to enable transformations in social practices" (Fine et al., 2003, p. 177). Through performance and participation, scholars develop a "participatory mode of consciousness" (Bishop, 1998, p. 208) that folds them into the moral accountability structures of the group.

■ CULTURAL POLITICS AND AN INDIGENOUS RESEARCH ETHIC

Nonindigenous scholars have much to learn from indigenous scholars about how radical democratic practices can be made to work. As I have indicated above, scholars such as Graham Smith, Linda Smith, and Russell Bishop are committed to a set of moral and pedagogical imperatives and, as Smith (1999) notes, "to acts of reclaiming, reformulating, and reconstituting indigenous cultures and languages . . . to the struggle to become self-determining" (p. 142). These acts lead to a research program that is devoted to the pursuit of social justice. In turn, a specific approach to inquiry is required. In his discussion of a Māori approach to creating knowledge, Bishop (1998) observes that researchers in Kaupapa Māori contexts are

repositioned in such a way as to no longer need to seek to *give voice to others*, to *empower* others, to *emancipate* others, to refer to others as *subjugated* voices, but rather to listen and participate . . . in a process that facilitates the development in people of a sense of themselves as agentic and of having an authoritative voice. . . . An indigenous Kaupapa Māori approach to research . . . challenges colonial and neo-colonial discourses that inscribe "otherness." (pp. 207–208)

This participatory mode of knowing privileges sharing, subjectivity, personal knowledge, and the specialized knowledges of oppressed groups. It uses concrete experience as a criterion against which to measure meaning and truth. It encourages a participatory mode of consciousness (Bishop, 1998, p. 205), asking that the researcher give the group a gift as a way of honoring the group's sacred spaces. If the group picks up the gift, the group members and the researcher can create a shared reciprocal relationship (Bishop, 1998, p. 207). This relationship is built on understandings about Māori beliefs and cultural practices.

In turn, the research is evaluated against Māori-based criteria. As in Freire's revolutionary pedagogy, West's prophetic pragmatism, and

Collins's Afrocentric feminist moral ethic, dialogue is valued as a method for assessing knowledge claims in Māori culture. The Māori moral position also privileges storytelling, listening, voice, and personal performance narratives (Collins, 1991, pp. 208–212). This moral pedagogy rests on an ethic of care, love, and personal accountability that honors individual uniqueness and emotionality in dialogue (Collins, 1991, pp. 215–217). This is a performative, pedagogical ethic, grounded in the ritual, sacred spaces of family, community, and everyday moral life (Bishop, 1998, p. 203). It is not imposed by some external bureaucratic agency.

This view of knowing parallels the commitment within certain forms of red pedagogy to the performative as a way of being, a way of knowing, and a way of expressing moral ties to the community (Grande, 2000, p. 356; Graveline, 2000, p. 361). Fyre Jean Graveline (2000, p. 263), a Metis woman, speaks:

As Metis woman, scholar, activist, teacher,
healer

I enact First Voice as pedagogy and
methodology

Observing my own lived experience as an
Educator

Sharing meanings with Others . . .

My Voice is Heard
in concert with Students and Community
Participants . . .

I asked: What pedagogical practices
Enacted through my Model-In-Use
contribute to what kinds of transfor-
mational learning?
For whom?

Moral Codes and the
Performative as a Site of Resistance

Because it expresses and embodies moral ties to
the community, the performative view of meaning

serves to legitimate indigenous worldviews. Meaning and resistance are embodied in the act of performance itself. The performative is political, the site of resistance. At this critical level, the performative provides the context for resistance to neoliberal and neoconservative attacks on the legitimacy of the worldview in question. The performative is where the soul of the culture resides. The performative haunts the liminal spaces of the culture. In their sacred and secular performances, the members of the culture honor one another and the culture itself.

In attacking the performative, critics attack the culture.¹¹ Smith (1999) states the issue clearly: "The struggle for the validity of indigenous knowledges may no longer be over the *recognition* that indigenous people have ways of knowing the world which are unique, but over proving the authenticity of, and control over, our own forms of knowledge" (p. 104).

Scholars need a new set of moral and ethical research protocols. Fitted to the indigenous (and nonindigenous) perspective, these are moral matters. They are shaped by the feminist, communitarian principles of sharing, reciprocity, relationality, community, and neighborliness (Lincoln, 1995, p. 287). They embody a dialogic ethic of love and faith grounded in compassion (Bracci & Christians, 2002, p. 13; West, 1993). Accordingly, the purpose of research is not the production of new knowledge per se. Rather, the purposes are pedagogical, political, moral, and ethical, involving the enhancement of moral agency, the production of moral discernment, a commitment to praxis, justice, an ethic of resistance, and a performative pedagogy that resists oppression (Christians, 2002, p. 409).

A code embodying these principles interrupts the practice of positivist research, resists the idea that research is something that white men do to indigenous peoples. Further, unlike the institutional review board model of Western inquiry, which is not content driven, an indigenous code is anchored in a particular culture and that culture's way of life; it connects its moral model to a set of political and ethical actions that will increase well-being in the indigenous culture. The code

refuses to turn indigenous peoples into subjects who are the natural objects of white inquiry (Smith, 1999, p. 118). It rejects the Western utilitarian model of the individual as someone who has rights distinct from the rights of the larger group, "for example the right of an individual to give his or her own knowledge, or the right to give informed consent" (Smith, 1999, p. 118)—rights that are not recognized in Māori culture. As Smith (1999) observes, "Community and indigenous rights or views in this area are generally not . . . respected" (p. 118).

Research ethics for scholars working with the members of Māori and other indigenous communities "extend far beyond issues of individual consent and confidentiality" (L. T. Smith, 2000, p. 241). These ethics are not "prescribed in codes of conduct for researchers but tend to be prescribed for Māori researchers in cultural terms," advising researchers to show respect for the Māori by exhibiting a willingness to listen, to be humble, to be cautious, to avoid flaunting knowledge, and to avoid trampling over the *mana* of people (L. T. Smith, 2000, p. 242).

Turning the Tables on the Colonizers

Here at the end it is possible to imagine scenarios that turn the tables on the colonizer. It is possible to imagine, for example, research practices that really do respect the rights of human subjects, protocols for obtaining subjects' informed consent that truly inform and do not deceive, and research projects that not only do no harm but in fact benefit human communities.

Here I borrow from indigenous scholar Robert Williams (1997, pp. 62–67), who takes us back to Lewis and Clark and asks us to imagine another version, or telling, of the Lewis and Clark myth. Williams turns Jefferson back on himself, arguing that it is possible to use the Lewis and Clark narratives as an occasion for reimagining the human rights of indigenous peoples. Williams argues that indigenous peoples should take up Jefferson's theory of democracy and claim, as whites did, their natural, inalienable rights to self-recognition, self-governance, survival, autonomy, life, liberty,

the pursuit of happiness, and sovereign authority over their own lands.

Similarly, the celebrations of Lewis and Clark's expedition that took place in 2003–2004 can be turned into political performances, transgressive events. In this form of historical theater, Lewis and Clark would be pushed aside, ignored. In their place, performers would enact a utopian disruptive theater, reclaiming and celebrating the inalienable rights of Native Americans to own and control their own history. These performance texts would be occasions for indigenous peoples to write their way into the journals, to offer their stories and narratives about the effects of Lewis and Clark on their ancestors and on themselves. Like the writings of William Least Heat-Moon (1999), these tellings would recover buried history, moments, representations, ancient pictographs that write across "all of us—red, white, mixed" (p. 217). This theater would advance the project of indigenous decolonization (Williams, 1997, p. 62). These performance events would represent Lewis and Clark as colonizers whose "undaunted courage" will no longer be recognized, honored, or celebrated.

■ CONCLUSION

The ethical and moral models of Russell Bishop, Graham Smith, and Linda Smith call into question the more generic, utilitarian, biomedical Western model of ethical inquiry (see Christians, 2000, 2002; Bracci & Christians, 2002). They outline a radical ethical path for the future that transcends the institutional review board model, which focuses almost exclusively on the problems associated with betrayal, deception, and harm. They call for a collaborative social science research model that makes the researcher responsible not to a removed discipline (or institution) but to those studied. This model stresses personal accountability, caring, the value of individual expressiveness, the capacity for empathy, and the sharing of emotionality (Collins, 1991, p. 216). This model implements collaborative, participatory, performative inquiry. It forcefully aligns the

ethics of research with a politics of the oppressed, with a politics of resistance, hope, and freedom.

This model directs scholars to take up moral projects that respect and reclaim indigenous cultural practices. Such work produces spiritual, social, and psychological healing, which in turn leads to multiple forms of transformation at the personal and social levels. These transformations shape the processes of mobilization and collective action, and the resulting actions help persons realize a radical politics of possibility. This politics enacts emancipatory discourses and critical pedagogies that honor human differences and draw inspiration from the struggles of indigenous peoples. In listening to indigenous storytellers, we learn new ways of being moral and political in the social world. Thus *research* ceases to be a dirty word.

■ NOTES

1. This chapter extends some of the arguments I present in my book *Performance Ethnography* (Denzin, 2003, pp. 1–23, 242–262). A performative cultural studies enacts a critical, cultural pedagogy. It does so by using dialogue, performative writing, and the staging and performance of texts involving audience members. Regarding the terms *decolonization* and *the postcolonial*, which I use here, it should be noted that decolonizing research is not necessarily postcolonial research. Decolonization is a process that critically engages, at all levels, imperialism, colonialism, and postcoloniality. Decolonizing research implements indigenous epistemologies and critical interpretive practices that are shaped by indigenous research agendas (Smith, 1999, p. 20). In this chapter, I draw on the work of Shohat (1992), Hall (1996b), Dimitriadis and McCarthy (2001), and Swadener and Mutua (2004) in troubling the concept of “post-colonial”—with Hall, I ask, When was the colonial ever post? In its hyphenated form, the term *post-colonial* functions as a temporal marker, implying linearity and chronology. With Swadener and Mutua, I prefer the form *postcolonial*, which implies a constant, complex, intertwined back-and-forth relationship between past and present. In this sense there is no postcolonial, there are only endless variations on neocolonial formations (Soto, 2004, p. ix). Regarding the term *critical pedagogy*:

As Kincheloe and McLaren (2000) note, cultural production functions as “a form of education, as it generates knowledge, shapes values, and constructs identity. . . . By using the term *cultural pedagogy*, we are specifically referring to the ways particular cultural agents produce particular hegemonic ways of seeing” (p. 285; see also McLaren, 1992a, p. 441). Critical pedagogy attempts to disrupt and deconstruct these cultural practices performatively in the name of a “more just, democratic, and egalitarian society” (Kincheloe & McLaren, 2000, p. 285; but see Lather, 1998).

2. See also Ashcroft, Griffiths, and Tiffin (2002), Battiste (2000a, 2000b), Balme and Christopher (2001), Beverley (2003), Bishop (1994, 1998), Churchill (1996), Cook-Lynn (1998), Cruikshank (1990), Ellsworth (1989), Gilbert (2003), Greenwood (2001), Harjo and Bird (1997), Kondo (2000), Magowan (2000), Marker (2003), Menchú (1984, 1998), Pratt (2001), G. Smith (2000), L. T. Smith (2000), and C. W.-L.-T.-R. Smith (2000).

3. This theater often uses verbatim accounts of injustices and acts of violence encountered in daily life. Mienczakowski (1995, 2001) provides a history of “verbatim theater” and discusses extensions of this approach that use oral history, participant observation, and the methods of ethnodrama (see also Chessman, 1971). One contemporary use of verbatim theater is the play *Guantánamo: “Honor Bound to Defend Freedom,”* created by Victoria Brittain, a former journalist, and Gillian Slovo, a novelist. This play addresses the plight of British citizens imprisoned at the U.S. naval base at Guantánamo Bay, Cuba. In the period since the September 11, 2001, terrorist attacks on the United States. According to Alan Riding (1999), writing for the *New York Times*, the “power of ‘Guantánamo’ is that it is not really a play but a re-enactment of views expressed in interviews, letters, news conferences and speeches by various players in the post-Sept. 11 Iraq war drama, from British Muslim detainees to lawyers, from Mr. Rumsfeld to Jack Straw, Britain’s foreign secretary.” Riding notes that Nicolas Kent, the play’s director, believes that “political theater works here [in England] because the British have an innate sense of justice. ‘When we do stories about injustice,’ he said, ‘there is a groundswell of sympathy . . . people are furious that there isn’t due process.’ . . . ‘With Islamophobia growing around the world today,’ he said, ‘I wanted to show that we, too, think there is an injustice’” (p. B2).

4. At another level, indigenous participatory theater extends the project connected to Third World

popular theater—that is, political theater “used by oppressed Third World people to achieve justice and development for themselves” (Etherton, 1988, p. 991). The International Popular Theatre Alliance, organized in the 1980s, uses existing forms of cultural expression to fashion improvised dramatic productions that analyze situations of poverty and oppression. This grassroots approach uses agitprop and sloganizing theater pieces (pieces designed to foment political action) to stimulate collective awareness and collective action at the local level. This form of theater has been popular in Latin America, in Africa, in parts of Asia, in India, and among Native populations in the Americas (Etherton, 1988, p. 992).

5. The *Camera Eye* and *Newsreel* are Dos Passos's (1937) terms (and methods) for incorporating current events and newsworthy items into a text.

6. The positive-negative debate often neglects indigenous discourses, presupposes consensus where there may be none, shuts down nuanced debate, and ignores the performative features of racial identity (Smith, 1997, pp. 3–4).

7. For Du Bois, race and racism were social constructions. Performances, minstrelsy, blackface are powerful performance devices that produce and reproduce the color line. Du Bois believed that African Americans need performance spaces where they can control how race is constructed. Consequently, as Elam (2001, pp. 5–6) observes, African American theater and performance have been central sites for the interrogation of race and the color line (see also Elam & Krasner, 2001). As Elam notes, “The inherent ‘constructedness’ of performance and the malleability of the devices of the theater serve to reinforce the theory that blackness . . . and race . . . are hybrid, fluid concepts” (pp. 4–5). Stuart Hall (1996a, p. 473) is correct in his observation that persons of color have never been successful in escaping the politics and theaters of (racial) representation.

8. Other projects involve a focus on testimonies, new forms of storytelling, and returning to, as well as reframing and regendering, key cultural debates.

9. I define fascism as a conservative, extreme right-wing political, economic, and sociological state formation characterized by authoritarian forms of government, extreme nationalism, manufactured consent at key levels of public opinion, racism, a large military-industrial complex, foreign aggressiveness, anti-communism, state-supported corporate capitalism, state-sponsored violence, extreme restrictions on individual freedom, and tendencies toward an “Orwellian

condition of perpetual war . . . [and] a national security state in which intelligence agencies and the military replace publicly elected officials in deciding national priorities” (Rorty, 2002, p. 13).

10. Here there are obvious political connections to Guy Debord's (1970) situationist project.

11. Smith (1999, p. 99) presents 10 performative ways to be colonized, 10 ways in which science, technology, and Western institutions place indigenous peoples—indeed, any group of human beings—their languages, cultures, and environments, at risk. These ways include the Human Genome Diversity Project as well as scientific efforts to reconstruct previously extinct indigenous peoples and projects that deny global citizenship to indigenous peoples while commodifying, patenting, and selling indigenous cultural traditions and rituals.

WRITING

A Method of Inquiry

Laurel Richardson and Elizabeth Adams St. Pierre

The world of ethnography has expanded in ways that were unimaginable a decade ago, when this chapter was first written for the first edition of this *Handbook*. Qualitative researchers in a variety of disciplines—medicine, law, education, the social sciences, and the humanities—have since found *writing as a method of inquiry* to be a viable way in which to learn about themselves and their research topic. The literature is vast and varied.

In light of these developments, this chapter's revision is organized into three parts. In Part 1, Laurel Richardson discusses (a) the contexts of social scientific writing both historically and contemporaneously, (b) the creative analytical practice ethnography genre, and (c) the direction her work has taken during the past decade, including "writing stories" and collaborations across the humanities/social sciences divide. In Part 2, Elizabeth St. Pierre provides an analysis of how writing as a method of inquiry coheres with the development of ethical selves engaged in social action and social reform. In Part 3, Richardson provides some writing practices/exercises for the qualitative writer.

Just as the chapter reflects our own processes and preferences, we hope that your writing will do

the same. The more different voices are honored within our qualitative community, the stronger—and more interesting—that community will be.

■ PART 1: QUALITATIVE WRITING

Laurel Richardson

A decade ago, in the first edition of this *Handbook*, I confessed that for years I had yawned my way through numerous supposedly exemplary qualitative studies. Countless numbers of texts had I abandoned half read, half scanned. I would order a new book with great anticipation—the topic was one I was interested in, the author was someone I wanted to read—only to find the text boring. In "coming out" to colleagues and students about my secret displeasure with much of qualitative writing, I found a community of like-minded discontents. Undergraduates, graduates, and colleagues alike said that they found much of qualitative writing to be—yes—boring.

We had a serious problem; research topics were riveting and research valuable, but qualitative books were underread. Unlike quantitative

work that can carry its meaning in its tables and summaries, qualitative work carries its meaning in its entire text. Just as a piece of literature is not equivalent to its "plot summary," qualitative research is not contained in its abstract. Qualitative research has to be read, not scanned; its meaning is in the reading. It seemed foolish at best, and narcissistic and wholly self-absorbed at worst, to spend months or years doing research that ended up not being read and not making a difference to anything but the author's career. Was there some way in which to create texts that were vital and made a difference? I latched onto the idea of *writing as a method of inquiry*.

I had been taught, as perhaps you were as well, not to write until I knew what I wanted to say, that is, until my points were organized and outlined. But I did not like writing that way. I felt constrained and bored. When I thought about those writing instructions, I realized that they cohered with mechanistic scientism and quantitative research. I recognized that those writing instructions were themselves a sociohistorical invention of our 19th-century foreparents. Foisting those instructions on qualitative researchers created serious problems; they undercut writing as a dynamic creative process, they undermined the confidence of beginning qualitative researchers because their experience of research was inconsistent with the writing model, and they contributed to the flotilla of qualitative writing that was simply not interesting to read because writers wrote in the homogenized voice of "science."

Qualitative researchers commonly speak of the importance of the individual researcher's skills and aptitudes. The researcher—rather than the survey, the questionnaire, or the census tape—is the "instrument." The more honed the researcher, the better the possibility of excellent research. Students are taught to be open—to observe, listen, question, and participate. But in the past, they were not being taught to nurture their writing voices. During the past decade, however, rather than suppressing their voices, qualitative writers have been honing their writing skills. Learning to write in new ways does not take away one's traditional writing skills any more than learning a

second language reduces one's fluidity in one's first language. Rather, all kinds of qualitative writing have flourished.

Writing in Contexts

Language is a constitutive force, creating a particular view of reality and of the Self. Producing "things" always involves value—what to produce, what to name the productions, and what the relationship between the producers and the named things will be. Writing things is no exception. No textual staging is ever innocent (including this one). Styles of writing are neither fixed nor neutral but rather reflect the historically shifting domination of particular schools or paradigms. Social scientific writing, like all other forms of writing, is a sociohistorical construction and, therefore, is mutable.

Since the 17th century, the world of writing has been divided into two separate kinds: literary and scientific. Literature, from the 17th century onward, was associated with fiction, rhetoric, and subjectivity, whereas science was associated with fact, "plain language," and objectivity (Clifford & Marcus, 1986, p. 5). During the 18th century, the Marquis de Condorcet introduced the term "social science." Condorcet (as cited in Levine, 1985) contended that "knowledge of the truth" would be "easy," and that error would be "almost impossible," if one adopted precise language about moral and social issues (p. 6). By the 19th century, literature and science stood as two separate domains. Literature was aligned with "art" and "culture"; it contained the values of "taste, aesthetics, ethics, humanity, and morality" (Clifford & Marcus, 1986, p. 6) as well as the rights to metaphorical and ambiguous language. Given to science was the belief that its words were objective, precise, unambiguous, noncontextual, and nonmetaphorical.

As the 20th century unfolded, the relationships between social scientific writing and literary writing grew in complexity. The presumed solid demarcations between "fact" and "fiction" and between "true" and "imagined" were blurred. The blurring was most hotly debated around writing for the public, that is, journalism. Dubbed by

Thomas Wolfe as the "new journalism," writers consciously blurred the boundaries between fact and fiction and consciously made themselves the centers of their stories (for an excellent extended discussion of the new journalism, see Denzin, 1997, chap. 5). By the 1970s, "crossovers" between writing forms spawned the naming of oxymoronic genres—"creative nonfiction," "faction," "ethnographic fiction," the "nonfiction novel," and "true fiction." By 1980, the novelist E. L. Doctorow (as cited in Fishkin, 1985) would assert, "There is no longer any such things as fiction or nonfiction, there is only narrative" (p. 7).

Despite the actual blurring of genre, and despite our contemporary understanding that all writing is narrative writing, I would contend that there is still one major difference that separates fiction writing from science writing. The difference is not whether the text really is fiction or nonfiction; rather, the difference is the claim that the author makes for the text. Declaring that one's work is fiction is a different rhetorical move than is declaring that one's work is social science. The two genres bring in different audiences and have different impacts on publics and politics—and on how one's "truth claims" are to be evaluated. These differences should not be overlooked or minimized.

We are fortunate, now, to be working in a postmodernist climate, a time when a multitude of approaches to knowing and telling exist side by side. The core of postmodernism is the doubt that any method or theory, any discourse or genre, or any tradition or novelty has a universal and general claim as the "right" or privileged form of authoritative knowledge. Postmodernism suspects all truth claims of masking and serving particular interests in local, cultural, and political struggles. But conventional methods of knowing and telling are not automatically rejected as false or archaic. Rather, those standard methods are opened to inquiry, new methods are introduced, and then they also are subject to critique.

The postmodernist context of doubt, then, distrusts all methods equally. No method has a privileged status. But a postmodernist position does allow us to know "something" without claiming to

know everything. Having a partial, local, and historical knowledge is still knowing. In some ways, "knowing" is easier, however, because postmodernism recognizes the situational limitations of the knower. Qualitative writers are off the hook, so to speak. They do not have to try to play God, writing as disembodied omniscient narrators claiming universal and atemporal general knowledge. They can eschew the questionable metanarrative of scientific objectivity and still have plenty to say as situated speakers, subjectivities engaged in knowing/telling about the world as they perceive it.

A particular kind of postmodernist thinking that I have found to be especially helpful is poststructuralism. (for application of the perspective in a research setting, see Davies, 1994). Poststructuralism links language, subjectivity, social organization, and power. The centerpiece is language. Language does not "reflect" social reality but rather produces meaning and creates social reality. Different languages and different discourses within a given language divide up the world and give it meaning in ways that are not reducible to one another. Language is how social organization and power are defined and contested and the place where one's sense of self—one's subjectivity—is constructed. Understanding language as competing discourses—competing ways of giving meaning and of organizing the world—makes language a site of exploration and struggle.

Language is not the result of one's individuality; rather, language constructs one's subjectivity in ways that are historically and locally specific. What something means to individuals is dependent on the discourses available to them. For example, being hit by one's spouse is experienced differently depending on whether it is thought of as being within the discourse of "normal marriage," "husband's rights," or "wife battering." If a woman sees male violence as normal or a husband's right, she is unlikely to see it as wife battering, which is an illegitimate use of power that should not be tolerated. Similarly, when a man is exposed to the discourse of "childhood sexual abuse," he may recategorize and remember his own traumatic childhood experiences. Experience and memory are, thus, open to contradictory

interpretations governed by social interests and prevailing discourses. The individual is both the site and subject of these discursive struggles for identity and for remaking memory. Because the individual is subject to multiple and competing discourses in many realms, one's subjectivity is shifting and contradictory—not stable, fixed, and rigid.

Poststructuralism, thus, points to the continual cocreation of the self and social science; they are known through each other. Knowing the self and knowing about the subject are intertwined, partial, historical local knowledges. Poststructuralism, then, permits—even invites or incites—us to reflect on our method and to explore new ways of knowing.

Specifically, poststructuralism suggests two important ideas to qualitative writers. First, it directs us to understand ourselves reflexively as persons writing from particular positions at specific times. Second, it frees us from trying to write a single text in which everything is said at once to everyone. Nurturing our own voices releases the censorious hold of "science writing" on our consciousness as well as the arrogance it fosters in our psyche; writing is validated as a method of knowing.

CAP Ethnography

In the wake of postmodernist—including poststructuralist, feminist, queer, and critical race theory—critiques of traditional qualitative writing practices, the sacrosanctity of social science writing conventions has been challenged. The ethnographic genre has been blurred, enlarged, and altered with researchers writing in different formats for a variety of audiences. These ethnographies are like each other, however, in that they are produced through creative analytical practices. I call them "CAP [creative analytical processes] ethnographies." This label can include new work, future work, or older work—wherever the author has moved outside conventional social scientific writing. CAP ethnographies are not alternative or experimental; they are, in and of themselves, valid and desirable representations of the social. In the

foreseeable future, these ethnographies may indeed be the most desirable representations because they invite people in and open spaces for thinking about the social that elude us now.

The practices that produce CAP ethnography are both creative and analytical. Any dinosaurian beliefs that "creative" and "analytical" are contradictory and incompatible modes are standing in the path of a meteor; they are doomed for extinction. Witness the evolution, proliferation, and diversity of new ethnographic "species"—autoethnography, fiction, poetry, drama, readers' theater, writing stories, aphorisms, layered texts, conversations, epistles, polyvocal texts, comedy, satire, allegory, visual texts, hypertexts, museum displays, choreographed findings, and performance pieces, to name some of the categories that are discussed in the pages of this *Handbook*. These new "species" of qualitative writing adapt to the kind of political/social world we inhabit—a world of uncertainty. With many outlets for presentation and publication, CAP ethnographies herald a paradigm shift (Ellis & Rechner, 1996).

CAP ethnography displays the writing process and the writing product as deeply intertwined; both are privileged. The product cannot be separated from the producer, the mode of production, or the method of knowing. Because both traditional ethnographies and CAP ethnographies are being produced within the broader postmodernist climate of "doubt," readers (and reviewers) want and deserve to know how the researchers claim to know. How do the authors position the selves as knowers and tellers? These issues engage intertwined problems of subjectivity, authority, authorship, reflexivity, and process, on the one hand, and of representational form, on the other.

Postmodernism claims that writing is always partial, local, and situational and that our selves are always present no matter how hard we try to suppress them—but only partially present because in our writing we repress parts of our selves as well. Working from that premise frees us to write material in a variety of ways—to tell and retell. There is no such thing as "getting it right," only "getting it" differently contoured and nuanced. When using creative analytical practices, ethnographers

learn about the topics and about themselves that which was unknowable and unimaginable using conventional analytical procedures, metaphors, and writing formats.

In traditionally staged research, we valorize "triangulation." (For a discussion of triangulation as method, see Denzin, 1978. For an application, see Statham, Richardson, & Cook, 1991.) In triangulation, a researcher deploys different methods—interviews, census data, documents, and the like—to "validate" findings. These methods, however, carry the same domain assumptions, including the assumption that there is a "fixed point" or an "object" that can be triangulated. But in CAP ethnographies, researchers draw from literary, artistic, and scientific genres, often breaking the boundaries of those genres as well. In what I think of as a postmodernist deconstruction of triangulation, CAP text recognizes that there are far more than "three sides" by which to approach the world. We do not triangulate; we crystallize.

I propose that the central imaginary for "validity" for postmodernist texts is not the triangle—a rigid, fixed, two-dimensional object. Rather, the central imaginary is the crystal, which combines symmetry and substance with an infinite variety of shapes, substances, transmutations, multidimensionalities, and angles of approach. Crystals grow, change, and are altered, but they are not amorphous. Crystals are prisms that reflect externalities and refract within themselves, creating different colors, patterns, and arrays casting off in different directions. What we see depends on our angle of repose—not triangulation but rather crystallization. In CAP texts, we have moved from plane geometry to light theory, where light can be both waves and particles.

Travels With Ernest: Crossing the Literary/Sociological Divide (Richardson & Lockridge, 2004) is a recent example of crystallization practices. *Travels With Ernest* is built on geographical travels (e.g., Russia, Ireland, Beirut, Copenhagen, Russia, Sedona, St. Petersburg Beach) that I shared with my husband Ernest Lockridge, who is a novelist and professor of English. We experienced the same sites but refracted them through different professional eyes, gender, sensibilities,

biographies, spiritual and emotional longings. After we each independently wrote a narrative account—a personal essay—inspired by the travel, we read each other's account and engaged in wide-ranging (taped/transcribed) conversations across disciplinary lines about writing, ethics, authorship, collaboration, witnessing, fact/fiction, audiences, relationships, and the intersection of observation and imagination. The travels, thus, are physical, emotional, and intellectual.

The collaborative process modeled in *Travels With Ernest* honors each voice as separate and distinct, explores the boundaries of observation and imagination, witnessing and retelling, memory and memorializing, and it confirms the value of crystallization. I remain a sociologist; he remains a novelist. Neither of us gives up our core visions. In the process of our collaboration, however, we discovered many things about ourselves—about our relationships to each other, our families, our work, and our writing—that we would not have discovered if we were not collaborating. For example, we discovered that we wanted the last piece in the book to break the book's writing format—to model other possibilities. We constructed from our conversation (and its multiple interruptions) a movie script set in our own Great American Kitchen. We especially like that the collaborative method we displayed in our text is one that is open to everyone; indeed, it is strategic writing through which established hierarchies between the researcher and the researched, between the student and the teacher, can be breached.

Crystallization, without losing structure, deconstructs the traditional idea of "validity"; we feel how there is no single truth, and we see how texts validate themselves. Crystallization provides us with a deepened, complex, and thoroughly partial understanding of the topic. Paradoxically, we know more and doubt what we know. Ingeniously, we know there is always more to know.

Evaluating CAP Ethnographies

Because the epistemological foundations of CAP ethnography differ from those of traditional

social science, the conceptual apparatus by which CAP ethnographies can be evaluated differ. Although we are freer to present our texts in a variety of forms to diverse audiences, we have different constraints arising from self-consciousness about claims to authorship, authority, truth, validity, and reliability. Self-reflexivity brings to consciousness some of the complex political/ideological agendas hidden in our writing. Truth claims are less easily validated now; desires to speak "for" others are suspect. The greater freedom to experiment with textual form, however, does not guarantee a better product. The opportunities for writing worthy texts—books and articles that are "good reads"—are multiple, exciting, and demanding. But the work is harder and the guarantees are fewer. There is a lot more for us to think about.

One major issue is that of criteria. How does one judge an ethnographic work—new or traditional? Traditional ethnographers of good will have legitimate concerns about how their students' work will be evaluated if they choose to write CAP ethnography. I have no definitive answers to ease their concerns, but I do have some ideas and preferences.

I see the ethnographic project as humanly situated, always filtered through human eyes and human perceptions, and bearing both the limitations and the strengths of human feelings. Scientific superstructure is always resting on the foundation of human activity, belief, and understandings. I emphasize ethnography as constructed through *research practices*. Research practices are concerned with enlarged understanding. Science offers some research practices—literature, creative arts, memory work (Davies et al., 1997), introspection (Ellis, 1991), and dialogical (Ellis, 2004). Researchers have many practices from which to choose and ought not be constrained by habits of somebody else's mind.

I believe in holding CAP ethnography to high and difficult standards; mere novelty does not suffice. Here are four of the criteria I use when reviewing papers or monographs submitted for social scientific publication:

1. *Substantive contribution.* Does this piece contribute to our *understanding* of social life? Does the writer demonstrate a deeply grounded (if embedded) social scientific perspective? Does this piece seem "true"—a credible account of a cultural, social, individual, or communal sense of the "real"? (For some suggestions on accomplishing this, see Part 3 of this chapter.)
2. *Aesthetic merit.* Rather than reducing standards, another standard is added. Does this piece succeed aesthetically? Does the use of creative analytical practices open up the text and invite interpretive responses? Is the text artistically shaped, satisfying, complex, and not boring?
3. *Reflexivity.* How has the author's subjectivity been both a producer and a product of this text? Is there adequate self-awareness and self-exposure for the reader to make judgments about the point of view? Does the author hold himself or herself accountable to the standards of knowing and telling of the people he or she has studied?
4. *Impact.* Does this piece affect me emotionally or intellectually? Does it generate new questions or move me to write? Does it move me to try new research practices or move me to action?

These are four of my criteria. Science is one lens, and creative arts is another. We see more deeply using two lenses. I want to look through both lenses to see a "social science art form"—a radically interpretive form of representation.

I am not alone in this desire. I have found that students from diverse social backgrounds and marginalized cultures are attracted to seeing the social world through two lenses. Many of these students find CAP ethnography beckoning and join the qualitative community. The more this happens, the more everyone will profit. The implications of race and gender would be stressed, not because it would be "politically correct" but rather because race and gender *are* axes through which symbolic and actual worlds have been constructed. Members of non-dominant worlds know that and could insist that this knowledge be honored (cf. Margolis & Romero, 1998). The blurring of the humanities and the social sciences would be welcomed, not because it is "trendy" but rather because the blurring coheres

more truly with the life sense and learning style of so many. This new qualitative community could, through its theory, analytical practices, and diverse membership, reach beyond academia and teach all of us about social injustice and methods for alleviating it. What qualitative researcher interested in social life would not feel enriched by membership in such a culturally diverse and inviting community? Writing becomes more diverse and author centered, less boring, and humbler. These are propitious opportunities. Some even speak of their work as spiritual.

Writing Stories and Personal Narratives

The ethnographic life is not separable from the Self. Who we are and what we can be—what we can study, how we can write about that which we study—are tied to how a knowledge system disciplines itself and its members and to its methods for claiming authority over both the subject matter and its members.

We have inherited some ethnographic rules that are arbitrary, narrow, exclusionary, distorting, and alienating. Our task is to find concrete practices through which we can construct ourselves as ethical subjects engaged in ethical ethnography—inspiring to read and to write.

Some of these practices include working within theoretical schemata (e.g., sociology of knowledge, feminism, critical race theory, constructivism, poststructuralism) that challenge grounds of authority, writing on topics that matter both personally and collectively, experiencing *jouissance*, experimenting with different writing formats and audiences simultaneously, locating oneself in multiple discourses and communities, developing critical literacy, finding ways in which to write/present/teach that are less hierarchal and univocal, revealing institutional secrets, using positions of authority to increase diversity both in academic appointments and in journal publications, engaging in self-reflexivity, giving in to synchronicity, asking for what one wants, not flinching from where the writing takes one emotionally or spiritually, and honoring the embodiedness and spatiality of one's labors.

This last practice—honoring the location of the self—encourages us to construct what I call “writing stories.” These are narratives that situate one's own writing in other parts of one's life such as disciplinary constraints, academic debates, departmental politics, social movements, community structures, research interests, familial ties, and personal history. They offer critical reflexivity about the writing self in different contexts as a valuable creative analytical practice. They evoke new questions about the self and the subject; remind us that our work is grounded, contextual, and rhizomatic; and demystify the research/writing process and help others to do the same. They can evoke deeper parts of the self, heal wounds, enhance the sense of self—or even alter one's sense of identity.

In *Fields of Play: Constructing an Academic Life* (Richardson, 1997), I make extensive use of writing stories to contextualize 10 years of my sociological work, creating a text that is more congruent with poststructural understandings of the situated nature of knowledge. Putting my papers and essays in the chronological order in which they were conceptualized, I sorted them into two piles: “keeper” and “reject.” When I reread my first keeper—a presidential address to the North Central Sociological Association—memories of being patronized, marginalized, and punished by my department chair and dean reemerged. I stayed with those memories and wrote a writing story about the disjunction between my departmental life and my disciplinary reputation. Writing the story was not emotionally easy: in the writing, I was reliving horrific experiences, but writing the story released the anger and pain. Many academics who read that story recognize it as congruent with their experiences—their untold stories.

I worked chronologically through the keeper pile, rereading and then writing the writing story evoked by the rereading—different facets, different contexts. Some stories required checking my journals and files, but most did not. Some stories were painful and took an interminable length of time to write, but writing them loosened their shadow hold on me. Other stories were joyful and

reminded me of the good fortunes I have in friends, colleagues, and family.

Writing stories sensitize us to the potential consequences of all of our writing by bringing home—inside our homes and workplaces—the ethics of representation. Writing stories are not about people and cultures “out there”—ethnographic subjects (or objects). Rather, they are about ourselves—our workspaces, disciplines, friends, and family. What can we say and with what consequences? Writing stories bring the danger and poignancy of ethnographic representation “up close and personal.”

Each writing story offers its writer an opportunity for making a situated and pragmatic ethical decision about whether and where to publish the story. For the most part, I have found no ethical problem in publishing stories that reflect the abuses of power; I consider the damage done by the abusers far greater than any discomfort my stories might cause them. In contrast, I feel constraint in publishing about my immediate family members. I check materials with them. In the case of more distant family members, I change their names and identifying characteristics. I will not publish some of my recent writing because doing so would seriously “disturb the family peace.” I set that writing away for the time being, hoping that I will find a way to publish it in the future.

In one section of *Fields of Play* (Richardson, 1997), I tell two interwoven stories of “writing illegitimacy.” One story is my poetic representation of an interview with Louisa May, an unwed mother, and the other is the research story—how I wrote that poem along with its dissemination, reception, and consequences for me. There are multiple illegitimacies in the stories—a child out of wedlock, poetic representation as research “findings,” a feminine voice in the social sciences, ethnographic research on ethnographers and dramatic representation of that research, emotional presence of the writer, and unbridled work *jouissance*.

I had thought that the research story was complete, not necessarily the only story that could be told but one that reflected fairly, honestly, and sincerely what my research experiences had been. I still believe that. But missing from the research story, I came to realize, were the personal

biographical experiences that led me to author such a story.

The idea of “illegitimacy,” I have come to acknowledge, has had a compelling hold on me. In my research journal, I wrote, “My career in the social sciences might be viewed as one long adventure into illegitimacies.” I asked myself why I was drawn to constructing “texts of illegitimacy,” including the text of my academic life. What is this struggle I have with the academy—being in it and against it at the same time? How is my story like and unlike the stories of others who are struggling to make sense of themselves, to retrieve their suppressed selves, to act ethically?

Refracting “illegitimacy” through allusions, glimpses, and extended views, I came to write a personal essay, “Vespers,” the final essay in *Fields of Play* (Richardson, 1997). “Vespers” located my academic life in childhood experiences and memories; it deepened my knowledge of my self and has resonated with others’ experiences in academia. In turn, the writing of “Vespers,” has refracted again, giving me desire, strength, and enough self-knowledge to narrativize other memories and experiences, to give myself agency, and to construct myself anew for better or for worse.

Writing stories and personal narratives have increasingly become the structures through which I make sense of my world, locating my particular biographical experiences in larger historical and sociological contexts. Using writing as a method of discovery in conjunction with my understanding of feminist rereadings of Deleuzian thought, I have altered my primary writing question from “how to write during the crisis of representation” to “how to document becoming.”

Like Zeno’s arrow, I will never reach a destination (destiny?). But unlike Zeno, instead of focusing on the endpoint of a journey that never ends, I focus on how the arrowsmiths made the arrow, its place in the quiver, and the quiver’s placement—displacement, replacement—in the world. I look at the promises of progressive ideologies and personal experiences as ruins to be excavated, as folds to unfold, as paths through academic miasma. I am convinced that in the story (or stories) of becoming, we have a good chance of deconstructing the underlying academic ideology—that

being a something (e.g., a successful professor, an awesome theorist, a disciplinarian maven, a covergirl feminist) is better than *becoming*. For me, now, discovering the intricate interweavings of class, race, gender, education, religion, and other diversities that shaped me early on into the kind of sociologist I did become is a practical way of refracting the worlds—academic and other—in which I live. None of us knows his or her final destination, but all of us can know about the shape makers of our lives that we can choose to confront, embrace, or ignore.

I am not certain how others will document their becoming, but I have chosen structures that suit my disposition, theoretical orientation, and writing life. I am “growing myself up” by refracting my life through a sociological lens, fully engaging C. Wright Mills’s “sociology”—the intersection of the biographical and the historical. I am discovering that my concerns for social justice across race, class, religion, gender, and ethnicity derive from these early childhood experiences. These have solidified my next writing questions. How can I make my writing matter? How can I write to help speed into this world a democratic project of social justice?

I do not have catchy or simple answers. I know that when I move deeply into my writing, both my compassion for others and my actions on their behalf increase. My writing moves me into an independent space where I see more clearly the interrelationships between and among peoples worldwide. Perhaps other writers have similar experiences. Perhaps thinking deeply and writing about one’s own life has led, or will lead, them to actions that decrease the inequities between and among people and peoples and that decrease the violence.

■ PART 2: WRITING AS A METHOD OF NOMADIC INQUIRY

Elizabeth Adams St. Pierre

My writing about writing as a method of inquiry in this doubled text appears after Laurel Richardson’s for good reason; it is an effect of

Richardson’s work in the sense that it is a trajectory, a “line of flight” (Deleuze & Parnet, 1977/1987, p. 125), that maps what can happen if one takes seriously her charge to think of writing as a *method* of qualitative inquiry. I read a very early draft of this chapter, titled “Writing: A Method of Discovery,” in 1992 in a sociology class that Richardson taught on postmodern research and writing. I had been trained years earlier, as an English major, to think of expository writing as a tracing of thought already thought, as a transparent reflection of the known and the real—writing as representation, as repetition. I still use that strategy for certain purposes and certain audiences even though I now chiefly use writing to disrupt the known and the real—writing as *simulation* (Baudrillard, 1981/1988), as “subversive repetition” (Butler, 1990, p. 32).

Thinking Richardson and Deleuze together, I have called my work in academia “nomadic inquiry” (St. Pierre, 1997a, 1997c), and a great part of that inquiry is accomplished in the writing because, for me, writing is thinking, writing is analysis, writing is indeed a seductive and tangled *method* of discovery. Many writers in the humanities have known this all along, but Richardson has brought this understanding to qualitative inquiry in the social sciences. In so doing, she has deconstructed the concept *method*, putting this ordinary category of qualitative inquiry *sous rature*, or under erasure (Spivak, 1974, p. xiv), and thereby opened it up to different meanings.

This concept certainly needs to be troubled. Two decades ago, Barthes (1984/1986) wrote, “Method becomes a Law,” but the “will-to-method is ultimately sterile, everything has been put into the method, nothing remains for the writing” (p. 318). Thus, he said, “it is necessary, at a certain moment, to turn against Method, or at least to regard it without any founding privilege” (p. 319). In other words, it is important to interrogate whatever limits we have imposed on the concept method lest we diminish its possibilities in knowledge production.

This is one of postmodernism’s lessons—that foundations are contingent (Butler, 1992). In fact, every foundational concept of conventional, interpretive qualitative inquiry, including method,

is contingent, and postmodernists have deconstructed many of them, including data (St. Pierre, 1997b), validity (Lather, 1993; Scheurich, 1993), interviewing (Scheurich, 1995), the field (St. Pierre, 1997c), experience (Scott, 1991), voice (Finke, 1993; Jackson, 2003; Lather, 2000), reflexivity (Pillow, 2003), narrative (Nespor & Barylske, 1991), and even ethnography (Britzman, 1995; Visweswaran, 1994). This is not to say that postmodern qualitative researchers reject these concepts and others that have been defined in a certain way by interpretivism; rather, researchers have examined their effects on people and knowledge production during decades of research and have reinscribed them in different ways that, of course, must also be interrogated. Nor do postmodern qualitative researchers necessarily reject the words themselves; that is, they continue to use, for example, the words *method* and *data*. As Spivak (1974) cautioned, we are obliged to work with the "resources of the old language, the language we already possess and which possesses us. To make a new word is to run the risk of forgetting the problem or believing it solved" (p. xv). So, we use old concepts but ask them to do different work. Interestingly, it is the inability of language to close off meaning into concept that prompts postmodern qualitative researchers to critique the presumed coherency of the structure of conventional, interpretive qualitative inquiry. For some of us, the acknowledgment that that structure is, and always has been, contingent is good news indeed.

Language and Meaning

Richardson gestured toward the work of language earlier in this chapter, but here I describe in more detail the tenuous relation between language and *meaning* in order to ground my later discussion of postrepresentation in a postinterpretive world. We know that much deconstructive work has been done in the human sciences since the "linguistic turn" (Rorty, 1967), the "postmodern turn" (Hassan, 1987), the "crisis of legitimation" (Habermas, 1973/1975), and the "crisis of representation" (Marcus & Fischer, 1986), all of

which employ a "consciousness of a language which does not forget itself" (Barthes, 1984/1986, p. 319) or, as Trinh (1989) put it, a consciousness that understands "language as language" (p. 17). Nearly four decades ago, Foucault (1966/1970) wrote that "language is not what it is because it has a meaning" (p. 35), and Derrida (1967/1974) theorized *différance*, which teaches us that meaning cannot be fixed in language but is always deferred. As Spivak (1974) explained, "word and thing or thought never in fact become one" (p. xvi), so language cannot serve as a transparent medium that mirrors, "represents," and contains the world.

The ideas that meaning is not a "portable property" (Spivak, 1974, p. lvii) and that language cannot simply transport meaning from one person to another play havoc with the Husserlian proposition that there is a layer of prelinguistic meaning (pure meaning, pure signified) that language can express. In this respect, postmodern discourses differ from "the interpretive sciences [that] proceed from the assumption that there is a deep truth which is both known and hidden. It is the job of interpretation to bring this truth to discourse" (Dreyfus & Rabinow, 1982, p. 180). These discourses also play havoc with the belief that noise-free rational communication (Habermas, 1981/1984, 1981/1987)—some kind of transparent dialogue that can lead to consensus—is possible, or even desirable, since consensus often erases difference. Further, Derrida's statement (as cited in Spivak, 1974) that "the thing itself always escapes" (p. lxix) throws into radical doubt (and, some would say, makes irrelevant) the hermeneutic assumption that we can, in fact, answer the ontological question "What is . . . ?"—the question that grounds much interpretive work.

But postmodernists, after the linguistic turn, suspect that interpretation is not the discovery of meaning in the world but rather the "introduction of meaning" (Spivak, 1974, p. xxiii). If this is so, we can no longer treat words as if they are deeply and essentially *meaningful* or the experiences they attempt to represent as "brute fact or simple reality" (Scott, 1991, p. 26). In this case, the interpreter has to assume the burden of

meaning-making, which is no longer a neutral activity of expression that simply matches word to world. Foucault (1967/1998) wrote that "interpretation does not clarify a matter to be interpreted, which offers itself passively; it can only seize, and violently, an already-present interpretation, which it must overthrow, upset, shatter with the blows of a hammer" (p. 275). However, despite the dangers of the hermeneutic rage for meaning, we interpret incessantly, perhaps because of our "human inability to tolerate undescribed chaos" (Spivak, 1974, p. xxiii). In this regard, Foucault (as cited in Dreyfus & Rabinow, 1982) suggested that we are "condemned to meaning" (p. 88). But Derrida (1972/1981) had another take on meaning and suggested, "To risk meaning nothing is to start to play, and first to enter into the play of *différance* which prevents any word, any concept, any major enunciation from coming to summarize and to govern . . . differences" (p. 14). Derrida (1967/1974) called this deconstructive work *writing under erasure*, "letting go of each concept at the very moment that I needed to use it" (p. xviii). The implications for qualitative inquiry of imagining writing as a letting go of meaning even meaning proliferates rather than a search for and containment of meaning are both compelling and profound.

Clearly, postmodern qualitative researchers can no longer think of inquiry simply as a task of making meaning—comprehending, understanding, getting to the bottom of the phenomenon under investigation. As I mentioned earlier, this does not mean they reject meaning but rather that they put meaning in its place. They shift the focus from questions such as "What does this or that mean?" to questions such as those posed by Scott (1988): "How do meanings change? How have some meanings emerged as normative and others been eclipsed or disappeared? What do these processes reveal about how power is constituted and operates?" (p. 35). Bové (1990) offered additional questions, and I suggest that we can substitute any object of knowledge (e.g., marriage, subjectivity, race) for the word "discourse" in the following: "How does discourse function? Where

is it to be found? How does it get produced and regulated? What are its social effects? How does it exist?" (p. 54).

And since Richardson and I especially love writing, we have asked ourselves these questions about writing and have posed another that we find provocative: *What else might writing do except mean?* Deleuze and Guattari (1980/1987) offered some help here when they suggested, "writing has nothing to do with signifying. It has to do with surveying, mapping, even realms that are yet to come" (pp. 4–5). In this sense, writing becomes a "field of play" (Richardson, 1997) in which we might loosen the hold of received meaning that limits our work and our lives and investigate "to what extent the exercise of thinking one's own history can free thought from what it thinks silently and to allow it to think otherwise" (Foucault, as cited in Racevskis, 1987, p. 22). In this way, the linguistic turn and the postmodern critique of interpretivism open up the concept writing and enable us to use it as a *method of inquiry*, a condition of possibility for "producing different knowledge and producing knowledge differently" (St. Pierre, 1997b, p. 175).

Writing Under Erasure: A Politics and Ethics of Difficulty

So what might the work of *writing as inquiry* be in postmodern qualitative research? What might writing under erasure look like, and how, in turn, might such writing rewrite inquiry itself? My own experiences in this regard have emerged from a long-term postmodern qualitative research project that has been both an interview study with 36 older white southern women who live in my hometown and an ethnography of the small rural community in which they live (St. Pierre, 1995). It is important to note that this study was not designed to do interpretive work—to answer the questions "who are these women?" and "what do they mean?" I never presumed I could know or understand the women—uncover their authentic voices and essential natures and then represent them in rich thick description. Rather, my task was twofold: (1) to use postmodernism to

study subjectivity by using Foucault's (1984/1985, 1985/1986) ethical analysis, care of the self, to investigate the "arts of existence" or "practices of the self" the women have used during their long lives in the construction of their subjectivities and (2) to use postmodernism to study conventional qualitative research methodology, which I believe is generally both positivist and interpretive.

Also, since I call myself a writer—thanks to Richardson (it took a sociologist to teach this English teacher writing)—I determined early in the study to use writing as a method of inquiry in at least these two senses: (1) I would think of writing as a *method of data collection* along with, for example, interviewing and observation and (2) I would think of writing as a *method of data analysis* along with, for example, the traditional—and what I think of as structural (and positivist)—activities of analytic induction; constant comparison; coding, sorting, and categorizing data; and so forth. It should be clear at this point that the coherence of the positivist and/or interpretivist concept method has already been breached by investing it with these different and multiple meanings and, henceforth, efforts to maintain its unity may be futile. (Indeed, I hope others will follow my lead and imagine other uses for writing as a method of inquiry.) Further, these two methods are not discrete as I have made them out to be. Making such a distinction is to stay within the confines of the structure of conventional qualitative inquiry in which we often separate data collection from data analysis. Nevertheless, I retain the distinction temporarily for the purpose of elucidation.

In my study, I used writing as a method of data collection by gathering together, by collecting—in the writing—all sorts of data I had never read about in interpretive qualitative textbooks, some of which I have called *dream data*, *sensual data*, *emotional data*, *response data* (St. Pierre, 1997b), and *memory data* (St. Pierre, 1995). Such data might include, for example, a pesky dream about an unsatisfying interview, the sharp angle of the southern sun to which my body happily turned, my sorrow when I read the slender obituary of one of my participants, my mother's disturbing

comment that I had gotten something wrong, and very real "memor[ies] of the future" (Deleuze, 1986/1988, p. 107), a mournful time bereft of these women and others of their generation. These data were neither in my interview transcripts nor in my fieldnotes where data are supposed to be, for how can one textualize everything one thinks and senses in the course of a study? But they were always already in my mind and body, and they cropped up unexpectedly and fittingly in my writing—fugitive, fleeting data that were excessive and out-of-category. My point here is that these data might have escaped entirely if I had not *written*; they were collected only *in the writing*.

I used writing as a method of data analysis by using writing to think; that is, I wrote my way into particular spaces I could not have occupied by sorting data with a computer program or by analytic induction. This was rhizomatic work (Deleuze & Guattari, 1980/1987) in which I made accidental and fortuitous connections I could not foresee or control. My point here is that I did not limit data analysis to conventional practices of coding data and then sorting it into categories that I then grouped into themes that became section headings in an outline that organized and governed my writing in advance of writing. *Thought happened in the writing*. As I wrote, I watched word after word appear on the computer screen—ideas, theories, I had not thought before I wrote them. Sometimes I wrote something so marvelous it startled me. *I doubt I could have thought such a thought by thinking alone*.

And it is thinking of writing in this way that breaks down the distinction in conventional qualitative inquiry between data collection and data analysis—one more assault to the structure. Both happen at once. As data are collected in the writing—as the researcher thinks/writes about her Latin teacher's instruction that one should thrive in adversity; about a mink shawl draped elegantly on aging, upright shoulders; about the sweet, salty taste of tiny country ham biscuits; about all the other things in her life that seem unrelated to her research project but are absolutely unleashed within it—she produces the strange and wonderful

transitions from word to word, sentence to sentence, thought to unthought. Data collection and data analysis cannot be separated when writing is a method of inquiry. And positivist concepts, such as audit trails and data saturation, become absurd and then irrelevant in postmodern qualitative inquiry in which writing is a field of play where anything can happen—and does.

There is much to think about here as conventional qualitative inquiry comes undone—in this case, as writing deconstructs the concept *method*, proliferating its meaning and thereby collapsing the structure that relied on its unity. But how does one “write it up” after the linguistic turn? Postmodern qualitative researchers have been courageous and inventive in this work, and Richardson identified and described this writing both as “experimental writing” (Richardson, 1994) and as “CAP ethnography” (Richardson, 2000). Of course, there is no model for this work since each researcher and each study requires different writing. I can, however, briefly tell a small writing story about my own adventures with *postrepresentation*.

As I said earlier, in my study with the older women of my hometown, I set out to study subjectivity and qualitative inquiry using poststructural analyses, so my charge was to critique both the presumed unified structure of an autonomous, conscious, knowing woman who could be delivered to the reader in rich, thick description as well as the presumed rational, coherent structure of conventional qualitative inquiry that could guarantee true knowledge about the women. Never having read a postmodern qualitative textbook, I initially tried to force—to no avail—postmodern methodology into the grid of interpretive/positivist qualitative inquiry. When the lack of fit became apparent and then absurd, I began to deconstruct that structure to make room for difference.

At the same time, I began to assume a writerly reticence to describe or represent my participants and thereby encourage some kind of sentimental identification. After all, it was subjectivity, not the women, that was the object of my inquiry. I became wary of the not-so-innocent assumption of interpretivism that the women should be

drilled and mined for knowledge (“Who are they?” “What do they mean?”) and then represented. This did not seem to be the kind of ethical relation these women who had taught me how to be a woman required of me. I am reminded here of a comment by Anthony Lane, the film critic for *The New Yorker*, who suggested that instead of asking whether David Lynch’s film, *Mulholland Drive*, makes sense (“What does it mean?”), viewers should ask what Laurence Olivier once demanded of Dustin Hoffman (“Is it safe?”) (Lane, 2001). In interpretive research, we believe representation is possible, if perhaps unsafe, but we do it anyway with many anxious disclaimers. In postmodern research, we believe it isn’t possible or safe, and so we shift the focus entirely, in my case, away from the women to subjectivity. We increasingly distrust the “old promise of representation” (Britzman, 1995, p. 234) and, with Pillow (2003), question a science whose goal is representation.

In my own work, I have developed a certain writerly incompetence and underachievement and am unable to write a text that “runs to meet the reader” (Sommer, 1994, p. 530), a comfort text (Lather & Smithies, 1997) that gratifies the interpretive entitlement to know the women. Rather than being an “epistemological dead end” (Sommer, 1994, p. 532) (the women as objects that can be known), the women are a line of flight that take me elsewhere (the women as provocateurs). This is not to deny the importance of the women or to say that they are not in my texts since they are everywhere, but I gesture toward them in oblique ways in my writing by relating, for example, one of our vexing conversations that burgeoned into splendid and productive confusion about subjectivity or by relating an aporia about methodology they insist I think. And when someone asks for a story about the women, I give them a good one, and if they ask for another, I say, “Go find your own older women and talk with them. They have stories to tell that will change your life.”

Nevertheless, I long to write about these older women who are dying, dying, dying and fear I will someday, but only after wrestling with that postrepresentational question: *What else might*

writing do except mean? That writing will involve a *politics and ethics of difficulty* that, on the one hand, can only be accomplished if I write but, on the other, cannot be accomplished on the basis of anything I already know about writing. There are no rules for postrepresentational writing; there's nowhere to turn for authorizing comfort.

What has postmodernism done to qualitative inquiry? I agree with Richardson's (1994) response to this question: "I do not know, but I do know that we cannot go back to where we were" (p. 524). Or, as Deleuze and Parnet (1977/1987) put it, "It might be thought that nothing has changed and nevertheless everything has changed" (p. 127). At this point, I return to the criteria that Richardson has set for postmodern ethnographic texts. Can the kind of writing I have gestured toward here—writing under erasure—exhibit a substantive contribution, aesthetic merit, reflexivity, impact, and reflect lived experience? I believe it can. But even more importantly, writing as a method of inquiry carries us "across our thresholds, toward a destination which is unknown, not foreseeable, not preexistent" (Deleuze & Parnet, 1977/1987, p. 25), perhaps toward the spectacular promise of what Derrida (1993/1994) called the "*democracy to come*" (p. 64), a promise those who work for social justice cannot not want. I think about this democracy often since it promises the possibility of different relations—relations more generous than those I live among, fertile relations in which people thrive.

The paradox, however, is that this democracy will never "present itself in the form of full presence" (Derrida, 1993/1994, p. 65) but nonetheless demands that we prepare ourselves for its arrival. Derrida (1993/1994) explained that it turns on the idea that we must offer "hospitality without reserve" to an "alterity that cannot be anticipated" from whom we ask nothing in return (p. 65). Thus, the setting-to-work of deconstruction in the democracy-to-come is grounded in our relations with the Other. In postmodern qualitative inquiry, the possibilities for just and ethical encounters with alterity occur not only in the field of human activity but also in the field of the text, in our writing. In these overlapping spaces, we

prepare ourselves for a democracy that has no model, for a postjuridical justice that is always contingent on the case at hand and must be effaced even as it is produced. Settling into a transcendental justice and truth, some deep meaning we think will save us, may announce a lack of courage to think and live beyond our necessary fictions.

Ethics under deconstruction then, is ungrounded, it is "what happens when we cannot apply the rules" (Keenan, 1997, p. 1). This ethics of difficulty hinges on a tangled responsibility to the Other "that is not a moment of security or of cognitive certainty. Quite the contrary: the only responsibility worthy of the name comes with the withdrawal of rules or the knowledge on which we might rely to make our decisions for us." The event of ethics occurs when we have "no grounds, no alibis, no elsewhere to which we might refer the instance of our decisions." In this sense, we *will always be unprepared to be ethical*. Moreover, the removal of foundations and originary meaning, which were always already fictions, simply leaves everything as it is but without those markers of certainty we counted on to see us intact through a text of responsibility. So, how do we go on from here? How do we get on with our work and our lives?

Deleuze (1969/1996) suggested that the events in our lives—and in this essay, I'm thinking specifically of all those relations with the Other that qualitative inquiry enables—tempt us to be their equal by asking for our "best and most perfect. Either ethics makes no sense at all, or this is what it means and has nothing else to say: *not to be unworthy of what happens to us*" (pp. 148–149). The event, then, calls us to be worthy at the instant of decision, when what happens is all there is—*when meaning will always come too late to rescue us*. At the edge of the abyss, we step without reserve toward the Other. This is deconstruction at its finest and, I believe, the condition of Derrida's democracy-to-come. This democracy calls for a renewed "belief in the world" (Deleuze, 1990/1995, p. 176) that, I hope, will enable relations less impoverished than the ones we have thus far imagined and lived. As I said earlier, the setting-to-work of deconstruction

is already being accomplished by postmodern qualitative researchers in all the fields of play in which they work.

As for me, I struggle every day not to be unworthy of the older women of my hometown who keep on teaching me ethics. It may seem that I am not writing about them in this essay, but I assure you they are speaking to you in every word you read. Brooding and writing about our desire for their presence (meaning) in this text and others I might write occupies much of my energy, yet I trust writing and know that one morning I will awaken and write toward these women in a way I cannot yet imagine. I trust you will do the same, that you will use writing as a method of inquiry to move into your own impossibility, where anything might happen—and will.

■ PART 3: WRITING PRACTICES

Laurel Richardson

Writing, the creative effort, should come first—at least for some part of every day of your life. It is a wonderful blessing if you will use it. You will become happier, more enlightened, alive, impassioned, light-hearted, and generous to everybody else. Even your health will improve. Colds will disappear and all the other ailments of discouragement and boredom.

—Brenda Ueland, *If You Want to Write*

In what follows, I suggest some ways of using writing as a method of knowing. I have chosen exercises that have been productive for students because they demystify writing, nurture the researcher's voice, and serve the processes of discovery about the self, the world, and issues of social justice. I wish that I could guarantee them to bring good health as well.

Metaphor

Using old worn-out metaphors, although easy and comfortable, invites stodginess and stiffness after a while. The stiffer you get, the less flexible you are. Your ideas get ignored. If your writing is

clichéd, you will not “stretch your own imagination” (Ouch! Hear the cliché of pointing out the cliché!) and you will bore people.

1. In traditional social scientific writing, the metaphor for theory is that it is a “building” (e.g., structure, foundation, construction, deconstruction, framework, grand) (see the wonderful book by Lakoff & Johnson, 1980). Consider a different metaphor such as “theory as a tapestry,” “theory as an illness,” “theory as story,” or “theory as social action.” Write a paragraph about “theory” using your metaphor. Do you “see” differently and “feel” differently about theorizing using an unusual metaphor? Do you want your theory to map differently onto the social world? Do you want your theory to affect the world?

2. Look at one of your papers and highlight your metaphors and images. What are you saying through metaphors that you did not realize you were saying? What are you reinscribing? Do you want to do so? Can you find different metaphors that change how you “see” (“feel”) the material and your relationship to it? Are your mixed metaphors pointing to confusion in yourself or to social science's glossing over of ideas? How do your metaphors both reinscribe and resist social inequities?

Writing Formats

1. Choose a journal article that exemplifies the mainstream writing conventions of your discipline. How is the argument staged? Who is the presumed audience? How does the article inscribe ideology? How does the author claim “authority” over the material? Where is the author? Where are “you” in the article? Who are the subjects and objects of research?

2. Choose a paper that you have written for a class or published and that you think is pretty good. How did you follow the norms of your discipline? Were you conscious of doing so? What parts did the professor/reviewer laud? Did you elide over some difficult areas through vagueness, jargon, a call to authorities, science writing norms, and/or other rhetorical devices? What voices did you exclude in your writing? Who is the audience?

Where are the subjects in the paper or article? Where are you? How do you feel about the paper or article now? How do you feel about your process of constructing it?

Creative Analytical Writing Practices

1. Join or start a writing group. This could be a writing support group, a creative writing group, a poetry group, a dissertation group, a memoir group, or the like (on dissertation and article writing, see Becker, 1986; Fox, 1985; Richardson, 1990; Wolcott, 1990).

2. Work through a creative writing guidebook (for some excellent guides, see Goldberg, 1986; Hills, 1987; Ueland, 1938/1987; Weinstein, 1993).

3. Enroll in a creative writing workshop or class. These experiences are valuable for both beginning and experienced researchers.

4. Use "writing up" fieldnotes as an opportunity to expand your writing vocabulary, habits of thought, and attentiveness to your senses and to use as a bulwark against the censorious voice of science. Where better to develop your sense of Self—your voice—than in the process of doing your research? What better place to experiment with point of view—seeing the world from different persons' perspectives—than in your fieldnotes. Keep a journal. Write writing stories, that is, research stories.

5. Write a writing autobiography. This would be the story of how you learned to write, the dicta of English classes (topic sentences? outlines? the five-paragraph essay?), the dicta of social science professors, how and where you write now, your idiosyncratic "writing needs," your feelings about writing and about the writing process, and/or your resistance to "value-free" writing. (This is an exercise used by Arthur Bochner.)

6. If you wish to experiment with evocative writing, a good place to begin is by transforming your fieldnotes into drama. See what ethnographic rules you are using (e.g., fidelity to the speech of the participants, fidelity in the order of the speakers and events) and what literary ones

you are invoking (e.g., limiting how long a speaker speaks, keeping the "plot" moving along, developing character through actions). Writing dramatic presentations accentuates ethical considerations. If you doubt that, contrast writing up an ethnographic event as a "typical" event with writing it as a play, with you and your hosts cast in roles that will be performed before others. Who has ownership of spoken words? How is authorship attributed? What if people do not like how they are characterized? Are courtesy norms being violated? Experiment here with both oral and written versions of your drama.

7. Experiment with transforming an in-depth interview into a poetic representation. Try using only the words, rhythms, figures of speech, breath points, pauses, syntax, and diction of the speaker. Where are you in the poem? What do you know about the interviewee and about yourself that you did not know before you wrote the poem? What poetic devices have you sacrificed in the name of science?

8. Write a "layered text" (cf. Ronai, 1995; Lather & Smithies, 1997). The layered text is a strategy for putting yourself into your text and putting your text into the literatures and traditions of social science. Here is one possibility. First, write a short narrative of the self about some event that is especially meaningful to you. Step back and look at the narrative from your disciplinary perspective. Then insert into the narrative—beginning, midsections, end, or wherever—relevant analytical statements or references using a different type-script, alternative page placement, or a split page or marking the text in other ways. The layering can be a multiple one, with different ways of marking different theoretical levels, different theories, different speakers, and so forth. (This is an exercise used by Carolyn Ellis.)

9. Try some other strategy for writing new ethnography for social scientific publications. Try the "seamless" text in which previous literature, theory, and methods are placed in textually meaningful ways rather than in disjunctive sections (for an excellent example, see Bochner, 1997). Try the "sandwich" text in which traditional social science

themes are the "white bread" around the "filling" (Ellis & Bochner, 1996), or try an "epilogue" explicating the theoretical analytical work of the creative text (cf. Eisner, as cited in Saks, 1996).

10. Consider a fieldwork setting. Consider the various subject positions you have or have had within it. For example, in a store you might be a sales clerk, a customer, a manager, a feminist, a capitalist, a parent, or a child. Write about the setting (or an event in the setting) from several different subject positions. What do you "know" from the different positions? Next, let the different points of view dialogue with each other. What do you discover through these dialogues? What do you learn about social inequities?

11. Write your "data" in three different ways—for example, as a narrative account, a poetic representation, and readers' theater. What do you know in each rendition that you did not know in the other renditions? How do the different renditions enrich each other?

12. Write a narrative of the self from your point of view (e.g., something that happened in your family or in your seminar). Then, interview another participant (e.g., a family member or seminar member) and have that participant tell you his or her story of the event. See yourself as part of *the participant's* story in the same way as he or she is part of your story. How do you rewrite your story from the participant's point of view? (This is an exercise used by Ellis.)

13. Collaborative writing is a way in which to see beyond one's own naturalisms of style and attitude. This is an exercise that I have used in my teaching, but it would be appropriate for a writing group as well. Each member writes a story of his or her life. For example, it could be a feminist story, a success story, a quest story, a cultural story, a professional socialization story, a realist tale, a confessional tale, or a discrimination story. Stories are photocopied for the group. The group is then broken into subgroups (I prefer groups of three). Each subgroup collaborates on writing a new story—the collective story of its members. The collaboration can take any form—drama, poetry, fiction,

narrative of the selves, realism, and so forth. The collaboration is shared with the entire group. Each member then writes about his or her feelings about the collaboration and what happened to his or her story—and life—in the process.

14. Consider a part of your life outside of or before academia with which you have deeply resonated. Use that resonance as a "working metaphor" for understanding and reporting your research. Students have created excellent reports and moored themselves through the unexpected lens (e.g., choreography, principles of flower arrangement, art composition, sportscasting). Those resonances nurture a more integrated life.

15. Different forms of writing are appropriate for different audiences and different occasions. Experiment with writing the same piece of research for an academic audience, a trade audience, the popular press, policymakers, research hosts, and so forth (Richardson, 1990). This is an especially powerful exercise for dissertation students who might want to share their results in a "user-friendly" way with their fellow students.

16. Write writing stories (Richardson, 1997). These are reflexive accounts of how you happened to write the pieces you wrote. The writing stories can be about disciplinary politics, departmental events, friendship networks, collegial ties, family, and/or personal biographical experiences. What these writing stories do is situate your work in contexts, tying what can be a lonely and seemingly separative task to the ebbs and flows of your life and your self. Writing these stories reminds us of the continual cocreation of the self and social science.

Willing is doing something you know already—there is no new imaginative understanding in it. And presently your soul gets frightfully sterile and dry because you are so quick, snappy, and efficient about doing one thing after another that you have no time for your own ideas to come in and develop and gently shine.

—Brenda Ueland, *If You Want to Write*

■ NOTE

1. The CAP acronym resonates with "cap" from the Latin for "head," *caput*. Because the head is both mind and body, its metaphorical use breaks down the mind-body duality. The products, although mediated throughout the body, cannot manifest without "head-work." In addition, "cap," both as a noun (product) and as a verb (process), has multiple common and idiomatic meanings and associations, some of which refract the playfulness of the genre—a rounded head covering or a special head covering indicating occupation or membership in a particular group, the top of a building or fungus, a small explosive charge, any of several sizes of writing paper, putting the final touches on, lying on top of, surpassing or outdoing. And then, there are the other associated words from the Latin root, such as capillary and capital(ism), that humble and contextualize the labor.

POETICS FOR A PLANET

Discourse on Some Problems of Being-in-Place

Ivan Brady

We are dwellers, we are namers, we are lovers, we make homes and search for our histories. And when we look for the history of our sensibilities, . . . it is to . . . the stable element, the land itself, that we must look for continuity.

—Seamus Heaney,
“The Sense of Place”

The great function of poetry is to give us back the situations of our dreams.

—Gaston Bachelard,
The Poetics of Space

A poetics must return to a way of dreaming works and the declarations that accompany them, of conceiving their possibility, and of working for their reality.

—Fernand Hallyn, *The
Poetic Structure of the World*

Author's Note. I thank Yvonna Lincoln, Norman K. Denzin, John F. Sherry, Jr., Stephen Saraydar, Tracy Lewis, and Sara Varhus for their generous comments on earlier drafts of this chapter. I am also grateful to Beth Messana and Crystal Knowland for technical support along the way.

Stonehenge, Wessex Chalklands, July 21, 1997

A Gift of the Journey

*Magical megaliths. Stonehenge. Sun mask. Druid dance.
The hand brushes the obelisk—mossy green and grey,
cold for a summer's day—dragging fingertips across
the texture, Braille for a pulse? We want to touch
the mystery of this place, even as the mind's eye squints
for a glimpse of deeper meanings, sequestered in time
and cultural distance, some of which seem to be murmured
in the eclipse of stones at dusk and dawn. But the magic
does not reside in the stones themselves. It is embedded in
the reading, the immersion of self in place, and the puzzle
of the circle that only gets more puzzling when spotted
by the eye of the sun. Like the morning dew, this Druid
magic is tied to a clock of nature. It emerges from nowhere
and disappears just as mysteriously with the heat of midday
—or too much inspection. Poets who would see this clearly
must chase the beams gently, introspectively, as they refract
on the traces of magicians and astronomers who have danced
through the bosom of these stones in patterns and rhythms
we hope are coded within us all. The experience steps us
into another reality and with all the power of ritual turns
day to dream, taking us out of ourselves for a while to show
us something about ourselves—about how we have been
and where we think we used to be—a kind of mythopoeic
archaeology. The best poets still know how to do it. Magic,
it seems, is a gift of the journey.*

This is a poem I wrote about method (Brady, 2003b, p. 34). It suggests that one can get to know places marked as culturally distant through careful reflections on current experiences, that is, introspectively and imaginatively, relative to whatever hard facts or remnants may appear to lie at hand. That is how landscapes become semiotically rich, historical, and perhaps even sacred. They are projections of self, of each of us—all of us—now and before. But interpreting such investments from previous inhabitants is extraordinarily difficult, if for no other reason than the

fact that even with widely shared constructs about the meaning of this place or that in any society, individual interpretations can vary widely. The same place can mean different things to different people in intensity of social and emotional commitment, if not in more dramatically different terms, even when they engage it on the same culturally standardized premises (e.g., when Americans visit the Grand Canyon or some other richly defined sacred national retreat). A sense of place, especially sacred space, shows all the volatility and variations of ritual inferences

for these reasons (Brady, 1999). Moreover, as an interpreter from another cultural epoch, excavating that information in some semblance of its original form from an otherwise mute landscape cannot be done without a code or guide, living or otherwise, to the semiotic investments of those who have passed that way before and perhaps are no longer represented there (cf. Lane Deer & Erdoes, 1972, pp. 96–107). And even then, interpretations of artifact use or texts slide into the soup of polyvalence and multivocality and themselves become creative rejuvenations of performances tied through time to a sea of shifting landscapes—to the intertextualities of life that we study as ethnographers. For these and other reasons, places such as Stonehenge and the great petroglyph areas of the American Southwest are steeped in mystery, compelling and interesting in the shadows of their kinships to us but puzzles that are nonetheless ripe for wide-ranging interpretations.

That said, we must wonder what exactly environmentally concerned critics, such as poet Gary Snyder, nature writer Barry Lopez, mountain climber Jack Turner, and art historian Simon Schama, have in mind when they exhort us to relearn respect for the land we inhabit and to renew our ties to places both sacred and less exalted as a countermeasure to the thoughtless destruction of modern life.¹ I think that what they want us to know is a kind of history that includes, but reaches far beyond, what we can learn from the archaeologies and histories one finds in museums today (which are themselves, of course, specialized interpretations in their own right).² These caring citizens share a quest for personal knowledge, for self-conscious information about being-in-place, and for participation that can catch us in the act of complacency about who we are, where we have been, and where we are going and thereby might change our thinking about the meaning of life in the landscapes of our respective pasts and presents. What they seek is, in that sense, more poetic than scientific. They are committed more to methods of immersion and self-conscious saturation than to those of clinical distancing as forms of learning. Each approach in the extreme begs comparisons of peoples and

their changing environmental circumstances, and each for those reasons is appropriate for pursuing the overall problem at hand, but the various approaches do so on vastly different terms of evidence and reporting. Our critics find common ground in the middle—respect for facts, as they can be determined more or less objectively, that is mixed with the first-person powers of poetic interpretation and representation (not just poetry). The overall effort loops into the area of educated imagination, that is, thoughtfulness focused on what is reasonable and possible in solving puzzles. On that score, poetics and science share common ground. Inference, speculation, and metaphor play an important role in both cases.³ The result, in this case, is approximately what I have referred to elsewhere as “artful science.”⁴ It shows up here as prolegomena to a poetics of place pushed through the following five organizing questions. What are we supposed to learn from such environmental inquiries? What are the sources of information? What are the obstacles in and prospects for doing so? What can we hope to gain? How shall we tell the story?

What follows is an attempt to answer these questions and, in the process, outline a poetics of place with a conscience.⁵ It is rooted in our propensities to make sense of material and imaginative experiences through projections of being-in-the-world and the use of our culturally appropriated bodies—our sensuous-intellectual apparatuses—as the primary instruments for doing so. It draws on landscapes variously described as “home,” “wild,” and “sacred,” where the sensuous is conspicuously brought to the fore through most forms of participation (sites where emotional content often dominates conscious interpretations). It pursues knowledge mostly ignored or formally discounted by the extremes of logical positivism. It advocates as a complement (not as a replacement) *a kind of knowing and reporting* that (a) promotes phenomenology as a philosophy that puts the observer (the seeker, the knower) upfront in the equation of interpreting and representing experience; (b) pushes interpretive anthropology back into the loop of sensual experience, a body-centered position that

includes a consideration of but transcends the sweeping metaphor that everything (e.g., people, landscapes) can and should be rendered as texts to be interpreted; (c) finds some continuity in the structures and orientations of body-groundedness and myth despite important limitations posed by language itself and by epistemic interference between the present and our preliterate past; and (d) gives poets special cachet through their offering forms of knowing and saying (robust metaphors and more) that can engage the senses and visions of being-in-place in ways that both exceed and complement more conventional strategies in anthropology and history. In deference to the critics named and the need for advocacy in the social sciences, all of this is tied to considerations of who we think we are, where we have been, and where we might go from here with the idea of reclaiming respect for the land and its inhabitants, human and otherwise, past and present.

■ OPPORTUNITY: BRING THERE

*I travel your length, like a river / I travel
your body, like a forest, / Like a mountain
path that ends at a cliff / I travel along the
edge of your thoughts, / and my shadow
falls from your white forehead, / my
shadow shatters, and I gather the pieces /
and go on with no body, groping my way.*

—Octavio Paz, *Piedra de Sol*¹⁸

"Ways of dividing up space vary enormously in intricacy and sophistication, as do techniques of judging size and distance," Yi-Fu (1979, p. 34) tells us, and if we look for fundamental principles of spatial organization in all cultures, we find them in two kinds of facts: "the posture and structure of the human body, and the relations (whether close or distant) between human beings" (p. 34). We organize the space we occupy through intimate experiences with these two things to make it serve our social and physical needs.¹⁹ That deeply evolved sense of place is strong and is linked to (among other things) natality, kinship, and mortality—to sacred and

personal space, spiritual help, travel, the seasons, and the calendar (cf. Geertz, 1996, p. 259). Personal space itself is a collecting center for experience and identity construction, as an individual and as a member of groups, and is a center for recollection that can be variously hoarded and shared with others through storytelling about life as lived (Brady, 2003b, pp. xiv–xv). Movement in these fields creates histories and also puts an emphasis on the present. Thoughts about past landscapes are necessarily grounded in contemporary processes of mind and knowledge about being-in-place, so the cleavage between now and what we think "used to be" cannot just give itself to us freely sans interpretation. Historical knowledge of any kind involves a culturally constructed, cognitively filtered, and reciprocal process, an apprehension and a representation of place to mind and back again, revolving and evolving in its constructions.²⁰ It is a mixed conscious and unconscious process, received much like the patterns of puzzlements that we take to task in the circle of stones and, therefore, subject to a variety of selective perception biases and omissions, if not simply paving the high road to inventing the truth that we *need* to find, the conclusions that comfort and support us no matter what the evidence by other calculations.²¹ Context is the key to it. Knowing the context of words, behaviors, and artifacts is practically everything for determining meaning. Whatever Stonehenge or other historical landscapes used to be, the larger point is that they can be known in meaningful elaborations only as they are grounded by perceptions in the moments of our current existence.²² There is no way to bypass that process. That is the sine qua non of a poetics of place, of being-in-place, and it starts in the ultimate home—the embodied self.

Is there some common ground that can be apprehended through the trowels, brushes, and screens of the senses that will give us a realistic impression of life in ancient places and thereby address the concerns of our environmental critics? We are one species, one subspecies in biological form, embodied more or less the same everywhere, and as conscious beings we need to know (or think we know) where we are before we

are able to choose definitive courses of action. The comparative framework provided by that posture gives us access to other humans through sympathy and empathy; that is, by tapping into "fellow feeling" with speculation and imagination at work, both of which are essential parts of the interpretive equation. Both can also be souped up in special ways by being on-site, in-place—by "being there" (cf. Geertz 1983)—anywhere. That by itself does not guarantee anything specific in terms of knowledge of culture or place. Getting *there* takes existing knowledge from which one can update or launch a new perspective, thereby invoking a boatload of biases and related selective constructions of mind about exactly *where* one is, "home" or not, and so on. But the processes of projecting a physical and cultured self on the places and moments at hand and making sense of them through an educated imagination—no matter how fantastic (we can learn things only in terms of what we already know)—are fundamental to human thought and, thus, to conditions of being-in-place. They provide a context for analogies between things present and past. Guided tours of historical and ancient places rely precisely on such in-person emulations to add realism (literally realization, an internalizing process) to the experience (see also Coles, 1979; Saraydar, 1976; Saraydar & Shimada, 1973). They also generally provide specific scripts or guidebooks to fill in historical details. That combination of "being and seeing" writ large situates itself in what we can call the *sensuous-intellectual continuum*, the biocultural grounding that we all bring to consciousness of being-in-place through our bodies and that, because of its integrated and systemic nature, can be represented in a common frame of reference (Blackburn, 1971). That is what makes us tick and know that we are ticking as sentient beings, as movers and makers of metaphors in place—the baseline of being and seeing and sharing it with others.¹¹

By using this model and relying especially on the comparative strengths of engaging in "parallel enterprises" as humans,¹² it follows that we can tap into the sensuous-intellectual continuum as we know and experience it, heighten consciousness

of our own culturally constructed screens of beliefs and behaviors (with and without scripts of expert testimony), and draw reasonable conclusions about how we are now as beings *in* and *of* place and perhaps what it *might* have been like to have occupied and left our marks on particular landscapes before us.

■ GETTING THERE: THE ONTOGENY OF SPACE AND PLACE

Man is nowhere anyway/Because nowhere is here/And I am here to testify.

—Jack Kerouac, *Mexico City Blues*¹³

"Getting there" complements "being there" as an important concept in ethnography and must be maintained in any attempt to create a poetics of place. Approaching literature as an existentialist, and thereby leapfrogging any narrowly textual or ethnographic forms of analysis in favor of an anthropology of experience, poet/ethnographer Michael Jackson puts a premium on the meaning in journeying rather than on the stacked-up facts that an ethnographer is likely to report after having reached and researched a destination. Jackson (1995) argues that "the authenticity of ethnographic knowledge depends on the ethnographer recounting in detail the events and encounters that are the grounds on which the very possibility of this knowledge rests" (p. 163). Getting to that point cognitively is seldom discussed in any ethnographic context. But that is where a phenomenological account of being-in-place must begin. Let me start with myself, going and being nowhere in particular (something on the order of my current employment), just negotiating my own existence in space and place.¹⁴

For me, *space* is transparent, ethereal, abstract, a vacuum cornered in the mind's eye abstractly as empty geometry. It is a cognitive and culturally defined container of sorts into which concrete and meaningful things can occur or be put. *Place*, in my comfortable view, is a filled space, tangible, concrete, habitable, traversable, or defined specifically against such interests as those unavailable

for human occupation (e.g., mountain peaks). It is the geography of earth, mind, body, and lived experience, the semiotically enriched site of events human and otherwise. It is where whatever happens in my experience does happen. My experience also leads me to believe that all people make something special of their engagements with the properties of place, including drawing boundaries of time, space, consciousness, and memory of being in it to orient and define themselves (see also Basso 1996a, 1996b; Feld, 1982; Feld & Basso, 1996; Low & Lawrence-Zúñiga, 2003; Yi-Fu, 1979). They make life-in-place meaningful and push it way beyond shelter making and survival (Danesi & Perron, 1999, p. 137). They turn it into signifying systems, render it in signs and images of themselves, apprehend it through metaphors and imagery of their own making—their languages, cultures, and histories—and use it to govern relations among families, native and stranger, own and other, things near and far, things past and future, and the everyday realities of being in particular places. They mark it with their embraces and alienations of kinship in a composite world, their horizons and trails of history, and the eschatologies of their fears. They find it in the high peaks of their hearts and minds and externalize the imprints of both in the physical world by accident and by design while exploring, claiming, residing, nurturing, repelling, depositing, building, storying, and sometimes even erasing the paths of their lives. For these reasons, as soon as we start identifying features of landscape (peopled or not) and marking off boundaries (actual or implied), we situate ourselves in particular concepts of place—in something approximating, by structure and category, the worldviews and histories of the cultures whose members “make sense” of these experiences—ours and those of others.

Nevertheless, thinking about space as a container for place can be misleading for analytic purposes (cf. Hirsch & O'Hanlon, 1995; Low & Lawrence-Zúñiga, 2003), especially when one projects that sequence on the ontogeny of place in individual experience (cf. Thompson, 1989,

p. 127)—the essence of a phenomenological stance.¹⁵ The conceptual relationship between space and place is transitional and metonymic, but not necessarily unidirectional in our emerging consciousness. The connection of bringing place to consciousness creates the illusion that its meaning is a function of the landscape itself, something external and discovered, shaped beyond us. But as Schama (1995) says, “Before it can ever be a repose for the senses, landscape is the work of the mind. Its scenery is built up as much from state of memory as from layers of rock” (pp. 6–7). A sense of being-in-place is given to us cognitively at some deep level, but it is also appropriated by culture and rendered meaningful in a variety of ways. It is a manufactured concept, a pan-human construct that anchors our sense of meaningful location—our *position* in space relative to other specific people or things (including social distance between persons or objects)—and it comes to mind only as our representational capacity makes the world appear twice: “once as a recalcitrant external reality and again as a malleable inner actuality” (Braun, 1991, p. 7).¹⁶ Places in this way are turned into cultural products, and our experiences of them, as Casey (1996) argues persuasively, are “never precultural or presocial” (p. 17). From a phenomenological perspective, the ontogeny is such that we emerge consciously *in* an occupied place and abstract the concept of space from that. In a phenomenological account, place is prior to space. It is *where* being-in-the-world happens.¹⁷ The *how* of it includes concrete immediacy in perception: Lowe (1982) says, “Before anything else, it is for me a real, pretheoretical world, wherein I undertake everyday living. This is my primary reality” (p. 170).¹⁸ Moreover, Casey (1996) continues, even though a phenomenological approach has “its own prejudicial commitments and ethnocentric stances,” its commitment to concrete description honors the experiences of its practitioners. That connects both the anthropological field-worker and the indigenes in place: “Both have no choice but to begin with experience. As Kant insisted, ‘there can be no doubt that all our knowledge begins with experience’” (p. 16; see also Csordas, 1994).¹⁹

■ IMAGINATION: PRIMARY TRANSPORT

I think I have told you, but if I have not, you must have understood, that a man who has a vision is not able to use the power of it until after he has performed the vision on earth for the people to see.

—Black Elk, *Black Elk Speaks*²⁰

We can add poets to the list of those conjoined by a phenomenological perspective (Heidegger, 1971) and use that thought to invite a deeper investigation of the role of imagination and creativity in constructing a poetics of place. Because places function as grounds for our projections of self and culture and a history of both—one private, the other public, all of it personal—and because we convert our place experiences into the “idioms” (the language and images) of the world as we know it, believe it, see it, and ordinarily argue it, the content may include what noninitiates see as mythical impossibilities (including landscapes peopled by spirits, etc.).²¹ That interiorizing and largely unconscious process is often taken for granted or conflated with the significance that people assign to what they see as the dominant or “definitive” contents of particular landscapes. These are specific constructs for mentally centering and filing one kind of experience or another, including the circumscriptions of turf traveled on foot or touched only in our imaginations. Thus, place is defined by what we see in terms of landscape features through projections of self and culture and, therefore, by fantasy and wish fulfillment and other trappings of consciousness in the identity of the perceivers. For these same reasons, Thompson (1989) sees history as

an imaginary landscape—a tableau of battles for some, a mural of scientific discoveries and technological inventions for others; and for those who avert their eyes from horizons of mystery or hallways of propaganda, there still remains an internal cinema of unconsciously edited perceptions in which self is the *figure* and nature the *ground*. (p. 127)

In fact, he suggests that “consciousness itself, as either a Buddhist heap (*skandha*) or a scientific narrative, is a landscape, for one cannot know without a world” (p. 127). Life in this sense is a constant process of negotiating landscapes (internal and external), and interpretation is as necessary to the process as is breathing, no matter how bizarre or fantastic it may seem from the outside looking in.

These creative dimensions, flexibilities, and transitive minglings of process pose a variety of analytic problems and beg the question of how we will tell the stories of places that structure our lives.²² The concept of place cannot in any absolute way be separated from its contents—from the meanings assigned to its location and the activities or features marked in association with it. It cannot be seen as a “thing in itself.” That would require an unobtainable absolute or clinical view beyond the cultural constructions of human consciousness (and that is why both logical positivism and, ultimately, hermeneutic “bracketing” fail here). But we can get closer to the essence of the concept of place—to the concrete and the sublime and largely ineffable qualities of it as a stabilizing, orienting framework for action—by looking for common denominators in the diversity of the meanings assigned to it by ourselves and others. Whatever they are, they ultimately form a comparative context with a personal sense of home at the center.

■ UNIVERSAL PLACE: HOME AND HEARTH

He had no use for sensual gratification, unless that gratification consisted of pure, incorporeal odors. He had no use for creature comforts either and would have been quite content to set up camp on bare stone.

—Patrick Suskind, *Perfume*²³

“Like a mirror,” Snyder (1990) writes, “a place can hold anything, on any scale” (p. 25). Everyone knows that it holds a sense of “home” at its roots.²⁴

We all have homes, and in some ways none of us has the same one. Individual perceptions and experiences vary to the point where even family experiences shared in the same geographic location, in a common dwelling, and in the same hearth from childhood to old age do not produce clones. There are always individual versions of the experience. We mark them with personal names and related claims, and we spend time pooling them more or less in our stories and related interactions with others as a way of constructing the social reality of events that define home for all. Home is, in this sense, a place held in common by experience but unpackable in its semiotic particulars as a single version for each person involved. It is never "a seamless whole, a single story. Our imaginations set free in us other selves that seldom see the light. We lead several lives in the course of one" (Jackson, 1995, p. 161).

Despite sometimes radical differences in cultural content, in this ego-centered and relativistic way our homes are the essence of our being-in-place and our becomings in life. Even at their weakest and most fragmented moments, they are grounded in bodily experiences as emotionally loaded and semiotically coded memories, either positive or negative, and they all have a networking or centrifugal quality attached to them. These bundles of thoughts and emotions fan out as meaningful expectations about how life is or ought to be in relations with others, intersecting with the hearths and homes in surrounding neighborhoods and regions and ultimately linking up with the natal centers, the fetal and fatal places, the ancestral turfs of the rest of the world. Various physical and cultural processes make that a shifting landscape, including natural disasters, the aggrandizements and failures of colonial expansions and conquering economies, the fortunes and misfortunes of war, and the furrows of migration plowed by things such as homesteading, job seeking, refugee evacuations, and the influential cultural ship jumpers—the beachcombers of life—crossing into the frontiers of strangers and making homes there. Although certain adaptations must be made in new places (including the option of "going home"), on some

scale migrants always carry their homes with them in the form of the languages, cultures, and traditions that defined their natal places (Jackson, 1995; Marshall, 2004). There is security in the transportable nest of knowledge that we call culture—the histories and desires embedded in knowing how to make and provision a hearth, in deciding who should share it and the wedding bed, and in determining where all of it literally might be placed.²⁵

One good bet nowadays is that most people will not place a long-term hearth in what they consider to be a wilderness area. Doing so through the orientations and transport of modern culture puts many elements of the environment at risk, including one's own body—especially for the uninitiated. That would also constitute yet another episode in—a continuation of powerful forces already set in motion by—colonization and urbanization. But these concerns can also be very misleading. Wilderness has always been fundamental to human experience. For hundreds of thousands of years, nature has been more than a place to visit. Snyder (1990) says that it is home, a territory with more *and* less familiar places. Some "are more difficult and remote, but all are *known* and even named" (p. 7).²⁶ Nonetheless, some places in our modern experiences remain decidedly "wild," beyond the pale of what most of us would consider comfortable and secure habitation. What urbanites see as wilderness today helps to define the centering concept of home place in the breach, that is, by conceptualizing what is plainly *not* home—and that can foster two dramatically different consequences. One is to relegate such areas to a netherland of mind, out of sight and out of concern, thereby letting the strip-and-sweep policies of economic development take their tolls on these places unnoticed. Such culture runs its course, economies are stimulated, hearths get provisioned by the substantially employed, the rich get richer, ancestral places get erased at exponential rates, and no one except the developers, the politicians, the people exploited on the margins, and a few odd ethnographers seem to care. The other consequence is to recognize wilderness as foundational to our

nist history of being-in-place in the long run as humans, let alone what is arguably a key to the future of the planet itself. This reaction shows up as an attempt to cherish and preserve what remains as wilderness, to learn from it some of the things we used to know about sustaining ourselves in body and spirit, and that in turn makes every such experience a candidate for creating sacred space. Mindful of the foundations of body and home, let me consider each of the categories of wild and sacred landscapes in more detail and then talk about their relationships and how we story them in ways that matter.

■ WILD PLACES AND THE ASSEMBLY OF ALL BEINGS

The rain comes over the hills, / like fluttering birds it comes. / I stand in my brother's tears / happy as the running stream. / Ho! Brother. / Tread upon the wide plains. / Lonely rugged mountains rule the land.

—Archie Weller, "The Hunter"²⁷

"Wild" places, such as home turf and sacred spaces, are sites where emotional content often dominates interpretations. If you say that you are going to live "in the wild" or "go wild" or just be "wild at parties," no one ever thinks that you are about to be placid and contemplative. Internally, we are in fact rooted in whatever was and is wild by our biology—by our "creatureliness." As a conscious motivation, aiming to "be wild" is a commitment of an embodied self to irregular and emotionally stimulating conditions. Externally, wild is a condition of landscape that modern Westerners might contemplate in fantasy or engage in person as adventurers, explorers, or castaways, among other marginal categories of being. The point is that being of the flesh and working in and with wild things in wild areas is a source of special identity for most of us, a marker of unusual boundaries. When *wild* becomes a *where*, it generally transforms into *wilderness*, a condition of wild landscape, a place where meaning

abounds. It is, therefore, ripe picking for poets and artisans of all types, for all who would love its riches and lament its losses. It forms another "architectonic" link to the peoples and processes that are fundamental to a poetics of place.²⁸ But *where* is it? Gone? Seldom near? Far away and gasping for breath under the crush of a global economy? Or, is it somehow all of the above yet always with us? Snyder (1990) has some answers.

A Western sense of the "wild" is a place where "nature" rules—a place marked by ancient and eternal activities, untamed animals, uncultivated plants, and "an ordering of impermanence," if not "unruliness, disorder, and violence" (Snyder, 1990, p. 5). Although wilderness cannot be seen in any way other than through the screens of culture, it is commonly thought of as an environment that is culturally unbuilt, ungoverned, unscarred, or otherwise unmodified by humans. Encountering it always gets our attention in special ways. *Where* we find it is important. It is not confined to isolated mountains, deserts, or forests. Snyder (1990) reminds us that "a ghost wilderness hovers around the entire planet; the millions of tiny seeds of the original vegetation are hiding in the mud on the foot of an Arctic tern, in the dry desert sands, or in the wind" (p. 14). He suggests that it may, in fact, return at some point, although not in "as fine a world as the one that was glistening in the early morning of the Holocene" (p. 14). Wildness, on the other hand, is now and has always been everywhere with its "ineradicable populations of fungi, moss, mold, yeast, and such that surround and inhabit us. Deer mice on the back porch, deer bounding across the freeway, pigeons in the park, spiders in the corners" (p. 14). Urbanites live constantly in a sublimated or ignored wildness in this sense (bug and vermin exterminators take care of the rest), and although it can be a source of both reverence and wonder for the people who case its margins, enter it, and dwell in it for any length of time, the wilderness where wildness dominates is often consciously displaced, moved to its own outback in the geography of our minds until it shows up in a television travelogue or the vicarious thrill of adventure novels or Arctic explorer accounts-turned-coffee table displays.²⁹

The wilderness that most people know is "a charade of areas, zones, and management plans that is driving the real wild into oblivion" (J. Turner, 1996, p. 23). It is a nice place to visit through the glass of an automobile in the national parks of Nairobi or Yellowstone or in the few brave steps from the paved roads that roll through these areas like carpets for the conquering kings.⁴⁰ Few would want to live there. The farmers of these margins get a little closer to the culturally untamed, but only on the other sides of their fences. More than anyone, their job for thousands of years has been to erase the wilderness, homestead its meadows, tame its grasses, and replace its original animals with liveries and livestock. But all of the farmers in the world cannot hold a candle to the environmental corruptions and erasures of the great urban developers. Our wild landscapes have changed as wildernesses have disappeared.

Snyder (1990) asks us to stand up and be counted on this both intellectually and ecologically:

Wilderness is a place where the wild potential is fully expressed, a diversity of living and nonliving beings flourishing according to their own sorts of order. In ecology we speak of "wild system." When an ecosystem is fully functioning, all members are present at the assembly. To speak of wilderness is to speak of wholeness. Human beings came out of that wholeness, and to consider the possibility of reactivating membership in the Assembly of All Beings is in no way regressive. (p. 12)

But we have to ask how that can be done. How will we know when it is being done? Where is the map for being-in-place this way? Some of the answers lie in history. Others lie in the politics and sensitivities of the moment. The only sure way of putting them together is to increase one's awareness of and participation in the landscapes of lived experience.⁴¹ Moreover, raising the stakes on both our being-in-place and having been there, Lopez (1990b), asserts,

A sense of place must include, at the very least, knowledge of what is inviolate about the relationship between a people and the place they occupy,

and certainly, too, how the destruction of this relationship, or the failure to attend to it, wounds people. Living in North America and trying to develop a philosophy of place—a recognition of the spiritual and psychological dimensions of geography—inevitably brings us back to our beginnings here, to the Spanish incursion. (p. 41)

It brings us back to the history of a place whose home crossings have uprooted practically everything indigenous and wild and have pushed it around in a movable tragedy of cross-cultural casualties and increasingly fluid disconnections from the land itself. That marks a dramatic change from what was once kindled and supplanted in the worldviews of many people, including Native Americans (see, e.g., Deloria, 1993), to something profane and dangerous. Setting overromanticized views of noble savages and pristine nature aside, one can discover that both kinds of circumstances—supportive and accommodating or dangerous to one's well-being—can hold value as "sacred" at one level or another. Only corruption kills the prospect altogether.

■ SACRED SPACES AND MYTH

There is a place of great importance to me on a pine-skirted plateau in Utah's Uinta Mountains. Elk and deer weave trails of meaning through the trees and into the escape of cliffs and heavy timber; coyotes plant scat, gorged with hair and bone, among sagebrush and juniper. The place resounds with voices of birds and small mammals, and a thousand smells of the wilderness. To me, this place is cleanly holy. I cannot explain why; I only know that for twenty years it has filled me with awe and yearning, and solitude and peace. It is a space of great sacredness, seldom visited, always appreciated.

—Richard Poulsen, *The Pure Experience of Order*⁴²

Perhaps no other experiential domain shows the "made" or implied impositions of culture on geography more than places held to be sacred by the

beholders (Brady, 2004). They are precious by definition. On the positive and more conventional side of that, the combination of cultural values and memory applied to such places can produce a poetics of reverie and respect, of awe and mystery, if not specific rituals designed to commemorate and renew such experiences.³⁴ But we know that the same places can be experienced very differently (the "parallax factor"). Unlike stepping in the puddles on a clay road after a rain, one can step in some sacred space as an outsider and never feel the change.³⁵ As Nelson (1983) observes quite correctly,

Reality is not the world as it is perceived directly by the senses; reality is the world as it is perceived by the mind through the medium of the senses. . . . [It] is what we have learned to see through our own traditions, and they do not always line up as equivalents from one culture to the next. The interactions between Koyukon people and nature illustrate this clearly, for theirs is a world in which nature moves with power and humans are bound to a special system of environmental morality. (p. 239)³⁶

Such space is easily trampled by the uninitiated, by the claims of interlopers—the mini-colonials that ethnocentrism makes of us—who see all before them as an unfolding of their own turf. Access to the initiates' codes can save us from this error, that is, at least remind us that natural landscapes are everywhere more than physiography. They are, first and foremost, repositories of meaning that, not counting our own impositions of view and minus an artifact or two to flag other human presence, are most likely to remain invisible without a living guide.³⁷

Investing the experiences of smell, taste, touch, sight, and hearing in a landscape whose features endear themselves to us or frighten us is a way of appropriating meaningful contexts in which to exist; to act in pleasure and remembrance; to meditate, marvel, and mystery over; to reassure; to reissue; to remember as a reconsideration of life circumstances in plans for the future, for the next step, perhaps for the rest of our lives and the emplotments of our deaths. Such projections can make sacred space in our mind's eye and the behaviors steered by it; they create places for

communion, ecstatic immersion, or other forms of poetic inspiration, on the one hand, and places for piaculum, supplication out of fear and anxiety (Yi-Fu, 1979), literally places to be avoided except under the most carefully calculated circumstances (e.g., rituals of sacrifice), on the other.³⁸ But the separation of these forms is not always clear because of cross-cultural misunderstandings and the knowledge that opposite interpretations can occupy the same geographic location (Brady, 2003b, pp. 93–100; Fernandez, 2003). There is also always much that appears "in between." Sacred places can stand alone as territory marked in the minds of those who know of them vicariously or in person. But when engaged in person and recognized as such, they inevitably beg questions of boundaries (where the sacred "ends" and something more secular begins) and thereby form an avenue to liminality, that is, to spiritual or imaginary places and conditions of being not only between particular people and their geography but also in the alignments of persons and spirits in a community that ostensibly shares such views.³⁹ These are "neither here nor there" spaces that become a crossing ground for senses of self and cultures, individuals and gods, powerful landscapes and access to the sublime, among other possibilities. That does not make them any less stimulating to the imagination or diminish the need to know how we, as intruders or observers, might or might not fit into them. On the contrary, once discovered, culturally defined environmental borders are even more likely to be conspicuous and puzzling if for no other reason than the semiotic diversity of their stimulations and expressions.⁴⁰

■ OPAQUE FACILITATOR: THE NATIVE MYTH-MIND

The leaves on the trees, the grasses on the hills and in the valleys, the waters in the creeks and in the rivers and the lakes, the four-legged and the two-legged and the wings of the air—all danced together to the music of the stallion's song.

—Black Elk. *Black Elk Speaks*⁴¹

All other things being equal, language communicates the mental being and moods corresponding to it in the communicator. "In the psychotopographic universe, language is also subject to transformation, and its disintegration from a vehicle for recognizable human communication into something 'other'—both divine and demonic—also signals the shift in the transcendental world of merged subject and object" (Nelson, 1996, p. 106). That makes the story context or form of communicating voice paramount to its meaning, and it includes stories about place, some of which are focused on places that are both wild and sacred. Among the gatherers and hunters of the world, these are sites that are rich with meaning and power and that have multiple uses (e.g., menstrual seclusion, graveyards, ritual initiations) and realities tied to them. They are the stuff of legends tied to human and more-than-human landscapes, and the memories of them "are very long" (Snyder, 1990, pp. 81–82).⁴¹ One reason for "the profound association between storytelling and the more-than-human terrain" in tribal societies, as Abram (1996) suggests, is that it "resides in the encompassing, enveloping wholeness of a story in relation to the characters that act and move within it" (p. 163). Indeed, because "we are situated in the land in much the same way that characters are situated in a story," the members of a deeply oral culture may experience this relation "as something more than mere analogy: along with the other animals, the stones, the trees, and the clouds, we ourselves are characters within a huge story that is visibly unfolding all around us, participants within the vast imagination or dreaming of the world" (p. 163)—and that is, at best, a shifting landscape, a moving target, but not totally beyond the scope of reclamations.⁴²

From his travels in Australia, Snyder (1990) offers the following "as one example of the many ways [in which] landscape, myth, and information were braided together in preliterate societies":

We were traveling by truck over dirt tract west from Alice Springs in the company of a Pintubi elder named Jimmy Tjungurrayi. As we rolled along the dusty road, sitting back in the bed of a pickup, he

began to speak very rapidly to me. He was talking about a mountain over there, telling me a story about some wallabies that came to that mountain in the dreamtime and got into some kind of mischief with some lizard girls. He had hardly finished that and he started in on another story about another hill over here and another story over there. I couldn't keep up. I realized after about half an hour of this that these were tales to be told while walking, and that I was experiencing a speeded-up version of what might be told over several days of foot travel. Mr. Tjungurrayi felt graciously compelled to share a body of lore with me by virtue of the simple fact that I was there.

So remember a time when you journeyed on foot over hundreds of miles, walking fast and often traveling at night, traveling night-long and napping in the acacia shade during the day, and these stories were told to you as you went. In your travels with an older person, you were given a map you could memorize, full of lore and song and also practical information. Off by yourself, you could sing those songs to bring yourself back. And you could maybe travel to a place that you'd never been, steering only by the songs you had learned. (pp. 82–83)

Even this little snippet about sacred space illustrates nicely the principle that existential interpretations situated in worldviews give place a temporal dimension and also reflect both the predicaments and the solutions to them posed by changing environmental circumstances.⁴³ Focusing in particular on Native American materials, Leonard and McClure (2004) see such stories as important

because in them the mythic breaks through into our present world, embodying the very kinds of boundary crossing that are so central to all mythological thinking. *Such stories give us a chance to see, to feel, the present of mythic truth in the midst of our perceptions of contemporary reality.* Whether they are the repositories of national or ethnic identity or the site of supernatural revelation or visitation, whether they are actual places where we can stand and hear the echoes of long-ago battles or imaginary places shaped by the requirements of mythic vision, sacred places serve to teach and remind us of who we are and how we ought to behave in our day-to-day lives. . . . Sacred places, especially in the

various senses that Native Americans use the term, call out to us to *become* “down to earth,” to remember and honor and revitalize our essential connections to the earth and the natural world, to the sacred all around us. They invite us to associate the spiritual with such natural material phenomena as mountains, rivers, lakes, trees, and caves. The study of stories about sacred places might just allow us to see such opposed binaries as past versus present, realistic versus mythological, or spiritual versus material as not so mutually exclusive. (p. 320, emphasis added)⁴⁴

Certain places within the mutually owned territory of old cultures, Snyder (1990) says, are loaded with “numinous life and spirit.” They are “perceived to be of high spiritual density because of plant or animal habitat intensities, or associations with legend, or connections with human totemic ancestry, or because of some geomorphological anomaly, or some combination of qualities” (p. 93). They are cultural and spiritual “gates through which one can—it would be said—more easily be touched by a larger-than-human, larger-than-personal, view” (p. 93; see also Deloria, 1993; Munn, 2003). Such sites offer a glimpse of the internal workings of belief and behaviors that put cultural histories into ecologies of place, some of which might be seen as “spiritual game management” (Snyder, 1990, p. 87). They also show us that storytelling is much more than amusement. It is fundamental to human life—especially (it seems) in myth, where one can change the content and bend the structure to achieve common understanding of perennial problems. Indeed, Verene (1976) finds that “human understanding must always have at its center the notion of the myth. In its movement toward the recollecting of origin, it discovers always again the myth, the original power of image-making or mimesis, the science of which, as Vico says, is the first that must be learned” (p. 34).

Within limits of coherence of the whole, consistency of theme, and related structural concerns, myths are a flexible and highly generalizable form of storytelling about the past in personal terms. They are linked to the now and then through one Gordian knot or another in terms

aimed specifically at stirring up something poetic in the audience.⁴⁵ Poetry itself is tied to the context of the immediate and the immanent, to the processes of “being there” and sensual saturation, and to the art of the possible and not necessarily the actual, in or out of what might seem to be an obvious historical or mythological context (Brady, 2003b). Like myth, poetry addresses the long run by allowing for diverse particulars in accounting for events of the moment in forms that tap into the larger continuities and commonalities of being human. Access to some of this material is guaranteed through studies of oral poetry, for much of that is tied directly to the timekeepings and implications of ritual and myth, to stories of origins and the peoplings of landscapes through events and discoveries over time as conceptualized by the tellers—and perhaps defended in what is viewed from other perspectives as a mix of fantasy and reality (Tedlock, 1983, p. 55). In this way, myths provide a complicated source of information on worldviews and associated behaviors that pervades both history (with its mix of literate and preliterate participants) and prehistory (with its exclusively preliterate participants) and thereby helps to frame meaning and action in our lives today.⁴⁶

Schama (1995), in his provocatively aesthetic and historical *Landscape and Memory*, argues that to put that to work in environmental review and renewal, “what we need are new ‘creation myths’ to repair the damage done by our recklessly mechanical abuse of nature and to restore the balance between man and the rest of the organisms with which he shares the planet” (p. 13; see also Kozinets & Sherry, 2004; Leonard & McClure, 2004, p. 324; Richardson, 1975; Saraydar, 1986; Sherry & Kozinets, 2004).⁴⁷ Wondering whether or not this is a cure for what ails us is not “to deny the seriousness of our ecological predicament, nor to dismiss the urgency with which it needs repair and redress” (Schama, 1995, p. 14), but we have to ask about the old ones in the process:

For notwithstanding the assumption, commonly asserted in these texts, that Western culture has

evolved by sloughing off its nature myths, they have, in fact, never gone away. For if, as we have seen, our entire landscape tradition is the product of shared culture, it is by the same token a tradition built from a rich deposit of myths, memories, and obsessions. The cults which we are told to seek in other native cultures—of the primitive forest, of the river of life, of the sacred mountain—are in fact alive and well and all about us *if we only know where to look for them*. (p. 14, emphasis added)⁴⁸

On the premise that “strength is often hidden beneath the commonplace,” Schama’s study is “constructed as an excavation below our conventional sight-level to recover the veins of myth and memory that lie beneath the surface” (p. 14). It is an archaeology of knowledge, another architectonic connection to a poetics of place that supplements and gives new instructions to the more parochial endeavors of academic archaeology and history. It is a deeply poetized effort that may coach us into finding something of our internal but dusty guidebooks in the places set aside as wilderness in our cultural traditions and in portrayals of those and other landscapes in writing, painting, and photography, both past and present. It is “a way of looking, of rediscovering what we already have, but which somehow eludes our recognition and our appreciation. Instead of being yet another explanation of what we have lost, it is an exploration of what we may yet find” (p. 14).⁴⁹

Snyder and others share the hope in this. The native myth-mind—first encountered by Europeans in North America by Cabeza de Vaca, last known fully by the Native American Ishi—is “not dead and gone. It is perennially within us, dormant as a hard-shelled seed, awaiting the fire or flood that awakes it again” (Snyder, 1990, p. 13; cf. Saraydar, 1986). This thinking again raises the issue of both myth-time and history in relation to landscape. “We are all capable of extraordinary transformations. In myth and story, these changes are animal-to-human, human-to-animal, animal-to-animal, or even farther leaps” (Snyder, 1990, p. 20) to other shared forms of being-in-place,⁵⁰ including the dreams we have had about such things and the oral and graphic

representations we have left behind in the winding and sometimes broken trails of being human over the long haul. “The essential nature” of being in any part of this equation, Snyder asserts with optimism, “remains clear and steady through these changes” (p. 20). That does not guarantee access to the particulars of our pasts, of course, but it does put us in a perpetual and comparative present of sorts. We cannot lose sight of ourselves even if we try, and yet even when we look closely, we find fuzzy boundaries, much to learn, and much that is known at some level but difficult to express.

■ INTANGIBLE OBSTACLES: BEYOND WORDS

*What moves on this archaic force / Wax
wild and welling at the source.*

—N. Scott Momaday,
*The Way to Rainy Mountain*⁵¹

Myth and history are two related ways in which we have kept records of being around as conscious beings-in-place for many thousands of years.⁵² But despite a track record of sameness in narrative form, especially written form, there is nothing in the rulebook that precludes innovation in the presentation of either (Brady, 2004). The pervasiveness of myth in all aspects of our lives shows that not to be a new idea in itself, and history in its most conventional sense, spliced into myth-time as a form of accounting since the advent of writing and the genre building of modern academies, can also be a poem (Brady, 2003b; Denning, 1995, 1998a). Getting at the larger goals of environmental reform staked out here might benefit by building on the kinds of narrative and artistic diversity in Schama’s (1995) compilation, not only by taking a new look at some older ways of telling the story of being-in-place but also by carefully inspecting what exactly is conveyed by such storying by asking about the larger perceptual context.

Reading within and between the lines of Schama’s inspiring work suggests quite readily

that some of what we seek in a poetics of place, both ancient and modern, lies beyond words. Language gathers at the root of all storytelling, including myth, but as Jackson (1995) says, it does not exhaust its content or its possibilities. Experience covers everything. Words do not.⁵³ Consciousness itself is mediated through language, and image and everything that we know emerges in one form or another from experiences of landscape and story. "Such a conception of fieldwork implies a conception of writing" (p. 113) and of language as constitutive of reality, but it does not restrict the inquiry to it even as it puts considerable emphasis on "the creative and ethical domains of human social existence" (Jackson, 1982, p. 2). The oral storyteller and the writer share the task of revealing "people to themselves and to their possibilities" (p. 2).⁵⁴ Furthermore, during this modern age,

one must have recourse to art and literature if one is to keep alive a sense of what hard science, with its passion for definitive concepts and systematic knowledge, often forgoes or forgets. The painter who dispenses with framing in order to reunite the field of artistic vision with the space of the world, or the composer who breaks down the boundaries between what is deemed music and noise . . . find a natural ally in the philosopher who, aware that concepts never cover the fullness of human experience, sees that task of description as more compelling than that of explanation [including descriptions of being-in-place] (Jackson, 1995, pp. 4–5)⁵⁵

Nonetheless, posing a conundrum of sorts, it is through the conveyance forms and content of language and story that we must enter an analysis of places and the events that unfold in them. Like the oral performances that house myths in some embrace of the long-run and second-tier translations of them by experts with their own cultural and textual biases, we need to learn how to interpret the places and events of others and relate them to our own sensuous-intellectual experiences with the best possible representations, that is, in a manner true to what we know, think, and *can* say with reasonable persuasion. But the sources of that information and the language we

need to use to understand and communicate it are not always easily obtained—if they are obtained at all.

■ LIMITED OPPORTUNITY: ORAL POETRY AND MYTH

[Secret Road:] There are trees, crags, gorges, rivers, precipitous places of precipitous land, various places of precipitous land, various precipitous places, gorges, various gorges. It is a place of wild animals, a place of wild beasts, full of wild beasts. It is a place where one is put to death by stealth; a place where one is put to death in the jaws of the wild beasts of the land of the dead.

—Bernardino de Sahagún, "Aztec Definitions"⁵⁶

What is lost from, or created and added to, discourse when it is moved from one person to the next in the same culture pool? Across cultural and linguistic boundaries? It is important to remember the dialogic character of such communications and to keep in mind Bakhtin's wisdom: that language never moves through uncluttered space. It is heteroglossic and mutually constructive in all utterances—all contexts of development, reception, and discovery (Holquist, 1981, p. xx; 1990, p. 69). Combined with what can be learned from history, archaeology, and on-site experiences (however changed over time), we can bolster our sense of past landscapes by studying the legends and tales, the myths and meanings, as we discover them through oral and written texts and the performances and translations of each. They all are, at one level or another, functions of language, and in the quest to understand the nature of being-in-place, language and storytelling are essential but also, in some ways, are inadequate to the task.

In some of his pioneering work on Native American narratives, Hymes (1987) points out that ethnopoetics necessarily starts with language (p. 80), that "it is first of all a matter of taking seriously the ways in which narrators select and

group words" (p. 41), and that the stories of Native American oral discourse "are to be heard, or seen, in lines, and thus are a form of poetry" (p. 49; see also Kroeber, 1983; Swann, 1983; Tedlock, 1972, 1983; Zolbrod, 1983). This is fairly recent and profound thinking that runs against the grain of Western ethnocentrism concerning what does and does not count as poetry. As Zolbrod (1983) says, it has taken a while for scholars to recognize that there is a substantial Native American poetic tradition once misperceived as little more than "casual tale-telling" that is conspicuously poetic to those who know how to recognize its "implicit semantic and rhetorical patterns" and who understand that performance and setting have "a bearing on the utterance of a storyteller not evident in ordinary prose" or in "the printed medium conventionally employed by most translators" (p. 227).⁵⁷

This is empowering knowledge. Tedlock (1983) argues that treating oral narratives as dramatic poetry

clearly promises many analytic . . . [and] aesthetic rewards. The apparent flatness of many past translations is not a reflection but a distortion of the originals, caused by the dictation process, the notion that content and form are independent, a pervasive deafness to oral qualities, and a fixed notion of the boundary between poetry and prose. Present conditions, which combine new recording techniques with a growing sensitivity to verbal art as performed "event" rather than as fixed "object" on the page, promise the removal of previous difficulties. (pp. 54–55)

Moreover, taking advantage of the poetic dimension in every act of speech or writing (which is "related but not identical to its linguistic dimension") and recognizing that all people in the world "continuously produce, reproduce, and revise their own cultures in dialogues among themselves," with or without ethnographers present, as an act of being human, language's dialogical potential can be used "to balance each representation with an alternative representation, producing poetry that is built on a process of translation rather than made to resist translation" (Tedlock, 1999, p. 155). But projecting the most modern of mentalities—reading

as an avenue to interpretation—as a facile metaphor on all that we wish to understand (e.g., "reading" oral performances and landscapes) can be an obstacle in the study of both oral *and* written traditions, that is, a problem in translating Native American and comparable oral presentations firsthand and also in deciphering the written translations we get from others before us (see, e.g., Finnegan, 1992; Hymes, 1987; Kroeber, 1983; Saraydar, 1986; Swann & Krupat, 1987; Tedlock, 1983, 1993, 1999). Times have changed, and our sensibilities have changed along with them.

■ PERCEPTUAL OBSTACLES: EPISTEMIC INTERFERENCE

*At first there is just one line, horizontal
/ A second appears / It's already closer
/ Soon one notices lines everywhere /
They draw rapidly together / Too late one
realizes that / There is no escape.*

—Walter Helmut Fritz,
"Fesselung [Entrapment]"⁵⁸

Texts are an important avenue to the discovery of place in its diverse purchases and appearances everywhere, but using them as evidence for anything is problematic, in part because of the creativities inherent in text construction and reception that change with contexts of interpretation (as we all know and as the history of hermeneutics and interpretive social science in general shows) and in part because of diversity in textual form, performance, and appreciation (cf. Finnegan, 1992, p. xii; Lansing, 1985). Oral or written, they are bound to be multivocal and polyvalent at one level or another and are, therefore, always subject to context-sensitive interpretations that we ourselves impose and that cannot always be determined for the original authors in the case of representations or rereadings. That makes original meanings elusive (cf. Barthes, 1972, 1977; Brady, 1991b; Herzfeld, 2004, p. 39), but it does not preclude the construction of reasonable or agreeable interpretations between author and reader, speaker and hearer, for

communication would then be impossible (Brady, 2003b, p. xxiv). Only the immaculate reception gets foiled in the process, and we do have some empirical data to help us steer and contextualize the problem rationally. But using oral or written texts as an avenue of access to really old things and behaviors is doubly complicated for other reasons as well, not least because we are separated from any possible dialogue with the original authors and from aboriginal conceptions of life in place by fundamental changes in perceptions of the world—by what we can cull from Foucault (1972) as *epistemic interference* in the gaps between prehistory and now, mostly because of the profound changes in our perceptions of ourselves, our products, and our landscapes insinuated through the invention of alphabetic literacy and compounded by the mass production of texts by way of the printing press (Abram, 1996; Lowe, 1982). Our views of the nature of the world and our embodied place in it have changed accordingly.⁵⁹

The rise of alphabetic literacy and its dissemination through printing technology have had a profound effect on what Lowe (1982) calls the “hierarchy of the senses” and, thus, on the way in which we register and store information as humans. One sea change (among others) in this put a special premium on seeing over hearing in the field of perception and provided a means for separating knowledge from speech. Lacking written records, speech in an oral culture fulfills many functions that tend to be compartmentalized in chirographic and typographic cultures. Speech is communication in the latter, and knowledge is primarily preserved by writing. In an oral culture, however, “speech has to fulfill both functions of preserving knowledge as well as of communication, for only in the act of speaking can its knowledge be preserved” (p. 3).⁶⁰ Oral cultures have “an ‘artisan’ form of communication” where “stories arise from the rhythms of a preindustrial order: a world with time to listen, a language that is communal and founded on shared perceptions of reality, a respect for wisdom born of the accrued experience of generations, and a sense of life as still organized around the cycles of nature” (Wolf, 1982, p. 108; see also Feld, 1996). This knowledge

is reinforced through personal experiences and is shared through tellings in oral performances—some ancient, some contemporary. Some with obvious continuity through both. In that connection it is important to recognize that the “residues from the earlier type persist to affect the later one” (Lowe, 1982, p. 2). It follows that aboriginal storytelling “is an art intrinsically at odds with a culture organized around writing and the dissemination of ‘information’” (Wolf, 1982, p. 108), and so it is problematic as a source of ancient anything. By replacing or in other ways influencing folk and oral traditions, written culture undermines our ability to interpret them. The apparent “naturalness” of “seeing” or “reading” knowledge, as opposed to making the more direct connection between oral productions and aural registers, makes all interpretations of preliterate communications subject to deep-seated biases by modern interpreters.

The mix of ancient and modern shows up in contemporary studies of oral narratives and is played out in a synchronic version of epistemic interference that we can call *epistemic pooling*. The pooling part refers to the inevitable mix of diachronic continuities and traces from different traditions that show up at any given moment in history. The principle and context of the problem are encapsulated in Finnegan’s (1992) observation that in folklore studies there is now “a deepening understanding of the *interaction* of oral and written forms as a regular and surprising process across a multi-dimensional continuum, rather than as something which involves bridging some deep divide” (p. xiii, emphasis added; see also Ong, 1967; Rothenberg, 1985, p. xxiii). That is precisely the scenario encountered today by ethnographers, linguists, and folklorists who seek secrets of the past from their contemporaries in other cultures, most pointedly for our purposes here, in the study of oral narratives and poetics as a measure of aboriginal forms of thought and behavior in ancient landscapes.⁶¹ Despite some identifiable presence and separations of those forms in such contexts, the epistemic conditions of current “tribal” tellers are as mixed as anyone else’s. They are modern people as well, and so they are influenced

by the thoughts and premises of literacy at one level or another in text and performance (cf. Bauman, 1992; Finnegan, 1992; Finnegan & Orbell, 1995; Sammons & Sherzer, 2000). Nonetheless, with new sensitivities to the long-run obstacles that separate us, regardless of how subject to muddling they are today, we need to be optimistic. The very fact that there *is* continuity with things ancient in the oral narratives and poetics of some surviving tribal traditions (see, e.g., Perrin, 1987, p. 154) ought to spark our attention and motivate us to refine our methods for studying them. That would help us to get over the hump of what we already know, namely that oral narratives and poetry add an important source to our quest for reclaiming a sense of being in ancient places.⁶²

These are some of the particulars that give motion and distinction to individuals and whole societies. They include fundamental differences that must be taken into account in any attempt to reconcile the separations and connections of language, story, and performance within and between communities, including ethnographers and their informants caught up in the mutually constructing and slippery ventriloquisms (as Dennis Tedlock would say) of speaking for others. That is equally true of attempts to reconcile the separations, and perhaps the traces of continuity, between modern written texts and the aboriginally unwritten (i.e., oral) accounts of being-in-place before the advent of writing (see, e.g., Layton, 1997). It also raises the stakes on the study of sacred space in aboriginal contexts—residual or lasting and reformed in our modern day or not—to something on the order of landscape poetics, to the study of poetics of place on both sides of the cultural fences that divide them. There is no guaranteed method to conquer it all. Meanings can be slippery, fugitive, irreducibly plural things—trains departed from the station leaving only warm tracks behind for us to touch and speculate on (Barthes, 1972, 1977, 1982; Brady, 1991b, pp. 10–11; 2003b, pp. xiii–xiv). But ethnopoetic research to date shows plainly that self-awareness and sensitivity to the impositions of cultural biases—the cultural “truths” that we

take for granted, see as “natural” if we are aware of them at all, or favor in some guise as the “truth we need to find” to validate our identities—are “ground zero” for even starting such projects.⁶³ Knowing about them advances the prospect of resituating ourselves in myth-time and the history of place through texts and associated images. Like Snyder’s Australian experience, that journey will also run the horizon of the old and the new. It will be history as we see it and live it, and so as we create it, with all of the interpretive problems outlined so far, but with the distinct advantage of locating the experience in a realistic site—the body itself, using language geared to sensuous-intellectual grounding and set analytically in an anthropology of ourselves.

■ ROOT FACILITATOR: POETICS AT HOME

To understand the fashion of any life, one must know the land it is lived in and the procession of the year.

—Mary Austin, *The Land of Little Rain*⁶⁴

Call out the poets from among the bards and other performers of life as lived, put them on the peaks of what they consider to be their own lives and lands (Suiter, 2002), and they will likely share the experience with you as an epiphany of landscape—a dance with the sublime, the ancient, the foundational, the deeply personal poetry of themselves as beings-in-place (Bachelard, 1964, pp. 214–215).⁶⁵ Ask them how they know so much, and they will tell you that it is a matter of being-in-place for the long run, of internalizing its smells, sounds, and images—its flow of events and articulations of people and things. It is a matter of building an *embodied* history, they will say, and sometimes of launching that history through trips in the wider world and then “coming home.”

We all have been somewhere beyond the homestead and its heather, and we know that returns can have a profound effect on views of the original experiences (Brady, 2003b). For one thing, nothing remains exactly the same. As Merwin (1997) says, “When I come back I find / a place that was never

there" (p. 121). Times, places, and people change right under our noses. But triggered by sensuously doused memories, recombining the local landscape with a head full of new experiences (and absences) can yield a deeply contextualized poetic that both reinforces and redefines one's place *in* place, that is, by reworking the margins of self and other, native and stranger, old and new, even as the experience unfolds.⁶⁶ Conceptually reregistering something as simple as place names in this context—for example, by virtue of their marrying "the legendary and the local" (or, say, in the case of Gettysburg, the legendary and the national)—can move the trekkers to special sentiments and symbolism of thought and action. The process is informed by both "being there" and "going there," by a then and a now, and by what we know from encounters with other cultures, including the academic and aesthetic works (e.g., painted, chanted, written) of other places, as pooled and compared with existing knowledge of our own (Agee & Evans, 1960; Brady, 2003b; Heaney, 1980b; Kerouac, 1958, 1959, 1960; Williams, 1973, pp. 1–12).⁶⁷

All of these things "interanimate" in the mind's eye (Heaney, 1980b, p. 148), and they are the kinds of things that the poetic-minded Williams (1973) says can be "summoned and celebrated by the power of poetry" (p. 17). But the mental associations are not unfettered archaic recoveries. Nowadays they are sure to be a mix of the kinds of knowledge learned at home, on one's own through personal experience, and through the social entrainments of formal education (Heaney, 1980b, p. 131). Global networking and vast increases in access to public education, according to Heaney (1980b), ensure that in Ireland, for example, people are no longer innocent and that once local parishes now cast a wider net in the world:

Yet those primary laws of our nature are still operative. We are dwellers, we are namers, we are lovers, we make homes and search for our histories. . . . When we look for the history of our sensibilities, I am convinced . . . that it is to . . . the stable element, the land itself, that we must look for continuity. (pp. 148–149)

And in the weave of personal emotion, myth, and symbol that Yeats once spun so effectively in Irish consciousness of self and place, so too do some of the new poets "weave their individual feelings round places they and we know, in a speech that they and we share; and in a world where the sacral vision of place is almost completely eradicated they offer in their art what Michael Longley has called 'the sacraments we invent for ourselves'" (p. 148). Their work shows that home and sacred go hand in hand as much for the sake of grounded identity—literally for locating a culturally defined self—as for the conservation and defense of an historical sanctuary of collected selves, a community, a plural being-in-place, a gathering of individuals with both shared and redefinable "roots" in matters sacred and profane.⁶⁸ Poetry latches on to that and represents for us places that matter plus something as dear as the self to cherish as part of them, as something interanimated and nuanced with the rest of life and the landscapes of its expression.

Perhaps it is also true that a planet of poets so embodied and emplaced would be much less likely to trammel the very source of its own existence; to cut off the milk, the honey, the aesthetic and ecological sustenance of its forests and waterholes, its peaks and valleys; to shatter the web of life that ties coral reef to caribou, owl and finch to prairie grass, buffalo to ground squirrel, and the winds of Sahara and stratosphere to the quality of life in Chicago, Honolulu, and Madrid. Removal from the thick of it by cultural amnesia or ignorance, ideological preference, or insulated physical means does not give this experience. Personal immersion does. It does not guarantee as a process love or admiration or even acceptance of what is encountered. It does force the issue of participation.⁶⁹ The trick is to do it and to share the experience in ways that matter, perhaps on the order of Yeats, who had, as Heaney (1980b) remarks, a dual purpose: (a) "to restore a body of old legends and folk beliefs that would bind the people of the Irish place to the body of their world" and (b) "to supplement this restored sense of historical place with a new set of associations that would accrue when a modern Irish literature,

rooted in its own region and using its own speech, would enter the imaginations of his countrymen" (p. 135). For that nourishment, I think, we will be well served by turning to the poets of place, Irish or not, American and Australian aborigines included, and find some way of hearing them that both represents them accurately in translation and resonates with our deepest being.

■ HEAVY LIFTING: POETS AT WORK

I think white people are so afraid of the world they created that they don't want to see, feel, smell, or hear it.

—John (Fire) Lane Deer,
*Lame Deer: Seeker of Visions*⁷⁰

To meet the goals of conscience in a poetics of place, to move people to action in environmental reform, we need to get beyond considerations of strictly conventional representations and into something richer, more robust, and more tuned to the wider domains of body-centered experience as an avenue to (among other things) the sublime, to epiphanies of place, at home and elsewhere. And if we succeed to some degree in our reclamations and rehearsals of such experiences through these means, we have to ask not only about the kinds of information mustered in the process but, once again, also about who should tell the story and on what terms (cf. Levenson, 2004; Weinstein, 1990; White, 2004). It cannot be the usual social science sources. They prefer language that has the life of uncommon metaphors and personal participation squeezed out of it. Theirs is a language of mortification, that is, of dead metaphors and dried-up facts applied through distanced, or what are supposed to be clinical, observations (cf. Graves, 1948, pp. 223–224). Poets take a different tack. We all are to some degree defined by where we are, where we have been, and where we think we are going. Our *selves* are insinuated in place culturally, historically, linguistically, and so forth through the usual channels of socialization, enculturation, and individual life experiences. But we are also insinuated in place sensually, as

sentient beings, and poetry marks sensual space more consistently than does any other form of representation (Brady, 2004).⁷¹ Although poetry cannot (and will not try to) free itself completely from the inevitable screens and biases of alphabetic literacy, it uses metaphor as a tool for discovering and positing the relations among things, and a poetic immersion of self in the experience of a much-traveled and culturally marked ancient place has a better chance of getting at a realistic account of such experiences primarily because of its devotion to sensuous particulars. Poets are potentially expert representers who offer comparative experiences in a commonly held domain—that of the body itself—and the ultimate aim of poetic expression is to touch the universal through the particular, to evoke and enter into discourse about the sublime, to move the discourse to what defines us all—what we share as humans.⁷²

This argument may apply to any finely wrought figurative language, whether verse or prose, that is, to *poesis* in general (Hallyn, 1990). Joseph Conrad's powerful prose may have the same effect as, or an even more exalted effect than, finely crafted verse by inspiring its audience with the kind of self-consciousness of being that can change lives (cf. Cushing, 1970; Hinsley, 1999). As verse or prose, the content of poetic representations exceeds the literal: "All poetic language is language strenuously composed beyond the requirements of information and therefore striking, perhaps most striking, when most apparently 'transparent'" (Vendler, 1985, p. 59). The "surplus" beyond the literal is inference and argument by analogy and allegory, among many other possible tropic combinations and prospects (cf. White, 1978). In its most creative form, poetry, surplus meaning is a protest against the constraints of the ordinary rules of inquiry: "When a rhyme surprises and extends the fixed relations between words, that in itself protests against necessity. When language does more than enough, as it does in all achieved poetry, it opts for the conditions of overlife and rebels at limit" (Heaney, 1995, p. 158). More than simple mimesis, *poesis* is a process of "being" and

"doing" in variable contexts, a dynamic and reflexive process of construction and selection.⁷³ Because its reception depends markedly on the experiences, preferences, and related biases of the receiver (e.g., reader, hearer), trying to legislate the one correct interpretation is futile; no aesthetic experience can be so governed (Brady, 2003b, p. xvii).⁷⁴ Like myth, one has to know how to interpret these creations. To do that successfully, following Jackson (1995), one has to know something about how and under what circumstances they were produced.

What I am proposing is much more than a change in writing style. More than selective editing is required to get from here to there in a poetics of place. We cannot revisit foundational human experiences in the wildernesses of our pasts simply by writing up knowledge in the present tense, much as one might do in trying to make a film in the ethnographic present, that is, by erasing traces of modern occupation through selective visions and contrived replications. Poetry offers a difference in forms of knowing as well as representing,⁷⁵ and as Howes (1990) sees it,

No amount of experimenting with one's writing style is going to make up for the deficiency of failing to experiment with one's perceptions or "sensory ratio" first. To understand a culture is to "make sense" of it . . . [and that] involves more than a "rejection of visualism" . . . or exchanging an ear for an eye. Making sense involves, minimally, learning how to be of two sensoria at once and reflecting upon how the interplay of the senses in another culture's perceptual system both converges and diverges from their interplay in one's own [culture]. (p. 69)

What distinguishes the best of this writing—thoughtful prose, not poetry (see, e.g., Ohnuki-Tierney, 1981; Seeger, 1975, 1981; Stoller & Olkes, 1986, 1987)—"is the extent to which expositions on odors, sounds, and tastes are treated as intrinsic to the ethnographic message rather than extraneous. . . . To analyze these expositions [exclusively] as textual markers of having 'been there' . . . would be to miss their point" (Howes, 1990, p. 69; see also Stoller, 1987, 2004).⁷⁶ Moreover, the emotional

truths of such experiences are perhaps best communicated emotionally (Sherry & Schouten, 2002, p. 219), and that is an open invitation to poetic bodies everywhere (Joy & Sherry, 2003). They all are equipped to make the case for how they are at any given time, with or without lines of words that by some estimations glow in the dark with eloquence.⁷⁷

Poetry immerses itself and revels in these sensual features (cf. Brady, 2003b, 2004; Carpenter, 1980; Classen, 1993). In so doing, it favors the analytic perspectives embodied in phenomenology and an anthropology of experience. All three perspectives attempt to represent a "natural" and self-conscious emerging in the world, a matter that begins with experiences of space and place and in some ways reaches beyond language itself as a form of knowing.⁷⁸ Each puts the observer upfront in the equation of interpreting and representing experience, starting with an upright and horizontal sentient being, present and accounting for itself. But each has its intellectual and methodological limitations as well. None offers perfect vision. Aside from its own ultimate puzzles (*aporias*) on time and being-in-place, among other considerations, a phenomenological approach has the problem of "tacit knowledge" as a fuzzy but strategic edge that is difficult to know or at least to put into words (Polanyi & Prosch, 1975). It does not deal with the unconscious in any accessible way (Joy & Sherry, 2003, p. 279; Lakoff & Johnson, 1999). The anthropology of experience finds words as subsets, imperfect and selective renderings of the larger realm of what can be known from being alive and awake as a sentient being, and so must find some way in which to account for these experiences. Poets want to stretch the limits of language, to wring everything possible out of words and metaphoric processes, ultimately to reach beyond the shortcomings of language in the landscapes of literature, speech, the sublime, and the ineffable and then pass on the whole bundle to all who will listen. They want work, as Heaney (1995) remarks about Dylan Thomas's early poetry, where "the back of the throat and the back of the mind" (p. 141) answer and support each other. That is both the promise

and the genius of poetry. It might not always apply or be accepted as intended, for any of several reasons.⁷⁹ But the aim and the prospects of putting a finger on “that great unity which is neither here nor beyond” (p. 141), of creating interpretations that “still make a catch in the breath and establish a positively bodily hold upon the reader” when “the wheel of total recognition has been turned” (p. 70), of engaging “the mechanical gears of a metre” that also takes hold “on the sprockets of our creatureliness” (p. 70), and in so many other ways of “recovering a past” or “prefiguring a future” (pp. 8–9), are always there. They are funded by imagination, by a need to articulate with the physical and social environments that surround us, and by an opportunity to communicate about what matters to us as we see it in the experiences of life as lived.⁸⁰

From that robust ground, tracking the sensual and imaginative qualities of experience through the emotionally open and rich language forms of poetry may create desire (one hopes) in the listener or reader to experience the same things in person, that is, in body. Getting to some authentic emulation or understanding of being in ancient landscapes in that context is in part a job for ethnographically informed translators and in part a job for the poets of all cultures; this is not an ethnically proprietary thing (Hymes, 1987). We cannot get there through any procedure that starts by attempting to throw out the single most important elements—the saturations of individual lives as lived, the biases of being personal, interpretive, alive, and awake on a planet that can, in the imaginaries of some, also be inhabited by ghosts of the past and fantasies of the future (cf. Heidegger, 1977, p. 333). That is the stuff of ordinary reality, and it is in terms of such things that we act first as cultured beings. By virtue of its secondary extractions, its focus on stasis (linear “snapshots” of events) rather than kinesis (the simultaneity of immersion or “ongoing film”) and other distancing techniques, hard science cannot ever capture these realities.⁸¹ But neither is just writing poetry enough. Internalizing poesis as experience by immersing in its subjects is what matters most for depth of understanding, and that must be followed by an attempt to make it

as carefully coached and exact a statement (including fantasy) of lived experience as we can.⁸² If the “great function of poetry is to give us back the situations of our dreams” (Bachelard, 1964, p. 15), the great demand of ethnographic poetics is that we render those experiences as clearly and accurately as possible through our sense of being-in-place and the guidance of histories—our own and those of others—that appear to contextualize the material best (Hartnett & Engels, chap. 41, this volume; on the same problem in science, cf. Hallyn, 1990). Such analyses can teach us things that are not available in any other way (Brady, 2003b, 2004).⁸³ Among many other possibilities, they can show us mystery and beauty and the need for being in them as we pass through the landscapes of our lives, and that in itself may motivate us to care about repairs where we see breaches in our rights and opportunities to continue.⁸⁴ Poetry, in one very important sense of the term, literally puts it all in place.

■ REPRISE: ROOTS AND FUTURES

[Then:] *The word was born / in the blood, / it grew in the dark body, pulsing, / and took flight with the lips and mouth.*

—Pablo Neruda, “The Word”⁸⁵

[Next:] *Long enough in the desert a man like other animals can learn to smell water. Can learn, at least, the smell of things associated with water—the unique and heartening odor of the cottonwood tree, for example, which in the canyon-lands is the tree of life.*

—Edward Abbey, *Desert Solitaire*⁸⁶

We are trainable, inventive, adaptable, and corporeal beings capable of making new and renewed associations among things and thoughts. With that in mind, and in the interest of breaking free as much as possible from the forces and forms of modern life that have ravaged the earth and its ancient creatures, if we have pumped up the appetite for “a kind of experience deep

enough to change our selves, our form of life" (J. Turner, 1996, p. 104), and if we also realize in the process that "our ecological crisis is not, at the roots, caused by industrialization, capitalism, and technology, but by a particular form of the human self" (p. 104), then self-renewal and reform are the applied agenda at hand. We have asked how to do that and found it to be problematic. What is the instrument? How do we reimagine, reclaim, and resurrect some semblance of participation in the changing environmental circumstances of the past and apply it to the present? Creating and sustaining a passion for place requires both primary and vicarious experience and language suitable for conveying the results realistically, that is, as they are conceptualized and felt and can be explored creatively by the participants through immersions in subject and place. Clinical abstractions tend to defeat that project, or at least they work in the wrong directions. But none of it comes to mind and body unfettered, beyond culture, personal bias, or predilections for certain kinds of interpretations against others.

The critics say that one path to a fair clearing in this, of doing something that counts in the Assembly of All Beings, is new myths, new applications of old myths, and thereby a renewed appreciation of continuities with the poetics and sacred spaces of yesterday. We need to reengage the study of myth and legend as embodied in landscapes and modern tellings (see especially Abram, 1996; Basso, 1996a, 1996b; Feld & Basso, 1996; Crapanzano, 2004). To reopen our eyes to the cross-cultural and ecological collisions of modern life, to "reveal the richness, antiquity, and complexity of our landscape tradition" as a way of showing the high cost of doing nothing (Scharma, 1995, p. 14), we need to move from our own conceptions of a "natural" reading of cultural values and landscapes—our own blind ethnocentrism—to something larger and more comparative, enlightening, and pragmatic through careful research and carefully reasoned imagination. Each of these efforts is a constructive and transferable source of identity. Each can tell us important things about how we are and where we have been and can thereby mark an important sense of

where we are going from here as humans. But each also has its lacunae, its shortcomings, and its impossibilities, and given that the action of revisiting and reimagining circumstances creates original material, and thus another source of distortion in the effort to recontextualize the past through the present, the bottom line has to be not simply a study of texts and artifacts but rather a critical exercise in the larger and more inclusive realm of an anthropology of experience. To enfranchise that, we need to return consciously to the sensuous (Abram, 1996), to the body as instrument of all we can do and know, and to history and practice with all we can learn about embodiment as sentient beings in the world. Developing an unromanticized but keenly felt sense of being-in-place—of the constructive powers of getting there versus being there along with the knowledge that the basic instrument in the process is our emotionally loaded and culturally coded physical selves—is fundamental to the effort.²⁰ The inner and outer landscapes of our bodies are the locations where these things take place. What happens to people under these circumstances is sensuous-intellectual experience, a point of negotiation in the landscapes of life (some of which shows up in worldviews, rituals, etc.), and defines our existence, especially when things go wrong as they have for us today in the "slow-motion explosions" (Snyder, 1990, pp. 4–5) of expanding urban frontiers.

At the heart of these concerns is a primary sense of home and the structures of our very survival. Bass (2000) declares with insight that "the more fragmented the world becomes, the more critical it is that we try and hold the weave of it together, and the more clearly we will notice that which is still full and whole" (p. 73; see also Deloria, 1993; Snyder, 1978). Added to the inevitable conflict of human interests and the natural world, that may be sufficient reason to renew our inquiries among aboriginal cultures "concerning the nature of time and space and other (invented) dichotomies; the relationship between hope and the exercise of will; the role of dreams and myths in human life; and the therapeutic aspects of long-term intimacy with a landscape"

(Lopez, 1986, pp. 368–369). We need to reclaim a sense of sacred space, both as personal enlightenment and in a more applied sense as an avenue to deeper understandings of place that will support commitments to social and environmental security for future generations. To earn constructive influence in the Assembly of All Beings, we need to immerse ourselves in it and be informed by it. We need to know and reevaluate the transformations of place and space embedded in the landscapes of history—private and public, national and colonial—including the destruction of meaning in the land by translating encounters with other creatures and cultures into the signs of empire. We need to know the secrets sleeping both in the land and in ourselves, the experiences of being-in-place that once made the wilderness sacred to all who would pass that way or dwell there in shared dominion. We need to rediscover the sacred in the wild and the wilderness in ourselves realistically, but with all the passion of a commitment to survival in an untamed land. We need to *rekindle* our relationship with the wilderness by putting it in the kind of caring custody that we assign to our own ancestries and the offspring who gather at the hearth. We need to be a civilization that recognizes lessons learned from the wild as training for an “etiquette of freedom,” as Snyder (1990, p. 24) says, that “can live fully and creatively together with wildness” (p. 6), and the New World is where we must start growing it. Such commitments can launch the opportunity for developing new sacred space, for resurrecting old myths, and for creating new myths on which to hang our survival in the long run, but only if we find some powerful way of communicating the experiences.

Meaningful life presumes a vital existence in the first place, and as we know and I have said in triplicate here, for humans that is accomplished not only by knowing and doing but by also by sharing the knowledge. *Telling* the story of place means *teaching* it as well, and Gruenewald (2003) has some very specific thoughts on that matter as applied to formal education. He argues that although culture and place are deeply intertwined, our educational system obscures that relationship

by distracting our attention from, and our responses to, the actual contexts of our existences in place (p. 621). We can join our children in the equation of solving some of these problems by giving them firsthand experiences in different places—some wild, some not so wild, but all differentiated by comparisons of the overbuilt urban areas and the never-built few remaining wild areas of the planet. They must be able to distinguish between human social environments and natural environments and, in the process, to recognize that we are biological beings embedded in and embodied by both. Filtered through the social constructions of community talk and marked (one hopes) with some exalted feelings, such experiences may lead them to affinities with the planet otherwise long diminished by a frustrating and destructive search for fulfillment in a scheme of endless wants with limited means. Perhaps it will lead to a taming of the wild in their minds by recognizing and accepting it for what it is—wild, our past, our future, the place that more than any other shows us what we are and are not, where we have been and must be—perhaps by recognizing that the wilderness is ultimately our home, the baseline of the place we call our planet. Better that than building it into oblivion. Better that than squeezing its margins into creature habitats smaller than Japanese hotel rooms, skinning it for its pelts, or corralling it for rodeos, circuses, and zoos of all kinds. Perhaps this montage of old tragedies and new hopes will lead to the consciousness and rituals needed to create the myths of the future, including a philosophy of place less destructive of ecosystem, self, and the long run of humanity. History has shown us that soaking the land with cultural values means investing it with the power to change it and ourselves.⁸⁸ However idealistic and improbable that is in a world beset and distracted by the harsh realities of terrorism and murder endorsed by instructions from imaginary gods, that is power that we can reclaim and use for social and ecological justice in the Assembly of All Beings, humans and nonhumans alike.⁸⁹

The concept of being-in-place embraces all of this, and a poetic underpinning helps to reveal the

process of putting that concept to work in various forms. Poetry can educate and move us into awe, mystery, the sublime, and related realizations by "stirring things up in us." It thrives on empathy and emulation and draws us into the sensuous-intellectual anchor for all knowing—that which comes from lived experience, where words are a subset of what is known and poetic expression is an attempt to render such experiences in texts and performances in a manner that often enlists the art of the possible more directly than it does the facts of the actual. While invested in radically different traditions of knowing, including an essential association with the multilayered metaphors of myth (see, e.g., Barthes, 1972; Dundes, 1984; Graves, 1948; Meletinsky, 1998, p. 153; Schama, 1995; Snyder, 1978; Thompson, 1989), poetry can also yield accurate and detailed information on being and doing and thereby can supplement even more directly the conventional methods and knowledge products of archaeology and history. But a poetic stance (poetry and more) always starts with the truth of raw experience, with life as lived and seen from the inside, from the role of the participant, not from some disembodied tortured analytic imposed from the outside on the premise that our sentient selves get in the way of discovery. By being inherently comparative, a poetic perspective also addresses anthropology's first principle. It moves us to draw comparisons from our own immersions in life in relation to those of others, as separated from them perhaps by the cultural differences of age, gender, generation, personal characteristics, and favored gods—by the gaps that have always separated "own" from "other" in the landscapes of cultures whose home territories touch but do not match. It begs comparisons between being now and being then, between being one and being other, between being here and being there, and it thereby situates itself in our experience as fundamental to knowing other people, their histories, and the environmental complications of being-in-place today.³⁰ It gives us knowable contexts for constructing more or less satisfying meanings about the nature of the world and our place in it. In that respect, it enters the concerns of art and

science with the opportunity to inform in both. The problem in each domain is to learn how to listen, especially when the poesis is not drawn from our own cultural wells.

The particulars of preliterate experiences in wild and sacred space are more or less lost to us as modern peoples through the displacements and reorientations of language and the concomitant separation of knowledge and thought that has come with writing, the cultural erasures and amalgamations of colonialism, and the appetites of mindless urbanization. But the important lessons of being a long-run creature in and of place are not. They are just too often obscured by the pace and rapacious confusions of modern life. A conscientious effort to develop a poetics of place, with careful attention paid to the sensuous and intellectual components of our existence that are laced into our own and other cultural traditions, and to the possibilities of both reimmersing and reinventing ourselves in the process, might bring us as close as we ever can be to the peaks of our human ancestry. Coupled with a critical use of the archaeologies, histories, and museologies of the day, that may give us our best glimpse of being-in-place in ancient circles of stones, our best claim on the spaces of ancestral voices, longings and desires, catastrophes and dilemmas, joys and defeats, the dreams of old horizons, and the life forms that contextualized all of it prior to the great steerage of alphabetic literacy, the indelible footprints of Columbus on the New World, and the launching of a loop of Western industrialism into outer space that has left no part of the planet untouched by its influence. Careful attention paid to, and a willingness to act in, that context may open the agenda of self-renewal and reform with greater wisdom and less complacency about the circumstances of our lives as lived. As interloper in an anthropology of experience, a poetics of place wants to insinuate itself in this milieu by starting with what makes us the same, the commonalities of sentient beings as seen through the great diversities of our collective meaningful existences. Being action oriented, it strives to know such things in every way possible and to defend them where they promote greater harmony in the

Assembly of All Beings. In more ways than one, that is essential ethnography."¹

■ Coda

I know that it is unusual to put theory in the same box with passion and commitment in the study of anything (Noam Chomsky to the contrary), and I know that I have romped through a whole industry of specialized interests in as many disciplines on the way to this point. So, a pilly review of the structure of the argument—the landscape of this text, if you will—might be useful in conclusion. Here is what I think I have done. In the interest of developing a conscientious and environmentally concerned poetics of place, including cultivating sources of information on experiences at “home” and in modern and ancient landscapes that might best be described as “wild” and “sacred” (while discounting, for the purposes of this chapter, detailed discussions of the archaeologies and histories housed in museums that are themselves specialized interpretations of related materials), I have emphasized the need for (a) “being there” (on-site, grounded in the sensuous-intellectual continuum of the body itself, imagination, and home experience, a data source that is fundamental to interpreting experience and transfers to ancient contexts mostly by educated analogy); (b) accounting for “getting there” in personal and epistemological terms; (c) studying “tribal” poetries and myths as sources of body-grounded information (albeit complicated) on worldviews and associated behaviors that pervades both history and prehistory and is embedded in oral performances (a source of hard data and, given the paucity of expert native performers, scarce opportunity) and written texts (a source of hard data and plentiful opportunity provided by secondary observers), with the caution that we need to learn how to interpret poetries and mythical thought in those contexts, especially in the light of epistemic problems insinuated in Western perceptions since the development of writing and mass production printing and in the light of certain inadequacies of language itself to convey experience.

As models of and for interpreting these materials, I have compared (a) scientific approaches (especially logical positivism with its distancing techniques) and (b) artisan frameworks (with their essential immersion techniques, including nonverbal representations and poetics) and collected them under the heading of “artful science.” I have cultivated the good fit of phenomenology as a philosophical underpinning for an anthropology of experience and for poetics as a way of knowing and communicating experiences of being-in-place. I have also given poetry *per se* special cachet under this umbrella, both because of and despite its composition beyond the requirements of basic information and because it is body grounded and can be a powerful source of communicating at both a sensuous and an intellectual level. Unlike the prerequisites for scientific discovery and representation, phenomenology, poetics, and an anthropology of experience put the observer upfront in the interpretive equation as an active participant. Each of these sources has its lacunae and other shortcomings relative to the other sources. But the composite attention paid to them in accounts of being-in-place and to culture as something constructed out of the interplay of the senses, filtered through imagination and the historical shapings that individuals and groups get from socialization and enculturation in particular traditions and perpetuate by storytelling, can give the overall effort an authenticity complementary to, but otherwise unavailable through, more conventional thinking in philosophy, anthropology, history, geography, and the social sciences in general. The end result has important applications in active research, formal education, and concerns for the quality of life on the planet.

■ NOTES

1. Geertz (1996) writes that the anthropology of place has a “sort of preludial quality, as if it marked the beginning of something that will reach far beyond the matters under immediate consideration” and that it “can be brought to bear on the grand complexities that plague the world” (p. 262). The current argument moves in that direction.

2. I do not wish to slight the academic disciplines of archaeology and history. So, too, for not reviewing the successes and failures of museology—that complex blend of representational problems in archaeology, history, and performance studies. Museums are an important area of contest on problems of ethnographic representation, authenticity, and the like (see especially Karp & Levine, 1991). I cannot burden the current argument with all of these asides. But I must argue in the same breath that what is presented here is relevant to the practitioners of those fields, including the politics of their reclamations and presentations, if one accepts the necessity of putting the observer in the equation of interpretation (e.g., compare the themes of this work with Allison, Hickey, & Dawson, 1997; Clifford & Marcus, 1986; Clifton, 1990; Denning, 2004; Gewertz & Errington, 1991; Greenblatt, 1991; Hobsbawm & Ranger, 1983; Huddell, 1982, 1987, 1989; Marcus, 1998; Metcalf, 2002; Pluciennik, 1999; Pratt, 1992; Wolf, 1992; see also Hartnett & Engels, chap. 41, this volume). Excluding the observer is, for me, an unacceptable fiction; (and, of course, that begs the whole issue of postmodernism and its various levels of intellectual shootouts and misfires (Brady, 1998; Denzin & Lincoln, 2000, 2002; Lincoln & Denzin, 2003b). Moreover, I have poets and their fictions in the mix of all of it (Brady, 2003b). Given Western conventions aimed at protecting science from art and vice versa, that is guaranteed to be controversial.

3. Roughly speaking, "Metaphor, calling one thing by the name of another, is not a strange poetic event. It is at the heart of language, and the direction of the metaphors is important. The body's influence [sensation and perception] spreads outwards, to features of the environment, and inwards to the mind" (Aitchison, 2000, p. 124; cf. Brady, 1991a, pp. 69–71; Snyder, 1990, p. 161. On body-grounded metaphors and the use of them in science and everyday life, see Brady (2003b, 2004), Brown (2003), Dancsi (1999, p. 111), Fernandez (2003), Gibbs (1994), Hallin (1990), Kövecses (2002), Lakoff and Johnson (1999), Laughlin, McManus, and d'Aquili, (1992), Midgley (2001), Montgomery (1996), and M. Turner (1996).

4. For more on the concept of artful science, see Brady (1991a, 1991b, 2000, 2003a, 2003b, 2004) and Brady and Kumar (2000).

5. What I mean by poetics follows Hallin (1990) in his study of abduction in science. He does "not use the term poetics in the Aristotelian sense of a system of normative rules, but rather in the sense that one speaks about the poetics of Racine or Baudelaire,

namely to designate a collection of choices made at different levels (style, composition, thematics . . .) by an author or a group. On the one hand, these choices lead to operations that inform the concrete work. On the other, they are loaded with meanings that more or less both determine and are determined by the artistic endeavor, for which the work is the result and sign. Ultimately, a study of poetics, in the sense understood here, comes down to what Umberto Eco calls 'the plan for shaping and structuring the work.' It is the program for the execution of a work, informed by presuppositions and exigencies whose traces one can locate, on the one hand, in explicit declarations, and on the other, in the work itself, to the extent that its completed form, with respect to other works, gives witness to the intentions that presided over its production. A poetics must return to a way of dreaming works and the declarations that accompany them, of conceiving their possibility, and of working for their reality" (pp. 14–15).

6. Paz (1981, p. 15). Compare Schama (1995, pp. 367–374).

7. Yi-Fu (1979) says, "The organization of human space is uniquely dependent on sight. Other senses expand and enrich the visual space" (p. 16). Sound "enlarges one's spatial awareness to include areas behind the head that cannot be seen," and it "dramatizes spatial experience. Soundless space feels calm and lifeless despite the visible flow of activity in it, as in watch[ing] events through binoculars or on the television screen with the sound turned off" (p. 16). In his view, "Taste, smell, and touch are capable of exquisite refinement. They discriminate among the wealth of sensations and articulate gustatory, olfactory, and textual worlds," whereas "odors lend character to objects and places, making them distinctive, easier to identify and remember" (p. 10). And he asks, "Can senses other than sight and touch provide a spatially organized world? It is possible to argue that taste, odor, and even hearing cannot in themselves give us a sense of space?" (p. 10). Fortunately, "The question is largely academic, for most people function with the five senses, and these constantly reinforce each other to provide the intricately ordered and emotionally charged world in which we live" (p. 10). See also Ackerman (1990) and the "sensorium of the blind" described by Kuusisto (1998). The concept of place is also a product of the various cultural experiences, themes, and beliefs about the circumstances and transformations of lives as lived through the senses. But that does not mean that all cultures put the same hierarchical valuations on sensory experience or that they represent the senses in

storytelling about life as lived in the same ways (Brady, 2003b, pp. 93–101; Carpenter, 1980; Joy & Sherry, 2003; Mitchell, 1983; Nelson, 1980, 1983).

8. The logic here is the ordinary logic of understanding for humans and their conjectural mentalities. It is both structural and hermeneutic in process (Brady, 1993), but I have conceptualized it as a progressive hermeneutic, as more of a spiral than the classic “hermeneutic circle,” to accommodate the accretions and shifts of knowledge that occur through time (see also Brady, 1991b).

9. There is a scholarly danger in that, of course, especially when one seeks the truth of “what actually happened” exclusive of the experiences of being there in body and spirit (Denning, 2004), or vice versa, by thinking that one can rely only on the intuitions of body and tacit knowledge to apprehend the particulars of cultural performance. But we need to accept the fact that multiple reality frameworks can be applied to all experience and then do our best to defend the one we prefer to all others *without* deprecating or dismissing out of hand competing arguments and systems of signification from, say, the tribal world. On allowing “sufficient cognitive ‘space’ for conflicting ontologies to coexist,” see Layton (1997, p. 128).

10. See Brady (in press) and Denning (1974, 1980, 1988, 1995, 1996, 1998a, 1998b, 2004).

11. The semiotics of talk and thought, artifact and architect, testament and text, teacher, trainer, seer, shaman, priest, and dreamer—the meaningful landscapes of “everyman” particularized in individual groups—are precisely the kind of information that is likely to dissipate with the death or disappearance of whole cultures or populations. But alluding at several levels to the kinds of problems identified in a common frame by 18th-century Italian philosopher Giambattista Vico in his *New Science* (Tagliacozzo & Verene, 1976) and to works by various phenomenologists (particularly Merleau-Ponty, 1962), and following an argument made explicit by Howes (1990), we can say that (a) *all* of this—culture itself—is “constructed out of the interplay of all the senses” (p. 68; see also Laughlin & D’Aquili, 1974; Laughlin et al., 1992; Stoller, 1987, 1989; Stoller & Olkes, 1986, 1987), (b) it is embedded in a conjectural mentality that is compelled to make sense of changing environmental circumstances (Laughlin & Brady, 1978), and (c) it is filtered through imagination and the historical shapings that individuals and groups get from socialization and enculturation in particular traditions, including language and its body-grounded metaphors. The resulting

knowledge is perpetuated largely by stories—oral, written, performed in other ways—in units as small as parables, giving new meanings to perceptions of changing environmental circumstances (M. Turner, 1996). Accounts of being-in-place ultimately must reengage this mix of sensuous-intellectual properties and processes—the broad landscape of human experience that forms a body-centered system—to have any legitimate claim to authenticity.

12. Engaging in parallel universes and common projects as sentient beings makes it possible for us to understand each other (Merrell, 2000, pp. 73–74; on Vico’s *fantasia*, thinking through the body, and the age of poetic wisdom, see Verene, 1976; on Quine’s principle of charity and related comments, see Brady, 2000). Thinking “through the body and to sense the world as an order of bodies, with meaning not being separable from bodies,” is difficult to imagine (Verene, 1976, p. 31; cf. Lowe, 1982), but a critical rereading of Vico’s arguments about body-centeredness is nonetheless a reminder that we are all animals—sensuous-intellectual creatures—and that there are some universal responses to things that we all share. The possibilities for understanding the beliefs and experiences of others are grounded both in the common sensory apparatus that we occupy as biological beings and in the comparable modes of thought and action when we respond to the feelings and sensations of environmental stimulation (Merrell, 2000, p. 73). “The body is, so to speak, in the mind. They are both wild” (Snyder, 1990, p. 16). The same possibilities must also be realized in an interpretive relation to other communicative organisms (and things that are believed to be animated, e.g., rocks and trees), that is, through the interactive processes that lead to the social construction of reality through whatever cultural screens (Berger & Luckmann, 1966; see also Zolbrod, 1983, pp. 227–228). Compare Wilmsen (1999): “Separate lives are congruent in experience, no matter how disparate their cultural environments. Once the words are learned, native speakers of different languages begin to recognize each other—thirst thick under an arid sun, identical errors in navigating unknown landscapes, parallel blunderings through sexual awakening—in evoked images of their separate experiences. For it is individuals, not cultures, who meet and re-present their contexts to each other” (p. xi). See also Fletcher (1967, p. 197).

13. Kerouac (1959, p. 106).

14. Because we are creatures in and of place—embedded, embodied, and enplaced—it is difficult to extract a proper concept of place for conversation and

instruction (Geertz, 1996). But I do mean to flag the process of being and becoming emplaced as a biological and cultural system that is subject to an inherent creativity of perception and expression and, above all, to inscriptions and transferences between the body and its sociocultural milieu. See Low and Lawrence-Zúñiga (2003), Merleau-Ponty (1962), Müller (1996), and Spiegelberg (1975). To have practical value as a principle, that thought needs to be played out and observed in the everyday world. On mimesis and its complexities, see Taussig (1993). For an exquisite coarticulation of theory and practice in cultural spaces, see Stewart (1996). On living persons and practical problems, see Smith (1997, p. 2).

15. See especially Merleau-Ponty (1962), Spiegelberg (1975), and adaptations of Merleau-Ponty's work in Abram (1996) and Gruenewald (2003). The upshot is that humans enter into a participatory relationship with other phenomena through the multisensory perception of direct experience. On phenomenology and culture, see Csordas (1994), Laughlin and Brady (1978), and Laughlin and colleagues (1992).

16. Thus, meaning is made, not found, and making sense of places is a reciprocal and mutually constructing process, taking shape and acquiring meaning "when the inner realm is projected onto the outer scene" (Brann, 1991, p. 7). Feld (1996) puts it this way: "As place is sensed, senses are placed; as places make sense, senses make place" (quoted in Casey, 1996, p. 19).

17. Ethnographers generally take us to a "location," that is, to a place where *something happens*. Like watching a movie, we seldom have reason to focus on the projector or the serving apparatus. Phenomenology brings the observer's equipment to the fore and makes it part of the equation of meaningful construction and participation. Compare Thompson (1989): "So here I sit, looking at the screen of a Macintosh and in imagination, rolling the screen of history back and forth. Instructed by the natural history of life, I suspect that what I am looking for are not 'events' but thresholds of emergence that are also projections of my own framing of perceptions" (p. 135).

18. Following Lowe (1982), "By 'perception' I do not mean the neurophysiology of perception, or the behavioral psychology of perception, but an immanent description of perception as human experience. . . . Perception as the crucial connection includes the subject as the perceiver, the act of perceiving, and the content of the perceived. The perceiving subject, from an embodied location, approaches the world as a lived, horizontal field. The act of perceiving unites the

subject with the perceived. And the content of the perceived, which results from that act, affects the subject's bearing in the world. Perception is therefore a reflexive, integral whole, involving the perceiver, the act of perceiving, and the content of the perceived" (p. 1). Moreover, according to Feld (1996), "places may come into existence through the experience of bodily sensation, but it is through expression that they reach heightened emotional and aesthetic dimensions of sensual inspiration" (p. 134). Among the Kahuli, "the poetics of place merge with the sensuousness of place as soundscape and with the sensuality of the singing voice" (p. 134).

19. We do not need Kant to tell us how fundamental space and time are to our lives. As Yi-Fu (1979) says, "Space' and 'place' are familiar words denoting common experiences. . . . Basic components of the lived world; we take them for granted. When we think about them, however, they may assume unexpected meanings and raise questions we had not thought to ask" (p. 3). For some concrete examples, see also Gallagher (1993).

20. Neuhardt (1959, p. 173).

21. See the various works by Claude Lévi-Strauss regarding the fantasy factor in all myths (e.g., Lévi-Strauss, 1976). On creativity and imagination in general, see especially Miller (1996). No categories of place have any meaning without imagination. It has a geography of its own—landscapes of fear and comfort where poets of virtual worlds bridge the concrete and the abstract, where the sign and its referent emerge in consciousness as places of soil, rock, sea, air, innumerable critters, and mind (Brady, 2003b). The expression "leap of the imagination" is often heard in discussions of writing, but that may be less of a leap than "a sauntering, a stepping across" into the reality at hand (Bass, 2000, p. 72). See also Caughey (1984), Joy and Sherry (2003), and Wooley (1992). Crapanzano (2004) says, "Like James, the literary critic Jean Starobinski stresses the determining role of the imagination in the perception—the constitution—of reality. 'Insinuated into perception itself, mixed with the operations of memory, opening up around us a horizon of the possible, escorting the project, the hope, the fear, speculations—the imagination is much more than a faculty for evoking images which double the world of our direct perceptions; it is a distancing power thanks to which we represent to ourselves distant objects and we distance ourselves from present realities. Hence, the ambiguity that we discover everywhere; the imagination, because it anticipates and previews, serves action, draws us before the configuration of the realizable

before it can be realized.' . . . Not only does the imaginative consciousness allow us to transcend (*dépasser*) the immediacy of the present instant in order to grasp a future that is at first indistinct, Starobinski argues, but it enables us to project our 'fables' in a direction that does not have to reckon with the 'evident universe.' It permits fiction, the game, a dream, more or less voluntary error, pure fascination. It lightens our existence by transporting us into the region of the phantasm. In turn it facilitates our 'practical domination over the real' or our breaking ties with it" (p. 174).

22. On art, science, and humanism, see Bruner (1986, pp. 49–50). On extrapolations from laconic representations as simple as a dateline in a poem, see Richardson (1999b, p. 334) and Brady (2003b, p. xiv). We are compelled to interpret such signs and cues about our environment because, in a general sense, our very existence as human creatures depends on it. Place is the anchor of fundamental human experience. But how do we recognize it? "Do we know enough about it to enjoy a fanciful imagining of passage there? If we visit a place at three separate times, is it still the same place? Does the place remember us? The answers are as much a function of landscape evolving as they are of finders finding what they want or need to see—a cultural meaning and orientation problem with historical implications" (Brady, 2003b, p. xv).

23. Suskind (1986, pp. 147–148).

24. As might be expected, the concept of home as a stable place is deeply embedded in our thinking about writing. On language and embodied space, see Jackson (1995, p. 6) and Low and Lawrence-Zúñiga (2003, pp. 6–7). The real work for individuals centered more or less (cf. Stewart, 1996, p. 3, on Appalachia) in what they recognize and perpetuate as a common home and the wider world, is to determine how all of these rooted poolings of life intersect so as to figure out who and by what commonalities of ancestral experience and related cultural claims should be grouped together by category and actual location, and who and what, in our estimation, should not. That is the essence of kinship and a classic set of norms for deciding issues of access and trespass, that is, for deciding who and what are to be included or excluded from particular activities at particular times in the places we call home.

25. On a larger scale, one thinks immediately of America in this context given its history as a collecting point for international migration processes and diverse cultural interests. On travel and uprootedness, see Snyder (1990, pp. 23–26). On travel as metaphor, see Jackson (1995, p. 1) and Van den Abeele (1992).

26. Naming a place is a way of taming it, bringing it at least to the control of a mental appropriation in a familiar set of signs—to the level of place punctuated by the hearths and travels of the imagination if not of the physical self. That is the same process applied through colonial appropriations of others; that is, by translating them into our own cultural system of signs, we render them "subordinate," at least by category of existence. On the importance of naming in human experience, see Cheyfitz (1997) and Aitchison (2000, p. 941f). Schama (1995) notes, "The wilderness, after all, does not locate itself, does not name itself. It was an act of Congress in 1864 that established Yosemite Valley as a place of sacred significance for the nation" (p. 7). See also Momaday (1969, p. 27).

27. Weller (1990, p. 14).

28. More or less following Bakhtin, by "architectonics" I mean the architecture of connections revealed between individuals and their wider environments, parts to whole in changing landscapes, including other people and other points of view, over time (Holquist, 1990, p. 149ff). Sensitive to readings from both sides of the cultural fences that separate us in fieldwork and life in general, and to the mutual constructions of our interactions under those circumstances, a poetics of place must be dialogic in nature. Furthermore, "a dialogic poetics must first of all be able to identify and arrange relations between points of view; it must be adequate to the complex architectonics that shape the viewpoint of the author toward his characters, the characters toward the author, and of all of these toward each other" (p. 162).

29. Speaking of an incident in the foothills of the Rocky Mountains, Smith (1997) recalls a telling moment "in the description of a colleague who had taken her class to the mountains, sat them in a circle, enticing them, in an ecological exercise, to 'breathe this place, to recollect themselves and their relations to . . . 'reconnect.' Suddenly, the heavy sounds of a cougar circling them can be heard, followed by the instantaneous and terrified evacuation of the place by the recollectors, the breathers, and the reconnectors! Whatever the pedagogy of the place may be, it has little to do with a warm cozy relationship with an imagined nature, and perhaps more to do with the courage to befriending one's own mortality in the midst of the ongoing project of self understanding" (p. 4). The wild inspires us to be practical. It also can be a tough experience (Snyder, 1990, p. 23).

30. Ducking the television travelogues designed to sell products on commercial breaks, the closest we

usually can come to wilderness today is to traffic in its remainder in places such as Yosemite, heavily marked by people—in fact, even created by people in so many important ways, including mapping and marking it as a preserve of sorts (Schama, 1995)—or in the outback stretches of earth where the timid never tread, be it alpine, desert, or swamp (Snyder, 1990, p. 6). Snyder (1990) sees these places as “the shrines saved from all the land that was once known and lived on by the original people, the little bits left as they were, the last little places where intrinsic nature totally wails, blooms, nests, gaints away. They make up only 2 percent of the land of the United States” (p. 14).

31. Immersion in the unpaved has special merits for helping the process unfold. “A week in the Amazon, the high Arctic, or the northern side of the Western Himalayas,” J. Turner (1996) writes, can show us that “what counts as wildness and wilderness is determined not by the absence of people, but by the relationship between people and place. A place is wild,” he says, “when it is self-willed land. Native peoples usually (though definitely not always) fit that order, influencing it but not controlling it, though probably not from a superior set of values but because they lack the technical means. Control increases with civilization, and modern civilization, being largely about control—an ideology of control projected onto the entire world—must control or deny wildness” (pp. 112–113).

32. Poulsen (1982, p. 116).

33. Some sacred spaces, of course, are purely man-made in their physical construction (e.g., the Vietnam memorial in Washington, D.C.), but even these are likely to be landscaped for beauty with a “natural” theme (Osborne, 2001; Véliz, 1996). Others are located in conspicuous landscapes, such as Mount Sinai and Devil’s Mountain, none of which is a “sacred” space in its own right. They are interesting in their irregularities or are novel to people who encounter them as necessary interpreters of space. But that very reading is a primary source of significance—a projection of self, culture, and emotion that occurs somewhat ironically through an appropriation of the otherwise unobtainable by wrapping the experiences in metaphor, by acquiring places in image and imagination, and by bringing them near through semiosis and fantasy, if not actual physical presence. In his analysis of Native American sites, Gulliford (2000) identifies nine categories of sacred places: “(1) sites associated with emergence and migration tales; (2) sites of trails and pilgrimage routes; (3) places essential to cultural survival; (4) altars; (5) vision quest sites; (6) ceremonial

dance sites; (7) ancestral ruins; (8) petroglyphs and pictographs; and (9) burial or massacre sites” (quoted in Leonard & McClure, 2004, p. 321). Building on that and Vine Deloria’s work on Native American sites, Leonard and McClure (2004) identify sacred places on two axes: one that follows “a continuum from historical/actual to imaginary/metaphorical” and one that follows “a continuum from human to divine agency” (p. 325). Deloria gives us four categories “arranged on a scale of ‘agency’—entirely human agency at one end versus the agency of ‘Higher Powers’ at the other” (p. 322). See also Dundes (1984) and Lane (2001).

34. Some sacred sites are deeply personal and private. On places sacred to one person that fail to move another, see Poulsen (1982, pp. 116–117).

35. True to this experience, and illustrative of the power of poetry to address such issues in laconic ways, see the defining principles and irony in Gregor’s (2004) smart poem, “Mammals of North America.” Despite the importance of hunting in both cultures, nothing could be farther removed from the place of mammals in the world of the Koyukon (Brody, 1982; Nelson, 1983).

36. Only the overall story form and perhaps the emotions of shared experiences as sentient beings-in-place, especially in the conspicuous places of whatever we can call “nature” today, can frame these inferences for us. The rest must come from material representations (cf. Clarkson, 1998; Hodder, 1982, 1987, 1989; Lewin, 1986; Richardson, 1982; Zolbrod, 1987), from written history, or from that wonderful interim point—a living person whose knowledge pool runs a continuum of semiotica from early tribal history to the present. Such guides are rare, of course, if they exist at all in ultimately reliable forms. They all are influenced by literacy and related forms of communication in the modern world, but they can be found in our current landscapes. On teachers of sacred space, see Layton (1997, p. 122) and Snyder (1990, pp. 12, 78). On contemporary horticultural experts in the American Southwest, see Nabhan (1982). See also Behar (1993), Nelson (1980, 1983), Swann (1983), Swann and Krupat (1987), and Tedlock (1972, 1983, 1990, 1993).

37. Note the irony that what are often held to be the most palatable and picturesque landscapes are also sometimes the least habitable (Barthes, 1972, pp. 74–77). With an overview of the relationships of landscapes, aesthetics, and pleasure as they might obtain in the human species, Brown (1991) says, “One of the fundamental assumptions of evolutionary psychology is that matters closely related to our survival and reproduction have a likelihood of engaging our

emotions. Thus, although there might be little evidence of a general adaptation for an aesthetic sense, a . . . disparate collection of emotion-producing activities and entities may structure what we consider aesthetic. . . . Orians (1980) has examined such matters as the emotional reactions of explorers to different natural settings, the landscaping and planting of parks, and the criteria that make particular pieces of real estate especially valuable, to show that humans seem to have an innate preference for settings that would have been optimal habitats for our Pleistocene foraging ancestors. We like 'lakes, rivers, cliffs, and savannahs' settings in which food, water, and protection (as in caves) were in optimal combination. Key elements in Orians' arguments are the emotional nature of the human preferences, and comparisons with habitat selection in other species, where its innate component is less questionable. Here the argument is that we have an innate tendency to prefer, seek out, and construct certain kinds of settings because we feel good in them" (pp. 115–116). On forests and the emergence of poetic wisdom, compare Rubinfeld (1976, p. 104).

38. This is especially true in the light of the horrifying events of September 11, 2001, in the United States and the country's subsequent declaration of war on terrorism (Lincoln & Denzin, 2003a). The whole problem can be framed in its fundamentals as one of sacred space and what is or is not allowed to take place in it. On poetics and place and the different imaginaries of country and city, see Williams (1973). On entering an age of human flourishing, see Lincoln and Guba (2000). On the Burning Man Project, see Kozinets and Sherry (2004) and Sherry and Kozinets (2004).

39. They are often represented in the mix of more than one culture, society, and/or physical landscape, the kind of heterogeneous zones we find bisected by the colliding margins of cross-cultural frontiers. They are "borderlands" of the here and the hereafter or are "beaches" as Denning (1980, 1996) liberated the concept from the stereotyped margin of surf and sand. On the U.S.–Mexican border, see also Brady (2003b, pp. 89–90). On Chicano narratives and their literary and cultural borders, see Rosaldo (1989). On Australian aboriginal notions of trespass and "spatial prohibitions as a mode of boundary making," see Munz (2003). On frontiers and the possibilities of passing into myth time, see Snyder (1990, p. 14). On the concept of "regeneration through violence," see Slotkin (1973).

40. Neihardt (1959, p. 35).

41. According to Snyder (1990), "For preagricultural people, the sites considered sacred and given

special care were of course wild" (p. 79). He adds, "The idea that 'wild' might also be 'sacred' returned to the Occident only with the Romantic movement" (p. 80).

42. In answering the question of why native cultures in general give so much importance to places, Abram (1996) sees the answer as obvious: "In oral cultures the human eyes and ears have not yet shifted their synaesthetic participation from the animate surroundings to the written word. Particular mountains, canyons, streams, boulder-strewn fields, or groves of trees have not yet lost the expressive potency and dynamism with which they spontaneously present themselves to the senses. A particular place in the land is never, for an oral culture, just a passive or inert setting for the human events that occur there. *It is an active participant in those occurrences* [precisely a poetic posture]. Indeed, by virtue of its underlying and enveloping presence, the place may even be felt to be the source, the primary power that expresses itself through the various events that unfold there" (p. 162). He adds, "It is precisely for this reason that stories are not told without identifying the earthly sites where the events in those stories occur. For the Western Apache, as for other traditionally oral peoples, human events and encounters simply cannot be isolated from the places that engender them. . . . From the Distant Time stories of the Koyukon people, and from the *agodzaahi* tales of the Western Apache, we begin to discern that storytelling is a primary form of human speaking, a mode of discourse that continually weds the human community to the land. Among the Koyukon, the Distant Time stories serve, among other things, to preserve a link between human speech and the spoken utterances of other species, while for the Western Apache, the *agodzaahi* narratives express a deep association between moral behavior and the land and, when heard, are able to effect a lasting kinship between persons and particular places. . . . The telling of stories, like singing and praying, would seem to be an almost ceremonial act, an ancient and necessary mode of speech that tends the earthly rootedness of human language. For narrated events, as Basso reminds us, always happen *somewhere*. And for an oral culture, that locus is never merely incidental to those occurrences. The events belong, as it were, to the place, and to tell the story of those events is to let the place itself speak through the telling" (pp. 162–163). See also Basso (1996a, 1996b), Carpenter (1980), Crapanzano (2004), Feld and Basso (1996), and Nelson (1983).

43. On movements toward symbolic order in modern architecture and the idea that every force evolves a

form, compare Poulsen (1982, pp. 118, 123–124). Schama (1995) adds, “And it is just because ancient places are constantly being given the topdressings of modernity (the forest primeval, for example, turning into the ‘wilderness park’) that the ambiguity of the myths at their core is sometimes hard to make out. It is there, all the same” (pp. 15–16).

44. Apropos of the current thesis, Deloria (1993) calls for “the possibility of new sacred places, underscoring even more the present, ongoing nature of the kinds of interactions between the human and the spiritual realms” (cited in Leonard & McClure, 2004, p. 324).

45. By dwelling on the language associated with primary emotions (and, therefore, the limbic system of the brain), poetry is capable of moving us sensuously and emotionally. Speaking of the power of poetry and prophecy, Leavitt (1997) says, “Much of this power is already implied in the nature of language itself. For the speaking subject, a linguistic element—a phoneme or word or grammatical pattern—not only says what it says, but does so cast in a specific form and carrying specific implications. That is to say, each linguistic element carries with it not only a semantic load but also both a material presence as a pattern of sound and a cloud of connotations and colorations picked up through the subject’s life experience and the elements of our own history of use. In some circumstances, people attend not only to what is being said but equally or primarily to the sound- and meaning-resonances of how it is being said. This ‘poetic mode of speech perception’ . . . and production defines . . . the poetic function of language: language carries sometimes actualized but always potential punch above and beyond the punch of information conveyed. The effect may be aesthetic, emotional, or physical” (p. 3). On the “thrill” or “physical emotion” that can come from reading, “the undisappointed joy of finding that everything holds up and answers the desire it awakens,” compare Heaney (1995, pp. 8–9). Bass (2000) notes that the artist has an “imperative to get as close to a thing as possible, not so much to create metaphors as to uncover them; to peel them way back to their source. For me there is undeniable solace and excitement in moving in as close as possible to things, in art, and in the woods—as close as possible to the source” (p. 73). On emotions and landscapes, see also Brown (1991, pp. 115–116).

46. See Abram (1996), Barthes (1972), Benjamin (1969a), Brady (2003a, 2003b), Crapanzano (2004), Gibbs (1994), Hoffman (1999), and Meletinsky (1998). Bachelard (1964), in his classic text *The Poetics of Space*, notes, “Great images have both a history and a

prehistory; they are always a blend of memory and legend, with the result that we never experience an image directly. Indeed, every great image has an unfathomable oneiric depth to which the personal past adds special color” (p. 33). To him, “Primal images, simple engravings are but so many invitations to start imagining again. . . . By living in such images as these, in images that are as stabilizing as these are, we could start a new life, a life that would be our own, that would belong to us in our very depths. . . . And because of this very primitiveness, restored, desired, and experienced through simple images, an album of pictures of huts would constitute a textbook of simple exercises for the phenomenology of the imagination” (p. 33). Schama’s (1995) collection of images and texts presents exactly that—an album of experiences that give us the past (albeit recent) as both imaginative history and a history of the imagination. It directs attention to the nature of landscape as myth, and vice versa, on America’s frontiers and is, therefore, most instructive for our current purposes and fair ground for contextualizing creations and renewals of sacred space.

47. Finding (or reinventing) new leaders for positive turns on sacred space is consistent with the moral and ethical goals of our environmental critics (see, e.g., Snyder, 1990, p. 78). But in the process we must also ask *whether* we really want to renew these things as sacred in our personal lives and to integrate them uncritically in modern views of what is sacred. The relativity of the concept—what is sacred for you is not necessarily the same for others—has led, as J. Turner (1996, p. 22) reminds us, to one violent confrontation after another throughout history. Moreover, a failure to distinguish between formal and popular religions has bastardized the concept in contemporary America. Turner suggests that Disneyland, national parks, the site of President John F. Kennedy’s assassination, and related “pilgrimage sites” are sacred “because of the function of entertainment and tourism in our culture. In a commercial culture, the sacred will have a commercial base. For many people, nothing is more sacred than the Super Bowl” (p. 22). That is not the sense of “sacred” that Snyder has in mind, but whatever the course of action taken, there is huge personal responsibility attached to it, for ourselves and for the collective futures of all who would revisit the savannahs and forests of our beginnings with a sense of respect and preservation rather than rapacious destruction.

48. Consider Schama (1995): “Whether such relationships are, in fact, habitual, at least as habitual as the urge toward domination of nature, said to be the

signature of the West, I will leave the reader to judge. Jung evidently believed that the universality of nature myths testified to their psychological indispensability in dealing with interior terrors and cravings. And the anthropologist of religion Mircea Eliade assumed them to have survived, fully operational, in modern, as well as traditional, cultures" (p. 15). Schama marks his own view as "necessarily more historical, and by that token much less confidently universal. Not all cultures embrace nature and landscape myths with equal ardor, and those that do go through periods of greater or less enthusiasm. What the myths of ancient forest mean for one European national tradition may translate into something entirely different in another" (p. 15). Schama has "tried not to let these important differences in space and time be swallowed up in the long history of landscape metaphors sketched in [his] book. But while allowing for these variations, it is clear the inherited landscape myths and memories share two common characteristics: their surprising endurance through the centuries and their power to shape institutions that we still live with. National identity, to take just the most obvious example, would lose much of its ferocious enchantment without the mystique of a particular landscape tradition: its topography mapped, elaborated, and enriched as a homeland" (pp. 15–16).

49. We are reminded in the process that "understanding the past traditions of landscapes can be a source of illumination for the present and the future," and with a lien on that, Schama (1995) says that it can also be a source for redeeming "the hollowness of contemporary life" (p. 17). This is not a promise of passage into Nirvana, an escape from the evils of the present into something constructed out of blind fantasy and a heavily romanticized past that can be regained in the future. Schama is too much of a realist for that. In acknowledging "the ambiguous legacy of nature myths," he points out that we must also "recognize that landscapes will not always be simple 'places of delight'—scenery as sedative, topography so arranged to feast the eye. For those eyes . . . are seldom clarified of the promptings of memory. And the memories are not all of pastoral picnics" (p. 18).

50. Compare Kroeber (1983): "Evidence of . . . interactivity is likely to impress us most in stories, such as those dealing with Coyote. These we find baffling because Coyote can be animal or man at any time and without any seeming consistency. This is a crucial imaginative point. The Indian imagination is not so rigidly tied as our own to given material forms and patterns. For us, to be 'characters' animals have to be

anthropomorphized. The Indian imagination recognizes Coyote as both animal and man, or either animal or man, the duality in fact making him 'Coyote' rather than 'just' the exceedingly interesting four-footed predator. The complexity of the Indian imagination is germane to the practical core of the hunting songs we are considering here" (p. 329). See also Bright (1987), Buller (1983), Diamond (1986), Eickelhart and Lomatuway'ma (1984), Haile (1984), Hymes (1987), Lopez (1977, 1986, 1990a), Snyder (1990), and Tedlock and Tedlock (1975). On Abram, Merleau-Ponty, and the phenomenological argument that "places are the ground of direct human experience" and associated assumptions about the interactions of the body with things, including the idea that "all objects or things are 'alive' and capable of entering into a relationship with a human perceiver," see Gruenewald (2003, p. 623).

51. Momaday (1969, p. 6).

52. Consider Yi-Fu (1979): "Three principal types [of space], with large areas of overlap, exist—the mythical, the pragmatic, and the abstract or theoretical. Mythical space is a conceptual schema, but it is also pragmatic space in the sense that within the schema a large number of practical activities, such as the planting and harvesting of crops, are ordered. A difference between mythical and pragmatic space is that the latter is defined by a more limited set of economic activities. [On "trails to heaven" and "maps of dreams," see also Brody, 1982, pp. 46–47.] The recognition of pragmatic space, such as belts of poor and rich soil, is of course an intellectual achievement. When an ingenious person tries to describe the soil pattern cartographically, by means of symbols, a further move toward the conceptual mode occurs. In the Western world, systems of geometry—that is, highly abstract spaces—have been created out of primal spatial experiences" (pp. 16–17). Leonard and McClure (2004) argue, "Myths which take us to a sacred place where rejuvenation or immortality is possible—whether that place is a garden, a forest, a mountain, a well, lake, stream, fountain, or river—have the effect of transporting us back to the primordial and womblike condition that preceded our quotidian struggles with money, relationships, and the eventual loss of our physical and mental powers" (p. 325). Compare Brown (1991, p. 116).

53. Snyder (1990) likens language to "some kind of infinitely interfertile family of species spreading or mysteriously declining over time, shamelessly and endlessly hybridizing, changing its own rules as it goes" (p. 7). It is "a mind-body system that coevolved

with our needs and nerves. Like imagination and the body, [it] rises unbidden . . . [with] a complexity that eludes our rational intellectual capacities" (p. 9). However, in developing his anthropology of experience, Jackson (1995) makes the cogent observation that experience, unlike language, "covers everything that is the case. This is why words alone can never do justice to experience" (p. 160). "Words are signs, 'stand-ins, arbitrary and temporary, even as language reflects (and informs) the shifting values of the people whose minds it inhabits and glides through" (Snyder, 1990, p. 8). But "no word is able to contain the moods of a moment" (Jackson, 1995, p. 5). "Life eludes our grasp and remains at large, always fugitive," never captured completely (p. 5). It "outstrips our vocabulary" (p. 5). "Like a forest in which there are clearings. Like a forest through whose canopy sunlight filters and fall" (p. 5). "Theodor Adorno called this the untruth of identity, by which he meant that concepts plunder but never exhaust the wealth of experience. Life cannot be pressed [exclusively] into the service of language. Concepts represent experience at the cost of leaving a lot unsaid. So long as we use concepts to cut up experience, giving value to some things at the expense of others, . . . we gain some purchase on the world, to be sure, but claiming that our concepts contain all that can be usefully said about experience, we close off the possibility of critique. It is only when we cease trying to control the world that we can overcome our fixation on the autarchy of concepts" (p. 5). "An anthropology of experience," Jackson says in that connection, "shares with phenomenology a skepticism toward determinate systems of knowledge. It plays up the indeterminate, ambiguous, and manifold character of lived experience. It demands that we enlarge our field of vision to take into account things central *and* peripheral, focal *and* subsidiary, illuminated *and* penumbral" (p. 160). These are the kinds of things, sometimes esoteric, bundled up by deep cultural contexts that are not easily discovered without access to the granaries of knowledge through the people who have built them. And even then, unable to be the "thing in itself," we will always have to settle for partial truths. On the difficulty of describing the experience of the *duende*, see Lorca (1985).

54. Richardson (1999b) observes, "To say that we must be in a story is not to say that we have our destiny already engraved in our neurons or awash in our subconscious. On the contrary, our life story continuously unfolds, shifts, changes. . . . Both place and story have to do with where we are, with location, but the *where* of each is distinct. The poetics of place is preeminently

sensory. Smell, sound, touch, and especially sight are attributes of place, which is consequently visual and spatial. On the other hand, words strung together in speech and in writing constitute stories. Narrative, therefore, is verbal and temporal. In place, our dominant mode of relating to one another is through seeing; in written narrative, it is through reading. Interestingly, we use each mode as a metaphor of the other. When we want to emphasize that we're interpreting what we look at, we speak of 'reading the landscape.' Conversely, we exclaim, 'I see!' to convey the insight gained by reading a text" (p. 332). See also Brady (2003b, pp. xiv–xv).

55. Bass (2000) tells the story of how nature writers at a conference, "much to the initial confusion of some of the audience—kept talking about *specifics*: about buffalo, about native medicines, about narwhals, caribou, grizzlies and ravens; about the things they *knew*—and it was not until the second or third day that the audience began to grumble, 'What about the writing?' The panelists looked at one another in confusion. This *was* the writing. The world they inhabited—the so-called natural world of rock and sand and wood and ice—had become so imbued with power by their living deeply within it that the only language they were comfortable with was that of the specific. So deeply and passionately did they inhabit their landscapes—physically, emotionally, and spiritually—that trees became both trees and metaphors; wolves were both wolves *and* symbols; and the lives, the movements of these things, had a logic and pattern that did not transcend art but became art. They were living in their stories. They had stepped across that line, so that everything was story. They believed intensely in the world in which they lived" (pp. 71–72). This is an ancient process so far separated from contemporary writers by the invention and absorption of alphabetic literacy that the participants failed to recognize it until they were called out for their "absence of writing."

56. de Sahagún (1985, pp. 23–24).

57. Consider Tedlock (1983): "The argument that American Indian spoken narratives are better understood (and translated) as dramatic poetry than as an oral equivalent of written prose fiction may be summarized as follows: The content tends toward the fantastic rather than the prosaic, the emotions of the characters are evoked rather than described, there are no patterns of repetition or parallelism ranging from the level of words to that of whole episodes, the narrator's voice shifts constantly in amplitude and tone, and the flow of that voice is paced by pauses that segment its sounds into what I have chosen to call lines. Of all

these realities of oral narrative and performance, the plainest and grossest is the sheer alternation of sound and silence; the resultant lines often show an independence from intonation, from syntax, and even from boundaries of plot structure. I understand the fundamental sound-shape of spoken narrative in much the same way that Robert W. Corrigan understood drama when he wrote that 'the playwright—and also the translator—cannot really be concerned with "good prose" or with "good verse" in the usual sense of those terms. The structure is action, not what is said or how it is said but *when*.' It is above all the *when*, or what dramatists call 'timing,' that is missing in printed prose" (pp. 55–56).

58. Fritz (unknown date and source), translated by Thomas E. Powell.

59. My thinking on this builds on Foucault's concept of *epistemes* as the totality of relations in knowledge of a given epoch (Dreyfuss & Rabinow, 1983; Foucault, 1970, 1972), which I have in this case applied to the separation of human activities before and after the invention of writing and the subsequent proliferations of it through mass production printing. Abram's (1996) articulate treatment of the distortions posed by studying preliterate through the mentality of alphabetic literacy is applied directly to considerations of place and translation. Lowe (1982) has an extended delineation of the root of the problem: "Recent scholarship reveals that communications media, hierarchy of sensing, and epistemic order change in time. Hence the perceptual field constituted by them differs from period to period. There is a history of perception [that delimits] the changing content of the known" (p. 2), and it has changed dramatically in the communication pools that have separated human societies before and after the advent of writing and its proliferation through mass production printing.

60. Lowe (1982) says, "Without the support of print, speech in oral culture is assisted by the art of memory. Rhythmic words are organized into formulas and commonplaces, then set to metric patterns. In this way, they can be recalled and recited with great facility. That which can be recited and repeated will be preserved. The metric recitation of rhythmic formulas and commonplaces provides a communicational grid to determine knowledge in oral culture. Only those phenomena which fit existing formulas and commonplaces can be preserved as knowledge. The new and distinctly different will soon be forgotten. Knowledge in oral culture therefore tends to be preservative and unspecialized, its content nonanalytical but formulaic."

(p. 3). He adds, "The introduction of written language, whether ideographic or alphabetic, and its preservation in some type of manuscript constituted a chirographic culture. Although it took a long time to accomplish, writing eventually detached knowledge from speech and memory. A written language preserved knowledge after the act of speech and beyond the lapse of memory. One could go over a piece of writing at will, learn it, and criticize it; whereas formerly, in an oral culture, knowledge depended on the performance of the speaker" (p. 3). On the modernization of myth, see Barthes (1972).

61. See Jackson (1995, pp. 156–157). Elsewhere, Jackson (1982) says, "Whenever one retraces one's steps in the imagination, an inevitable transformation occurs. One gives thought to things one did without thinking. One replaces words actually said with a vocabulary of one's own choosing. Face-to-face reality is subverted by a second order—written reality. Life gets rendered as [written] language" (p. 3). In constructing this thesis, Jackson draws "extensively on many studies in the ethnography of speaking" in an effort to "avoid any inadvertent domination of the world of preliterate possibilities by the modes of abstract analysis developed in literate cultures" (p. 3). See also Tedlock (1983): "I am reminded of the Zuni who asked me, 'When I tell these stories do you picture it, or do you just write it down?'" (p. 55). On Geertz and cultures as "texts" to be read, see also Tedlock (1999, p. 161).

62. Anthropologists are generally happy to declare that shamanism (the world's oldest profession) is the root of all performative art—a point made effectively by the ethnopoet Rothenberg (1981; see also Rothenberg & Rothenberg, 1983) and the anthropologist Harner (1990), among others. That links us to the Paleolithic era (ca. 100,000 years ago) and opens up ethnographic inquiry to what we are considering in the current work—an enlarged sense of communal ties through the history of talk, performance, myth, poetry, and being-in-place.

63. For various expressions of the same topic, compare Abram (1996), Abu-Lughod (1988), Basso (1996a, 1996b), Brody (1982), Clifton (1990), Damon (2003), Dundes (1972), Feld (1982), Feld & Basso (1996), Howes (1990), Hymes (1987), Jackson (1982), Kreeber (1983), Lavie (1991), Layton (1997), Metcalf (2002), Munn (2003), Nabhan (1982), Riebeur (1991), Rothenberg (1972, 1985), Rothenberg & Rothenberg (1983), Swann & Krupat (1987), B. Tedlock (1992), D. Tedlock (1972, 1983, 1993, 1999), Zolbrod (1983, 1987).

64. Austin (1997, p. 61).

65. The concept of the sublime as "tending to inspire awe usually because of elevated quality (as of beauty, nobility, or grandeur) or transcendent excellence" figures into our sentient existence and survival prospects in several ways. Brown (1991) says, "One of the fundamental assumptions of evolutionary psychology is that matters closely related to our survival and reproduction have a likelihood of engaging our emotions. Thus, although there might be little evidence of a general adaptation for an aesthetic sense, a . . . disparate collection of emotion-producing activities and entities may structure what we consider aesthetic" (p. 115), including the experiences of being-in-place. Writing about Burke, Bromwich (1997) says, "Burke's conclusion is that the feelings of the sublime and the beautiful in life, . . . which may also be excited by moments of works in art, are an inseparable condition of existence" (p. 30). They push the edges and the limits of human nature. The theorist's job "is to show how the affective powers of the sublime and beautiful can be causes of mental activity without ideas or images. At the very end, he will offer a possible reason why words above all can affect us like this. The mind has a hunger for belief, and it has a natural tendency toward abstraction. The appeal of the sublime and the beautiful must somehow relate to that hunger and that tendency of the mind. And words, which bear no resemblance to things, which at the height of their influence on the passions leave no image at all, are therefore the leading artificial and natural source of our sympathy with the sublime and beautiful" (p. 32). Compare Denzin (1997) and Diamond (1987). Denzin (1997) points out, "Modernist ethnographers (and poets) stood outside their texts so as to produce a sense of awe or reverence or respect for what is being written about. The writer was missing from the text. The postmodern writer also seeks the sublime, but it is a new sublime—a nostalgic sublime that transgresses Diamond's poetry of pain. The new scribe seeks a sense of respect and awe for the lost writer who experiences what is being written about. What was previously unrepresentable (the writer's experiences) is now what is presented. Paradoxically, that which is most sought after remains the most illusive" (p. 215).

66. Yi-Fu (1979) notes, "Place can acquire deep meaning for the adult through the steady accumulation of sentiment over the years. Every piece of heirloom furniture, or even a stain on the wall, tells a story" (p. 33). According to Schama (1995), "To see the ghostly outline of an old landscape beneath the superficial covering of the contemporary is to be made vividly

aware of the endurance of core myths. . . . And it is just because ancient places are constantly being given the topdressings of modernity (the forest primeval, for example, turning into the 'wilderness park') that the ambiguity of the myths at their core is sometimes hard to make out. It is there, all the same" (p. 16).

67. Historical trekking can be at once a new and a renewed experience. The "new" information (as word, image, symbol, sensation, etc.) builds on the "old" in that process and has the prospect of resorting it all in still newer terms, including the extensive "mazeway resyntheses" of individuals and groups in revitalization movements (Wallace, 1970). Smith (1997) argues, "The relationship between place and language is perhaps best understood through the experience of breakdown—personal and collective—when one experiences the sense that one's received language, with all of its grammatical enframements and vocabulary tools, is inadequate to express what one is currently realizing to be true about the world" (p. 3).

68. On poets making place an element of their own private mythology as opposed to surrendering obediently to the existing mythology of place, see Heaney (1980b, p. 148). That is a sensuous and intellectual mingling—a tension—of past and present in a nutshell, and therein lies a path to a personal poetics, to a poetry of history and place that speaks to consciousness, commitment, action, and myth—to a possible "marriage between the geographical country and the country of the mind, whether that country of the mind takes its tone unconsciously from a shared oral inherited culture, or from a consciously savored literary culture, or from both . . . that constitutes the sense of place in its richest possible manifestation" (p. 132). See also Graves (1948:14–15) and, of course, Thoreau's (1854/1993) classic, *Walden*.

69. Poetic experiences also show that immersion in place has its shiftings as well, its contradictions and alienations, and that the alienations of an ethnographer are not restricted to encounters with other cultures (Damon, 2003). Estrangement can happen through the intellectual and aesthetic encounters that one has at home, that is, by freezing moments and interpreting their particulars as both ethnographers and poets must do. On close inspection, everything is strange, and that can be a powerful source of alienation, even from hearth and family (Heaney, 1980b, pp. 137–138). On the other hand, Heaney knows that staying with the comfort and imagination of a summer's day in a strange and rural landscape can bring forth an aesthetic sense of communion with "prehistoric

timelessness." These experiences must give way to the imagination, for that is the carpet on which the Muses fly and is the beacon that signals fair landing. The work is subjective, but that should not be a disqualification for anything except mathematics crammed into teaching formulas. Participation and self-conscious interpretation are how we learn about ourselves in place. Nature can be more in our appreciations than can "inanimate stone." It can be "active nature, humanized, and humanizing" (pp. 144–145).

70. Lame Deer and Erdoes (1972, p. 110).

71. For related work in an anthropological vein, see especially the verse and/or prose of Abu-Lughod (1988), Basso (1996a, 1996b), Brady (2003b, 2004), Cahnmann (2000, 2001), Diamond (1982, 1986, 1987), Farella (1993), Feid (1982), Feid and Basso (1996), Flores (1982, 1999), Hartnett (2003), Heaney (1980a, 1987), Hymes (1995, 2001), Jackson (1995), Kusserow (1998, 1999), Lavie (1991), Lewis (2002), Lopez (1991), Maynard (2003), Nowak (2000), Prattis (1985), Richardson (1982, 1998a, 1998b, 1999a, 1999b, 2001), Rosaldo (2003), Rose (1991), Sherry (1997), Simonelli (2001), Snyder (1969, 1974), Stewart (1996), Suiter (2002), Tarn (1991, 2002), B. Tedlock (1992), and D. Tedlock (1990, 1993).

72. Compare Vendler (1985): "In trying to speak for 'all men and women,' the poet risks losing selfhood altogether" (p. 60).

73. Thompson (1989) says, "What frames and defines a world is the act of participating in a context. To take part in something is to take part from an immensity of possibilities" (pp. 129–130). See also Taussig (1993).

74. None of this is to say that poetic texts (including myths) are empty of important or precise information—another blind prejudice of positivistic science (Brady, 1991a, 1991b, 1998, 2000, 2003a, 2003b; Brady & Kumar, 2000)—or to say that creativity in thought and communication enfranchises a free-for-all of interpretation, ungoverned by existing constraints on sensibility, reality, clarity, and possibility (Brady, 2003b, p. xxiv). On the inversions of poetry and myth, compare Barthes (1972, p. 134).

75. Everybody knows that scientific writing differs from poetry in fundamental ways, for example, that scientific writing is more clinical and less given to uncommon metaphors than is poetry. But an important theoretical implication that often goes unappreciated in these discussions is that each form technically plays a different language game; the positivists use language that is supposed to be transparent or invisible, whereas the humanists (and most pointedly the

poets) do exactly the opposite by openly displaying their presence as observers and authors in their works. More than just a difference of "style," each mode of representation thereby has different criteria for deciding on acceptable or satisfactory forms of expression, and the implications of that are enormous. Changing the language of our descriptions, as Wittgenstein (1974) says, also changes the analytic game itself, including changing the premises for research entry points (Brady, 2004).

76. See also Stoller (1987, 2004) and Joy and Sherry (2003). Yi-Fu (1979) says, "The Eskimos' sense of space and place is very different from that of Americans" (p. 5). Compare Carpenter (1980) and Dundes (1972).

77. Not all poetry travels with equal effectiveness across personal and cultural boundaries—but then, what does? On the roles of preferences and firm, on critics who enter a world not of their own making, and on the importance of slipping any poem into mind with good effect, see Brady (2000, p. 958). On Western ethnocentrism, see Zolotor (1983).

78. On Australian writer David Malouf and being at a loss for words, see Smith (1997, p. 3). J. Turner (1996), after an encounter with a mountain lion, says, "An aura of prehistory marked the night. Undoubtedly people still have experiences with animals like those of ancient epochs, however unintelligible to our modern lives—unintelligible because we no longer know how to describe them. The vocabularies of shamanism, totems, synchronicities, and *She are tongues again made bold by such experiences*—experiences many believe are irretrievably lost. I believe in the experiences, but I do not understand the vocabularies. I perceive this as my own failing. My life is devoid of practices that might link such events and words. And yet the very existence of such experience is moving—beyond words" (p. 47). Moreover, in a discussion of Hemingway, he asks the question: Where is the point "at which myth and nonlinguistic practices would be required to communicate?" (p. 97). On the whiteness of the page and experiential space beyond writing, see Juarroz (1988, cited in Brady, 1991a, p. 341). On the subjected body exceeding itself and becoming "a space of excess in which the physicality of cultural politics (vocality, tactility, touch, resonance) exceeds the rationalized clarity of 'system' and transcendent understanding," see Stewart (1996, p. 130). Rickman (2002–2003) argues, "Nature is not just a linguistic edifice and language is meaningless if it does not refer beyond itself" (p. 31). See also Maslow (1964) and Sherry and Schouten (2002).

79. Poetry loses, however, if it does not conform at some level to the experience of its audience. We must be able to exchange experiences. On separations of private and public voices, see Benjamin (1969b, p. 156) and Wolf (1982, p. 108). On lyric poetry, see Damon (2003) and Tedlock (1999, p. 56). On poetry and the need for historical contexts, see Hartnett and Engels (chap. 41, this volume). On poetry and the senses, see Stewart (2002). On ways of articulating history and place through poetry and painting, see Brady (2003b).

80. Addressing similar issues, Jackson (1995) says, "I wanted to develop a style of writing which would be consonant with lived experience in all its variety and ambiguity" (p. 4), including consciousness itself as a form of projected and prospective awareness. Consciousness "expresses interrelationships between self and other, subject and object, which do not have to be contrived because they are the very precondition of our human situation" (p. 169). Moving in that intellectual zone with an appealing and innovative mixed verse and prose account of his fieldwork in Africa, the poet/ethnographer Wilmsen (1999), knowing little of the local languages as his African journey began, queries himself: "While walking in the debilitating heat, I asked myself how I was going to make my experience intelligible to others" (p. xii). His answer? "It seemed to me that a way to do this lay in exposing the simultaneity of experience in individual life: recurrences in which earlier occurrences resonate—recognized as memories, expectations, reveries, informing each momentary awareness, shaping each" (pp. xi–xii). Wilmsen continues, "I have tried only to translate the texture of experience without claiming it to be mine alone. . . . I wanted to demonstrate that simultaneity of experience is not an exclusive prerogative of today's world but is a condition of being human. . . . I wanted to find a way to express the historicities of persons in contact—to express the fact that there are no alien cultures, only alienating ways of categorizing diversity" (p. xiv).

81. But consider the notion of "messy texts," that is, "texts that are aware of their own narrative apparatuses, that are sensitive to how reality is social[ly] constructed, and that [understand] that writing is a way of 'framing' reality. Messy texts are many sited, intertextual, always open-ended, and resistant to theoretical holism, but always committed to cultural criticism" (Denzin, 1997, p. 224). According to Denzin (1997), "Ethnopoetics and narratives of the self are messy texts: They always return to the writerly self—a self that spills over into the world being inscribed. This is a writerly self with a particular hubris that is neither

insolent nor arrogant. The poetic self is simply willing to put itself on the line to take risks. These risks are predicated on a simple proposition: This writer's personal experiences are worth sharing with others. Messy texts make the writer part of the writing project. These texts, however, are not just subjective accounts of experience; they attempt to reflexively map the multiple discourses that occur in a given social space [see especially Wilmsen, 1999]. Hence, they are always multivoiced. No interpretation is privileged. These texts reject the principles of the realist ethnographic narrative that makes claims to both textual autonomy and epistemological validity" (p. 225). See also Brady (1998, 2000, 2003b, in press) and Marcus (1994).

82. "Theodor Adorno speaks of 'exact fantasy' to describe a genre of writing that is rigorously empirical but, without 'going beyond the circumference' of the empirical, rearranges constellations of experienced facts in ways that render them accessible and readable. It is a method of writing that repudiates the form of lineal and progressive argumentation. It is paratactic. No one element is subordinated to another. Perhaps the term 'exact fiction' best describes such an approach to ethnographic writing" (Jackson, 1995, pp. 163–164). Compare Brady (2003b), Favero (2003), and Metcalf (2002).

83. There are other effects as well. Tedlock (1983) argues, "Event" orientation, together with an intensified appreciation of fantasy, has already led modern poets to recognize a kinship between their own work and the oral art of tribal peoples. As Jerome Rothenberg points out in *Technicians of the Sacred*, both 'modern' and tribal poets are concerned with oral performance, both escape the confines of Aristotelian rationalism, both transcend the conventional genre boundaries of written literature, and both sometimes make use of stripped-down forms that require maximal interpolation by audiences" (p. 55). These kinds of interests and the focus on poetry and interpretive methods in general in ethnopoetics join up with other forms of experimental texts in making "public what sociologists and anthropologists have long kept hidden: the private feelings, doubts, and dilemmas that confront the field-worker in the field setting" (Denzin, 1997, p. 214). They "humanize the ethnographic disciplines . . . under a postmodern aesthetic assumption concerning the sublime to make what was previously unrepresentable part of the presentation itself" (p. 215). They simultaneously break from and continue "the ethnographic tradition of representing experiences of others," rejecting "the search for absolute truth that is suspicious of totalizing theory," breaking down as part

of the process "the moral and intellectual distance between reader and writer" (p. 215), and perhaps helping to close the gap with fresh approaches to what we, as modern peoples, have lost (or buried or in other ways deprioritized) since the advent of writing and the removal from daily contact with the soil and animals of our ancient selves.

84. Compare Lopez (1990b): "If, in a philosophy of place, we examine our love of the land—I do not mean a romantic love, but the love Edward Wilson calls biophilia, love of what is alive, and the physical context in which it lives, which we call 'the hollow' or 'the canebrake' or the 'woody draw' or 'the canyon'—if, in measuring our love, we feel anger, I think we have a further obligation. It is to develop a hard and focused anger at what continues to be done to the land not so that people can survive, but so that a relatively few people can amass wealth" (p. 42).

85. Neruda (1997, p. 213).

86. Abbey (1968, p. 131).

87. Fawning over noble savages or pristine environments and societies only clouds the issue. We need to catch ourselves in the act of oversimplifications and ethnocentric wishes. We need to be cognizant of the fact that, as Hartnett and Engels point out elsewhere in this volume (chap. 41), the life circumstances of the ancients were "like our own world—wracked with political, economic, and cultural dilemmas."

88. Gruenewald (2003) says, "An expanded framework for analyzing the power of place might include more discussion of Native American and other indigenous traditions, natural history, psychology, anthropology, architecture, sociology, cybernetics, ecological science, and religious studies, as well as all genres of imaginative literature. Once one begins interrogating the power of place as a construct for analysis, one sees that it might be, and increasingly is, applied constructively to any realm of human experience or inquiry. . . . The question is worth asking: Without focused attention to places, what will become of them—and of us?" (p. 646). On poetry in educational research, see also Cahmann (2003).

89. By writing from their own body-grounded experiences and addressing directly those of others similarly embodied, both personally and conscientiously, poets can dice up what ails us into vivid and believable accounts. That is an empowering and political act, and poets are not strangers to it. On poetry and politics, see Heaney (1995, pp. 1, 7–8), von Hallberg (1987), and Rich (2003). On educational reform and taking "teachers and students beyond the experience

and study of places to engage them in the political process that determines what these places are and what they will become," see Gruenewald (2003, pp. 629, 640). See also the pioneering and thoughtful work on "investigative poetry" by Hartnett and Engels (chap. 41, this volume) and the powerful testament to poetic rendering as a course of social action in Hartnett (2003).

90. See Lopez (1990b, 1998) and Snyder (1983). In *Arctic Dreams*, Lopez (1986) says that the "ethereal and timeless power of the land, that union of what is beautiful with what is terrifying, is insistent. It penetrates all cultures, archaic and modern" (p. 368). And just as we are necessarily situated in the land, "The land gets inside us, and we must decide one way or another what this means, what we will do about it"—accept it as it is, attempt "to achieve congruence with a reality that is already given a . . . reality of 'horror within magnificence, absurdity within intelligibility, suffering within joy,'" as one could argue fits the worldviews of the Inuit, or should we take our profound modern ability to alter the land, that is, "change it into something else" (p. 368)? In one respect, there is no choice at all. "The long pattern of purely biological evolution . . . strongly suggests that a profound collision of human will with immutable aspects of the natural order is inevitable" (p. 368). On place, technology, and representation, see also Sherry (2000).

91. Denzin (1997) knows that "good ethnography always uses language poetically, and good poetry always brings a situation alive in the mind of the reader" (p. 26).

CULTURAL POESIS

The Generativity of Emergent Things

Kathleen Stewart

What follows is a piece of imaginative writing grounded in an intense attention to the *poesis*, or creativity, of ordinary things. This is an ethnographic attention, but it is one that is loosened from any certain prefabricated knowledge of its object. Instead, it tracks a moving object in an effort (a) to somehow record the state of emergence that animates things cultural and (b) to track some of the effects of this state of things—the proliferation of everyday practices that arise in the effort to know what is happening or to be part of it, for instance, or the haunting or exciting presence of traces, remainders, and excesses uncaptured by claimed meanings.

The writing here is committed to speculations, experiments, recognitions, engagements, and curiosity, not to demystification and uncovered truths that snap into place to support a well-known picture of the world. I ask the reader to read actively—to follow along, read into, imagine, digress, establish independent trajectories and connections, disagree. My own voice is particular and partial, tending in this case to be a surreal, dream-like description of ordinary spaces and events. The subject I “am” in the stories I tell is a point of impact meandering through scenes in

search of linkages, surges, and signs of intensity. I suppose that the writing gropes toward embodied affective experience. Finally, the writing is also a set of provocations in that it tries to cull attention to moments of legibility and emergence, to moments of impact (instead of to stable subjects), to models of agency that are far from simple or straightforward, to the vitality or animus of *cultural poesis* in the jump or surge of affect (rather than on the plane of finished representations), and to the still life—the moment when things resonate with potential and threat.

In calling this particular arena of things cultural poesis—the creativity or generativity in things cultural—I am thinking of the ways in which this field of emergent things has been written into cultural theory in various ways by Walter Benjamin, Michel Foucault, Mikhail Bakhtin, Roland Barthes, Gilles Deleuze, Raymond Williams, Donna Haraway, Marilyn Strathern, Eve Sedgwick, Michael Taussig, and others. There are Foucault’s (1990) theses on the productivity and micropoetics of power, Williams’s (1977) attention to emergent structures of feeling, Benjamin’s (1999, 2003) theories of allegory (vs. symbol) and his own nomadic tracking of dream worlds still

resonant in material things, Bakhtin's (1982, 1984) fundamental theorization and elaboration of the social poetics lodged in language, texts, and social worlds, and Barthes's (1975, 1977, 1981, 1985) intense and sustained insistence on the workings of spaces and pleasures in between, or outside, or somehow in excess of the recognized objects we call texts, experience, meaning, concept, and analysis. Deleuze and Guattari (1987) polemicized the conflict between meaning-based models of culture and models that track actual events, conjunctures, and articulations of forces to see what they do. In the wake of their critique, they outlined a theory of the affective as a state of potential, intensity, and vitality (see also Guattari, 1995). Contemporary feminist theorists, notably Haraway (1997, 2003), Strathern (1991, 1992a, 1992b, 1999), and Sedgwick (1992, 1993, 1997, 2003), have carefully—and with enormous creative energy of their own—worked to theorize the generativity in things cultural and to make room for ways of thinking and writing it, as has Taussig (1986, 1992, 1993, 1997, 1999).

Here, I try to incite curiosity about the vitality and volatility of cultural poesis in contemporary U.S. public culture through a story of ethnographic encounters (see also Stewart, 1996, 2000a, 2000b, 2002a, 2002b, 2003a, 2003b).

■ ORDINARY INTENSITIES:

AFFECT, VITALITY, GENERATIVITY

This is a story about public circulations in moments of vital impact. It takes place in the United States during an ongoing present that began some time ago. This is a time and place in which an emergent assemblage made up of a wild mix of things—technologies, sensibilities, flows of power and money, daydreams, institutions, ways of experiencing time and space, battles, dramas, bodily states, and innumerable practices of everyday life—has become actively generative, producing wide-ranging impacts, effects, and forms of knowledge with a life of their own. This is what I mean by cultural poesis.

Here, I offer some random examples of the generativity of all things in a state of cultural emergence. The objects of my story are emergent vitalities and the ordinary practices that instantiate or articulate them, if only partially and fleetingly. Caught, or glimpsed, in their very surge to be realized, these are things that are necessarily fugitive, shifting, opportunistic, polymorphous, indiscriminate, aggressive, dreamy, unsteady, impractical, unfinished, and radically particular.

The writing here is one that tries to mimic felt impacts and half-known effects as if the writing were itself a form of life. It follows leads, sidesteps, and delays, and it piles things up, creating layers on layers, in an effort to drag things into view, to follow trajectories in motion, and to scope out the shape and shadows and traces of assemblages that solidify and grow entrenched, perhaps doing real damage or holding real hope, and then dissipate, morph, rot, or give way to something new. It talks to the reader not as a trusted guide carefully laying out the perfect links between theoretical categories and the real world but rather as a subject caught in the powerful tension between what can be known and told and what remains obscure or unspeakable but is nonetheless real. Its thoughts are speculative, and its questions are the most basic. What is going on? What floating influences now travel through public routes of circulation and come to roost in the seemingly private domains of hearts, homes, and dreams? What forces are becoming sensate as forms, styles, desires, and practices? What does it mean to say that particular events and strands of affect generate impacts? How are impacts registered in lines of intensity? How are people quite literally charged up by the sheer surge of things in the making? What does cultural poesis look like?

■ DREAMLAND

The roller-coaster ride of the American dream had come into a sharp-edged focus. Good and bad. Winning and losing. Those were your choices. Anxious and haunted sensibilities tracked unwanted influences and veiled threats in idioms

of addiction, trauma, and conspiracy while dreams of transcendence and recluses set afloat reckless hopes of winning or escape. Life was animated in equal parts by possibility and impossibility. We lurched between poles of hope and despair as overwrought dreams flopped to the earth, only to rise up again, inexplicably revitalized, like the monster in a horror movie or the fool who keeps going back for more. Lines of escape were fascinating too—the rocketing fortunes of the rich and famous, the dream of a perfect getaway cottage, the modest success stories of people getting their lives together again. New lifestyles proliferated at the same dizzying pace as did the epidemic of addictions and the self-help shelves at the bookstore.

The political dynamism of this tense mix of dreams and nightmares registered in an everyday life infused with the effort to track and assimilate the possibilities and threats lodged in things. Newly charged forms of the desire to know, to see, and to make a record of what was behind or underneath surfaces and systems formed a network of ordinary practices. Proliferating practices of turning desires and ideals into matter both encoded the everyday effort to master, test, and encounter emergent forces and demarcated a state of being tuned in to the mainstream. The new objects of mass desire promised both inclusion in the very winds of circulation and the nested still life of a home or identity resting securely in the eye of the storm.

As previously public spaces and forms of expression were privatized, previously privatized arenas of dreams, anxieties, agencies, and morals were writ large on public stages as scenes of impact. Yet the world had become weirdly mysterious just when it started to seem like a private life writ large or some kind of collective psyche institutionalized and exported in a global mutation. It was like a net had grown around a gelatinous mutating substance, creating a strange and loose integration of planes of existence and sensibilities. Things had become both highly abstract and intensely concrete, and people had begun to try to track emergent forces and flows on these variegated registers without really knowing what they were

doing. Somehow it was all personal, but it was also something huge flowing through things.

The feminist slogan, “the personal is political,” took on a new charge of intensity and swirled in spinning and floating contexts far beyond any simple ideological clarity or political program.

■ ORDINARY LIFE

We were busy. Homes were filled with the grounding details of getting the rent money together, getting or keeping jobs, getting sick, getting well, looking for love, trying to get out of things we had gotten ourselves into, eating in, working out, raising kids, walking dogs, remodeling homes, and shopping. There were distractions, denials, shape-shifting forms of violence, practical solutions, and real despair. For some, one wrong move was all it took. Worries swirled around the bodies in the dark. People bottomed out watching daytime television. Credit cards were maxed out. There was downsizing and unemployment. There was competition to get kids into decent schools and for them to keep their grades up. Schedules had to be constantly juggled to keep up with dance classes or layoffs. Dizzying layers of tasks filled in the space of a day.

People took walks in their neighborhoods, peering into windows by night and murmuring over beautiful flowerbeds by day. Or, we scrambled to find ways to get to work and back on unreliable buses that quit running at night. We baked birthday cakes or ordered them from the supermarket decorated with Tigger or a golf course. We “flipped off” other drivers, read the luscious novels and sobering memoirs, disappeared into the Internet, and shopped at Wal-Mart and the other megastores because they were cheap, convenient, or new and had slogans such as “Getting It Together” and “Go Home a Hero.”

Positions were taken, habits were loved and hated, dreams were launched and wounded. There was pleasure in a clever or funny image. Or in being able to see right through things. Some people claimed that they could rise above the flow and walk on water. Others wore their irony like an

accessory that gave them room to maneuver. There were all the dreams of purity, martyrdom, a return to nature, getting real, having an edge, and beating the system.

Just about everyone was part of the secret conspiracy of ordinary life to get what he or she could out of it. There were the dirty pleasures of holing up to watch one's secret bad TV show, taking a trip to the mall, working out in spinning classes at the gym, spending nights on the Internet, or playing music loud in the car on the way to the supermarket.

■ GAMES

There were games you could play. One was the driving game of trying to predict when the car up ahead was going to try to change lanes. Some people developed a sixth sense about it. They discovered that if they concentrated on the car they could sense when it was considering a move, even when the driver was not signaling a lane change and when the car itself was not surreptitiously leaning to the edge of the lane or acting "nervous." The game of the sixth sense became a pleasure and a compulsion in itself. It spread fast, even without the usual help of expert commentary.

You could try out this game in supermarket checkout lines too. There the game was to try to size up the flow of a checkout line in a glance. How fast is that cashier? Does that woman have coupons? That one looks like a check writer. That one looks like a talker. But the checkout line game was harder than the driving game. Even a brilliant choice could be instantly defeated by a dreaded price check or the cash register running out of tape. And once you made your choice, you were stuck with it. Already impatient, you might then start to feel a little desperate. You could switch to multitasking—make a phone call, make lists in your head, or get to work on your palm pilot. Or, you could scan the surrounding bodies and tabloid headlines for a quick thrill or an ironic inner smirk at signs of other people's eccentricity or gullibility. Or, you could just check *yourself* out by opening and paging through *Home and Garden* or *Glamour* or *Esquire*. You could relax into the

aura of tactile bodies, living rooms, and gardens that staged the jump from fantasy to flesh and back again right before your eyes. The glossy images offered not so much a blueprint of how to look and live as the much more profound experience of watching images touch matter.

■ ODD MOMENTS

At odd moments in the course of the day, you might raise your head in surprise or alarm at the uncanny sensation of a half-known influence. Private lives and the public world had gotten their wires crossed. Any hint of private movement would be sniffed out and thrown up on public stages, and people now took their cues so directly from circulating sensibilities that the term "hard-wired" became shorthand for the state of things.

Public specters had grown intimate. The imaginary had grown concrete on public stages. All of those bodies lined up on the talk shows, outing their loved ones for this or that monstrous act. Or the reality TV shows, with the camera busting in on intimate dramas of whole families addicted to sniffing paint right out of the can. We would zoom in to linger, almost lovingly, on the gallon-sized lids scattered around on the living room carpet and then pan out to focus on the faces of the parents, and even the little kids, with big rings of white paint encircling their cheeks and chins like some kind of self-inflicted stigmata.

The labor of looking had been retooled and upgraded so that we could cut back and forth between the images popping up in the living room and some kind of real world out there.

America's Most Wanted aired photos of bank robbers with and without beards so that you could scan the faces at the local convenience store looking for a match.

The streets were littered with cryptic, half-written signs of personal/public disasters. The daily sightings of homeless men and women holding up signs while puppies played at their feet could haunt the solidity of things with the shock of something unspeakable. *Hungry. Will work for food. God bless you.*

The sign hits the senses with a mesmerizing and repellent force. Too sad. The graphic lettering that pleads for the attention of the passing cars glances off the eye as something to avoid like the plague. Moving on. But it also holds the fascination of catastrophe, the sense that something is happening, the surge of affect toward a profound scene.

The handmade, handheld sign of the homeless on the side of the road pleads to be recognized, if only in passing. In its desperation, the sign makes a gesture toward an ideological center that claims the value of willpower ("will work for food") and voices the dream of redemption ("God bless you"). But it is abject; it offers no affect to mime, no scene of a common desire, no line of vitality to follow, no intimate secret to plumb, no tips to imbibe for safety or good health. Instead, it sticks out of the side of vision. The shock of something unreal because it is too real, too far outside the recognized world, unspeakable. There is no social recipe for what you can do about homelessness or even what you can do with your eyes when confronted with homelessness face to face. We live in a profound social fear of encounters like this.

Even to glance out of the corner of the eye at the sign on the side of the road is a dizzying side-step. What the glance finds in the scene it glances at, half panicked, is the excluded other's abject surge to be included in the wind of circulation—the mainstream. Its message is too stark; it begs. It mimes the discourse of the mainstream to the letter, pushing it to the point of imitation or parody or fraud. It makes the mainstream seem unreal and heartless—dead.

A dollar bill stuck out of a car window gets a quick surge forward from the one with the sign and the heightened, yet unassimilated, affect of a raw contact. "God bless you."

Now we are trudging the rough terrain of bodies and the sensuous accumulation of impacts.

■ WHATEVER

Jokes had started to circulate about how we might as well wire ourselves directly to sensation buttons and just skip the step of content altogether.

One day an e-mail came her way from Penny, a friend in the neighborhood who liked to keep up a running commentary on quirky characters and scenes spied from her studio windows or fabricated on drowsy afternoon walks. Penny would stop by to report tidbits and then move on. A light touch. When she used the e-mail, it was to forward funny tales filled with delicious descriptive details sent to her from like-minded others building a corpus of matters to chew on. This one told the tale of something that happened shortly after the attacks of September 11, 2001, in a medical clinic where a friend of a friend of Penny's apparently worked:

Of course, it's not the big money area and the building is very rinky-dink. Not a big target for anthrax, let's just put it that way. She works with mothers who have drug abuse problems and the office downstairs treats juvies [juveniles]. Apparently one of the women who works downstairs turned on the a/c [air conditioner] (window unit) and a white dust sprayed out all over her. Yikes. They called the CDC [Centers for Disease Control and Prevention] and men in white suits and gas masks invaded. My friend who works upstairs was dubious—and so the people in her office just stayed and worked while the downstairs was cordoned off and investigated. They rushed the substance off to the lab and put everyone who was in the office on Cipro. Then the test results came back. Low and behold, the substance tested positive for cocaine! So good, isn't it? They think one of the juvies hid his stash in the a/c when he was afraid of being searched. I think it's a brilliant idea to start pumping cocaine into the workplace. No need for caffeine anymore. Let's just move right on up to the next level of productivity inspiration. Whadya say?

■ A LITTLE ACCIDENT, LIKE ANY OTHER

She was in a café in a small town in west Texas. A place where ranchers hang out talking seed prices, fertilizer, and machines and where strangers passing through town are welcome entertainment. The sun had gone down, and she was half-way through her fresh-killed steak and baked potato when the biker couple came in limping.

All eyes rotated to watch them move to a table and sit down. The couple talked intently, as if something was up, and from time to time they exchanged startled looks. When she walked past the couple's table on her way out, they raised their heads and asked whether she was heading out on the west road and whether she could look for bike parts. They had hit a deer coming into town and dumped their bike. The deer, they said, had fared much worse.

The room came to a dead stop as all ears tuned in to the sentence of the crash, still resonating in the bikers' bodies. Slowly, taking their sweet time, people began to offer questions from their tables, drawing out the details. Then other stories began to surface of other deer collisions and strange events at that place on the west road.

As she left, she pictured how, during the days to come, people would keep their eyes open for deer parts and bike parts when they traveled the west road out of town. She imagined that there would be more talk. Conversations would gather around the event and spin off into other questions such as the overpopulation of deer, hunting regulations, and the new law that legalized riding without a helmet. There might be discussions of how to fix bikes (and especially this particular make of bike), what parts might break or twist when the bike is dumped, and who was a good bike mechanic. Or, people might talk about the condition of the roads. The image of hitting the wide open road or surviving the desert injured might come up. The talk might call up anything from the image of sheer speed encountering a deer caught in one's headlights to the abstracted principles of freedom, fate, and recklessness.

But one way or another, the little accident would compel a response. It would shift people's life trajectories in some small way, change them by literally changing their course for a minute or a day. The chance event might add a layer of story, daydream, and memory to things. It might unearth old resentments or suddenly bring a new conflict to a head. It might even compel a search for lessons learned. Resonating levels of body and mind might begin to rearrange themselves into simpler choices—good luck and bad luck, animal

lives lost and threats to machine-propelled humans, risk-taking wild rides and good old common sense.

But for now at least, and in some small way in the future too, the talk would secretly draw its force from the resonance of the event itself. Its simple and irreducible singularity. And the habit of watching for something to happen would grow.

SCANNING

Everyday life was now infused with the effort to track and assimilate the possibilities and threats lodged in things. Newly charged forms of the desire to know, to see, and to record what was behind surfaces and inside systems formed a network of ordinary practices.

She was no different from anyone else. All of her life, she had been yelling "pay attention!" but now she was not sure whether that was such a good idea. Hypervigilance had taken root as people watched and waited for the next thing to happen. Like the guy she heard about on the radio who spends his whole life recording everything he does: "Got up at 6:30 am, still dark, splashed cold water on my face, brushed my teeth, 6:40 went to the bathroom, 6:45 made tea, birds started in at 6:53. . . ."

Or, there was the neighbor on a little lake in Michigan whose hobby was recording his every move on video—his walks in the neighborhood and in the woods, his rides in his Ford Model T, his forays into Polish folk dances where old women went round and round the dance floor together, the monthly spaghetti suppers at the Catholic church in town. He gave one of his videos to her and her friends to watch. They played it one night—three anthropologists peering at whatever came their way from the weird world out there. It was a video of him walking around the lake in the winter snow and ice. They heard his every breath and footstep. There were some deer droppings on the path and some snow piles with suspicious shapes. Then he was walking up to Bob and Alice's cabin (the couple were in Florida for the winter), and he was zooming in on a huge lump of something that was pushing out the black plastic

wrapped around the base of the house. Uh oh. Could be ice from a broken water main. Maybe the whole house was full of ice. The neighbor guy wondered out loud, if in fact it was ice, what would happen when the ice thawed. Could be a real problem. He said that maybe he would send a copy of his video on to Bob and Alice down in Florida. Then he moved on. Back to his breathing and the icicles on trees and his footsteps in the snow. Tracking the banal, scanning for trauma.

The three anthropologists looked at each other. What was that? She was mesmerized by it, like it held a key to how the ordinary could crack open to reveal something big and hidden that it had swallowed long ago. The other two were not so easily swayed. It was some kind of weirdness that pushed banality to the point of idiocy and made no sense at all. A puzzle as to why anyone would want to record the droning sameness of things, looking for something worth noting to come his way. Some strange threat or promise that popped up just for a minute and then sank below the surface again as if nothing had ever happened. A shimmering—there one minute and gone the next. Or maybe some lyrical scene you would want to remember. Something with *meaning*.

All of this watching things was mostly a good-natured thing. Like happy campers, people would put up with a lot of nothing in hopes of a glimpse of something. The ordinary was the mother lode that they mined, hoping for a sighting of a half-known something coming up for air.

It could be that ordinary things were beginning to seem a little “off,” and that was what drew people’s attention to them. Or, maybe the ordinary things had always seemed a little off if you stopped to think about them.

There were the obsessive compulsives who kept track of things because they had to (“Got up at 6:30 a.m., still dark, splashed cold water on my face. . . .”). These people became sightings in themselves.

Or, there were those who gave shape to their everyday by inventing practices of mining it for something different or special. People like her friends, Joyce and Bob, who lived in the woods in New Hampshire. He was a lumberjack. She

cleaned those little 1950s tourist cabins that were called things such as “Swiss Village” and “Shangrila.” She had left her husband and four kids after years of living straight in a regime of beatings under the sign of Jesus. She went out the back window one day and never looked back. Then she met Bob when she was tending bar, and the two took a walk on the wild side together that lasted for a dozen happy years (although not without trouble and plenty of it). He had a drinking problem, and she let him have it because he worked hard. He would hit the bottle when he got home at night and all weekend long. She called him “Daddy” even though she was a good 10 years older and pushing 50.

Joyce and Bob moved from rental cabin to rental cabin in the north woods. They invited raccoons into their cabin as if the animals were pets. They got up at 5 a.m. to write in their diaries, and then when they got home at night they would read their daily entries out loud and look at the artsy photos of treetops and bees’ nests that Bob took. Finally, they were able to get a “poor people’s” loan to buy a little cabin they had found in some God-forsaken place on the north side of the lake and to fix it up. But then a card came from Joyce saying that Bob had left her for “that floozy” he met in a bar.

She wonders whether Joyce still keeps a diary, whether she still fancies the serendipitous discovery of happiness and looks for ways to deposit it in the ordinary, or whether something else has happened to her ordinary.

■ THE ANTHROPOLOGISTS

The anthropologists kept doing the fun things they did together. Like knocking on the doors of the little fishermen’s huts on the frozen lake. They would invite themselves in for a visit, but then they would sit down on the bench and the fishermen would not say anything. Not even “who are you?” or “what are you doing here?” So, they sat together in a wild and awkward silence, staring down into the hole in the ice and the deep dark waters below. The anthropologists could not think of a single question that made any sense at all.

When the anthropologists took walks in the woods, they would come across hunters. The hunters were more talkative than the ice fishermen. That is because they all wanted the friendly, nosy, overeducated strangers to know that they were not "Barbi killers." Maybe some other hunters were, but not them—the new breed. They were nice, and a lot of them had been to college and had things to say about politics and the environment and the state. Most of the time there was a woman in the group. The others were teaching her to hunt. Everyone—the anthropologists too—would cower when the mean-looking game wardens came around a bend looking for poachers. The wardens were the bad guys. They would drive slowly past in postapocalyptic cars with burned paint and giant guns and spotlights mounted on the hood. They would fix us with hard stares, and you could see the muscles jump under their camouflage hunting suits. These guys were jumpy.

■ BEING JUMPY

Sometimes, the jumpy move would take over. Lingis (1994) saw that this had happened among miners at the Arctic Circle:

The young miner who showed me the mine put out every cigarette he smoked on his hand, which was covered with scar tissue. Then I saw the other young miners all had the backs of their hands covered with scar tissue. . . . When my eye fell on them I flinched, seeing the burning cigarette being crushed and sensing the pain. . . . The eye does not read the meaning in a sign: it *jumps* from the mark to the pain and the burning cigarette, and then jumps to the fraternity signaled by the burning cigarettes. (p. 96)

■ A SLASHING

On the river in Austin, Texas, in the early morning, joggers pass over the long high bridge and stop to stretch their hamstrings on its metal rails. Pairs of friends, about to part for the day, will stop to stare out at the expanse of watery sights laid out

below—fishermen in flat-bottomed boats sit upright in straight-backed chairs, giant blue herons poise on drowned cottonwoods, raw limestone mansions perched on the cliffs above throw reflections halfway across the river. Crew boats pass silently under the bridge like human-powered water bags skimming the surface. Occasionally, a riverboat will thrust itself slowly up the river, dredging the hard mass of the water up and over its wheel. Here, the world-in-a-picture still vibrates, as if it was just at that very moment that the real world crossed paths with an imagined elsewhere and the two realms hung suspended together in a still life.

Sometimes there are scenes of quiet desperation.

Sometimes people leave memorials on the bridge.

One morning, a crude sign appeared, taped to the metal railing. Below it was a shrine—yellow ribbons and a Sacred Heart of Jesus votive candle with half-burned sticks of incense stuck in the wax. The names Angela and Jerry were written in bold letters at the top of the sign, like the names of young lovers repeated over and over in school notebooks or graffitied on train trestles. The star-crossed lovers' names were harshly crossed out and followed by the words "Relationship destroyed, with malice by Federal Agents & A.P.D. [Austin Police Department] for beliefs guaranteed under U.S. Constitutional Bill of Rights. I miss you Angela, Jessica, & Furry Dog Reef."

It was signed "Always, Jerry."

Below the signature were two graphics: the nickname "Yankee Girl" encircled by a pierced heart and a thick black box encasing the prayer "Please Come Back." Then a final howl and a promise:

Angela, Jessica and Furry Dog Reef. . . . I miss you.

May God have mercy on the souls of the hateful, evil, vindictive people who conspired to take you from me, and did so with success. Angela, I will love you always and forever.

I miss you babe.

Jerry

At the bottom, another pierced heart held Yankee Girl in its wounded arms.

The sign was both cryptic and as crystal clear as a scream. Bitter fury was its vitality and its end. Its drive to a sheer satisfaction quivered like flesh in its wavering letters. It heaved grief and longing at the world not as an outer expression of an inner state but more directly as an act of the senses making contact with pen and paper and matches. Its slashing was like the self-slashing of young women who cut themselves so that they can feel alive or literally come to their senses. It had the same self-sufficient fullness and did not ask for interpretation or dream of a meaning.

This is a sensibility as common as it is striking. It is the kind of thing you see everyday. In the elaborate poetics of graffiti—the signatures left so artfully, the politics of slashing through them, crossing them out, erasing them, replicating them all over town. Or in the signs of the homeless on the side of the road. Or in the countless verbal and visual signs that come to life on the charged border between things private and things public. It is the kind of sensibility that surges through the wild conversation of AM radio talk shows and Internet sites. It adds force to the railing of the enraged in everything from road rage, to letters to the editor, to the face-to-face raging resentments of workplaces and intimate spaces. It permeates politics from right wing to left wing.

Something in its roughened surface points to a residue in things, a something that refuses to disappear. It draws attention, holds the visual fascination of unspeakable things—transgressions, injustices, the depths of widespread hopelessness. What animates it is not a particular message but rather the more basic need to forcefully perform the unrecognized impact of things.

It flees the easy translation of pain and desire into abstract values or commonsense coping. Yet every day its dramas of surge and arrest are bathed in the glow of some kind of meaning or form of dismissal. Then there are these questions: Will the gesture of the slashing shimmer as a curiosity passed on an everyday walking path, and will you feel a little jolt as you pass? Or, will it just go in one eye and out the other?

Sometimes, it might have the vitality of a pure surge pushing back, gathering a counterforce to a

point of intensity that both slashes at itself and spits at the world.

Other times, its very violence means that it will be erased, ignored, or drawn up, like blood in a syringe, to infuse new life into the enveloping categories of good sense, healthy protest, productive acts and lives, and mainstream moods by virtue of its bad example. It will be unwilling and unwitting nourishment for the more settled world of calculation, representation, value, and necessity that gave rise to its spitting fury to begin with. Yet even then, the sign, in its perverse singularity, will peep out of little cracks on barely public stages simultaneously defying and demanding witness. It will remain a partially visible affecting presence because what it registers is not only points of breakdown in "the system" but also lines of possible breakthrough beating unbidden in the blood of the mainstream.

A person walking by such signs might be touched by them or hardened to their obnoxious demands. But either way, a charge passes through the body and lodges in the person as an irritation, a confusion, an amusement, an ironic smirk, a thrill, a threat, or a source of musing. For better or worse, signs that erupt as events teach us something of their own jumpy attention to impacts by leaving visceral traces in their wake.

■ STRESS

The lone body and the social body had become the lived symptoms of the contradictions, conflicts, possibilities, and haunted sensibilities of pervasive forces. Stress was the lingua franca of the day. If you had it, you were onto something, part of the speeding force of things-in-the-making. But it could puncture you too, leaving you alone during times of exhaustion, claustrophobia, resentment, and ambient fear.

The self became a thing filled with the intricate dramas of dreams launched, wounded, and finally satisfied or left behind. You could comfort it like a child. Or, you could look at the outlines of it against the relief of other people's missed opportunities. Or, you could inhabit it as a flood of

events and relationships caught in a repetitive pattern that you recognized only when you got to the end of a cycle, and by then you were already onto the next one.

There were little shocks in the rhythms of splurging and purging and in the constant edgy corrections of the self-help regimes—take an aspirin a day (or not), drink a glass of red wine a day (or not), eat butter or low-fat margarine or canola oil, eat oatmeal to strip the bad cholesterol from your arteries, eat salmon to add the good cholesterol, try antioxidants or kava kava or melatonin.

The figure of a beefed-up agency became a breeding ground for all kinds of strategies of complaint, self-destruction, flight, reinvention, and experimentation as if the world rested on its shoulders. Straight talk about willpower and positive thinking claimed that agency was just a matter of getting on track, as if all the messy business of real selves affected by events and haunted by threats could be left behind in an out-of-this-world levitation act.

Against this tendency, a new kind of memoir began to work the lone self into a fictional sacrifice powerful enough to drag the world's impacts out onto secret stages. Self-help groups added density to the mix, offering both practical recipes for self-redeeming action and a hard-hitting, lived recognition of the twisted, all-pervasive ways in which compulsions permeated freedoms and were reborn in the very surge to get free of them once and for all.

■ THE BODY SURGES

The body builds its substance out of layers of sensory impact laid down in the course of straining upstream against recalcitrant and alien forces or drifting downstream, with its eyes trained on the watery clouds and passing treetops overhead and its ears submerged in the flow that surrounds it, buoys it, and carries it along. The body surges forward, gets on track, gets sidetracked, falls down, pulls itself up to crawl on hands and knees, flies through the air, hits a wall, regroups, or beats a

retreat. It knows itself as states of vitality, exhaustion, and renewal. It exerts itself out of necessity and for the love of movement and then it pulls a veil around itself to rest, building a nest of worn clothing redolent with smells of sweat or cheap perfume or smoky wood fires burrowed into wool.

The body cannot help itself. It is an extremist seeking thrills, a moderate sticking its toe in to test the waters, a paranoid delusion looking for a place to hide. It is a bouncing fool throwing itself at an object of round perfection in the dogged conviction that it is on the right track this time. What the body knows, it knows from the smell of something promising or rancid in the air or the look of a quickening or slackening of flesh. It grows ponderous, gazing on its own form with a Zen-like emptiness. As a new lover, it dotes on revealed scars and zones in on freckles and moles and earlobes. As one of the anxious aging, it is drawn to the sight of new jowls and mutant hairs and mottled skin in the bathroom mirror.

The body is both the persistent site of self-recognition and the thing that will always betray you. It dreams of its own redemption and knows better. It catches sight of a movement out of the corner of its eye and latches on to a borrowed intimacy or a plan that comes as a gift to sweep it into the flow of the world and free it of its lonely flesh.

The body consumes and is consumed. Like one big pressure point, it is the place where outside forces come to roost, condensing like thickened milk in the bottom of the stomach. It grows sluggish and calls for sweet and heavy things to match its inner weight. Or salty or caffeinated things to jolt it to attention.

Layers of invented life form around the body's dreamy surges like tendons or fat.

Lifestyles and industries pulse in a silent, unknown reckoning of what to make of all this.

The body builds itself out of layer on layer of sensory impact. It loves and dreads what makes it. At times, it is shocked and thrilled to find itself in the driver's seat. At other times, it holes up, bulks up, wraps itself in its layers. The world it lives in spins with the dancing poles of ups and downs and rests its laurels in a banality that hums a tune of its own.

■ BODY FOR LIFE

She once took up *Body for Life* on the advice of a friend. Between them, it was a joke. They called it their cult. But they also knew that there was something to a little extreme self-transformation. Or at least the effort. *Body for Life* was a best-selling book with glossy "before-and-after" pictures of bodybuilders on the inside covers. It started as a bodybuilder's, movement-building, moneymaking challenge to the unwashed to put down the beer and chips and start loving life instead of just living it, to start thriving and not just surviving. It was "12 weeks to mental and physical strength."

She was not at all taken with the tanned, oiled, muscle man and muscle woman look on the inside covers, but the little game of moving her eyes back and forth between each pair of before-and-after shots caught her in a spell of momentary satisfaction. The eye jumped happily between the paired scenes. Now fat and pale, now muscled and oily and tan. Peek-a-boo. All of the bodies were white. They made her think of the body displays that she was always running into when she lived in Las Vegas. At the post office, or at the drive-in movie theater, or while waiting in line to get a new driver's license, there were always half-naked bodybuilders with wet-skinned snakes draped around their necks, or monkeys on leashes, or stars-and-stripes halter tops and permed blond hair.

Her friend called the people in the pictures "beefcakes." Class seemed to be somehow involved in all of this, but people would swear up and down that those who were into *Body for Life* came from all walks of life. That comfortable claim to plainness emerging out of some kind of mainstream. Some kind of mall culture. Ordinary Americans unmarked by anything but the will to change their bodies and by the real or imagined fruits of their success after those glorious 12 weeks. They were people who had been catapulted out of the back seat of life onto the magic carpet ride that turns flighty self-defeating dreams into vital generative flesh.

They had experienced their breakthroughs when they saw the inspiring photos on the inside

covers, or when they took a good hard look at their own eye-opening "before" pictures, or when—while watching the inspirational video that they could get for a \$15 donation to the Make-A-Wish Foundation—they were suddenly released from the feeling of being alone and felt hope instead. They began to crave the 12-week program even more than they craved a piece of key lime pie or a beer.

There is nothing weird about how this happens. It is laid out step by step like a 12-step program where the spiritual transformation flows directly through the flesh. You follow the steps in the book as if it were a recipe book, consuming each new exercise with relish. You create 12-week goals out of gossamer wishes. Done. You pull your dreams out of their shadow existence into the light of day. Okay then! You harness the force in your own faintly beating desire to change. Wow! Okay. You ask yourself hard questions. You write down the answers. You speak your goals out loud with mimicked confidence every morning and night until the confidence is real. You commit. You focus; forget the zoning out and drifting downstream. You create five daily habits. You imagine other people looking at your new body with gleaming eyes, and you hear their approving comments until the imagining is effortless and part of you. You surrender the negative emotions that hold everyone back, and you start looking forward. You realize that you will never again get sidetracked. Everyone who takes the 12-week challenge feels like a winner. You do not need a carrot on a stick anymore; you take your eyes off the prize (a blood red Lamborghini Diablo) and even consumer fetishism seems to fade into the background of a half-lived past. Now you are consuming your body, and your body is consuming you. It is more direct.

She was not really interested in the inspirational business, however, and she never actually read the book. She passed directly from the game of before-and-after photos to the charts near the end of the book that tell you exactly what you have to do and eat. She got organized. She made copies of the exercise charts so that she could fill one out each day like a daily diary. She memorized the acceptable

foods in the three food groups and stocked up. She ritualized each meal and gleefully took off the 7th day each week, carefully following the instruction to eat exactly whatever she wanted that day and no less. She ordered boxes of the shakes and power bars and began to experiment with the recipes that made the chocolate shake taste like a banana split and turned the vanilla shake into that famous liquid key lime pie. She got the picture. She felt the surge. She let it become a new piece of her skeleton. Then there were the inevitable ups and downs, the sliding in and out of its partial cocoon.

A couple of years later, long after she had consumed the program enough to reduce it to a few new prejudices about how to exercise and how to eat, she drifted into Body for Life Community.com and the dozens of listservs and chat rooms in its nest. Some were modeled as Christian fellowships:

The only requirement for membership is the desire to be healthy. This is not just a set of principles but a society for people in action. Carry the message or wither. . . . Those who haven't been given the truth may not know the abundant life we have found—a way out, into life, a real life with freedom.

Other listservs were just organized by state. In any of them, you could click on someone's name and up would pop a *Body for Life* photo, slipping you right into the culture of personal ads. In the chat rooms, things got really concrete. One woman confessed that she could smell the chocolate right through the wrappers in the bowl of Halloween candy by the door, and someone shouted support in capital letters: "HANG IN THERE! YOU CAN DO IT!!!" A man happily obsessed about how to prepare his shakes:

My favorite is chocolate, and to prepare the shake I always use 3 cubes of ice from the Rubbermaid mold, put them (without water) in the jar, and then pour the water in. Use 12 and a half ounces and 1 centimeter, then blend for about 55 seconds. You [have] got to use a stopwatch! I think this is why I love Myoplex, because I blend it for more seconds and I drink it cool without milk or bananas.

People exchanged stories of ongoing tragedies, seeking workout partners to help them

get through the ordeals. Others just focused on keeping up the network connections:

Good morning to everyone. Been off for a few days. Lizzy—sorry to hear about your migraine—scary! Jim—it's true—your pictures don't do you justice! Abs—I love your philosophy! It's true—we become what we think about. Deb—congratulations! Good luck with your photos—can't wait to see your progress! If you find something that covers bruises, let me know—I bruise just thinking about bumping into something. Can't wait to see you all at the upcoming events!

All of these self-expressions are excessive in their own way. They proclaim, confess, obsess, and gush. But that is not because the body really does just get on track and march forward armed with the drama of success and the minutia of disciplinary practices. It is because it slumps and gets sidetracked and rejoins its *Body for Life* self. It is because it wants and it does not want and because it might do one thing or another. It is because it smells its way along tracks, and new tracks intersect the old and carry it away. It is because it catches things out of the corner of its eye, and half-hidden things on the sidelines are always the most compelling.

Body for Life draws its own life from the force of a bodily surge enacting not the simple, deliberate, one-way embodiment of dreams but rather the pulsing impact of dream and matter on each other in a moment when the body is beside itself. Caught in a movement, floating suspended between past and future, hesitation and forward thrust, pain and pleasure, knowledge and ignorance, the body vibrates or pulses. It is only when the body remains partly unactualized and unanchored that it seems intimate, familiar, and alive. This can be lived as an event—a moment of shock, climax, or awakening. But there is also something of it in the banal and quotidian—a continuous background radiation, a humming left unremarked like a secret battery kept charged.

Body for Life says that turning fleeting fantasies into the force of vitality is about making a decision, but making a decision is itself about

playing games, looking at pictures, following recipes, mimicking desired states, inventing social imaginaries, and talking to yourself in the mirror. Getting on track and staying there is not the simple and sober choice of a lifetime but rather a thin line from which you can, and probably will, topple back to ordinary sloppiness or onto an "epidemic of the will" (Sedgwick, 1992) such as excessive dieting. Then the body might swing itself back to a state of moderation or exhaustion, stick its toe in to test the waters, and pull the blankets over itself to hide.

The proliferating cultures of the body spin madly around the palpable promise that fears and pleasures and forays into the world can be literally made vital all-consuming passions. But this promise (and threat) is already there in the body directly engaged by shifting public sensibilities, in the senses retooled and set in motion. Like an antenna, the body picks up pulses that are hard to hear or hard to bear, in the normalizing universe of cultural codes. It stores the pulses in a neck muscle or a limb, or it follows them just to see where they are going. It dares them and registers their impacts. It wants to be part of their flow. It wants to be in touch. It wants to be touched. It hums along with them, flexing its muscles in a state of readiness.

■ SOMETIMES WHEN YOU HEAR SOMEONE SCREAM . . .

Laurie Anderson had a show at the Guggenheim Soho called "Your Fortune, \$1." A spooky white plastic owl perched on a stool in a darkened corner spewed out a stream of two-bit advice, trenchant commentary, and stray advertising lingo plucked out of a realm of sheer circulation. The owl's mechanical yet sensuously grainy voice droned on and on, transfixing her in a flood of Hallmark greeting card schlock. She was fascinated to see how the flood's ordinary reality seemed to instantly deflate and become both laughable and alarming from the owl's simple mimicking.

Then it said something that she swore she had already been anxiously chanting to herself.

Sometimes when you hear someone scream, it goes in one ear and out the other. Sometimes it passes right into the middle of your brain and gets stuck there.

It was one of those moments when the indiscriminate flow stops dead in its tracks. The super-saturated soup of sensory images and sounds gently prodding and massaging us like waves lapping a shore takes this opportunity to solidify into something momentarily clear or even shocking. Like a trauma we had forgotten or never quite registered that comes back in a flash. Or like a whiff of something hopeful or potentially exciting passing with the breeze. We perk up in a mix of recognition, pleasure, and alarm.

One minute you are afloat in the realm of sheer circulation. Then some random sound bite hits you with a force that seems to bring you to your senses. We sober up in the face of a cruel lucidity. But it is the hungry sense that has been awakened that drives the world back into the land of enchantment. The waves of desire lap at our feet, and we drift off again, held aloft by the sheer density of images, sensory signals, and objects drawn into play in the dreamworld.

When she heard the owl's line about screams that pass right into the middle of your brain and get stuck there, she went home and wrote down a story that had been lodged in her psyche ever since she heard it.

The story starts with a question lodged in a tactile sensate anxiety and then opens onto an aesthetic scene of the senses. The question: Do you ever wake up in the morning, or in the middle of the night, with a sense of sudden dread and start scanning your dreamy brain for the memory of what you have done or a premonition of what is coming? Some do this all of the time; for them, this is what morning has become.

The aesthetic scene: She has a big iron bed lodged against long wide windows looking onto the back deck. Tropical breezes waft over her in the night, carrying the sweet and fetid smells of kumquat trees and mimosa blossoms. At dawn, there are wild bird cries—mourning doves and grackles and parrots that once escaped their pet cages and now breed in the trees. At certain hours

in the still of the night, the train cries in the near distance. The night pulses with the high lonesome sound of haunted machine dreams roaming the landscape.

When she has guests, she lets them use the iron bed, and they wake up talking about the bed and the wailing train as if they feel pleased to be set down in some kind of American Heartland. But she is only too happy to lay down a pallet on the living room floor and fall into a deep sleep with only the smell of old ashes from the fireplace because she knows why the train sings.

The train sings for Bobby, a homeless drunk who laid himself down on the tracks one night and passed out as if he too could lay down a pallet and escape from his ghosts. He and his old lady had been down at the free concert on the river where some of the street people party hard. The weekly concert was their moment to be at home in public, doing what everyone else was doing, only more. Some would laugh loud or make announcements or give people directions and advice. As the day went to full dark, the power of music would flow out from the stage, touch spellbound bodies, and spread out to the neon skyline reflecting in the dark glassy expanse of the river. There were always graceful moments—a dance gesture, a wide open smile, a sudden upsurge of generosity, the startled gratitude of pariahs who suddenly found themselves seamlessly rubbing shoulders with the housed. There were always crashes too—people falling down drunk in front of the stage; the vomiting; a man huddled and pale, too sick to party; flashes of hope and ease dashed on the rocks of familiar fury, frustration, humiliation, and grief; people making spectacles of themselves. Sometimes there were fights.

That night, Bobby had a fight with his old lady and stomped off alone. He followed the train tracks through the woods to the homeless camp, where he sat on the tracks alone, taking stock in a booze-soaked moment of reprieve. He loved the romance of the high lonesome sound in the distance and the train's promise of tactility and power—the rumbling weight of power incarnate rumbling past, the childhood memory of the penny laid on the tracks, the way the tracks

carved out a "no man's land" where shadows could travel and live.

He laid himself down on the icy cold tracks and closed his eyes, as if tempting fate. As if that simple move held both the possibility of checking out and a dream of contact with a public world that might include him.

Somewhere in the middle of the long train passing over, he raised his head, awakening. They say that if he had not woken up, the train would have passed right over him.

Now the train screams out a warning when it draws close to that place on the tracks not far from her iron bed. It often wakes her. Or it lodges in her sleep and comes as an unknown shock of anxiety in the morning.

■ Coda

The stories that make up my story—disparate and arbitrary scenes of impact tracked through bodies, desires, or labors and traced out of the aftermath of a passing surge registered, somehow, in objects, acts, situations, and events—are meant to be taken not as representative examples of forces or conditions but rather as constitutive events and acts in themselves that animate and literally make sense of forces at the point of their affective and material emergence. More directly compelling than ideologies, and more fractious, multiplicitous, and unpredictable than symbolic representations of an abstract structure brought to bear on otherwise lifeless things, they are actual sites where forces have gathered to a point of impact, of flirtations along the outer edges of a phenomenon, or extreme cases that suggest where a trajectory might lead if it were to go unchecked. They are not the kinds of things you can get your hands on or wrap your mind around, but they are things that have to be literally tracked.

Rather than seek an explanation for things we presume to capture with carefully formulated concepts, my story proposes a form of cultural

and political critique that tracks lived impacts and rogue vitalities through bodily agitations, modes of free-floating fascination, and moments of collective excitation or enervation. It attempts to describe how people are quite literally charged up by the sheer surge of things in the making.

My story, then, is not an exercise in representation or a critique of representation; rather it is a cabinet of curiosities designed to incite curiosity. Far from trying to present a final, or good enough, story of something we might call "U.S. culture," it tries to deflect attention away from the obsessive desire to characterize things once and for all long enough to register the myriad strands of shifting influence that remain uncaptured by representational thinking. It presumes a "we"—the impacted subjects of a wild assemblage of influences—but it also takes difference to be both far more fundamental and far more fluid than models of positioned subjects have been able to suggest. It is not normative. Its purpose is not to evaluate things as finally good or bad, and far from presuming that meanings or values run the world, it is drawn to the place where *meaning* per se collapses and we are left with acts and gestures and immanent possibilities. Rather than try to pinpoint the beating heart of its beast, it tracks the pulses of things as they cross each other, come together, fragment, and recombine in some new surge. It tries to cull attention to the affects that arise in the course of the perfectly ordinary life as the promise, or threat, that something is happening—something capable of impact. Whether such affects are feared or shamelessly romanticized, subdued or unleashed, they point to the generative immanence lodged in things. Far from the named "feelings" or "emotions" invented in discourses of morals, ideals, and known subjectivities (leave that to Hallmark and the Family Channel), they take us to the surge of intensity itself.

My story tries to follow lines of force as they emerge in moments of shock, or become resonant in everyday sensibilities, or come to roost in a stilled scene of recluse or hiding. It tries to begin the labor of knowing the effects of current restructurings not as a fixed body of elements and representations imposed on an innocent world

but rather as a literally moving mix of things that engages desires, ways of being, and concrete places and objects.

"ARIA IN TIME OF WAR"

Investigative Poetry and the Politics of Witnessing

Stephen J. Hartnett and Jeremy D. Engels

Contemporary intellectual production in the humanities is haunted by two scandalous hypocrisies. First, although *interdisciplinarity* and *excellence* are the catchwords of the era, universities for the most part continue to teach, hire, and tenure according to stultifying genre-bound traditions rather than fresh pedagogical, artistic, or intellectual ambitions. Second, although humanists can build flashy careers using words such as *radical*, *intervention*, *transgression*, and *counterhegemonic*—even while fitting snugly into safe discrete fields—the number of academics doing political work is embarrassingly small. In contrast to these two driving hypocrisies, we invoke the spirit of Ralph Waldo Emerson, who demanded in a sermon-like essay from 1844 that a poet should strive toward becoming “the Knower, the Doer, and the Sayer.”

Emerson (1844/1982) told his readers that knowing, doing, and saying “stand respectively for the love of truth, for the love of good, and for the love of beauty” (p. 262). Filtered through a postmodern lens, we suggest that knowing indicates the necessity of scholarship, that doing points toward activism and other forms of embodied knowledge, and that saying calls for an examination of and participation in the politics of representation. Read in this way—as calling for the combination of serious scholarship, passionate activism, and experimental representation—Emerson’s transcendentalist dictum serves as a ringing indictment of the hypocrisies described previously and as a clarion call for what we describe in what follows as *investigative poetry*.

Although attempts to define a genre are doomed to failure and inevitably invite a cascade of

Authors’ Note. An earlier version of the material in Section 4 of this essay originally appeared as part of Hartnett (1999); that material appears courtesy of the National Communication Association. Parts of Sections 2 and 4 of this essay appeared in a slightly different form in Hartnett (2003); that material appears courtesy of Rowman & Littlefield Publishers. The authors are deeply grateful for the editorial insights of Norman Denzin and Ivan Brady.

counterarguments, refutations, and modifications, we nonetheless begin with the premise that investigative poetry exhibits these characteristics:

- An attempt to supplement poetic imagery with evidence won through scholarly research, with the hope that merging art and archive makes our poetry more worldly and our politics more personal
- An attempt to use reference matter not only to support political arguments but also as a tool to provide readers with additional information and empowerment
- An attempt to problematize the self by studying the complex interactions among individuals and their political contexts, hence witnessing both the fracturing of the self and the deep implication of the author in the very systems that he or she examines
- An attempt to problematize politics by witnessing the ways that social structures are embodied as lived experience, hence adding to political criticism ethnographic, phenomenological, and existential components
- An attempt to situate these questions about self and society within larger historical narratives, thereby offering poems that function as genealogical critiques of power
- An attempt to produce poems that take a multiperspectival approach, not by celebrating or criticizing one or two voices but rather by building a constellation of multiple voices in conversation
- A deep faith in the power of commitment, meaning that to write an investigative poetry of witness the poet must put himself or herself in harm's way and function not only as an observer of political crises but also as a participant in them

We elucidate these claims in what follows via a series of case studies. It is impossible to begin this essay, however, without noting that arguments over the possible relationships among poetry, politics, and social justice—to say nothing of the methodological criteria offered earlier—are as old as civilization itself. As Birkerts (1987) observes, “The poetry/politics debate began when Plato booted the poet from his ideal Republic, maybe even sooner; it will go on so long as there

is language” (p. 55). But unlike Birkerts and the hundreds of other critics who have weighed in with weighty pronouncements on one aspect of this debate, often in tones that we can only describe as partisan at best and shrill at worst, we want to honor the epic and sometimes comic nature of that debate without descending into it. Instead, we offer readers a series of interlocking readings of some veins of work that we have found to be edifying. Our comments here may be taken, then, not so much as our levying an argument about how we think poets, activists, and scholars should proceed as our sharing some hopefully pedagogical thoughts on the literary and activist inspirations that have fed our fascination with and unbounded support for investigative poetry.¹

Our essay unfolds in four movements. First, to frame our arguments about investigative poetry, we explore the poetic and political possibilities embodied in recent works by Carolyn Forché and Edward Sanders. Forché’s (2003) *Blue Hour* is a haunting, elegiac, and spiritual meditation on the ever-piling wreckage of violence. Sparse and abstract, with words floating in the hushed glimmer of no-where and no-time, Forché’s devastating poems feel like a dismal history lesson detached from history. Sanders’s (2000) *America: A History in Verse* offers a different model. Packed with details organized chronologically, and reading like a catechism of lessons gleaned from the lost fragments of our national history, these celebratory poems offer readers an empowering investigation into the still great promises of the American experiment. By comparing these texts, we establish some of the benefits and consequences of pursuing these different modes of investigative poetry. Second, we review the literature regarding the recent turn across the humanities to a concern with social justice, hence grounding our thoughts about investigative poetry within the tradition of engaged scholars who use their positions as teachers and writers to try to help expand democratic rights, economic opportunities, and cultural aspirations for an ever larger circle of readers, students, and fellow activists. Third, to illustrate some of the promises

and problems with one of the main intellectual traditions informing investigative poetry, we examine the literary, pedagogical, and anthropological ambitions of the movement known loosely as *ethnopoetics*. Although our reading of the various branches of ethnopoetics grants their important roles in initiating conversations about multiculturalism, bringing a literary consciousness to anthropology, breaking down positivism, and criticizing colonialism, our readings of specific ethnopoems finds them to be consistently removed from questions of power. Fourth, we celebrate the dense triumphs of John Dos Passos, the early Carolyn Forché, and Peter Dale Scott, all of whom merge concerns for social justice and a commitment to writing a political poetry of witness in texts that, although historical, political, personal, philosophical, and beautiful, consistently place a critique of power at the center of their work. Taken as a whole, these four sections offer readers a sweeping overview of the opportunities and obligations of both producing and consuming "Aria in Time of War"; that is, we celebrate those who honor the persistence of poetry in the face of horror, who commit their academic work to social justice, and who merge the two—scholarship and poetry—in the political work of witnessing.

■ 1. OSCILLATING BETWEEN NO-TIME AND THE BLIZZARD OF FACTS: FORCHÉ, SANDERS, AND THE QUESTION OF HISTORICAL CONTEXT

We begin with eight haunting lines from "On Earth," the central poem from Forché's (2003) unsettling *Blue Hour*:

- a random life caught in the net of purpose (p. 26)
- a search without hope for hope (p. 27)
- America a warship on the horizon at morning (p. 29)
- and it is certain someone will be at that very moment pouring milk (p. 30)

aria in time of war (p. 32)

black with burnt-up meaning (p. 35)

history decaying into images (p. 42)

inhabiting a body to be abolished (p. 45)

On and on it goes in relentless ethereal detail, working methodically through a 48-page alphabetically structured poem meant to approximate the feel of a Gnostic abecedarian hymn, ending with but one entry for the letter z: "zero" (p. 68).

These lines prompt readers to wonder about the mysterious relationships among agency and chance, personal volition and historical velocity ("a random life caught in the net of purpose"); to empathically walk a mile in the shoes of someone who bravely, yet apparently fruitlessly, pursues justice ("a search without hope for hope"); to ponder a world in which American power is feared by faraway peoples ("America a warship on the horizon at morning"); to know that despite such fears, someone somewhere is enjoying a quiet moment of sustenance and plenty ("and it is certain someone will be at that very moment pouring milk"); to listen closely to hear whether the explosions of war and the silent misery of poverty are graced with beauty ("aria in time of war"); to ask after all that has been lost in the ever-piling wreckage of history ("black with burnt-up meaning"); to ponder what it means to think historically in a world that appears with each day to possess meaning not from words and sounds and touches and smells but rather from the blinding whirl of mass-produced pictures ("history decaying into images"); and to imagine for a moment what it must feel like to be one of the damned ("inhabiting a body to be abolished"), condemned perhaps to die on death row, or on skid row, or from the torturous spiral into hopelessness, where one inhabits a body that slowly loses meaning. Thus, Forché invites us on a terrifying voyage into the mysteries of life during an age of mass-produced misery.

Readers are left to fill in the blanks as they choose, to complete the jigsaw puzzle of horror by supplying details from their own warehouses

of knowledge and memory and even fantasy, for who can hold such sweeping imagery together without moving from the realm of expertise and experience to imagination and projection? The danger of enabling such projection is that it invites readers to move from thinking about the specific causes and consequences of historical loss to nostalgically longing for some abstract *absence*. As LaCapra (2001) argues in *Writing History, Writing Trauma*, this shift from loss to absence is potentially dangerous because “when loss is converted into (or encrypted in an indiscriminately generalized rhetoric of) absence, one faces the impasse of endless melancholy” (p. 46). Moving from the healthy mourning of specific historical loss to the endless web of melancholy is fueled, LaCapra claims, by a tendency “to shroud, perhaps even to etherealize, them [historical losses] in a generalized discourse of absence” that relies on figures that are “abstract, evacuated, disembodied” (pp. 48–49). Forché’s dilemma in *Blue Hour*, then, as in all works that strive to merge hard-hitting politics and joyous poetic reverie while roaming across a wide swath of time, revolves around the question of how to provide a cosmopolitan, truly globalizing perspective on the tragedy of life without falling into the trap of morose and politically paralyzing longing for immaterial absence.²

In her introduction to the magisterial anthology of poems, *Against Forgetting*, Forché (1995) argues, “The poetry of witness frequently resorts to paradox and difficult equivocation, to the invocation of what is *not* there as if it *were*. . . . That it must defy common sense to speak of the common indicates that traditional modes of thought, the purview of common sense, no longer *make sense*” (p. 40). We imagine that most readers will grant the wisdom of this claim, for who has not thrilled at the truth conveyed in an oblique poem or song or dance, bringing a rush of sensemaking greater than anything ever found in dry tomes of history or sociology or political science? And who has not found himself or herself walking through historical wreckage or working through a novel with the eerie sense that he or she were conversing with the dead (Gordon, 1997)? But at what point

does defying common sense and invoking the dead fade into helpless abstraction, into the infinitely repeatable layering of random projections against one another (O’Rourke, 2003)? Like flipping distractedly through 100 channels of late-night television, or watching billboards tick by on some anonymous stretch of highway, don’t such invocations of the dead and such refusals of common sense ultimately leave readers awash in confusion? Where are we? What is the date? What are the stakes? Who are the players? *Why does this matter?*

Sanders’s (2000) *America: A History in Verse* answers these questions on every page. “I love the way my nation seethes/ I love its creativity/ & the flow of its wild needs,” Sanders proclaims in his introduction (p. 9). Channeling the epic and synthesizing sweep of Whitman, Sanders thus offers readers a love poem qualified by the knowledge that “I know of course/ that I have to trace the/ violence of my nation” (p. 8). These poems matter, then, because they aspire to rewrite the history of America circa 1900–1939 and, by investigating specific historical losses, to provide readers with the factual knowledge, rhetorical resources, and political encouragement to try to reclaim the nation’s better half from its lingering—and recently ascendant—demons. Sanders pursues this goal by studying the nation’s players, institutions, struggles, and sounds, which he offers up in newspaper-like snippets organized by years. Thus, whereas Forché’s melancholy *Blue Hour* offers a chillingly beautiful yet ultimately disempowering meditation on absence, Sanders’s *America* offers a compelling, if didactic, tribute to the winners and losers of specific historical battles.

As one of the founders of the 1950s micropublishing culture that freed artists from corporate constraints, as a seminal New York hipster during the beat generation, as an accomplished pre-punk musician, as witness to the travesty of the Democratic Convention in Chicago in 1968, and on and on—in short, as one of those miraculous figures who seem to always be at the center of what is *happening*—Sanders has for the past 50 years or so been a tireless and good-natured gadfly watching America struggle to achieve the glory of its

promises. Given his personal experiences with some of the leading artists and activists who have prompted America's cultural and political changes over the past decades, it comes as no surprise that Sanders reminds readers that history hinges in large part on individual actors exercising agency. *America* accordingly offers a "who's who" catalogue of heroes and villains in action.

For example, here is one of Sanders's many loving tributes to Isadora Duncan, who first danced in America in 1908 and who

based her revolution in Dance
on the natural grace of bodies moving in
Beauty
It was ancient, she said, from the form-loving
Greeks
& so when she showed a nipple or knee
she could claim those ancient roots
She was an advocate of free love
a political radical
& a stunning emblem to the women
who wanted to smoke, strut, paint
write, dance, & fuck more freely. (p. 80)

Sanders (2000) shows us a brave woman dancing her and her sisters' way toward freedom. Close readers might want more poetic detail here. *Just how did she reveal that nipple or knee? What did it look like? How did crowds respond? Were lovers actually thinking of Duncan when they fucked more freely?* But in these poems Sanders is less interested in the micro-logical details than in the ways iconic figures and actions function synecdochically, as representative parts that reveal the majesty of the whole. Indeed, as Sanders (1976) declares in his manifesto *Investigative Poetry*, "the essence of investigative poetry" is to create "lines of lyric beauty [that] descend from data clusters," hence both seducing and empowering readers with "a melodic blizzard of data-fragments" (p. 9). Synecdoche is therefore the rhetorical trope that enables Sanders to weave individual lines of

beauty into a collective swirl of data fragments and thus to write poetic history.³

Indeed, *America* is based largely on the trope of synecdoche, which hinges on the convertibility between parts and wholes, on the representational electricity assumed to link actors to their epochs. For example, whereas Duncan stands as a representative woman, as the individual embodiment (part) of the period's struggle for women's freedom of mind and movement (whole), so Sanders reverses the equation and offers institutions (wholes) as symbolic aggregates of individual hope (part). Put differently, because even exceptional individuals are only as strong as their larger community bonds, Sanders is obliged to represent not only radical individuals but also the hope-sustaining and change-making institutions that support their visionary work. For example, Sanders's investigations into the struggle against racial violence lead him to celebrate the 1909 founding of the National Association for the Advancement of Colored People (NAACP):

& there comes a time in the time-track
when you work for good, no matter the danger
...
There comes a time—
You can look in photo archives
at the shiny-eyed trash
gathered about a lynching tree
as if it were the homecoming parade
—therefore the NAACP. (pp. 83–84)

Although Sanders is a relentless critic of the "shiny-eyed trash" who choose violence over understanding, readers may wish for more details regarding the pleasures of crowds at lynchings. That is, instead of 4 lines describing the energies of white supremacists, why not 30 lines showing us in more detail what the alluded to—but not cited—"photo archives" teach attentive viewers? More than just a quibble about the focus or length of the poem, such questions carry for investigative poets a heavy methodological burden,

for we proceed with the understanding that just as melancholia stands as the paralyzing result of failed mourning, so simply rebuking one's enemies—even lynch mobs—begins the process of moving from understanding specific historical loss to projecting terms of generalized absence and otherness. In this case, the complexities of white supremacy are glossed within a heroic tribute to the NAACP, but one cannot fathom the gravity of the task faced by the NAACP without a more nuanced understanding of what its members were fighting against. We are thus asking for the poem to accept the admittedly heavy burden of playing a more clearly pedagogical function.³

Moreover, without showing us the complexities of the players involved in a given struggle in a clearly pedagogical fashion, much of Sanders's *America* might feel to some readers like an exercise in nostalgia. For example, here is one of his many tributes to the International Workers of the World:

In Fresno in '11

another protest for the right of free speech

again the jails were packed

and Wobblies were singing and giving speeches

to supporters and the curious

gathered outside the jail

...

When it was obvious that

more and more Wobblies were coming to Fresno

to commit civil disobedience

the power structure relented

and rescinded the ban on speaking in the streets. (pp. 87–88)

In 1911, the Wobblies were fighting for workers' rights, yet they rocketed into national consciousness a few years later because of their brave stand against America entering World War I. But as

Sanders notes in his poems from the years 1917 and 1918, it would not be long before the Espionage Act was crushing dissent, sending thousands of protesters to jail and shipping boatloads of socialists back to Europe. At the same time, the draft scooped up additional thousands of young men to be marched to their deaths in Europe's lice-infested trenches. Although many readers will thrill at the image of brave Wobblies fighting for justice in Fresno in 1911, the longer view is ultimately one of defeat: the Wobblies were crushed, free speech was curtailed, and America sloughed off to a disastrously bloody war. Regardless of what readers think of this narrative, the pedagogical function of investigative poetry suggests that Sanders should have offered extensive referencing so that readers could make up their own minds about this version of the Wobblies and America during the World War I era, yet no such reference matter is provided.³

Nonetheless, despite the sense that it is infused with nostalgia, that it lacks the referencing matter required to help readers take the pedagogical step of beginning their own research, and that it sometimes skims too quickly across the surface of events, Sanders's *America* accumulates into a majestic—even awe-inspiring—narrative, for by moving from the exuberance and genius of individuals (Duncan and her revolutionary dancing) to the strength and dignity of organizations (the NAACP and its fight against racism) to the brave triumph of struggles for freedom (the Wobblies' free speech victory in Fresno in 1911) and back again, zigzagging all the while through a kaleidoscopic montage of historical fragments, the poem offers a model of engaged citizenship, literally a handbook of democracy in action. Indeed, whereas Forché's *Blue Hour* can feel oppressively bleak—"collective memory a dread of things to come" (p. 30), "scoop of earth: slivers of femurs, metacarpals" (p. 51), "your mother waving goodbye in the flames" (p. 68)—Sanders's *America* reminds readers of the bravery of our forebears and thus of our obligations to continue their fights for justice.

In addition to this empowering and activating function, Sanders's *America* relishes the more traditionally poetic slices of joy that slither through

daily experience. Indeed, by juxtaposing horror against the frivolous, joyous, and sometimes brilliant aspects of daily life, *America* provides a startlingly honest glimpse into the lived sensation of watching history crash all around you. Sanders is particularly interested in the relationship between sound and politics, as in this passage about 1925:

George Gershwin's *Piano Concerto*

Prokofiev's *Symphony #2*

Aaron Copeland's *Symphony #1*

and in Chicago Louis Armstrong began the
Hot Five recordings

while December 10

the Grand Old Opry began radio broadcasts

Henry Ford, hating jazz

set up a series of folk dances. (p. 245)

One could obviously write hundreds of pages on each of these figures, but Sanders appears to be more interested in letting readers figure out the implications of such juxtapositions. Like Whitman's famous catalogue poems, then, Sanders makes no attempt to dive into the complexity of these figures, instead positioning them as icons loaded with apparently self-evident meaning, as synecdoches meant to suggest the larger forces at play. For example, it is assumed that one reads the line about Armstrong and understands the importance of the Hot Five moving away from big band formats toward what would eventually become hard swinging bebop; it is assumed that one reads the line about the Grand Old Opry and understands the significance of the mass production (via radio, press, and eventually television) of a nostalgia-based, quietly racist, down home country aesthetic; it is assumed that one reads the line about Copeland and understands how he sought to merge the nation's many musical vernaculars into a majestic symphony-of-the-whole; and so on, with readers left to surround each line with their own comprehension. In this sense, then, Sanders appears to be practicing less what

we are calling investigative poetry than a Whitman-like catalogue poetry, for what we have here are not so much investigations into the complexity of specific moments as suggestive shards, fleeting images, and passing glimpses that are meant to be self-evidently and transparently significant (Buell, 1968; Chari, 1972; Mason, 1973; Reed, 1977).

The fact that these terms—self-evident and transparent—stand in absolute contrast to the allusive and impenetrably dense verse in Forché's *Blue Hour* demonstrates how even though both Sanders and Forché strive to write a political and historical poetry of witness, they practice dramatically different forms of investigative poetry. Indeed, the vast aesthetic differences between *Blue Hour* and *America* raise a host of questions about the possible relationships among different forms of poetry, politics, witnessing, and historical scholarship. In fact, the poems addressed here throw the terms listed earlier into question, forcing us to reappraise not only how they speak to each other but also what they stand for in their own right. Before addressing how investigative poetry speaks to these issues, it is necessary to review the ways that contemporary scholars have tried to reconsider and to merge historical, political, and artistic works to produce engaged scholarship that is both witness to and participant in struggles for social justice.

■ 2. SOCIAL JUSTICE AND THE OBLIGATIONS AND OPPORTUNITIES OF ENGAGED SCHOLARS

Although Forché and Sanders both clearly see their poems as fulfilling political roles, their divergent aesthetic strategies might leave readers wondering about how the fight for social justice figures into such work. One way of answering that question is to shift genres and to address the flood of materials calling on scholars to become more active in their communities' various struggles for social justice. Although it is not difficult to piece together a loose genealogy of intellectuals

concerned with issues of social justice over the past centuries, we are glad to see that during recent years scholars across a variety of disciplines have begun arguing in a systematic manner that those teacher-activists committed to the ends of social justice, while still cherishing the wondrously messy means of democratic life, need to approach issues of social justice not only as sites of research but also as sites of engagement with disadvantaged communities (Crabtree, 1998; Frey, 1998; Hartnett, 1998). Located loosely between Forché's melancholic absence and Sanders's exuberant lists, this social justice literature calls for scholarship that speaks to sweeping ideas by paying deft attention to local needs.

Our thinking here is deeply indebted to Dwight Conquergood, a performance studies professor at Northwestern University who spent years doing research on, and advocating on behalf of, the gangs with whom he lived as a neighbor, teacher, and substitute father figure in the decimated Cabrini Green public housing of Chicago. Conquergood lectured widely about his experiences and wrote about them and their implications for academics and activists in two brilliant book chapters (Conquergood, 1994, 1995). Inspired by Conquergood's bravery, Larry Frey, Barnett Pearce, Mark Pollock, Lee Artz, and Bren Murphy, colleagues at Loyola University in Chicago, implored their fellow speech communication scholars in 1996 to conduct research "not only *about* but *for* and *in the interests of* the people with whom" their research was conducted (Frey, Pearce, Pollock, Artz, & Murphy, 1996, p. 117). This means that scholars can no longer assume they are objective outsiders analyzing static objects of inquiry; instead, in this new model of engaged scholarship, researchers become subjects mutually enmeshed in the processes they are studying. Following Conquergood's lead, then, Frey and his colleagues asked engaged scholars to channel their academic work toward pressing community needs and thus to produce works that "foreground ethical concerns," "commit to structural analyses of ethical problems," "adopt an activist orientation," and "seek identification with others" (p. 111; see also Adelman & Frey, 1997).

For specific ways of thinking about the prospects of teaching on, researching about, and fighting for social justice, we have been influenced by Pierre Bourdieu's "For a Scholarship With Commitment," an essay adapted from a presentation he gave as part of a panel organized by Edward Said for the 1999 meeting of the Modern Language Association (MLA). Bourdieu (2000) recommends that scholars hoping to make a difference pursue four goals: (a) "produce and disseminate instruments of defense against symbolic domination"; (b) engage in "discursive critique," meaning analyses of the "sociological determinants that bear on the producers of dominant discourse"; (c) "counter the pseudoscientific authority of authorized experts"; and (d) "help to create social conditions for the collective production of realist utopias" (p. 42). We may conceptualize these imperatives as pointing to four modes of critical activity. First is helping to teach and popularize the critical thinking skills necessary for citizens to become more conscientious consumers of mass media; we may think of this as *debunking cultural symbolism*. Second is demonstrating through rigorous case studies how dominant discourse reflects the economic imperatives of elites; we may think of this as *analyzing class privilege*. Third is revealing and helping others to reveal the political assumptions and biases of experts within specific fields of inquiry; we may think of this as *becoming rhetorical critics*. And fourth is both imagining and advocating alternative ways of being; we may think of this as *inventing new possibilities*. In that same panel, Elaine Scarry put this fourth imperative in lovely terms—terms that would make Emerson and Whitman proud—arguing that teachers of literature and the arts share a special burden to cultivate in both their students and their communities "a reverence for the work of the imagination" (Scarry, 2000, p. 21; see also Becker, 1994). The task, then, is to fulfill Bourdieu's four critical criteria in forms that meet Scarry's aesthetic criteria, hence our fascination with the possibilities of investigative poetry.

The one obvious shortcoming of the suggestions of Bourdieu, Scarry, and their fellow MLA

participants is that even while asking us to pursue scholarship with commitment, they tend to privilege certain traditional forms of textual production, hence excluding (perhaps unwittingly) many genres of human communication. This explains Conquergood's insistence that engaged scholarship and activism must take into account "the embodied dynamics that constitute meaningful human interaction" by striving for "a hermeneutics of experience, copresence, humility, and vulnerability." Recent literature on ethnography and performance studies has demonstrated the many ways these imperatives may be pursued, often with stunning results, yet as we detail in what follows, we fear that much of this work has tended to fall into a troubling pattern of sensationalism and narcissism, celebrating the raw immediacy of personal experience over any attempt to make structural sense of the larger historical, political, and cultural conditions surrounding daily life.

For both would-be investigative poets in particular and engaged scholars in general, then, the methodological conundrum is striving to balance self with society, text with context, the existential delirium of the now with the scholarly rigor of analysis—all the while honoring the obligations to social justice discussed here. Among the many subgenres and submovements within contemporary arts and letters, ethnopoetics stands as a significant attempt to tackle these conundrums; therefore, we turn to the problems and possibilities of ethnopoetics as a case study of how poets have sought to weave historical, political, and personal materials into a poetry of witness.

■ 3. THE LESSONS AND LEGACIES OF ETHNOPOETICS

Ethnopoetics could be labeled investigative poetry's immediate predecessor, for it was a seminal attempt to make poetry political by merging a critique of colonialism, soft anthropology, and a poetics of witnessing. The term *ethnopoetics* was coined in 1967 by Jerome Rothenberg, Dennis Tedlock, and their colleagues. As Rothenberg (1990) argues, the project of ethnopoetics peaked

during the late 1970s before *Acheringa*, the magazine that Rothenberg and Tedlock founded in 1970 as an exhibition of ethnopoetic practices, finally sputtered out in 1980 (p. 8). Like defining any advanced cultural and/or academic practice, defining ethnopoetics is difficult (p. 8). As Friedrich (in press) argues, the term is "protean" and has adopted many connotations during the past three decades. For example, foregrounding its role in practicing what has since come to be known as multiculturalism, Tedlock (1992) defines ethnopoetics as the "study of the verbal arts in a worldwide range of languages and cultures" (p. 81). Likewise, Rothenberg (1990) argues that ethnopoetics "refers to an attempt to investigate on a transcultural scale the range of possible poetics that had not only been imagined but put into practice by other human beings" (p. 5). For Tedlock and Rothenberg, then, ethnopoetics is an attempt to think about poetry in a global context and thus to consider the roles of poets as witnesses to, critics of, and activists committed to healing the damage wrought by colonialism and violent modernity. Indeed, Rothenberg argues that one of the chief goals of ethnopoetics is to engage in "the struggle with imperialism, racism, chauvinism, etc." (p. 5). That quotation-ending "etc." is significant, for it indicates the off-hand, sloppy way in which much of Rothenberg's work on ethnopoetics collapses specific political crises into one catch-all basket of wrongs—you know, *modernity, colonialism, racism, chauvinism, etc.*

In contrast to that sweeping "etc.," we have argued here that investigative poetry is committed to a version of synecdoche in which grand claims can be supported only through micrological analyses based on deep historical scholarship. We return to this critique of the sloppy uses of "etc." that seem to plague the Rothenberg school of ethnopoetics later, but for now we turn to Friedrich, who argues that the genre falls into two categories: analytic and synthetic. Whereas analytic ethnopoetics operates on a "meta" level by inspecting other ethnopoetic works, synthetic ethnopoetics either creates an anthropological poem that bridges a gap between two cultures or translates a poem from one culture to another; in

both synthetic cases, the goal is to make one culture familiar to another. For example, Friedrich (in press) praises Gary Snyder's "Anasazi" for "converting a foreign culture and poetry into poems that speak to Western, specifically American, sensitivities." Snyder's poem is a fine example of synthetic ethnopoetics, then, because it does the work of anthropology in the form of poetry, both enticing and enabling readers to transcend their provincialism.

Here is how Snyder (1974) brings the Anasazi to his readers:

Anasazi,
 Anasazi,

 tucked up in clefts in the cliffs
 growing strict fields of corn
 sinking deeper and deeper in earth
 up to your hips in Gods

 your head all turned to eagle-down
 & lightning for knees and elbows
 your eyes full of pollen

 the smell of bats,
 the flavor of sandstone
 grit on the tongue.

 women
 birthing
 at the foot of ladders in the dark,

 trickling streams in hidden canyons
 under the cold rolling desert

 corn-basked wide-eyed
 red baby
 rock lip home,

Anasazi. (p. 3)

The poem offers a beginner's loving guide to some basic facts about the Anasazi, namely that they live on cliffs in the desert, corn is a major part of their culture, and they live in close proximity with their gods—in short, they are human. Snyder (1974) takes us to a different time and place, to a world he describes in "Control Burn" as one "more/like,/when it belonged to the Indians/Before" (p. 19). Like Rotherberg's "etc.," that poem-closing "Before" indicates the loose way in which this branch of ethnopoetics envisions itself as searching for a premodern, prehistoric, pre-Western world of innocence and virtue. But by conveying his sense of this lost civilization in verse that reads like a series of textbook stereotypes, Snyder teaches us little about the culture of the Anasazi. Indeed, the romanticization of Anasazi life makes the "Before" of "Control Burn" sound like a naïve plea to return to a world that is long gone and to do so while ignoring the fact that even when it existed it was—like our own world—wracked with political, economic, and cultural dilemmas.

Therefore, it is difficult to imagine anthropologists or historians taking such poems seriously. However, for Snyder and some ethnopoets, the function of such poems is not so much to stand as rigorous scholarship as to stand as rhetorical platforms from which to launch scathing critiques of Western modernity. For example, Snyder's (1974) "The Call of the Wild" leaps forward from the Anasazi to offer a blistering critique of "All these Americans up in special cities in the sky/Dumping poisons and explosives" (p. 23). Published amid the war in Vietnam, this clear reference to the saturation bombings sanctioned by President Richard Nixon invites readers to think about the deep historical connections among Indian genocide, environmental destruction, and the butchery under way in the name of defeating communism. By thinking in this multitemporal manner, by holding the Anasazi and the Vietnamese in one's mind at the same time, Snyder gains historical and political leverage for his claim in "Tomorrow's Song" that

The USA slowly lost its mandate
 in the middle and later twentieth century

it never gave the mountains and rivers,
 trees and animals,
 a vote.
 all the people turned away from it. (p. 77)

Reading these lines in the midst of another set of U.S.-triggered wars, raging now in Afghanistan and Iraq, one is struck by the commonsensical—yet so often overlooked—argument that there is an intimate relation between the violence used to demolish nature and the violence used to murder our fellow humans. Indeed, in the face of the well-oiled machinery of death that slaughtered the Indians, that murdered millions of Vietnamese, that is currently leveling Afghanistan and Iraq, and that has left a worldwide trail of ecological destruction in its path, we are struck by how relevant—how powerful—this poem feels 30 years after its first publication (Thomas, 1995).

Whereas Snyder thus uses loosely anthropological poems about the deep past to gain historical leverage for a political critique of the violence of colonialism and ecological destruction, other proponents of ethnopoetics see the genre as more directly concerned with producing a form of cultural criticism that points toward multiculturalism. For example, in his review of ethnopoetics in *Symposium of the Whole: A Range of Discourse Toward an Ethnopoetics*, Turner (1983) argues that ethnopoetics is committed to "making visible." "The more we are aware of the multiplicity of Others," he argues, "the more we become aware of the multiple 'selves' we contain, the social roles we have 'internalized'" (pp. 340–341). For Turner, then, ethnopoetics explores the polyglot multiplicity of the social self, thus leading to a self-reflexive humility that opens the door to multiculturalism: "Once they [our tired versions of 'self'] are 'made visible' they are revealed as faintly comic figures. . . . It may be that the recognition of diversity in cultural voices has the therapeutic function of confronting us with the problem of the One and the Many—a new reflexivity in itself" (p. 341). This version of ethnopoetics thus functions as verbal therapy, aspiring to help its readers question their taken-for-granted

cultural assumptions, and includes the assumption that deconstructing tired versions of a unified Western self will help to bridge the distance between these now problematized selves and the multiple Others who linger outside the comfortable living rooms of the West. From this perspective, ethnopoetics aspires to produce cultural criticism capable of functioning both as political engagement and as personal therapy.

Given this framework, let us return to another piece of ethnopoetics, "The New (Colonial) Ball Game" by Robert C. Williamson. A professor of anthropology at the University of Saskatchewan, Williamson specializes in fieldwork on the Inuit Indians. Attempting both to make the humiliations of colonialism clearer for the colonizer and to vent his own frustrations at the difficulty of the process of making the invisible visible, Williamson (1985) offers the following scene:

Then the little man
 Who'd just arrived
 And felt important
 And, of course, responsible
 Said nicely, pompously
 With British vowels
 As tight and round
 As his big ass
 How everybody should be grateful
 For the Christly whites
 Who came, of course, to help
 And not to satisfy themselves
 And here in their own country
 For their sakes
 We all should
 (As it surely must inevitably
 Come to be
 And the sooner, don't you see

The better for us all)——

Talk White

For once their words will fit

The words we hear the most

OK

Do this

Right now

And hurry, see?

Fuck off. (pp. 189–190)

Brady (2000) claims that “by varying their forms of expression to include poetry, anthropologists attempt to say things that might not be said as effectively or at all any other way” (p. 956). Williamson’s (1985) poem-ending and resounding “Fuck off” surely fits this model, for it is hard to imagine this line finding its way into his professional academic work. So the poem gives Williamson the linguistic latitude to say what he cannot say elsewhere. But does this expressive latitude enable the poet to write a powerful poem? Does the poem show us anything that is not already the subject of hundreds, if not thousands, of stereotypical images? We do not even know where this colonial ballgame takes place, what the date is, who the players are, or what game is being played, so we are in the realm of abstraction, the generic, the ahistorical no-place of generalized anticolonial anger. The same concerns have been raised about Porché’s *Blue Hour*, but at least that poem’s stunning beauty leaves readers awash in reverberating images that (hopefully) provoke further critical reflection. In traditional poetry criticism, such abstract verse might be taken as allegorical, as aspiring to offer a transhistorical moral lesson, yet Williamson’s “Fuck off” hardly counts as an allegory. So even though the poem succeeds as therapy for its author, who must have been carrying that “Fuck off” around with him for quite a while just waiting to launch it into space, the poem fails as a poem and fails as anthropology, amounting ultimately to little more than a

self-serving rant. Moreover, given the professed pedagogical function of ethnopoetics to transcend racism and cultural chauvinism by making the faraway and the strange more human and thus more familiar to Western readers, we would have to say that the poem is a pedagogical failure as well, for it teaches us little about the people being oppressed by the “little man” who speaks with “British vowels.”

We have seen how Snyder merges anthropology, history, and political criticism to produce blistering and beautiful poems that speak directly to the carnage of the war in Vietnam, and we have watched as Williamson uses a poem about colonialism as verbal therapy. To further complicate our treatment of ethnopoetics, let us inquire as well about its practices as a form of cultural translation. *Alcheringa* was among the primary sources of ethnopoetics. Its “Statement of Intention” (1970) claims that “ALCHERINGA will not be a scholarly ‘journal of ethnopoetics’ so much as a place where tribal poetry can appear in English translation & can act (in the oldest & newest of poetic translations) to change men’s minds & lives” (p. 1). For example, consider this version of “What Harm Has She Dream?” (1970), a Quechua tribal poem translated in the first issue of *Alcheringa*:

Her long hair is her pillow
the girl is sleeping on her hair.
She cries blood
she does not cry tears
she cries blood.
What is she dreaming?
what harm is she dreaming?
Who hurt her?
who hurt her heart like this?
Whistle to her, whistle, whistle,
little bird
so she wakes

so she wakes now
whistle whistle
little bird. (p. 50)

The poem presumably enables a Western audience to hear a Quechua orator implicate the violence of colonialism, a force so powerful and insipid that it has seeped into the dreams of its victims. The effort is clearly heartfelt, yet without massive prefatory information, we suspect that most readers will learn little from this poem about the tribal culture in question. Where do the tribe members live? Who is causing the tribe's young women to cry tears of blood? These may seem like unfair burdens to place on any individual translation, yet without answering these historically specific questions, the poem/translation cannot help but produce a vague and characterless sense of some premodern other, some far-off culture about which we know little if not nothing. Rather than bridging the gap between smug Western assumptions of privilege and the lived experiences of cultures on the fringes of modernity, those that have been shattered by colonialism, such poems leave readers uninformed, clueless, feeling vaguely touched yet not empowered to take any specific action.

One of the many goals of ethnopoeitics was to offer such translations as a corrective to what has been widely criticized as the creeping biases leading to sloppy, if not downright exploitative, translations of the works and cultures of non-Western peoples. As Basso (1988) argues, there is "a growing conviction among linguistic anthropologists that the oral literatures of Native American people have been inaccurately characterized, wrongly represented, and improperly translated" (p. 809). Such translating inaccuracies pose a significant problem for cultural critics from a variety of fields, for as Clifford (1988/1999) demonstrates in *The Predicament of Culture*, anthropologists such as Bronislaw Malinowski allowed their colonial biases to shape their fieldwork on other cultures, hence leading to supposedly scientific reporting that in fact mirrors Western prejudices (pp. 92–113). In response to this anthropological

dilemma, ethnopoeists sought to produce translations that were closer to the spirit of their originals, hence trying to bring to Western readers a more authentic sense of the foreign cultures under consideration. Although this is an admirable goal, the fact is that there can be no direct and unclouded transcribing of a tribal poem into forms accessible to Western readers. *All translations are interpretations.*

This fact is demonstrated nicely in *Nineteen Ways of Looking at Wang Wei*, a fascinating study by Weinberger and Paz (1987) of 19 translations of an eighth-century Buddhist poem by Wang Wei. Weinberger and Paz conclude, "In its way a spiritual exercise, translation is dependent on the dissolution of the translator's ego: an absolute humility toward the text. A bad translation is the insistent voice of the translator—that is, when one sees no poet and hears only the translator speaking" (p. 17). But as *Nineteen Ways of Looking* suggests, one always hears the translator speaking—often in rhythms and voices that bring new depth and meaning to the poem. Indeed, because all translations are interpretive acts that, at their best, aspire to fulfill pedagogical and artistic functions, ethnopoeists have come to realize that translation is a form of cultural criticism and artistic production in its own right (Alfred, 1999, pp. 55–65; Rosaldo, 1989/1993, pp. 25–87; Smith, 1999). From this perspective, then, translating poems from cultures on the fringes of modernity amounts not so much to a doomed attempt to reclaim a lost past or an unsullied Other as to an attempt to multiply—and hence add diversity to—the voices mingling in our conversations about the norms, obligations, and hopes of modernity.

Given the sweeping nature of that last claim, it is important before closing our discussion of ethnopoeitics to add yet another layer of complicating theoretical factors and one more set of readings of ethnopoeists. We accomplish both tasks by turning to the work of Ivan Brady, who for many years has been among the leading theorists and artists of this vein of work. Brady is particularly instructive, for whereas we have referred previously to various strains of ethnopoeitics, Brady

prefers the term “anthropological poetics.” For Brady (2004), anthropological poetics consists of three interrelated yet distinct categories: “*ethnopoetics*, ‘the emics of native poetics that are mid-wifed by Western poets’; *native poetry*, the poetry of traditional native poets; and *ethnographic poetics*, the poetic productions of ethnographers” (p. 639). We have already addressed examples of native poetry (the Quechua poem “What Harm Has She Dreamt?”) and “ethnographic poetics” (Snyder’s “Anasazi” and Williamson’s “The New (Colonial) Ball Game”), and so we now focus on Brady’s version of ethnopoetics. In anthropology, “emic” entails using the normative values and symbolic categories of those studied rather than imposing one’s own cultural biases, and a “mid-wife” is someone who helps in the process of birth in particular and creation more generally (and who may, as in the case of the midwife who birthed the first author’s first child, be a man); thus, for Brady, ethnopoetics relies on the local idioms of groups studied by anthropologists and the flexible forms of Western poetry, translation, and storytelling to aid in the process of creating new forms of expression.

To watch how this process unfolds, we turn to Brady’s (2003) masterful *The Time at Darwin’s Reef: Poetic Explorations in Anthropology and History*. We should note that Brady is an accomplished anthropologist who specializes in Pacific Island cultures, so whereas the ethnopoems and translations discussed previously felt slender on anthropological details, Brady’s poems bristle with a lifetime of research and personal experience; this expertise is reflected in helpful sets of references and introductions to clusters of poems. As evidence of the book’s (and Brady’s) remarkably broad sense of time and place, *Darwin’s Reef* closes with an alphabetical “Place List” and a chronological “Date List,” both of which include information relevant to the other. For example, the Place List begins with “Abaiang Island, February 14, 1840,” closes with “USMCRD, San Diego, California, August 27, 1958,” and includes 60 other place/time entries sandwiched in between (pp. 128–129). Thus, before reading a single poem, readers recognize from glancing through the

Place List and Date List that *Darwin’s Reef* addresses the long history of naval conquest, beginning for the purposes of this book in the South Pacific during the 1840s, culminating in the world’s largest floating arms depot, San Diego, during the late 1950s, and wreaking havoc on all the places in between. The Place List and Date List thus function as semiotic machines of imaginative yet historically grounded suggestions, producing juxtapositions, layerings, and clues meant to lead the reader on geographic and temporal journeys through the wreckage of colonialism.

“Time” at Darwin’s Reef is therefore, as in Snyder’s (1974) *Turtle Island*, less linear than in traditional historical writings and more like the twisting, reverberating, ecological, and even spiritual forms it often takes in folklore. For example, in the poem that names the book, “The Time at Darwin’s Reef”—located with the place and date listings that preface each poem as “Playa de la Muerte, South Pacific, July 4, 1969”—Brady conveys time as “High Time, 1:05 p.m., Fiji time” (local clock time, p. 69), as “Time to Get Down” (from the Cessna flying overhead, p. 69), as “Island Time” (the deep ecological time of natural change, p. 70), as “Copy time in the coral” (the movements of coral reproduction as seen in “ejaculating rocks,” pp. 71–72), as “Magic Time” (p. 73), and so on in a dizzying multiplication of possible times, most of them rooted not in Western notions of clocks but rather in the natural temporal forms of tides, seasons, and life cycles. Taken together, these layered “times” indicate a spiritual sense of completeness, of multiplicities woven into an organic whole, of ecological centeredness.

Lest readers assume that Brady’s gorgeous experiments in temporal confusions lapse into political complacency, “Proem for the Queen of Spain” layers such temporal dislocations against spatial and political fragments, hence creating a sense of bitter poetic judgment. The bulk of the piece is a letter (fictional but true to its historical moment) from Fernando Junipero Dominguez, written in “New Spain” (Mexico) in 1539, in which the writer thanks the queen for bringing to his people “the Embrace of the Mission and the Love of God, Amen” (p. 51). This is a letter, then, that

demonstrates how colonized peoples internalized oppression, in this case in the form of howing to a foreign god brought to the New World by a foreign empire. Tucked within the letter, however, Brady offers expletive-laced commands from U.S. troops in Vietnam, who shout at the locals "Nam fuckin' xuong dat! Lie the fuck down! Or y'all gonna fuckin' die!" (p. 51). The end matter following the poem provides multiple historical references on the history of Dominguez, so the poem fulfills the pedagogical function of both seducing readers to think historically and then leading them to the necessary information to pursue their own further readings. Much like Snyder's juxtaposing the Anasazi against Nixon's saturation bombing of Vietnamese peasants, then, Brady's inserting dialogue from U.S. soldiers within a 1539 letter to the queen of Spain illustrates a sense of continuity linking the Spanish invasion of Mexico to the U.S. invasion of Vietnam. Against the deeply satisfying ecological times of "Time at Darwin's Reef," then, "Poem for the Queen of Spain" offers a chilling sense of *imperial time*, of the looping repetitive horrors of conquest.

Despite this numbing sense of the ways that imperial powers have savaged weaker peoples for centuries, the bulk of Brady's poems are committed to loving and often gorgeous tributes to the ways that even the strangest Others are in fact not only human but also human in ways that are deeply familiar to Western readers, for as Brady (1991) argues elsewhere, ethnopoems function by "defining the humanity of humankind and positing it as something to be achieved in practice" (p. 6). As demonstrated in *Darwin's Reef*, those practices will be so multifarious, so convoluted, and even so magical that it takes remarkable kindness and patience to appreciate their significance. As Brady (2004) argues, "Ethnographic poets meditate on the ethnographic experience or focus on particulars arranged to elicit themes of general humanity that might apply cross-culturally" (p. 630). Brady's *Darwin's Reef* offers us a glimpse of what such cross-cultural, anthropological, and poetic consciousness might look like, hence expanding our notion of who counts as our brothers and sisters while envisioning a new, better, and

more generous way of being in the world. Thus, although Brady flags these works as "poetic explorations in anthropology and history" in the subtitle to *Darwin's Reef*, our readings of them would add that they are, like Snyder's poems, both politically progressive and deeply spiritual meditations, self-reflexive opportunities for postmoderns to move past irony and cynicism toward something like multicultural commitment.

As demonstrated in the preceding paragraphs, we are deeply moved by Brady's contributions. The only problem—and it is a problem not so much with Brady as with most works of art—is that regimes of truth often obscure the ability or the desire to see another as human. Stereotypes and prejudices cloud judgment, making the generosity demonstrated in Brady's texts a difficult enterprise. Brady (2004) sees the overarching problem of anthropological poetics as one of "plural 'knowables' and the frustrations of choosing among them. (Or having someone choose for you, someone or some institution with the power to enforce the choice, say, society, for example. Or the Taliban. Or your department head)" (p. 632). This is a crucial passage, for we suspect that this parenthetical aside regarding the powers that filter through all life, the powers that allow others to "choose for you," may be the most important blockage preventing the fulfillment of Brady's vision. Indeed, the investigative poetry to which we turn in our closing section begins from the understanding that someone or some structure is always trying to choose for us, meaning that our plural knowables are often the products of oppressive regimes, stultifying cultural norms, or bureaucratic deadweight. Whereas the ethnographic poetry studied here offers us a compelling set of models for thinking critically about and engaging politically in the world—with Brady's *Darwin's Reef* standing as our best exemplar of the rich possibilities of this work—we still want to ask more from investigative poetry, for without a nuanced and pedagogically rich articulation of how multiple forms of power filter through, and sometimes even structure, our contexts of action, we can never know how to rhetorically build consensus and common humanity.

In short, in the final section, we propose—not so much as a critique of ethnographic poetry as a supplement to it—that society's power to choose for us is not an aside but rather the focal point of poetic criticism. The works we address in what follows thus move away from a sense of anthropological wonder toward hard-hitting political and poetic critiques of specific regimes of power.

■ 4. THREE MODELS OF INVESTIGATIVE POETRY:

DOS PASSOS, FORCHÉ, AND SCOTT

The works considered here are immersed completely in, and are fully aware of their complicity with, the contradictions of U.S. power; they accordingly focus on case studies of economic, military, political, and cultural oppression. Indeed, the poems considered in this section work imminently, constructing their investigative poetry from within the very social systems they hope to examine. Whereas the ethnographic poetry considered previously works in an alluring sideways manner, thinking about U.S. power by working along its edges and using anthropology to teach us about the peoples affected by U.S. power, the works considered in what follows take a more direct approach. In fact, Peter Dale Scott, in particular, has been attacked by those who find his poems too political and not poetic enough. Our comments in this section therefore are not meant to stand as normative judgments about what is a better or more powerful form of poetry; rather, we offer them as the final piece of our puzzle, as a closing set of options and models of how our best poets have struggled to merge historical and political criticism in a form of investigative poetry.

First among these models is John Dos Passos's U.S.A. trilogy, consisting of *The 42nd Parallel* (1930/1969c), *Nineteen Nineteen* (1932/1969a), and *The Big Money* (1936/1969b). The bulk of these sprawling novels consists of traditional narratives following the misadventures of characters confronted with the various economic, cultural, and political complications following from the manic

boom-and-bust cycles of unregulated capitalism and America's entry into World War I. Each story is followed, however, by short sections titled Newsreels and the Camera Eye and by poetic biographies of the period's key players. The Newsreels consist of newspaper headlines, snippets of newspaper stories, and snatched refrains from popular songs—*Oh say can you see . . . , Where do we go from here, boys?* Arrayed on the page as a string of disconnected shards of evidence, these Newsreels provide both a clear forerunner to the form of Sanders's *America* and an eerie glimpse into the world of popular culture, mass-produced misinformation, and the vast majority of events that have simply fallen into historical oblivion.

The Newsreels are followed by Camera Eye sections in which Dos Passos offers disjointed observations, literally camera shots of turmoil. In this case, we watch the angry response of socialists in Paris to the Treaty of Versailles: "at the République à bass la guerre MORT AUX VACHES à bas le Paix de Assassins they've torn up the gratings from around the trees and are throwing stones and bits of castirons at the fancydressed Republican Guards hissing whistling poking at the horses with umbrellas scraps of the *International*" (Dos Passos, 1932/1969a, pp. 396–397). As indicated by the random gaps in the passages just quoted, the confusion as to who is speaking, and the bristling sense of confused immediacy, these sections fade into the stream of consciousness, thus offering readers glimpses into the fractured experience of living daily life amid epochal historical transformations. Dos Passos follows these blasts of existential confusion with poetic biographies, from which we have taken this verse on Randolph S. Bourne:

This little sparrow like man
tiny twisted bit of flesh in a black cape,
always in pain and ailing,
put a pebble in his sling
and hit Goliath in the forehead with it
War, he wrote, is the health of the state. (p. 120)

Made popular in Zinn's (1980) magnificent *A People's History of the United States*, Bourne's phrase has stood for generations as an indictment of U.S. militarism (pp. 350–367). By chronicling the struggles of this largely forgotten figure, Dos Passos's biographical poem enriches our sense of American history, making it more somber and personal. The combination of the explanatory narratives, the evidence-offering Newsreels, the existentially rich Camera Eye sections, and the poetic biographies offers readers four perspectives from which to approach history. Dos Passos thus strives to merge these four modes of writing to form a collective whole capable of thinking simultaneously about the deep structural integrity of history and the baffling, awestruck wonder and confusion that fills each small moment of time.

A second important model of textual production influencing our argument here is provided by Forché's *The Country Between Us* (1981) and *The Angel of History* (1994), her two books prior to *Blue Hour*. Based on her journalistic work in El Salvador during the height of that country's civil war, *The Country Between Us* offers a model for a poetry of witness in which the poet is not only a chronicler of hope and terror but also a participant in the processes she examines. The poems in this remarkable book thus veer from scalding political critiques of Salvadoran tyrants to self-implicating ruminations on how even the most mundane pleasures in the United States bear the stain of the violence our government funds in the Third World. Like so many of us who find that our grassroots political work changes the ways that we think about freedom (Hartnett, 2003; Tannenbaum, 2000), Forché finds that living in close proximity to barbarism in El Salvador casts shadows across daily space. Forché (1981) is thus unnerved by the sense of decadence and ease signaled by "the iced drinks and paper umbrellas, clean / toilets and Los Angeles palm trees moving / like lean women" (p. 17). Like so many of us, she finds the happy ignorance of many Americans regarding the brutality that their country foists on the world to be unbearable. Speaking to a friend, she laments,

you were born to an island of greed
and grace where you have the sense
of yourself as apart from others. It is
not your right to feel powerless. Better
people than you were powerless. (p. 20)

Many of these better people appear in the pages of *The Angel of History*, where Forché (1994) expands her poetry of witness to encompass the European Holocaust and the impact of the United States dropping nuclear bombs on Japan. Taking her title from the well-known story told in Benjamin's (1940/1969) "Theses on the Philosophy of History," where an angel is blown backward into the future while watching the present produce an ever-growing pile of wreckage (pp. 257–258), Forché tackles the horrors of World War II in personal poems full of stories of her lost relatives and friends. While leading readers on this personally inflected historical journey into barbarism, Forché speculates—frequently through the voices of other writers and philosophers—on the possibilities of forgiveness. Much like Brady's *Darwin's Reef*, then, *The Angel of History* is less an investigative attempt to name names and pinpoint causes than a philosophical attempt to make sense of the persistence of hope in the face of unspeakable suffering. Aphoristic and enigmatic—and thus nearly impossible to quote without including pages of supporting material—the poems accumulate power from their many references to other texts, hence offering readers less a definitive statement than a series of beautiful theses, each equipped with what amounts to a list of suggested readings. Thus, while embodying the wonder and openness of elegant poetry, *The Angel of History* stands ultimately as a pedagogical tool for wondering what it means to cherish art during an age of destruction.

The third, and by far the most important, model of investigative poetry is Peter Dale Scott's *Seculum* trilogy. The first part of the trilogy, *Coming to Jakarta: A Poem about Terror* (1988), has been lauded in *The Boston Review* as "remarkable and unnerving" (Weiner, 1995, p. 31), in

London's *Times Literary Supplement* as "a work of great richness and complexity" (Gunn, 1991, p. 19), in *Parnassus* as "revolutionary" (Campbell, 1993, p. 395), and in a special issue of *AGNI*—by no less a national hero than the Poet Laureate Robert Hass—as "the most important political poem to appear in the English language in a very long time" (Hass, 1990, p. 333). Like these enthusiastic reviewers, we have been deeply impressed by the sophistication and depth of Scott's political analysis, the epic sweep of his historical knowledge, the revelatory honesty of his self-implicating poems, and the sheer beauty of his verse. By interweaving these four qualities—political acumen, historical grounding, self-reflexivity, and poetic beauty—Scott produces what we call *an interdisciplinary aesthetics of provisional eloquence*. That is, by merging the four qualities just noted, and by doing so while confronting a political calamity, Scott provides us with an empowering and elegant example of the search for grace amid terror.

Coming to Jakarta was triggered by Scott's (1988) need to write "about the 1965 massacre/of Indonesians by Indonesians" (p. 24) while simultaneously questioning his own complicity—as poet, professor, one-time diplomat, father, husband, and activist—in the events that led to the Central Intelligence Agency (CIA)-sponsored butchery of more than 500,000 Indonesian "communists" following the coup that replaced Sukarno with Suharto.⁶ For example, in the second poem of *Coming to Jakarta*, we find Scott suffering from

the uprising in my stomach
against so much good food and
wine America or was it
giving one last broadcast too many
about the Letelier assassins
the heroin traffic
a subject I no longer hope
to get a handle on. (p. 10)⁷

These lines depict Scott as an activist/intellectual speaking publicly about the subterranean links between assassination politics and the drug war, as a typical overconsumer gorged on too much decadence, and as a consummate researcher who, suffering from the nausea brought on by too much familiarity with evil, wishes that the facts would mysteriously vanish into the comforting oblivion of ignorance—but of course they do not.⁸ Instead, history forces itself mercilessly onto Scott (1988), prodding him to engage in a relentless pursuit of evidence, dragging him deeper and deeper into both the psychology and the political economy of terror:

Already we are descending
into these shadows which
hang about as if there
were something much more urgent
left wholly unsaid. (p. 13)

Readers interested in the facts of the Indonesian massacre will find more than 100 sources listed in Scott's notes, which situate Suharto's coup and the ensuing anticommunist genocide within the overlapping politico-economic framework of post-World War II international finance; the transition from modern, empire-driven, and ideologically driven colonialism into the postmodern neocolonialism of multinational corporations, underground think tanks, and globetrotting mercenaries; and the continuing subversion of democratic politics at the behest of the global caste-bound thugs who run secret governments as if they were their own private shooting galleries. The research used to document these charges is breathtaking, thus offering readers a tutorial in how to pursue interdisciplinary political criticism. In this sense, then, Scott is perhaps the most impressive cobbler of what we saw Sanders (1976) refer to earlier as "a melodic blizzard of data-fragments" (p. 9).

But whereas such melodic blizzards might leave many readers baffled, or at least searching for personal relevance in such waves of "data-fragments,"

Scott weaves his remarkable research around and through moments of daily life, hence showing us how power courses through even the most mundane activities. For example, watch here as Scott (1988) links the disparate strands of the international political economy of terror, U.S. weapons manufacturers, Indonesian and Saudi tycoons, the refuse of Nixon's henchmen, and the friendly neighborhood bank:

and I thought of Adrian Khashoggi
 the Indonesian shipping magnate
 Saudi friend of Pak

 Chung Fee and Roy Furmak
 \$106 million
 in Lockheed commissions

 to Khashoggi alone
 and twice that
 amount withdrawn by Khashoggi

 from Rebozo's bank in Key Biscayne
 in May and November '72
 and of Lim Suharto's *cukong*

 who has bought the Hibernian bank
 with a branch on the Berkeley campus
 from profits on arms deals. (pp. 127–128)⁸

Scott's awesome courage in exposing the shadowy operatives and offshore bankers and behind-the-scenes boardroom connections that fuel imperialism, in conjunction with his sweeping grasp of history and his uncanny ability to render such topics in recognizable terms—a *branch on the Berkeley campus*—render *Coming to Jakarta* a world-class example of the detailed historical and political analysis needed to render investigative poetry persuasive.

In fact, it took nearly 15 years following the publication of *Coming to Jakarta* for the mainstream

media to begin to address the underworld U.S.–Indonesia connections first exposed in Scott's poem. For example, it is now known that Freeport MacMoRan, Texaco, Mobil, Raytheon, Hughes Aircraft, and Merrill Lynch (among others) are major financial sponsors of the U.S.–Indonesia Society, a lobbying group cochaired by President Ronald Reagan's Secretary of State, George Schultz, and featuring James Riady as a trustee and John Huang as a consultant. Thus, two of the central figures (Riady and Huang) in one of the Democratic party campaign finance scandals that rocked the Clinton presidency turned out to be significant U.S.–Indonesia Society figures. Press (1997) observed at the time that the society was "a public relations organ for the Suharto regime" (p. 19). Thus, beneath the surface scandal of the Democratic party accepting illegal foreign campaign contributions, journalists found the much deeper scandal of continuing links among Suharto's brutal regime, U.S.-based transnationals, and the U.S. government. That Scott's *Coming to Jakarta* exposed these connections 15 years before the mainstream press would even consider them demonstrates the remarkable depth and courage of the poem's political and historical analysis. Using Scott's *Coming to Jakarta* as a model, then, we argue that investigative poetry uses rigorous research to name names, to show who owns what and whom, and thus to lay bare the institutional and economic structures supporting specific modes of oppression.

Scott's work is just as impressive, however, as an experiment in reconstructing a new and problematic sense of an endlessly compromised self in the face of terror, hence Scott's revelation that

To have learnt from terror
 to see oneself
 as part of the enemy

 can be a reassurance
 whatever it is
 arises within us. (p. 62)

Like the poems of Dos Passos and Forché, then, Scott's poems perform a dialectical interweaving of perspectives. Each well-documented scene of political barbarism segues into personal observations on the nature of complicity; each personal rumination on complicity fades into questions of commitment and the historical obligation of engaged citizens to at least attempt to speak truth to power, and each engagement with the numbing expanse of global power politics, in turn, leads back to the suspicion that perhaps grace can only be found, after all, amid those moments when daily life is lived as an aesthetic experience. Hence the prevalence in *Listening to the Candle* (Scott, 1992), the second part of the *Seculum* trilogy, of simple pleasures

focused on the mysteries
of dailiness
baking bread on Saturdays
smelling the freshness
of sun-dried laundry
while you fold the sheet
against yourself
from the garden line. (p. 94)

Later in the poem, after chronicling the December 1980 murder of American evangelicals working with peasants in El Salvador, Scott (1992) suggests that

in such a time it is still good
having danced until midnight
to Mika's and John's new band
after the family lasagna
all generations
our children and their friends
dancing together singly. (p. 106)

Terror and grace thus jostle each other within the infinitely textured particulars of the day:

From the Bay Bridge
on the way home from the opera
you could look down on the searchlights
of the Oakland Army Terminal
where they loaded the containers
of pellet-bombs and napalm. (Scott, 1988,
p. 103)

Like Forché's line about "aria in time of war," then, Scott shows us how even the drive home from the opera, that quintessential marker of high art, leads one past places of mass-produced violence. *If you look around, Scott tells us, you will find yourself implicated in things you have previously spent a great deal of time and energy pretending not to recognize.*

These epiphanic moments of realization need not be paralyzing, however, as Scott shows us again and again how to channel them into a renewed commitment to work not only politically for peace and justice but also personally for something approaching kindness. In fact, in *Minding the Darkness*, the third volume of the *Seculum* trilogy, Scott (2000) turns increasingly to Buddhism as a way of practicing what he calls mindfulness. Much like Snyder's ecological consciousness in *Turtle Island*, or Brady's spiritual sense of time in *Darwin's Reef*, Scott's Buddhism is woven throughout the book as a counterthread to his political criticism. Scott demonstrates its challenges and opportunities most explicitly in four poems chronicling Buddhist retreats (pp. 72–80, 140–148, 221–229, 244). In contrast to the scathing investigative poetry of *Coming to Jakarta* and the meditative work in *Listening to the Candle*, then, *Minding the Darkness* demonstrates a middle way of mindful politics, of both critique and contemplation. This turn to Buddhism clearly illustrates Scott's hankering less for the smoking gun that will rip away the lies of any given regime than for the wisdom that will help him to live amid so

much waste and cruelty. Indeed, by tracking down his footnotes; by rambling through his childhood traumas and parental pleasures; by forcing ourselves to confront both his and our complicity with the global carnage of low-intensity anticommunism, unabashed designer capitalism, and the pleasures of high culture; by making paratactical leaps from fragmentary images and quotations toward our own approximate understanding of the text; and by enthusiastically embodying a turn toward Buddhist values, Scott teaches attentive readers to treat the poem as a heuristic—even therapeutic—device. The mysterious “something much more urgent / left wholly unsaid” (Scott, 1988, p. 13) appears here to be the realization that poetry—as a trigger for research, as a source of grace, as a means of confronting terror, as a process of self-critique and reconstruction—amounts to a self-regenerating process in which, as Scott says in an interview, “one works through personal resistance and disempowerment to re-empowerment” (Scott, 1990, p. 303).

We are reminded here of Terrence Des Pres’s comment in a roundtable discussion on the possibilities of political poetry that

we turn where we can for sustenance, and some of us take poetry seriously in exactly this way. . . . When it comes to the Bomb, or just to the prospect of empires in endless conflict, it seems clear we cannot do very much very fast. So the immediate question isn’t what to do but *how to live*, and some of us, at least, turn for help to poetry. (Des Pres, 1986, p. 21)

The sustenance of *Coming to Jakarta*, *Listening to the Candle*, and *Minding the Darkness* derives from the pleasures of sharing one’s burden as an informed and engaged citizen in a rapidly unraveling democracy while not devolving into solipsism, cynicism, or madness. Hence Scott’s (1988) prudent advice about how to live in the closing section of *Coming to Jakarta*:

as for those of us
who are lucky enough
not to sit hypnotized

our hands on the steering wheel
which seems to have detached itself
from the speeding vehicle

it is our job to say
relax trust
spend more time with your children

things can only go
a little better
if you do not hang on so hard. (p. 129)

■ 5. CONCLUSION

We began our essay with the claim that despite the prevalence of buzzwords indicating the rise of *interdisciplinarity* and *intellectual border crossing*, the vast majority of scholarly production falls under the aegis of time-worn departmental and disciplinary norms. We offered ethnographic and investigative poetry as ways of moving past this hypocrisy. Likewise, we argued that despite the cultural cache of terms such as *radical intervention*, and *transgression*, we know of only an embarrassingly small number of academics whose work engages in social justice concerns. The second section of this essay accordingly offered some guidelines for thinking about how to make social justice more central to what humanists do. The third and fourth sections then offered case studies examining how different poets have produced politically driven and interdisciplinary investigative poems. Taken together, the four sections of the essay offer concrete examples of how scholars, artists, and activists might begin tackling the seven methodological proposals with which we opened the essay. We therefore hope to have offered readers a series of working models, conceptual prompts, and historical examples of how to merge scholarship and poetry, social justice and self-reflection, hence producing texts that may serve the role of “aria in time of war.” Indeed, given the remarkable proliferation of cultural offerings swimming in an apparently ever more specialized world of niche consumerism—a

trend as problematic in poetry as in the general culture at large—the combination of detailed case studies and sweeping historical claims that marks the best investigative poetry offers a powerful model of engaged, artful, and cosmopolitan citizenship. At their best, these models of aria in time of war might well provide us, to borrow a phrase from an interview with Sanders (1997), “pathways through the chaos.”

■ NOTES

1. Birkerts (1987) proceeds to make a formalist argument demonstrating his allegiance to a traditional version of poetry and an emaciated version of politics. For more empowering responses to this question, see the essays collected in Jones (1985). For more experimental responses, see the remarkable works in Bernstein (1990) and Monroe (1996). For more programmatic responses, see “The Art of the Manifesto” (1998).
2. For a case study of the difference between healthy mourning and paralyzing melancholia, see Kaplan (2001). See also Freud (1963, pp. 166–179) for his diagnosis of the problem.
3. The passages quoted here are offered in praise of Ezra Pound, whose use of such “data clusters” was poetically dubious at best and politically dangerous at worst (Hartnett, 1993). On the rhetorical complexities of synecdoche, see Hartnett (2002, pp. 155–172).
4. Although long a subject of scholarly analysis, the pleasures of lynch mobs came to popular attention via *Without Sanctuary: Lynching Photography in America*, a show that opened at the New York Historical Society on March 14, 2000, and that has subsequently toured the nation, searing into the minds of its many viewers images of lynch mobs laughing, drinking, barbecuing, and otherwise enjoying the spectacle of death. Some of the images from the exhibit may be seen online at the homepage of the New York Historical Society or in Allen (2000). See also the comments on the pleasures of racial violence in Hartman (1997).
5. To study the legislation alluded to here, see “An Act to Punish Acts of Interference . . .” (June 15, 1917) and “An Act to Amend . . .” (April 16, 1918)—the so-called Espionage Acts—from *Statutes at Large of the United States of America* (U.S. Congress, 1919, pp. 217–231, 531). See also “Chapter 75,” the May 16, 1918, amendment to the Espionage Act, in *Statutes of the United States of America* (U.S. Congress, 1918, pp. 553–554). For Eugene Victor Debs’s heroic response to these acts, see his June 16, 1918, “Canton Speech” in *The Debs White Book* (n.d., pp. 3–64). For the U.S. Supreme Court’s upholding these laws, see *Schenck v. U.S.*, *Frohwerk v. U.S.*, and *Debs v. U.S.* (all May 1919) in *The Supreme Court Reporter* (West Publishing, 1920, pp. 247–254). This case is cited by lawyers as 39 S. Ct. 247 (1919).
6. For analyses of Suharto’s domination of Indonesia, his brutal 1975 invasion of East Timor, and Jakarta’s place in the new global economy, see Anderson (1995), Curtis (1995–1996), and Fabrikant (1996). U.S. complicity with Suharto’s occupation of East Timor and his bloody repression of oppositional groups in Indonesia continues. In fact, since Suharto’s December 1975 invasion of East Timor, in which more than 200,000 people—more than 25% of the population—were slaughtered, the United States has sold Indonesia more than \$1.1 billion worth of advanced weaponry. The Clinton administration alone sold close to \$270 million worth of arms to Suharto (see Klare, 1994, and Washburn, 1997). Suharto was finally forced from power in the spring of 1998. For coverage of his departure, see Mydans (1998) and any major newspaper during the latter half of April and all of May 1998.
7. Orlando Letelier, the Chilean ambassador to the United States, was killed by a car bomb in Washington, D.C., in September 1976. Right-wing Cuban expatriates, trained by DINA (the Chilean Secret Service) and funded through illegal CIA connections, claimed responsibility for the blast. See Scott and Marshall (1991, pp. 30–34).
8. The impulse here is reminiscent of the lament that “There are times/ I wish my ignorance were/ more complete” in Hass (1973, p. 61). In fact, Scott (1990) later wrote of his “growing self-hatred for carrying around a head full of horrors which most people were less and less willing to hear about” (p. 300).
9. Khashoggi’s perpetual role as banker to terrorists and thugs has been reprised in his post-9/11 acting as well, in this case working with Richard Perle, the recently disgraced member of President George W. Bush’s Defense Policy Board. See Hersh (2004, pp. 189–201).

QUALITATIVE EVALUATION AND CHANGING SOCIAL POLICY

Ernest R. House

In 1965, the U.S. Congress passed the Elementary and Secondary Education Act. At the insistence of Senator Robert Kennedy, this bill included an evaluation rider that became the stimulus for program evaluation. That same year, President Lyndon Johnson introduced the Program Planning and Budgeting System (PPBS), developed by the Pentagon, to the U.S. Department of Health, Education, and Welfare. The goal of the PPBS was to develop government programs that could be stated, measured, and evaluated in cost-benefit terms. Economists William Gorham and Alice Rivlin headed the evaluation office (McLaughlin, 1975).

Federal policy stipulated that key decisions for social services would be made at the higher levels of the federal government. The only true knowledge about social services was a production function specifying stable relationships between inputs and outputs. The only way of obtaining such knowledge was through experimental and statistical methods. "Information necessary to

improve the effectiveness of social services is impossible to obtain any other way" (Rivlin, 1971, p. 108). To that end, several large-scale experiments were funded.

Campbell and Stanley's (1963) classic work became the methodological guide. Experimental studies became the new fad, with Campbell and Stanley describing experiments

as the only means of settling disputes regarding educational practice, as the only way of verifying educational improvements, and as the only way of establishing a cumulative tradition in which improvements can be introduced without the danger of a faddish discard of old wisdom in favor of inferior novelties. (p. 2)

During the early days of professional evaluation, both policymakers and evaluators put their faith in large-scale quantitative studies such as Follow Through, Head Start, and the Income Maintenance experiment. Policymakers and many evaluators thought that these large national

studies would yield definitive findings that would demonstrate which programs worked best. The findings could serve as the basis for mandates by the central government to reform inefficient social services.

In time, these large studies proved to be extremely disappointing. One problem was their scale. The Follow Through experiment cost \$500 million, and during one data collection Follow Through evaluators collected 12 tons of data. They were overwhelmed by the logistics to the point where they could not produce timely reports. Eventually, the government sponsors reduced the study to a fraction of its original size by reducing the number of sites and variables.

A more serious problem was that the findings of these studies proved to be equivocal. The studies did not produce the anticipated clear-cut results that could be generalized. For example, when the Follow Through data were analyzed, the variance in test score outcomes across the dozen early childhood programs being compared was about as great as the variance within these programs. In other words, if a given early childhood program had been implemented at six sites, two sites might have good results, two might have mediocre results, and two might have poor results. This was not the kind of conclusive evaluative finding on which the government could base national recommendations. After years of frustration and hundreds of millions of dollars spent, policymakers and most evaluators became disenchanted with large-scale studies because of their cost, time scale, and lack of definitive results.

Meanwhile, evaluators were developing alternative approaches, including qualitative studies, meta-analysis, and program theory. Small qualitative studies were practical. For example, if a school district wanted an evaluation of its early childhood education program, interviewing administrators, teachers, and students was a simple and cheap method, and the findings were easy to understand even if they could not be published in scholarly journals. Furthermore, generalizability was not the problem that it was for large national studies. The demand on the local study was that the results be true for this place at

this time; they did not need to be true for sites all over the country for all time.

However, some evaluators did not consider qualitative studies to be scientific. Evaluators engaged in intense internecine debates about the scientific legitimacy of qualitative methods. This dispute preoccupied the profession for 20 years, even as qualitative studies became increasingly popular. After many words and much rancor, the field finally accepted the idea that evaluation studies could be conducted in a number of different ways (Reichardt & Rallis, 1994). Evaluation became methodologically ecumenical, although personal sensitivities lingered. By 2000, the quantitative–qualitative dispute seemed to be history.

Another alternative to large-scale quantitative studies was meta-analysis (Glass, 1976). Meta-analysis was more acceptable to quantitative methodologists, although not without controversy. In some ways, meta-analysis was a natural successor to large-scale quantitative studies. Meta-analysis assembles the results of many experimental studies—studies that have control groups—and combines the findings of these studies quantitatively by focusing on the differences between performances of the experimental and control groups. The technique is more radical than it sounds given that researchers might combine outcomes that are quite different in kind into summary scores. Meta-analysis became overwhelmingly popular in social and medical research to the point where today it is difficult to pick up a major research journal without finding meta-analytic studies.

A third alternative to large-scale experimental studies was program theory (Chen & Rossi, 1987). Program theory consists of constructing a model of the program that can be used to guide the evaluation. Earlier, some researchers had advocated basing evaluations on grand social theories, but those attempts failed. First, there were no social theories that had much explanatory power. Second, if such theories existed, there was still the question of whether they could be used to evaluate social programs. For example, given the task of evaluating automobiles, could evaluators use theories of physics to do the job? It seems unlikely.

Evaluators reduced the grand theory concept to theories for individual programs. This worked better. The program formulation is concrete enough to guide evaluations, and it communicates directly with program participants. Program theory delineates points where evaluators might confirm whether the program is working and enables evaluators to eliminate rival hypotheses and make causal attributions more easily (Lipsey, 1993). Underlying qualitative studies, meta-analysis, and program theory have been changes in our conception of causation. These changes suggest why these alternatives worked better than large experimental studies.

■ CHANGING CONCEPTIONS OF CAUSATION

The conception of causation that we inherited is called the regularity or Humean theory of causation, named after David Hume's influential analysis of cause (House, 1991). Regularity describes the conception. Put simply, the reason why we know one event caused another event is that the first event took place regularly before the other event—regularity of succession. If one event occurred and another event occurred after it repeatedly, we would have reason to believe that the events would occur together again. We look for succession of events. In fact, Hume said that regularity, along with contiguity of events, is all there is to causation. The research task is to determine the succession of events. Put succinctly: If p , then q ; p , therefore q .

This notion of cause is the underlying basis for most discussions of experimental design, and it is manifest in early evaluation books: "One may formulate an evaluation project in terms of a series of hypotheses which state that 'Activities A, B, C will produce [R]esults X, Y, Z'" (Suchman, 1967, p. 93). In other words, if we have a Program A under Circumstances B and C, it will produce Results X, Y, and Z. Furthermore, the perfect design for determining whether the result has occurred is the classic randomized control group design. No error could result from employing this design, according to Suchman.

Although this assertion sounds reasonable, it falls apart on closer inspection. If we return to the Follow Through studies, the same early childhood program at six different sites produced different outcomes. Why? Because social causation is more complex than the regularity theory suggests. Even with the same program, there are different teachers at different sites who produce different results. We might try to control for the teachers, but there are so many variables that might influence the outcomes, the researchers cannot control for all of them. Put another way, the program is not in and of itself an integrated causal mechanism. Parts of the program might interact with elements in the environment to produce quite different effects.

Such considerations led Cronbach to abandon treatment–interaction research altogether. He tried to determine how student characteristics and outcomes interacted. There were so many possibilities that could not be controlled, he gave up trying. Put more technically, the effects of the secondary interactions of the variables were consistently as strong as the main effects. Cronbach (1982) rethought causation and devised a more complex formulation: In S , all (ABC or DEF or JKL) are followed by P . In other words, in this particular setting, P , the outcome, may be determined by ABC or DEF or JKL. The problem for evaluators is that if A is the program, we get P only if Conditions B and C are also present. So we could have A (the program) and not have the outcome P . More confounding, because P is caused by DEF and JKL combinations as well, we might not have the Program A but still get P . Neither the presence nor the absence of the Program A determines P . Succession of events is not a definitive test of cause and effect. The classic control group design will not produce definitive conclusions if causation is this complex.

Even so, we could devise a determinate research design using Cronbach's formulation, albeit a very expensive and complex one. However, social causation is more complex than even Cronbach's formulation indicates. Cronbach based his analysis on Mackie (1974), a seminal work on causation. Mackie's original formulation

was this: All F (A . . . B . . . or D . . . H . . . or) are P (the dots represent missing causal factors we do not know about). We have huge gaps in our knowledge of social events—not only gaps we do not know about but also gaps we do not even know we do not know about. Because we can never fill those gaps, we can never be certain of all that is involved. This does not mean that experiments are hopeless, only that they have to be interpreted carefully. They are not as foolproof as advocates may claim. There are always things we cannot account for.

Qualitative studies, meta-analysis, and program theory work better than large-scale studies because each approach takes account of a more complex social reality by framing the study more precisely, albeit in different ways. Qualitative studies show the interaction of people and events with other causal factors in context, thereby limiting causal possibilities and alternatives (Maxwell, 1996). Meta-analysis uses individual studies, each of which occurred in separate circumstances of rich variation, thereby making generalization possible (Cook, 1993). Program theory delineates the domain investigated, thereby allowing the posing of more precise questions (Lipsey, 1993).

■ CHANGING CONCEPTIONS OF VALUES

A second issue that shaped development in qualitative studies is the changing conception of values, often phrased as the fact-value dichotomy. This dichotomy is the belief that facts refer to one thing and values refer to something totally different. The fact-value dichotomy is a particularly embarrassing problem given that values lie at the heart of evaluation. I doubt that anything in the history of the field of evaluation has caused more trouble than this belief.

The distinction between facts and values has been around for decades, but the evaluation community inherited it through the positivists and their influence on social science. The logical positivists thought that facts could be ascertained and that only facts were the fit subject of science, along with analytic statements that were true by

definition such as "1 plus 1 equals 2." Facts were empirical and could be based on pristine observations, a position called "foundationalism."

Values were something else. Values might be feelings, emotions—possibly useless metaphysical entities. Whatever they were, they were not subject to scientific analysis. People simply believed in certain values or they did not. Values were chosen. Rational discussion had little to do with them. The role of scientists was to determine facts. Others—politicians perhaps—could worry about values.

Donald Campbell, one of the great founders of the evaluation field, accepted the fact-value dichotomy explicitly (Campbell, 1982). However, he did not accept foundationalism about facts. Counter to the positivists, he contended that there were no pristine observations on which factual claims could be based because all observations are influenced by preconceptions that people hold. Knowledge is still possible because although one cannot compare a fact to a pristine observation to determine whether the fact is true (as positivists thought), one can compare a fact to the body of knowledge to which it relates. The fact should fit the whole body of beliefs. Occasionally, the body of knowledge has to change to accommodate the fact. In any case, one is comparing a belief to a body of beliefs, not comparing a belief to pure observation. This "nonfoundationalism" was counter to the positivist view.

Unfortunately, Campbell accepted the positivist conception of values. Values could not be determined rationally; they had to be chosen. It was not the evaluator's job to choose values. Once politicians, sponsors, or program developers determined values, evaluators could examine the outcomes of programs with criteria based on those values. Practically speaking, this meant that evaluators could not evaluate the program goals because the goals were closely connected to the values. Evaluators had little choice but to accept program and policy goals as they were.

Campbell had the correct idea about facts but not about values. Evaluators can deal with both facts and values rationally. Facts and values are not separate kinds of entities altogether, although

they sometimes appear to be that way (House & Howe, 1999). Facts and values (factual claims and value claims) blend together in the conclusions of evaluation studies and, indeed, blend together throughout evaluation studies. We might conceive of facts and values schematically as lying on a continuum like this:

Brute Facts _____ Bare Values

What we call facts and values are fact and value claims, which are expressed as fact and value statements. They are beliefs about the world. Sometimes these beliefs look as if they are strictly factual without any value built in. For example, the statement "Diamonds are harder than steel" may be true or false, and it fits at the left end of the continuum. There is little individual preference built into it.

A statement such as "Cabernet is better than chardonnay" fits better at the right end of the continuum. It is suffused with personal taste. What about a statement such as "Follow Through is a good educational program"? This statement contains both fact and value aspects. The evaluative claim is based on criteria from which the conclusion is drawn and is based on factual claims as well. The statement fits the middle of the continuum—a blend of factual and value claims. Most evaluative conclusions fall toward the center of the continuum as blends of facts and values.

Context makes a huge difference in how a statement functions. A statement such as "George Washington was the first president of the United States" looks like a factual (historical) claim. But if this statement is made at a meeting of feminists who are excoriating the racist and patriarchal origins of the United States, the statement becomes evaluative in this context. The statement can be factual and evaluative simultaneously. It does not cease to be a factual claim. Similarly, claims that might seem factual in another context might be evaluative in an evaluation.

Evaluative claims are subject to rational analysis in the way we ordinarily understand rational analysis. First, the claims can be true or false. For example, Follow Through may or may not be a

good educational program. Second, we can collect evidence for and against the truth or falsity of the claim, as we do in evaluation studies. Third, the evidence can be biased or unbiased, and it can be good or bad. Finally, the procedures for evidential assessment are determined by the evaluation discipline.

Of course, some claims are not easy to determine. In some situations, it might not be possible to determine truth or falsity. Also, we might need new procedures to help us collect, determine, and process fact-value claims. Just as we have developed procedures for testing factual claims, we might develop procedures for collecting and processing claims that contain strong value aspects so that our evaluative conclusions are unbiased regarding these claims as well. The claims blend together in evaluation studies. In the old view of values, to the extent that evaluative conclusions were value based, they were outside the purview of the evaluator. In the revised view, values are subject to rational analysis by the evaluator and others. Values are evaluations.

In a sense, this analysis of values helps to legitimize qualitative research. Qualitative researchers have been criticized for collecting information that merely reflects the opinions of those in and around the program when instead they should be collecting data not distorted by human judgment. Qualitative information is viewed as too subjective. In fact, the views, perspectives, and values of participants are vital pieces of information about the success of the program—if processed properly. Indeed, there is no information in evaluations that does not contain value elements. And qualitative methods are the best way in which to approach value claims, although they are not the only way.

■ CHANGING CONCEPTIONS OF SOCIAL JUSTICE

The saga of value-free research and the reluctance to do qualitative research and evaluation was not simply a philosophical position. The story must be understood within the historical, political,

and social context in which the value-free ideas developed. There are political reasons why qualitative studies were viewed as too subjective and illegitimate. Ultimately, it has to do with social justice.

Principles of social justice are used to assess whether the distribution of benefits and burdens among members of a society are appropriate, fair, and moral. The substance of such assessments usually consists of arguments about the concepts of rights, deserts, or needs. When applied to society as a whole, social justice pertains to whether the institutions of a society are arranged to produce appropriate, fair, and moral distributions of benefits and burdens among societal members. As such, social justice is linked directly to the evaluation of social and educational programs because these entities, and their evaluations, affect directly the distribution of benefits and burdens.

In spite of the direct conceptual link between social justice and evaluation, social justice concerns are routinely omitted from evaluation discussions. There are two reasons for this. First, evaluators are not well versed in philosophy or political science and feel unprepared to discuss such concepts. Many evaluators have had methodological training that does not deal with social justice. Second, and more important, social justice concerns have long been excluded from social science research for political reasons.

In her history of the origins of American social science, Ross (1991) documented how social justice concerns were indeed topics of discussion in the social sciences during the early 20th century. However, several "Red Scare" episodes, stemming from fears of Marxism, swept the United States and intimidated social researchers. Some prominent economists and sociologists were dismissed from their university positions for supporting labor unions, child labor laws, and other social policies opposed by university boards of trustees, whose members came mostly from business.

The upshot was that many social scientists retreated from issues that might be seen as politically risky into concerns about research methodology. If social researchers could be persecuted for taking stands on political and "value" issues, they might

be safe by focusing on which tests of statistical significance to employ or what sampling procedures to use—issues of no interest to politicians or boards of trustees. Those social researchers who remained concerned about social justice were relegated to the fringes of their disciplines as being too political. Certainly, given the history of American social science, the Marxists were considered out of bounds. Social science in other countries had different origins, and these differences were reflected in different discourses in other countries where critical theory and neo-Marxist approaches were acceptable. For example, qualitative evaluation in Britain was based on political control considerations from the beginning (MacDonald, 1977). In the United States, case studies were promoted as a means of illuminating the values of teaching and learning (Stake, 1978).

On the other hand, if social scientists with liberal positions were silenced or ignored (the fate of critical ethnographers), scholars on the political right continued to promote policies such as sterilization of the poor and elimination of social programs. A long history of biological racism stretching back to Galton, Burt, Spearman, Terman, Jensen, and others (Gould, 1981) continued unabated, reflecting the political temperament of the times. During the 1990s, this long tradition was manifested in *The Bell Curve* (Herrnstein & Murray, 1994). Scholars in this tradition claim that they are value neutral; they are merely following scientific evidence where it leads them, unfortunate though that may be.

This shift into safer political waters by many social scientists was bolstered intellectually by a convenient philosophy of science—logical positivism—that endorsed "value-free" research. Value-free social science became accepted research dogma. In the view of logical positivists and those influenced by them, values were not researchable. Only entities that could be confirmed by direct reference to "facts" were appropriate for scientific research.

Eventually, historical, philosophical, and sociological investigations into the nature of inquiry in the hard sciences demonstrated that the positivist view of science was incorrect. Nonetheless, the

positivist interpretation of values continued, even among those who had grasped the nature of nonfoundationalism about factual claims. This attitude toward values was reinforced by the political climate during the cold war, the period when professional evaluation began. The origins of American social science were forgotten, and research methodology remained the primary focus of American social scientists. For many evaluators, social justice issues in evaluation retain nuances of illegitimacy and "politics."

The dominance of value-free social research meant that the conception of social justice embraced by politicians would be accepted without challenge in the evaluation of social programs and policies (except for those at the fringe e.g., neo-Marxists). For much of the 20th century, the liberal utilitarian conception of justice prevailed. This was identified with one of its main formulators, John Stuart Mill. Utilitarianism is captured in the phrase "the greatest good for the greatest number," although it is more sophisticated than the slogan implies. The way in which this theory played out in social policy was that overall benefits should be increased to the maximum. Society should be organized to maximize overall benefits. Hence, everyone could have more.

How those benefits were distributed was not a major issue. When applied to social programs, the nuances of utilitarian theory disappeared. The politics of more for everyone was more acceptable than the politics of distribution. As implemented in research practices, utilitarianism focused attention on outcomes. If the gross domestic product increases, that is good regardless of how it is distributed. The presumption is that there is more to distribute, even if not everyone gets more. Distribution is not an issue. If an educational program increases overall test scores, the amount of the increase is the focus regardless of the distribution of scores or resources—and sometimes regardless of the personal costs of obtaining the gains. Quantitative outcome measures fit well into such a framework; qualitative methods do not. Furthermore, the goals of social programs and policies, being value laden, were not subject to rational or empirical analysis by evaluators. The goals had to be accepted.

In the major reformulation of moral thinking during the 20th century, John Rawls challenged utilitarian theory with his "theory of justice," which was more egalitarian than utilitarianism. With sophisticated philosophical argument, Rawls (1971) proposed two major principles of justice by which to assess social arrangements. The first principle was that every citizen should have basic civil liberties and rights and that these rights were inviolate. These individual rights and liberties closely resembled those in the American Bill of Rights. There was little controversy about this principle of justice.

The second principle of justice, called the "difference" principle, was controversial. Rawls argued for the *distribution* of benefits—not only the overall level of benefits—to count as significant. Inequalities of economic fortune were permitted in the Rawlsian framework only if those inequalities helped the "least advantaged" people in society, defined as those with the fewest resources. For example, it was permissible to have medical doctors earn high fees if such financial inducements to study medicine helped poor people.

Hence, Rawls's theory was not strictly egalitarian because it did allow for significant inequalities in society. The Rawlsian theory did shift the focus to how the disadvantaged were treated and, in that sense, was more egalitarian than utilitarianism, which allowed trading off the benefits of the least advantaged (e.g., the unemployed) if such a move increased the level of benefits for societal members as a whole (e.g., a lower rate of inflation).

Both utilitarian and Rawlsian justice required manipulating social arrangements to maximize benefits. Unlike utilitarianism, Rawlsian justice placed constraints on the shape that the distribution of benefits could take. Social arrangements should be designed to tend toward equality in the distribution of benefits. The effects of circumstances that are arbitrary from a moral point of view (e.g., who one's parents happen to be) should be mitigated to this end and, if necessary, at the expense of maximizing benefits. Distributions resulting from the operation of markets must be held in check if those distributions are unjust,

according to the second principle. (Yet a third theory of justice regards any distribution that results from free markets as socially just, no matter what that distribution looks like or what effects it has. The interplay of free markets determines social outcomes [Nozick, 1974]. This is called libertarianism. To this point, it has not been reflected in the evaluation discourse in any overt way, although many evaluators may hold this view implicitly.)

Following Rawls, some evaluators applied his theory to evaluation, arguing that evaluators should be concerned not only with overall test score gains but also, for example, with how test score gains were distributed among groups (House, 1980). How social benefits were distributed was important for evaluation. In addition, evaluators might have to solicit the views of stakeholders to determine which social benefits were at issue. Qualitative studies soliciting stakeholder views were necessary.

Of course, concerns about the distribution of benefits and calls for qualitative studies moved evaluators away from the value-free, quantitative methodology that the social sciences had been nurturing. Eventually, concern about stakeholders permeated the evaluation literature, even seeping into quantitative studies, and an acceptance of multiple methods, multiple stakeholders, and multiple outcomes in evaluation studies emerged, even among those not accepting egalitarian social justice.

During the 1980s and 1990s, Rawls's theory of justice came under criticism. One criticism was that the theory of liberal egalitarianism was insensitive to diverse group identities. In that sense, it could be oppressive and undemocratic. The theory focused on economic inequalities with little regard for other benefits that people might want. The criticism was that liberal egalitarianism identified the disadvantaged solely in terms of the relatively low economic benefits they possessed and proposed eliminating these disadvantages by implementing compensatory social programs.

Typically, this planning and evaluation process was conceived as requiring little input from those most affected. Liberal egalitarianism assumed that the benefits to be distributed, and the procedures by which the distribution would occur, were

uncontroversial. In fact, the defined benefits might reflect only the interests of those in dominant positions. For example, consider a highly sexist curriculum with which girls, but not boys, have great difficulty. Providing girls with help in mastering this curriculum so as to remove their disadvantage is not a solution. The problem lies with the sexist curriculum. The distributive paradigm implied a top-down, expert-driven view. Critics saw such an approach as too paternalistic.

In response, philosophers revised the egalitarian theory of justice to take diverse identities into account, that is, to change the theory away from equality as a principle of distribution toward equality as a principle of democratic participation. In what might be called the "participatory shift," the requirements of distributive justice and those of democracy were intertwined. Justice required giving stakeholders, particularly members of groups that had been excluded historically, an effective voice in defining their own needs and negotiating benefits.

This shifting conception of social justice had implications for evaluation. The participatory paradigm fit views of evaluation in which equality was sought not solely in the distribution of predetermined benefits but also in the status and voice of the participants themselves. Benefits were to be examined and negotiated along with needs, policies, and practices. Democratic functioning became an overarching ideal. Some evaluators now advocate giving stakeholders roles to play in the evaluation itself, although evaluators differ on what roles participants should play (Greene, Lincoln, Mathison, Mertens, & Ryan, 1998). (Many who endorse participatory evaluation do so because they believe that stakeholders are more likely to use the findings for pragmatic reasons than because of social justice considerations.) In general, social justice continues to be controversial for historical and political reasons.

■ BUSH'S NEOFUNDAMENTALIST POLICIES

As evaluation gradually moved away from quantitative methods and value-free studies toward

multiple methodologies and qualitative studies focused on stakeholders, social justice issues, and participatory techniques, these trends did not go unnoticed by those in power. Not only did neoconservatives view such studies as too permissive, they did not like the direction in which the entire society was headed. Pointing to what they saw as postmodern excesses, they railed against modern trends, mostly to little avail.

However, the events of September 11, 2001, changed government policies regarding qualitative evaluation. The federal government is now promulgating what I call methodological fundamentalism—a manifestation of the neofundamentalism of President George W. Bush's regime. The Bush administration has embraced a new fundamentalism that permeates many aspects of American life. Before the September 11 terrorist attack, the Bush administration struggled to find traction. Bush emerged from a contested presidential election with fewer votes than the Democratic contender. Only through the peculiarities of the American electoral system and the notorious handling of ballots in Florida did Bush emerge the victor. As he assumed office in January 2001, his legitimacy was in question, his personal abilities were the butt of jokes, and his popularity was in decline.

On September 11, terrorists attacked the World Trade Center and the Pentagon, and Bush assumed the mantle of wartime president. The moral fervor with which he embraced this transformation fit his personal, born-again, religious fundamentalism. During his younger days, he had been a heavy drinker and drug user who converted to religion, saving himself from personal ruin, in his view. He embraced the new role that had been thrust on him with religious intensity, and he projected this moral certainty onto his administration and the country—a country traumatized by the attacks. This simple mission suited him. As observed by Condoleezza Rice, his then national security adviser, the worst thing she could say to Bush was that an issue was complex.

Previously, he had balanced the politics of his administration with people from different factions in the Republican party. He placed neoconservatives, such as Dick Cheney, Donald Rumsfeld, and

Paul Wolfowitz, in key posts and balanced them with moderates such as Colin Powell. In foreign policy, the neoconservative vision of preemptively using American power to transform the world was checked by the realist view of maintaining multilateral international relationships. However, September 11 provided neoconservatives with the license they needed to pursue the hawkish policies they had long advocated, including the invasion of Iraq, an obsession of Wolfowitz, deputy secretary of defense. His plan called for preemptive military strikes on countries threatening American interests. He had prepared this policy during the first Bush administration, but the preemptive position had been dismissed as being too radical at that time. After September 11, it became official American doctrine. Bush's neofundamentalism emerged in full force.

Fundamentalism has several characteristics. First, there is one source of truth, be it the Bible, the Koran, the Talmud, or whatever. Second, this source of authority is located in the past, often in a Golden Age, and is associated with particular individuals. Believers hark back to that time. Third, true believers have access to this fundamental truth, but others do not. Applying the truth leads to a radical transformation of the world for the better. Fundamentalists have a prophetic vision of the future, that is, revelatory insight. Fourth, having access to the source of truth means that believers are certain they are correct. They have moral certitude, a defining attribute. They are "elected." Fifth, fundamentalists are not open to counterarguments. Indeed, they are not open to other ideas generally. They do not assimilate evidence that contradicts their views. They dismiss contrary information or ignore it. Sixth, they are persuaded by arguments consistent with their beliefs even when outsiders find these arguments to be incomplete, illogical, or bizarre. Seventh, people who do not agree with them do not have this insight, and fundamentalists do not need to listen to them. In fact, sometimes it is all right to muscle nonbelievers aside because they do not understand and only impede progress. Eighth, believers associate with other true believers and avoid nonbelievers, thereby

closing the circle of belief and increasing certainty. Ninth, they find ways of promulgating their beliefs by means other than rational persuasion—by decree, policy, or laws—through forcing others to conform rather than persuading them—in short, through coercion. Finally, fundamentalists try to curtail the propagation of other viewpoints by restricting the flow of contrary ideas and those who espouse them.

The Bush administration has exercised this new fundamentalism in foreign affairs, domestic affairs, and even evaluation. In foreign policy, the fundamentalism is evident in the invasion of Iraq. The Golden Age for neoconservatives was the Reagan administration, and Reagan was the sacred figure. Many neoconservatives prefer to call themselves Reaganites and hope to restore the age during which the United States brought down the Soviet Union and won the cold war, in their view of history.

Bush's speeches have taken on a quasi-religious, liturgical tone, including phrases such as "axis of evil" as compared with Reagan's "the evil empire." Bush believes that he is a great leader like Reagan, Churchill, or even Lincoln. By his own admission, he talks to God every night. He has surrounded himself with fellow evangelicals who see him as "chosen" since his peculiar election, for which they prayed. And their prayers were answered. No matter what evidence was presented against his position on Iraq, it had no effect. If the Iraqis had no weapons of mass destruction, they were hiding them. If the Iraqis admitted to having weapons, they had violated the UN mandate. If the war might be disastrous for the region, if most nations in the world were opposed to it, and if world public opinion was overwhelmingly opposed to it, no matter. Others did not understand. They were "old Europe," unwilling to take risks.

The Bush team was closed to counterevidence. Bush team members presented arguments seen by others as inconclusive and at times strange. They concocted a revelatory vision of democratic transformation for Iraq that Middle East experts viewed as incredible. The more criticism that was encountered from outside, the more they banded together, like President Johnson and his advisers

did during the war in Vietnam. Coercion was the tool of choice for compliance, whether it was used against enemies or allies. They either had little sense of how others might react to their actions or did not care. The fundamentalism of the Muslim terrorists was countered with the new fundamentalism of the American president.

Methodological Fundamentalism in Evaluation

Bush's neofundamentalism has influenced other parts of the federal government, including evaluation. In evaluation, this takes the form of methodological fundamentalism. Government agencies that sponsor evaluations have aggressively pushed the concept of "evidence-based" progress, policies, and programs. The core of the evidence-based idea is that research and evaluation must be "scientific." In this definition, scientific means that research and evaluation findings must be based on experiments, with randomized experiments being given strong preference. Other ways of producing evidence are not scientific and not acceptable. There is one method for discovering the truth and one method only—the randomized experiment. This is a fundamentalist position.

This doctrine is embedded in Bush's education legislation, *No Child Left Behind*. In this legislation (www.ed.gov), the term "scientific" is repeated more than 100 times. The method of inquiry is written into the legislation itself, an unusual event. Imagine an allocation for research in physics specifying the methods by which physicists are to conduct studies. In addition, the U.S. Department of Education has established a What Works Clearinghouse to screen evidence-based projects and has encouraged the construction of lists of researchers who comply with the new methodological strictures—a white list as opposed to a black list.

An explicit rationale for evidence-based progress is provided in a report prepared for the U.S. Department of Education by the Council for Evidence-Based Policies (2002). The council consists mostly of Washington insiders, bureaucrats, and think tank fellows plus some social researchers. In accepting the report, Secretary of

Education Rod Paige remarked that Bush education policy was based on four concepts: accountability, options for parents, local control, and evidence-based instruction. The first two policies have been mainstays of the neoconservative educational platform for some time. As for evidence-based instruction, "for the first time we are applying the same rigorous standards to education research as are applied to medical research" (Paige, 2002). Standards will save the day once again. The disdain for the opinions of professional educators manifested in national and statewide testing systems was now carried into disdain for professional evaluators, disdain for professionals being a hallmark of neoconservative policy.

The basic argument of the Council for Evidence-Based Policies (2002) report is that education is a field of fads in which there has been no progress—progress measured by national tests—for the past 30 years. In contrast, there has been great progress in medicine: "Our extraordinary inability to raise educational achievement stands in stark contrast to our remarkable progress in improving human health over the same period—progress which . . . is largely the result of evidence-based government policies" (p. i). The claim is that progress in medicine has resulted primarily from randomized field trials.

Hence, the Department of Education should build a "knowledge base" of educational interventions proved effective by randomized trials and should provide strong incentives for the use of such interventions. "This strategy holds a key to reversing decades of stagnation in American education and sparking rapid, evidence-driven progress" (Council for Evidence-Based Policies, 2002, p. i). Such is the revelatory vision for the transformation of American education. The report recommends that all discretionary funds for research and evaluation be focused on randomized trials. After all, other research designs produce erroneous findings.

These arguments are weak, to say the least. They may be sufficient to persuade those who already believe in randomized experiments or those who lack knowledge of evaluation. They could hardly withstand the scrutiny of scholars in evaluation. It is the case that education is riddled with fads that have

no research backing. Indeed, the neoconservatives have promoted many of these such as charter schools, vouchers, and accountability through test scores. One might also agree that the schools have not improved much over the past 30 years and that medicine has shown progress.

However, medical progress has not been primarily due to randomized field trials. Medicine is the beneficiary of decades of breakthrough research in the physical sciences, notably biophysics, biochemistry, biology, and molecular biology, that has resulted in elaborate theories about human disease. To my knowledge, no one in medicine has received a Nobel Prize for promoting randomized studies. Field trials only test ideas—a valuable service for sure, but hardly the primary source of progress.

It is true that education has no corresponding theory on which to base its practices. The social sciences that might have produced the underlying theory, primarily psychology, have failed to do so. Actually, psychology is a field that relies heavily on randomized trials. Not only has psychology failed to produce viable theory for education, it has failed to produce cures for mental illness comparable to medical advances. Similarly, criminology, which also uses randomized trials, has failed to produce solutions to crime. Otherwise, the United States would not have 2 million people in prison.

As Noam Chomsky noted, psychology is a methodology without a substance. Members of the Council for Evidence-Based Policies, several of whom are psychologists, would have been more honest to argue that because randomized methods have produced little of substance in psychology, maybe they will produce something useful in education. Actually, randomized trials are neither the problem nor the cure. I believe that we could use more randomized field trials in evaluation, but the evangelical arguments advanced by these proponents are embarrassing.

Attributes of Methodological Fundamentalism

In addition to a revelatory vision that promises transformation, methodological fundamentalism has other features of neofundamentalism. It has a

simple credo: Only randomized experiments produce the truth. There is one source of truth—the randomized experiment. If we but follow, it will lead us to a Golden Age. Methodological fundamentalism even has a storied past. The key figure is Campbell, who championed the concept of social experiments as the *only* way in which to evaluate social programs early in the history of evaluation. Although Campbell later relented, admitting that there were other valid ways of acquiring knowledge about social programs, many followers did not. Apparently, they have been biding their time and have found their opportunity in Bush's neofundamentalism as the neoconservatives have done with war policy.

The prescription for randomized trials has been written into legislation without extensive discussion in the relevant professional communities, whose members would oppose such a narrow prescription of how to conduct research and evaluation. But avoiding contrary ideas is part of the orientation. And of course, the prescription is enforced by government decree and incentives. One significant outcome of choosing randomized experiments as the only method for conducting studies is that it eliminates stakeholder views in studies. Most evaluations now incorporate the perspectives of stakeholder groups. This experimental approach precludes the views of stakeholders. Such exclusion must have appeal for those who do not want to be confused by contrary ideas and complex issues.

From a philosophy of science perspective, the difficulty is that the prescription is based on an overly simplistic view of social causation, namely the regularity theory of causation, as noted earlier. Social programs are not closed to outside influences in the same way as experiments in the physical world can be. Hence, definitive experiments to test theories are not possible because they sometimes are in the physical world. This is not to say that experiments cannot be useful. They can be valuable if they are used in the right circumstances and are supported by other evidence that provides the context for interpreting findings. Theory is not available for this purpose in social research, and findings are often interpreted

ideologically or politically. There is a need for collecting and assessing various stakeholder views to aid interpretation.

The appropriate situation for randomized field trials is one similar to evaluating physical entities. For example, evaluating drugs by way of randomized experiments is extremely useful because the drugs themselves can be reproduced in identical form. Drug treatment does not vary nearly as much as social programs, although even in drug trials people react to drugs differently. When the treatment focuses on entities that are difficult to control, experiments become less useful. When educational programs are placed in different settings, there are dozens—if not hundreds—of influences that are impossible to control even in randomized experiments. This means that the results vary even when the treatment appears to be the same. Randomized experiments are one way of providing evidence, but they are not the only way. Field experiments are not appropriate in all situations, neither are they foolproof.

The utility of randomized experiments was discussed extensively in the evaluation community long ago and was abandoned as the sole way in which to conduct studies. The experiments-only advocates lost the debate, but now the same doctrine has been resurrected. This time advocates have appealed to government officials, who are easier to persuade given that they have limited expertise in research and evaluation. Government officials often yearn for certitude in evaluation findings as a way of bolstering their authority. It would make the task of mandating new programs much easier and less controversial. Evaluators have not been able to deliver such unequivocal findings. It is not difficult to understand why a method that promises certainty has appeal for them. However, the certainty that fundamentalism provides is false.

So, after 40 years, evaluation policy has come full circle. What is different this time around is that there is a sizable evaluation community that has considered, discussed, and dismissed the narrow focus on experimental method that is being promoted by the government. For those interested in how such differences will play out, they might

look to history. Since its founding, the United States has been swept repeatedly by strong evangelical movements that claim to have absolute truth and attempt to restrict ideas. During the 20th century, these movements took the form of anticommunism crusades, and they had a profound effect on the shape of American social science. It appears to be time for the mettle of the current generation in evaluation to be tested.

Part VI

THE FUTURE OF QUALITATIVE RESEARCH

And so we come to the end, which is only the starting point for a new beginning. Several observations have structured our arguments to this point. The field of qualitative research continues to transform itself. The changes that took shape during the early 1990s are gaining momentum, even as they confront multiple forms of resistance during the first decade of this century. The gendered narrative turn has been taken. Foundational epistemologies, what Schwandt (1997, p. 40) calls epistemologies with the big *E*, have been replaced by constructivist, hermeneutic, feminist, poststructural, pragmatist, critical race, and queer theory approaches to social inquiry. Epistemology with a small *e* has become normative, displaced by discourses on ethics and values, conversations on and about the good, and conversations about the just and moral society.

We have argued throughout that qualitative inquiry is under assault from three sides. First, on the *political right* are the methodological conservatives who are connected to neoconservative governmental regimes. These critics support evidence-based, experimental methodologies or mixed methods. This stance consigns qualitative research to the methodological margins. Second, on the *epistemological right* are neotraditionalist methodologists who look with nostalgia at the Golden Age of qualitative inquiry. These critics find in the past all that is needed for inquiry in the present. Third, on the *ethical right* are mainstream biomedical scientists and traditional social science researchers who invoke a single ethical model for human subject research. The ethical right refuses to engage the arguments of those researchers who engage in collaborative, consciousness-raising, empowering inquiry.

Qualitative researchers in the seventh and eighth moments must navigate among these three oppositional forces, each of which threatens to deny the advances in qualitative research over the past three decades. These critics do not recognize the influences of indigenous, feminist, race, queer, and ethnic border studies. We need to protect ourselves from these criticisms. We also need to create spaces for dialogue and public scholarly engagement of these issues.

The chapters in this volume speak collectively to the great need for a compassionate, critical, interpretive civic social science. This is an interpretive social science that blurs both boundaries and genres. Its participants are committed to politically informed action research, inquiry directed to praxis and social change. Hence, as the reformist

movement called qualitative research gains momentum, its places in the discourses of a free democratic society become ever more clear. With the action researchers, we seek a set of disciplined interpretive practices that will produce radical democratizing transformations in the public and private spheres of the global postcapitalist world. Qualitative research is the means to these ends. It is the bridge that joins multiple interpretive communities. It stretches across many different landscapes and horizons, moving back and forth between the public and the private, the sacred and the secular.

Paradigm shifts and dialogues have become a constant presence within and across the theoretical frameworks that organize both qualitative inquiry and the social and human sciences. The move to standpoint epistemologies has accelerated. No one still believes in the concept of a unified sexual subject or, indeed, of any unified subject. Epistemology has come out of the closet. The desire for critical, multivoced, postcolonial ethnographies increases as capitalism extends its global reach.

We now understand that the civic-minded qualitative researcher uses a set of material practices that bring the world into play. These practices are not neutral tools. This researcher thinks historically and interactionally, always mindful of the structural processes that make race, gender, and class potentially repressive presences in daily life. The material practices of qualitative inquiry turn the researcher into a methodological (and epistemological) *bricoleur*. This person is an artist, a quilt maker, a skilled crafts person, a maker of montages and collages. The interpretive bricoleur can interview, observe, study material culture, think within and beyond visual methods, write poetry or fiction, write autoethnography, construct narratives that tell explanatory stories, use qualitative computer software, do text-based inquiries, construct *testimonios* using focus group interviews, and even engage in applied ethnography and policy formulation.

It is apparent that the constantly changing field of qualitative research is defined by a series of tensions and contradictions as well as emergent understandings. These tensions and understandings have been felt in every chapter in this volume. Here, as in the first and second editions of this *Handbook*, we list many of them for purposes of summary only. They take the form of questions and assertions:

1. Will the performance turn in qualitative inquiry lead to performances that decolonize theory and help to deconstruct that global postcolonial world?
2. Will critical, indigenous interpretive paradigms, epistemologies, and pedagogies flourish in the eighth moment?
3. Will critical, indigenous interpretive paradigms, epistemologies, and pedagogies lead to the development and use of new inquiry practices, including counternarratives, autoethnographies, cultural poetics, and arts-based methodologies?
4. Can indigenous and nonindigenous qualitative researchers take the lead in decolonizing the academy?
5. Will the emphasis on multiple standpoint epistemologies and moral philosophies crystallize around a set of shared understandings concerning the contributions of qualitative inquiry to civil society, civic discourse, and critical race theory?
6. Will the criticisms from the methodological, political, and ethical conservatives stifle this field?
7. Will the performance turn in ethnography produce a shift away from attempts to represent the stream of consciousness, and the world of internal meanings, of the conscious subject?

8. How will feminist, communitarian, and indigenous ethical codes change institutional review boards (IRBs)? Will the two- and three-track IRB models become normative?
9. Will a new interpretive paradigm, with new methods and strategies of inquiry, emerge out of the interactions that exist between and among the many paradigms and perspectives we have presented in this volume?
10. How will indigenous, ethnic, queer, postcolonial, and feminist paradigms be fitted to this new synthesis if it comes?
11. Will the postmodern, antifoundational sensibility begin to form its own foundational criteria for evaluating the written and performed text?
12. When all universals, including the postmodern worldview, are gone in favor of local interpretations, how can we continue to talk and learn from one another?

There is no definitive answer to any of these questions. Here we can only suggest, in the barest of detail, our responses to them. In our concluding chapter (Epilogue), we elaborate these responses, grouping them around several basic themes or issues: text and voice, the existential sacred text, reflexivity and being in the text, working the hyphen, ethics and critical moral consciousness, and the textual subject, including our presence in the text. Examined from another angle, the 12 questions just listed focus on the social text, history, politics, ethics, the other, and interpretive paradigms more broadly.

■ INTO THE FUTURE

Zygmunt Bauman (Chapter 43) reflexively moves qualitative inquiry (and sociology) into the new century, telling us that the work of the poet and the sociologist—and of history—is to uncover, in ever new situations, “human possibilities previously hidden.” Writing and inquiry are not innocent practices. In its representational and political practices, qualitative inquiry, like sociology, makes visible the possibility of “living together differently with less misery or no misery. . . . Disclosure is the beginning—not the end—of the war against human misery.” We have no choice; we are always already political, always already engaged. A neutral noncommitted form of inquiry is an impossibility. In a truly democratic society, Bauman observes (quoting Cornelius Castoradis), everyone is free to question “everything that is pre-given. . . . In such a society, all individuals are free to create for their lives the meanings they will.” In such a society, qualitative inquiry becomes a vehicle for questioning all that is pre-given. Thus does Bauman lead us into the future.

Douglas Holmes and George Marcus (Chapter 44) extend this argument, calling for a “refunctioning of ethnography,” a regrouping of ethnography in the contemporary moment. They are quite explicit, observing that “a new set of regulative norms of fieldwork are needed to release ethnographers-in-the-making from the . . . imaginary” of classic ethnography. Contemporary ethnography could profitably be oriented to para-ethnography; that is, to the ecologies of knowledge, existing discourses, and local practices that are in place in field settings. The ethnographer finds the “literal field” by working through complex scenes, levels, and multiple sites that connect the local to the global.

Holmes and Marcus observe that recognizing the multisited nature of fieldwork produces a "rethinking of a whole set of issues in fieldwork—complicity instead of rapport, . . . the necessity of collaborations and their personal politics, the uneven distribution or depth of knowing, . . . the changing nature of the object of study, the grounding of abstract relations . . . in forms of human action and knowing." Thus do they offer terms of a refunctioned ethnography where subjects, now called para-ethnographers, are treated as experts, as collaborators and partners in research. They ground their interpretation of the para-ethnographer in the analysis of a famous political actor, the French nationalist Jean-Marie Le Pen.

Para-ethnography goes beyond merely identifying a new ethnographic subject. Rather, it opens the door for deeper questions of how "culture operates within a continuously unfolding contemporary." More deeply, and more radically, Holmes and Marcus believe that "spontaneously generated para-ethnographies are built into the structure of the contemporary and give form and content to a continuously unfolding skein of experience."

The collapse of foundational epistemologies has led to emerging innovations in methodology. These innovations reframe what is meant by validity. They have shaped the call for increased textual reflexivity, greater textual self-exposure, multiple voicing, stylized forms of literary representation, and performance texts. These innovations shade into the next issues surrounding representation.

Representational issues involve how the other will be presented in the text. Representational strategies converge with a concern over the place of politics in the text. We can no longer separate ideology and politics from methodology. Methods always acquire their meaning within broader systems of meaning, from epistemology to ontology. These systems are themselves embedded in ethical and ideological frameworks as well as in particular interpretive communities. Our methods are always grafted into our politics.

Scientific practice does not stand outside ideology. As argued in the first and second editions of this *Handbook*, a poststructural social science project seeks its external grounding not in science but rather in a commitment to post-Marxism and an emancipatory feminism. A good text is one that invokes these commitments. A good text exposes how race, class, and gender work their ways into the concrete lives of interacting individuals.

We foresee a future where research becomes more relational, where working the hyphen becomes both easier and more difficult, for researchers are always on both sides of the hyphen. We also see a massive spawning of populist technology. This technology will serve to undermine qualitative inquiry as we know it, including disrupting what we mean by a stable subject (where is the cyberself located?). The new information technologies also increase the possibilities of dialogue and communication across time and space. We may be participating in the reconstruction of the social sciences. If so, qualitative inquiry is taking the lead in this reconstruction.

Finally, we predict that there will be no dominant form of qualitative textuality in the seventh and eighth moments; rather, several different hybrid textual forms will circulate alongside one another. The first form will be the classic, realist ethnographic text, redefined in poststructural terms. We will hear more from the first-person voice in these texts. The second hybrid textual form will blend and combine poetic, fictional, and performance texts into critical interventionist presentations. The third textual form will include testimonios and first-person (autoethnographic) texts. The fourth form will be narrative evaluation

texts, which work back and forth between first-person voices and the testimonios. These forms will be evaluated in terms of an increasingly sophisticated set of local, indigenous, antifoundational, moral, and ethical criteria.

Variations on these textual forms will rest on a critical rethinking of the notion of the reflexive, self-aware subject. Lived experience cannot be studied directly. We study representations of experience—stories, narratives, performances, dramas. We have no direct access to the inner psychology and inner world of meanings of the reflexive subject. The subject in performance ethnographies becomes a performer. We study performers and performances, persons making meaning together, the how of culture as it connects persons in moments of cocreation and coperformance.

■ HISTORY, PARADIGMS, POLITICS, ETHICS, AND THE OTHER

Many things are changing as we write our way out of writing culture and move into the eighth moment of qualitative research. Multiple histories and theoretical frameworks now circulate in this field, whereas before there were just a few. Today foundationalism and postpositivism are challenged and supplemented by a host of competing paradigms and perspectives. Many different applied action and participatory research agendas inform program evaluation and analysis.

We now understand that we study the other to learn about ourselves, and many of the lessons we have learned have not been pleasant. We seek a new body of ethical directives fitted to postmodernism. The old ethical codes failed to examine research as a morally engaged project. They never seriously located the researcher within the ruling apparatuses of society. A feminist, communitarian ethical system will continue to evolve, informed at every step by critical race, postcolonial, and queer theory sensibilities. Blatant voyeurism in the name of science or the state will continue to be challenged.

Performance-based cultural studies and critical theory perspectives, with their emphases on moral criticism, will alter the traditional empiricist foundations of qualitative research. The dividing line between science and morality will continue to be erased. A postmodern, feminist, poststructural communitarian science will move closer to a sacred science of the moral universe.

As we edge our way into the 21st century, looking back and borrowing Max Weber's metaphor, we see more clearly how we were trapped by the 20th century and its iron cage of reason and rationality. Like a bird in a cage, for too long we were unable to see the pattern in which we were caught. Coparticipants in a secular science of the social world, we became part of the problem. Entangled in the ruling apparatuses that we wished to undo, we perpetuated systems of knowledge and power that we found, underneath, to be all too oppressive. It is not too late to get out of the cage. Today we leave that cage behind.

And so do we enter, or leave, the eighth moment. In our concluding chapter (Epilogue), we elaborate our thoughts about the next generation of qualitative research.

AFTERTHOUGHT

On Writing; on Writing Sociology

Zygmunt Bauman

The need in thinking is what makes us think.

—Theodor W. Adorno

Quoting the Czech poet Jan Skacel's opinion on the plight of the poet (who, in Skacel's words, only discovers the verses that "were always, deep down, there"), Milan Kundera comments (*En l'Art du roman*, [1986]): "To write, means for the poet to crush the wall behind which something that 'was always there' hides." In this respect, the task of the poet is not different from the work of history, which also discovers rather than "invents"; history, like poets, uncovers—in ever new situations—human possibilities previously hidden.

What history does matter-of-factly is a challenge, a task, and a mission for the poet. To rise to this mission, the poet must refuse to serve up truths known beforehand and well worn, truths already "obvious" because they have been brought to the surface and left floating there. It does not

matter whether such truths "assumed in advance" are classified as revolutionary or dissident, Christian or atheist—or how right and proper, noble and just, they are or have been proclaimed to be. Whatever their denomination, those "truths" are not this "something hidden" that the poet is called to uncover; they are, rather, parts of the wall that the poet's mission is to crush. Spokespersons for the obvious, self-evident, and "what we all believe, don't we?" are *false poets*, says Kundera. But what, if anything, does the poet's vocation have to do with the sociologist's calling? We sociologists rarely write poems. (Some of us who do take a leave of absence from our professional pursuits for the time of writing.) And yet if we do not wish to share the fate of "false poets" and resent being "false sociologists," we ought to come as close as the true poets do to the yet hidden human possibilities. For that

reason, we need to pierce the walls of the obvious and self-evident, of that prevailing ideological fashion of the day whose commonality is taken for the proof of its sense. Demolishing such walls is as much the sociologist's calling as the poet's calling—and for the same reason; the walling up of possibilities belies human potential while obstructing the disclosure of its bluff.

Perhaps the verses that the poet seeks "were always there." One cannot be so sure, though, about the human potential discovered by history. Do humans—the makers and the made, the heroes and the victims of history—indeed carry forever the same volume of possibilities waiting for the right time to be disclosed? Or is it rather that, as human history goes, the opposition between discovery and creation is null and void and makes no sense? Because history is the endless process of human creation, is not history for the same reason (and by the same token) the unending process of human self-discovery? Is not the propensity to disclose/create ever new possibilities, to expand the inventory of possibilities already discovered and made real, the sole human potential that always has been, and always is, "already there"? The question of whether the new possibility has been created or "merely" uncovered by history is no doubt welcome nourishment to many a scholastic mind. As for history itself, it does not wait for an answer and can do quite well without one.

Niklas Luhmann's most seminal and precious legacy to fellow sociologists has been the notion of *autopoiesis*—*self-creation* (from Greek: do, create, give form, be effective; the opposite of suffering, being an object—not the source—of the act), meant to grasp and encapsulate the gist of the human condition. The choice of the term was itself a creation or discovery of the link (inherited kinship rather than chosen affinity) between history and poetry. Poetry and history are two parallel currents ("parallel" in the sense of the non-Euclidean universe ruled by Bolyai and Lobachevski's geometry) of that autopoiesis of human potentialities, in which creation is the sole form that discovery can take, whereas self-discovery is the principal act of creation.

Sociology, one is tempted to say, is a third current running in parallel with those two. Or at least this is what it should be if it is to stay inside that human condition that it tries to grasp and make intelligible. This is what it has tried to become since its inception, although it has been repeatedly diverted from trying by mistaking the seemingly impenetrable and not-yet-decomposed walls for the ultimate limits of human potential and going out of its way to reassure the garrison commanders and the troops they command that the lines they have drawn to set aside the off-limits areas will never be transgressed.

Alfred de Musset suggested nearly two centuries ago that "great artists have no country." Two centuries ago, these were militant words, a war cry of sorts. They were written down amid deafening fanfares of youthful and credulous, and for that reason arrogant and pugnacious, patriotism. Numerous politicians were discovering their vocation in building nation-states of one law, one language, one worldview, one history, and one future. Many poets and painters were discovering their mission in nourishing the tender sprouts of national spirit, resurrecting long-dead national traditions or conceiving of brand-new ones that never lived before, and offering the nation as not-yet-fully-enough-aware-of-being-a-nation the stories, the tunes, the likenesses, and the names of heroic ancestors—something to share, love, and cherish in common and so to lift the mere living together to the rank of belonging together, opening the eyes of the living to the beauty and sweetness of belonging by prompting them to remember and venerate their dead and to rejoice in guarding their legacy. Against that background, de Musset's blunt verdict bore all the marks of a rebellion and a call to arms; it summoned his fellow writers to refuse cooperation with the enterprise of the politicians, the prophets, and the preachers of closely guarded borders and gun-bristling trenches. I do not know whether de Musset intuited the fratricidal capacities of the kind of fraternities that nationalist politicians and ideologists laureate were determined to build or whether his words were but an expression of the intellectual's disgust with and

resentment of narrow horizons, backwaters, and parochial mentality. Whatever the case then, when read now with the benefit of hindsight through a magnifying glass stained with the dark blots of ethnic cleansings, genocides, and mass graves, de Musset's words seem to have lost nothing of their topicality, challenge, and urgency, nor have they lost any of their original controversiality. Now, as then, they aim at the heart of the writers' mission and challenge their consciences with the question decisive for any writer's *raison d'être*.

A century and a half later, Juan Goytisolo, probably the greatest among living Spanish writers, took up the issue once more. In a recent interview ("Les batailles de Juan Goytisolo" in *Le Monde*, February 12, 1999), he points out that once Spain had accepted, in the name of Catholic piety and under the influence of the Inquisition, a highly restrictive notion of national identity, the country became, toward the end of the 16th century, a "cultural desert." Let us note that Goytisolo writes in Spanish but for many years lived in Paris and in the United States before finally settling in Morocco. And let us note that no other Spanish writer has had so many of his works translated into Arabic. Why? Goytisolo has no doubt about the reason. He explains, "Intimacy and distance create a privileged situation. Both are necessary." Although each for a different reason, both these qualities make their presence felt in Goytisolo's relations to his native Spanish and acquired Arabic, French, and English—the languages of the countries that, in succession, became his chosen substitute homes.

Because Goytisolo spent a large part of his life away from Spain, the Spanish language ceased for him to be the all-too-familiar tool of daily, mundane, and ordinary communication, always at hand and calling for no reflection. His intimacy with his childhood language was not—and could not be—affected, but now it has been supplemented with distance. The Spanish language became the authentic homeland in his exile, a territory that was known and felt and lived through from the inside and yet, because it also became remote and was full of surprises and exciting discoveries. That intimate/distant territory lends

itself to the cool and detached scrutiny *sine ira et studio*, laying bare the pitfalls and the yet untested possibilities invisible in vernacular uses, showing previously unsuspected plasticity, admitting and inviting creative intervention. It is the combination of intimacy and distance that allowed Goytisolo to realize that the unreflexive immersion in a language—just the kind of immersion that exile makes all but impossible—is fraught with dangers: "If one lives only in the present, one risks disappearing together with the present." It was the "outside" detached look at his native language that allowed Goytisolo to step beyond the constantly vanishing present and so to enrich his Spanish in a way that otherwise was unlikely, perhaps altogether inconceivable. He brought back into his prose and poetry ancient terms, long fallen into disuse, and by doing so blew away the storeroom dust that had covered them, wiped out the patina of time, and offered the words' new and previously unsuspected (or long forgotten) vitality.

In *La Contre Allée*, a book published recently in cooperation with Catherine Malabou, Jacques Derrida invites his readers to think in *travel*—or, more exactly, to "think travel." That means to think that unique activity of departing, going away from *chez soi*, going far toward the unknown, taking all of the risks, pleasures, and dangers that the "unknown" has in store (even the risk of not returning).

Derrida is obsessed with "being away." There is some reason to surmise that the obsession was born when, in 1942, the 12-year-old Derrida was sent down from the school that, by the decree of the Vichy administration of North Africa, was ordered to purify itself of Jewish pupils. This is how Derrida's "perpetual exile" started. Since then, Derrida has divided his life between France and the United States. In the United States, he was a Frenchman. In France, however hard he tried to avoid it, time and time again the Algerian accent of his childhood kept breaking through his exquisite French *parole*, betraying a *piéd noir* hidden under the thin skin of the Sorbonne professor. (This is, some people think, why Derrida came to extol the superiority of writing and composed the axiological myth of priority to support the axiological

assertion.) Culturally, Derrida was to remain "stateless." This did not mean, though, having no cultural homeland. Quite the contrary; being "culturally stateless" meant having more than one homeland, building a home of one's own on the crossroads between cultures. Derrida became and remained a *métèque*—a cultural hybrid. His "home on the crossroads" was built of language.

Building a home on cultural crossroads proved to be the best conceivable occasion to put language to tests it seldom passes elsewhere, to see through its otherwise unnoticed qualities, to find out what language is capable of and what promises it makes but can never deliver. From that home on the crossroads came the exciting and eye-opening news about the inherent plurality and undecidability of sense (in *l'Écriture et la différence*), about the endemic impurity of origins (in *De la grammatologie*), and about the perpetual unfulfillment of communication (in *La Carte postale*), as Christian Delacampagne notes in *Le Monde* (March 12, 1999).

Goytisolo's and Derrida's messages are different from that of de Musset. It is not true, the novelist and the philosopher suggest in unison, that great art has no homeland; on the contrary, art, like the artists, may have many homelands and most certainly has more than one. Rather than homelessness, the trick is to be at home in many homes but to be in each inside and outside at the same time, to combine intimacy with the critical look of an outsider, involvement, with detachment—a trick that sedentary people are unlikely to learn. Learning the trick is the chance of the exile—technically one that is *in* but not *of* the place. The unconfinedness that results from this condition (that *is* this condition) reveals the homely truths to be manmade and unmade and reveals the mother tongue to be an endless stream of communication between generations and a treasury of messages always richer than any of their readings and forever waiting to be unpacked anew.

George Steiner has named Samuel Beckett, Jorge Luis Borges, and Vladimir Nabokov as among the greatest contemporary writers. What unites them and what made them all great, he says, is that each of the three moved with equal

ease—was equally "at home" in several linguistic universes, not one. (A reminder is in order here. "Linguistic universe" is a pleonastic phrase; the universe in which each one of us lives is, and cannot be anything but, "linguistic"—made of words. Words light the islands of visible forms in the dark sea of the invisible and mark the scattered spots of relevance in the formless mass of the insignificant. It is words that slice the world into the classes of nameable objects and bring out their kinship or enmity, closeness or distance, affinity or mutual estrangement. And so long as they stay alone in the field, they raise all such artifacts to the rank of reality—the only reality there is.) One needs to live, to visit, to know intimately more than one such universe to spy out human invention behind any universe's imposing and apparently indomitable structure and to discover just how much human cultural effort is needed to divine the idea of nature with its laws and necessities—all that is required to muster, in the end, the audacity and the determination to join in that cultural effort *knowingly*, aware of its risks and pitfalls but also of the boundlessness of its horizons.

To create (and so also to discover) always means breaking a rule; following a rule is mere routine, more of the same—not an act of creation. For the exile, breaking rules is not a matter of free choice but rather an eventuality that cannot be avoided. Exiles do not know enough of the rules reigning in their country of arrival, nor do they treat these rules unctuously enough for their efforts to observe them and conform to be perceived as genuine and approved. As for their country of origin, going into exile has been recorded there as their original sin, in the light of which all that the sinners later may do may be taken down and used against them as evidence of their rule breaking. By commission or by omission, rule breaking becomes a trademark of the exiles. This is unlikely to endear them to the natives of any of the countries between which their life itineraries are plotted. But paradoxically, it also allows them to bring to all of the countries involved gifts that they need badly without even knowing it—gifts that they could hardly expect to receive from any other source.

Let me clarify. The "exile" under discussion here is not necessarily a case of physical bodily mobility. It may involve leaving one country for another, but it need not. As Christine Brook-Rose puts it (in her essay "Exsul"), the distinguishing mark of all exile, and particularly the writer's exile (i.e., the exile articulated in words and thus made into a communicable *experience*) is the refusal to be integrated—the determination to stand out from the physical space, to conjure up a place of one's own, different from the place in which those around are settled, a place unlike the places left behind and unlike the place of arrival. The exile is defined not in relation to any particular physical space, or to the oppositions among a number of physical spaces, but rather through the autonomous stand taken toward space as such. Ultimately, asks Brooke-Rose, is not every poet or "poetic" (exploring, rigorous) novelist an exile of sorts, looking in from outside into a bright desirable image in the mind's eye, of the little world created, for the space of the writing effort and the shorter space of the reading? This kind of writing, often at odds with publishers and the public, is the last solitary, nonsocialized creative art.

The resolute determination to stay "nonsocialized"; the consent to integrate solely with the condition of nonintegration; the resistance—often painful and agonizing, yet ultimately victorious—to the overwhelming pressure of the place, old or new; the rugged defense of the right to pass judgment and choose; the embracing of ambivalence or calling ambivalence into being—these are, we may say, the constitutive features of exile. Note that all of them refer to attitude and life strategy and to spiritual mobility rather than physical mobility.

Michel Maffesoli (in *Du nomadisme: Vagabondages initiatiques*, 1997) writes of the world we all inhabit nowadays as a "floating territory" in which "fragile individuals" meet "porous reality." In this territory, only such things or persons may fit as are fluid, ambiguous, in a state of perpetual becoming, and in a constant state of self-transgression. "Rootedness," if any, can be only dynamic; it needs to be restated and reconstituted daily, precisely through the repeated act of "self-distantiation"—that foundational, initiating act

of "being in travel," on the road. Having compared all of us—the inhabitants of the present-day world—to nomads, Jacques Attali (in *Chemins de sagesse*, 1996) suggests that, apart from traveling light and being kind, friendly, and hospitable to strangers whom they meet on their way, nomads must be constantly on the watch, remembering that their camps are vulnerable and have no walls or trenches to stop intruders. Above all, nomads, struggling to survive in the world of nomads, need to grow used to the state of continuous disorientation and to traveling along roads of unknown direction and duration, seldom looking beyond the next turn or crossing. They need to concentrate all of their attention on that small stretch of road that they need to negotiate before dusk.

"Fragile individuals," doomed to conduct their lives in a "porous reality," feel like skating on thin ice, and "in skating over thin ice," Ralph Waldo Emerson remarks in his essay "Prudence," "our safety is in our speed." Individuals, whether fragile or not, need safety, crave safety, and seek safety, and so they try, to the best of their ability, to maintain a high speed in whatever they do. When running among fast runners, slowing down means being left behind; when running on thin ice, slowing down also means the real threat of being drowned. Speed, therefore, climbs to the top of the list of survival values.

Speed, however, is not conducive to thinking, not to thinking far ahead, not to long-term thinking at any rate. Thought calls for pause and rest, for "taking one's time," recapitulating the steps already taken, and looking closely at the place reached and the wisdom (or imprudence, as the case may be) of reaching it. Thinking takes one's mind away from the task at hand, which is always the running and keeping speed and whatever else it may be. And in the absence of thought, the skating on thin ice, which is the fate of fragile individuals in the porous world, may well be mistaken for their *destiny*.

Taking one's fate for destiny, as Max Scheler insists in his *Ordo amoris*, is a grave mistake: "Destiny of man is not his fate. . . . The assumption that fate and destiny are the same deserves to be

called fatalism." Fatalism is an error of judgment because in fact fate has "a natural and basically comprehensible origin." Moreover, although fate is not a matter of free choice, and particularly of individual free choice, it "grows up out of the life of a man or a people." To see all that, to note the difference and the gap between fate and destiny, and to escape the trap of fatalism, one needs resources not easily attainable when running on thin ice—"time off" to think and a distance allowing a long view. "The image of our destiny," Scheler warns, "is thrown into relief only in the recurrent traces left when we turn away from it." Fatalism, however, is a self-corroborating attitude; it makes the "turning away," that *conditio sine qua non* of thinking, appear useless and unworthy of trying.

Taking distance and taking time to separate destiny and fate, to emancipate destiny from fate, and to make destiny free to confront fate and challenge it—this is the calling of sociology. And this is what sociologists may do if they conscientiously, deliberately, and earnestly strive to reforge the calling they have joined—their fate—into their destiny.

"Sociology is the answer. But what was the question?" states—and asks—Ulrich Beck in *Politik in der Risikogesellschaft*. A few pages previously, Beck seems to articulate the question he seeks—the chance of a democracy that goes beyond "expertocracy," a kind of democracy that "begins where debate and decision making are opened about whether we *want* a life under the conditions that are being presented to us."

This chance is under a question mark not because someone has deliberately and malevolently shut the door on such a debate and prohibited an informed decision taking; hardly ever in the past was the freedom to speak out and to come together to discuss matters of common interest as complete and unconditional as it is now. The point is, though, that more than a formal freedom to talk and pass resolutions is needed for the kind of democracy that Beck thinks is our imperative to start in earnest. We also need to know what it is we need to talk about and what the resolutions we pass ought to be concerned with. And all of this

needs to be done in our type of society, in which the authority to speak and resolve issues is the reserve of experts who own the exclusive right to pronounce on the difference between reality and fantasy and to set apart the possible from the impossible. (Experts, we may say, are almost by definition people who "get the facts straight," who take the facts as they come and think of the least risky way of living in their company.)

Why this is not easy, and is unlikely to become easier unless something is done, Beck explains in his *Risikogesellschaft: auf dem Weg andere Moderne*: "What food is for hunger, eliminating risks, or *interpreting them away*, is for the consciousness of risks." In a society haunted primarily by material want, such an option between "eliminating" misery and "interpreting it away" did not exist. In our society, haunted by risk rather than want, it does exist—and is taken daily. Hunger cannot be assuaged by denial; in hunger, subjective suffering and its objective cause are indissolubly linked, and the link is self-evident and cannot be belied. But risks, unlike material want, are not subjectively experienced; at least, they are not "lived" directly unless they are mediated by knowledge. They may never reach the realm of subjective experience. They may be trivialized or downright denied before they arrive there, and the chance that they will indeed be barred from arriving grows together with the extent of the risks.

What follows is that *sociology is needed today more than ever before*. The job in which sociologists are the experts—the job of restoring to view the lost link between objective affliction and subjective experience—has become more vital and indispensable than ever, while being less likely than ever to be performed without their professional help, because its performance by the spokesmen and practitioners of other fields of expertise has become utterly improbable. If all experts deal with practical problems and all expert knowledge is focused on their resolution, sociology is one branch of expert knowledge where the practical problem it struggles to resolve is *enlightenment aimed at human understanding*. Sociology is perhaps the sole field of expertise in

which (as Pierre Bourdieu pointed out in *La Misère du monde*) Dilthey's famed distinction between *explanation* and *understanding* has been overcome or cancelled.

To understand one's fate means to be aware of its difference from one's destiny. And to understand one's fate is to know the complex network of causes that brought about that fate and its difference from that destiny. To work in the world, as distinct from being "worked out and about" by it, one needs to know how the world works.

The kind of enlightenment that sociology is capable of delivering is addressed to freely choosing individuals and aimed at enhancing and reinforcing their freedom of choice. Its immediate objective is to reopen the allegedly shut case of explanation and so to promote understanding. It is the self-formation and self-assertion of individual men and women, the preliminary condition of their ability to decide whether they want the kind of life that has been presented to them as their fate, that may gain in vigor, effectiveness, and rationality as a result of sociological enlightenment. The cause of the autonomous society may profit together with the cause of the autonomous individual; they can only win or lose together.

To quote from Cornelius Castoriadis's *Le Délablement de l'Occident*:

An autonomous society, a truly democratic society, is a society which questions everything that is pre-given and by the same token *liberates the creation of new meanings*. In such a society, all individuals are free to create for their lives the meanings they will (and can).

Society is truly autonomous once it "knows, must know, that there are no 'assured' meanings, that it lives on the surface of chaos, that it itself is a chaos seeking a form, but a form that is never fixed once for all." The absence of guaranteed meanings—of absolute truths, of pre-ordained norms of conduct, of predrawn borderlines between right and wrong no longer needing attention, of guaranteed rules of successful action—is the *conditio sine qua non* of, simultaneously, a truly autonomous society and truly free

individuals; autonomous society and the freedom of its members depend on each other. Whatever safety democracy and individuality muster depends not on fighting the endemic contingency and uncertainty of human condition but rather on recognizing it and facing its consequences point blank.

If orthodox sociology, born and developed under the aegis of solid modernity, was preoccupied with the conditions of human obedience and conformity, then the prime concern of sociology made to measure of liquid modernity needs to be the promotion of autonomy and freedom; such sociology must, therefore, put individual self-awareness, understanding, and *responsibility* at its focus. For the denizens of modern society in its solid and managed phase, the major opposition was one between conformity and deviance. For the major opposition of modern society in its present-day liquefied and decentered phase, the opposition that needs to be faced up to so as to pave the way to a truly autonomous society is one between taking up responsibility and seeking a shelter where responsibility for one's own actions need not be taken by the actors.

That other side of the opposition, seeking shelter, is a seductive option and a realistic prospect. Alexis de Tocqueville (in the second volume of his *De la démocratie en Amérique*), notes that if selfishness, that bane haunting humankind during all periods of its history, "desiccated the seeds of all virtues," then individualism, a novel and typically modern affliction, dries up only "the source of public virtues"; the individuals affected are busy cutting out small companies for their own use, while leaving the "great society" to its own fate. The temptation to do so has grown considerably since de Tocqueville jotted down his observation.

Living among a multitude of competing values, norms, and lifestyles without a firm and reliable guarantee of being in the right is hazardous and commands a high psychological price. No wonder that the attraction of the second response—of hiding from the requisites of responsible choice—gathers in strength. As Julia Kristeva puts it (in *Nations Without Nationalism*), "It is a rare person who does not invoke a primal

shelter to compensate for personal disarray." And we all, to a greater or lesser extent, sometimes more and sometimes less, find ourselves in that state of personal disarray. Time and again, we dream of a "great simplification." Unprompted, we engage in regressive fantasies of which the images of the prenatal womb and the walled-up home are prime inspirations. The search for a primal shelter is "the other" of responsibility, just like deviance and rebellion were the other of conformity. The yearning for a primal shelter these days has come to replace rebellion, which has now ceased to be a sensible option. As Pierre Rosanvallon points out (in a new preface to his classic *Le Capitalisme utopique*), there is no longer a "commanding authority to depose and replace. There seems to be no room left for a revolt, as social fatalism vis-à-vis the phenomenon of unemployment testifies."

Signs of malaise are abundant and salient, yet as Pierre Bourdieu observes repeatedly, they seek in vain a legitimate expression in the world of politics. Short of articulate expression, they need to be read out, obliquely, from the outbursts of xenophobic and racist frenzy—the most common manifestations of the primal shelter nostalgia. The available, and no less popular, alternative to neotribal moods of scapegoating and militant intolerance—the exit from politics and the withdrawal to behind the fortified walls of the private—is no longer prepossessing and, above all, no longer an adequate response to the genuine source of the ailment. And so it is at this point that sociology, with its potential for explanation that promotes understanding, comes into its own more than at any other time in its history.

According to the ancient but never bettered Hippocratic tradition, as Pierre Bourdieu reminds the readers of *La Misère du monde*, genuine medicine begins with the recognition of the invisible disease—"facts of which the sick does not speak or forgets to report." What is needed in the case of sociology is the "revelation of the structural causes which the apparent signs and talks disclose only through distorting them (*ne dévoilent qu'en les voilant*). One needs to see through—explain and understand—the sufferings characteristic of the

social order that "no doubt pushed back the great misery (though as much as it is often said), while . . . at the same time multiplying the social spaces . . . offering favourable conditions to the unprecedented growth of all sorts of little miseries."

To diagnose a disease does not mean the same as curing it. This general rule applies to sociological diagnoses as much as it does to medical verdicts. But one should note that the illness of society differs from bodily illnesses in one tremendously important respect: In the case of an ailing social order, the absence of an adequate diagnosis (elbowed out or silenced by the tendency to "interpret away" the risks spotted by Ulrich Beck) is a crucial, perhaps decisive, part of the disease. As Cornelius Castoriadis famously puts it, society is ill if it stops questioning itself. And it cannot be otherwise considering that—whether it knows it or not—society is autonomous (its institutions are nothing but human-made and so, potentially, human-unmade) and that suspension of self-questioning bars the awareness of autonomy while promoting the illusion of heteronomy with its unavoidably fatalistic consequences. To restart questioning means to take a long step toward the cure. If in the history of human condition discovery equals creation, if in thinking about the human condition explanation and understanding are one, then in the efforts to improve human condition diagnosis and therapy merge.

Pierre Bourdieu expressed this perfectly in the conclusion of *La Misère du monde*: "To become aware of the mechanisms which make life painful, even unlivable, does not mean to neutralize them; to bring to light the contradictions does not mean to resolve them." And yet, skeptical as one can be about the social effectiveness of the sociological message, the effects of allowing those who suffer to discover the possibility of relating their sufferings to social causes cannot be denied, nor can one dismiss the effects of becoming aware of the social origin of unhappiness "in all its forms, including the most intimate and most secret of them."

Nothing is less innocent, Bourdieu reminds us, than *laissez-faire*. Watching human misery with equanimity while placating the pangs of conscience with the ritual incantation of the TINA ("there is no alternative") creed means complicity.

Whoever willingly or by default partakes in the cover-up or, worse still, the denial of the human-made, noninevitable, contingent, and alterable nature of social order, notably the kind of order responsible for unhappiness, is guilty of immorality—of refusing help to a person in danger.

Doing sociology and writing sociology are aimed at disclosing the possibility of living together differently with less misery or no misery—the possibility that is daily withheld, overlooked, or unbelieved. Not seeing, not seeking, and thereby suppressing this possibility is itself part of human misery and a major factor in its perpetuation. Its disclosure does not by itself predetermine its use. Also, when known, possibilities might not be trusted enough to be put to the test of reality. Disclosure is the beginning—not the end—of the war against human misery. But that war cannot be waged in earnest, let alone with a chance of at least partial success, unless the scale of human freedom is revealed and recognized so that freedom can be fully deployed in the fight against the social sources of all, including the most individual and private—unhappiness.

There is no choice between “engaged” and “neutral” ways of doing sociology. A noncommittal sociology is an impossibility. Seeking a morally neutral stance among the many brands of sociology practiced today, brands stretching all the way from the outspokenly libertarian to the staunchly communitarian, would be a vain effort. Sociologists may deny or forget the worldview effects of their work, and the impact of that view on human singular or joint actions, only at the expense of forfeiting that responsibility of choice that every other human faces daily. The job of sociology is to see to it that the choices are genuinely free and that they remain so—increasingly so—for the duration of humanity.

REFUNCTIONING ETHNOGRAPHY

The Challenge of an Anthropology of the Contemporary

Douglas R. Holmes and George E. Marcus

We begin this chapter with some basic orientations that are driving our work these days. Part of it is sticking with the so-called *Writing Culture* critiques of anthropology (Clifford & Marcus, 1986) and trying to figure out what are their most productive legacies in the present. Part of it has to do with the changing circumstances of producing anthropological research that we experience every day in the supervision of graduate students. And relatedly, part of it has to do with contemplating the systematic changes that are necessary in the practice of ethnography to accommodate the kinds of new social and cultural formations that are emerging within frames of work that are conceived distinctively as contemporary. We see a need to "refunction ethnography" or at least to provide it with an alternative formulation to the classic Malinowskian one so as to address certain problems of research. We are pursuing this as a project by producing a series of small studies and discussion papers (Holmes, 1993; Holmes &

Marcus, 2004; Marcus, 1999b, 1999d, 2001, 2002a, 2002b, 2003).

■ BEYOND MALINOWSKI'S STAGING

Early in the essay in *Argonauts of the Western Pacific*, in which fieldwork is evoked and its practices are inculcated, Malinowski (1928/1961) intones, "Imagine yourself, suddenly set down, surrounded by all your gear, alone on a tropical beach close to a native village, while the launch or dinghy which has brought you sails away out of sight" (p. 46). Anthropologists have always thought about each other's fieldwork and about teaching it to initiates not just in terms of stories or tales of the field but also, in more analytic moments, strongly in terms of images and scenarios. Such a dramaturgical regime of method is most effective when the experience of fieldwork actually corresponds at least roughly to the imaginary that anthropologists make out of what they

report to each other from distant experiences that are theirs alone. There is a great premium placed on ethnography that is able to set scenes that can be entered through concretely visualized and situated thought experiments.

Another distinctive, if not peculiar, aspect of the professional lore about fieldwork in anthropology is that it is highly specific and richly evoked for the early phases of fieldwork experience with the image (as per Malinowski) of "first contact" and heightened otherness in mind. The initiate's experience of fieldwork is how the imaginary is slanted, even when it expresses the experience of seasoned field-workers. But what about the continuing research of an anthropologist who has been working in a particular site for a decade or even decades? Is there any model of method in anthropology for what fieldwork is like for the virtuoso? Is it even recognizable as fieldwork according to the Malinowskian *mise-en-scène*? Our point is that the later work of mature ethnographers usually operates free of the tropes of their earlier work. And we would argue that somehow initiatory fieldwork in certain arenas where many younger anthropologists are working today requires something of the more diffuse and open idea of what fieldwork can be that seems to be characteristic of virtuoso fieldwork, if only it were articulated in the traditional imaginary under which ethnographers-in-the-making train. So this is a problem of pedagogy. Students now enter anthropology inspired by complex social and cultural theories from the interdisciplinary ferment of the 1980s and early 1990s, as well as by the examples of mature second and third works of senior anthropologists—themselves deeply influenced by this period of interdisciplinary ferment—that they admire and want to emulate, and then are faced with a still powerful culture of method that insists that they do something less ambitious. We insist that a new set of regulative norms of fieldwork are needed to release ethnographers-in-the-making from the emphatic and vivid "being there-ness" of the classic imaginary of fieldwork.

Now, turning to the actual challenges to the traditional fieldwork imaginary, what in the world (today) has led to fieldwork's entanglements in

multiple and heterogeneous sites of investigation and in complicitous forms of collaboration that have changed markedly what anthropologists want from "natives" as subjects and have deeply compromised claims to authoritative knowledge even of the revised sorts reinstated by the reflexive critiques of the 1980s? The conventional understanding of these developments has lain in certain presumptions about the nature of postmodernity that circulated widely in the arenas of interdisciplinary work of the past two decades, namely that as cultures and settled populations have fragmented and become mobile and transnational, as well as more cosmopolitan locally (or at least more invaded or intervened on), fieldwork has simply had literally to follow, when it could, these processes in space. Furthermore, the weight of political and ethical critique of the traditional fieldwork relationship that generated ethnographic data, as revealed by the scrupulous reflexive probing of the postmodern gaze, broke the modicum of innocence and naïveté necessary to sustain the distance in the ethnographer's relationship to subjects, so that complicity with subjects—a state of ambiguity and improper seeming alliance—now pervades the scene of fieldwork, signaling a loss of innocence in the wake of postmodern exposures. Herein both the intensity of focus and the integrity of relationship that have shaped the Malinowskian scene of fieldwork have been challenged.

Although we are sympathetic to this conventional understanding of the challenges to the traditional composure of fieldwork, they do not arise simply from the complexities of a postmodern or now globalizing world. After all, many anthropologists can easily continue doing the same thing, and in fact many do; in many situations, it is even valuable to do so. But our take on what generates multisitedness and complicit relations in fieldwork projects today has more to do with the self-esteem of anthropology in the diminution of its distinctive documentary function amid many competing and overlapping forms of representation comparable to its own. In effect, every project of ethnography enters sites of fieldwork through zones of collateral counterpart knowledge that it

cannot ignore in finding its way to the preferred scenes of ordinary everyday life with which it is traditionally comfortable. This condition alone makes fieldwork both multisited in nature, and heterogeneously so, as well as complicit with certain subjects (often experts or authorities in the scene of fieldwork, so to speak), who are crucial to bounding fieldwork and giving it orientation. The fundamental problem here is in confronting the politics of knowledge that any project of fieldwork involves and the ethnographer's trying to gain position in relation to this politics by making this terrain itself part of the design of fieldwork investigation.

Thus, since the 1980s, any critical anthropology worthy of the name not only tries to speak truth to power—truth as subaltern and understood within the closely observed everyday lives of ordinary subjects as the traditional milieu of fieldwork, power as conceptualized and theorized but not usually investigated by the strategies of fieldwork—but also tries to understand power and its agencies in the same ethnographically committed terms and in the same boundaries of fieldwork in which the subaltern is included. Ethnographic understanding itself, as a dominated segment of the dominant (in Pierre Bourdieu's terms), suggests an alternative modality relevant to the circumstances of contemporary fieldwork in which incorporating a second-order perspective on often overlapping, kindred official, expert, and academic discourses as counterpart to the ethnographer's own is an essential and complicating formulation of the traditional *mise-en-scène* of fieldwork. It is what accounts most cogently for making much of contemporary fieldwork multisited and political. It also makes contemporary fieldwork both slightly alienated and slightly paranoid in ways that are both inevitable and productive (Marcus, 1999c).

The keenly reflexive critical anthropology after the 1980s is well suited to this incorporation of cultures of the rational as a strategic part of its sites of fieldwork. Indeed, if there was one great success of these earlier critiques, it was to create an anthropology of current formations of knowledge and their distributions in a way that was thoroughly new and original. In a sense, all

anthropology since has been most effectively an intimate critique of diffused Western knowledge practices in the name of specific communities of subjects misrepresented by, excluded from, seduced by, or victimized by such practices. The emerging innovation of fieldwork currently is to treat such power/knowledges as equal subjects of fieldwork in their complex and obscured connections to the scenes of everyday life as the cultivated and favored milieu of classic ethnography. But to be effective, such fieldwork has to do something more with this complex field of engagements than just provide distanced, however reflexive, description and interpretation. At the moment, a pervasive and sometimes cloying discourse and rhetoric of moral redemption holds this vacant place of an alternative, fully imagined and worked out alternative function for ethnography. Eventually, this rhetorical placeholder might be replaced by more active techniques that are styled in the range between ideas of experimentation and ideas of activism.

So contemporary critical ethnography orients itself through the imaginaries of expert others—through what we call *para-ethnography*—and operates through found zones of powerful official or expert knowledge-making practices so as to find more traditional subjects for itself. But what does it want of the complicit collaborations it makes with counterpart subjects in these domains, and what does it make of the scene of ethnography? This is distinctly not about an ethnography of elite cultures (Marcus, 1983); rather, it is about an access to a construction of an imaginary for fieldwork that can be shaped only by alliances with makers of visionary knowledge who are already in the scene or within the bounds of the field. The imaginaries of knowledge makers who have preceded the ethnographer are what the dreams of contemporary fieldwork are made of. But what are the practices/aesthetics of technique that go along with such complicitous, multisited fieldwork investigations?

■ ECOLOGIES OF KNOWLEDGE

As the anthropologist arrives at the gleaming headquarters of a multinational pharmaceutical

corporation in New Jersey, the imposing governmental offices of the Bank of Japan, the sprawling alternative arts space in an urban ward of Cape Town, the courtrooms of the War Crimes Tribunal in The Hague, the offices of software engineers in Uttar Pradesh, or the research laboratories of the World Health Organization in Hong Kong, he or she is faced with unsettling questions. What do I do now? How do I start the fieldwork that is at the heart of my profession? How do I engage the human subjects who can enliven my research and can make my theoretical ideas anthropological? These are not just the questions that haunt the graduate student facing his or her first stint of fieldwork. They are the deep preoccupations that arise on a more or less daily basis, and it is with a veritable ethnographic treatment of the politics and ecologies of such knowledge forms that every project of the ethnography of the contemporary begins.¹ This initial ethnographic treatment produces both the context and the scaffolding of fieldwork. We suppose that this sensitivity to the zones of discourses in play as the portal through which every ethnographic project enters, and indeed constitutes the field, comes from the emphases of the 1980s critiques on reflexivity, representation, rhetorics, and especially politics. But rather than viewing these functions as constitutive of the Malinowskian project within its traditional boundaries, we see them as shaping different and methodologically more challenging conceptions of this theme of fieldwork and the practices they elicit. For us, the kind of reflexivity that is most valuable is the one that positions anthropologists within a field of already existing discourses as subjects of ethnography themselves so that they can find their way to the classic subjects of ethnography.

The work of Fortun (2001), Maurer (1995, 1999, 2002a, 2002b), Riles (2000, 2004a, 2004b, in press), and Miyazaki (2000, 2003, 2004), among many others,² demonstrates this rethinking of how projects of ethnography can begin deeply and critically within discourses of the rational that evoke ecologies and politics of knowledge that can be examined ethnographically. Moreover, the work of these authors has identified the

deeply reflexive and complicit character of this kind of ethnography and the ways in which *theory* becomes implicated in this work. As Miyazaki (2003) notes regarding his work on Japanese securities traders,

My ultimate goal is to carve out a space for a different kind of anthropological knowledge formation that finds an opportunity, rather than a problem, in social theorists' collective sense of belatedness. I suggest that the explicit construction of temporal incongruity as an opportunity in financial transactions makes financial markets a particularly suitable site for such exploration. (p. 256)

He further notes how the dilemmas of his subjects, securities traders, are analogous to those of the social theorists and how this convergence creates the basis of a distinctive kind of knowledge production:

I suggested that social theorists' attention to financial markets as a new target of criticism has resulted from, and in turn intensified, their own collective sense of a temporal incongruity between their knowledge and its object of contemplation, the market. My response to this condition has been to point to analogues of such a sense of temporal incongruity in the financial markets themselves. I have argued that the traders I knew generated prospective momentum in their work precisely by reorienting the temporality of their work so as to continually re-create various forms of temporal incongruity. These analogies to the problems of social theory would suggest that the task of social theorists must be not so much to find new objects of contemplation on the constantly receding horizon of the new, such as financial markets, as to reflect on the work of temporal incongruity as an engine of knowledge formation, more generally. (p. 262)

In a sense, then, the anthropologist finds the literal field by working through the imaginaries of his or her counterparts who are already there, so to speak. This transforms the well-established scene of fieldwork as the encounter with the "other" into a much more complex scene of multiple levels, sites, and kinds of association in producing ethnographic knowledge.

We have become associated with discussing the predicament that we have been describing in terms of the emergence of multisited ethnographic research (Marcus, 1999b). Anthropology cannot remain local but rather must follow its objects and subjects as they move and circulate. This is true, and there are special problems with this, both practical and otherwise. But multisited fieldwork arises as much from the hypersensitivity of anthropology to the ecologies and politics of knowledge in which it operates that are necessary to constitute any subject today for fieldwork investigation. It cannot bracket these in the name of disciplinary authority but rather must incorporate them within the field of fieldwork, so to speak. This in itself is what generates multisitedness in its most pragmatic and feasible sense because there is no doubt that anthropological studies of the contemporary have most often taken the form of examining the relation of institutions to subjects, of systems to everyday life, and of domination to resistance. It is just that now these leading tropes of the contemporary terrain of fieldwork must be thought through in terms of the specific capacities and limits of ethnography as method and as a matter of design in how these tropes literally emerge in the constitution of fieldwork strategies, serendipity, and opportunities. The self-consciously multisited character of fieldwork comes into being as an epiphenomenon of the need to constitute the field and the object of study by incorporating both communities of often elite discourse and communities of often subaltern subjects. From this comes a rethinking of a whole set of issues of fieldwork—complicity instead of rapport (Marcus, 2001), the necessity of collaborations and their personal politics, the uneven distribution or depth of knowing in ethnography (both thickness and thinness as virtues of ethnographic description are in play), the changing nature of the object of study, the grounding of abstract relations that define cultural systems in forms of human action and knowing.

For us, one of the most important settings for developing this project of refunctioning that we are proposing is a pedagogical one. We want to

give a sense of what, during recent years, has made the traditional regulative ideals of fieldwork unstable in the work of anthropology and an object for refunctioning. Part of it has to do with failures in the reigning folkloric, storytelling mode of inculcating ethnography as the distinctive practice in the professional culture of anthropology by which fieldwork has long been regulated, thought about, and idealized. This involves articulating certain dimensions that were always there in the Malinowskian staging or *mise-en-scène* of fieldwork but are now more important than ever in guiding adequately student ethnographers-in-the-making in the kinds of research they are increasingly undertaking. Yet at the same time, it is not clear—based on old governing tropes—what fieldwork is to be experientially in these student projects and what kinds of data it is supposed to generate. Thus, part of the destabilization has to do with the conditions that are reshaping research projects and demanding both more and different emphases from the old ethos in its vision and imaginings of what fieldwork is. This is hardly worthy of the term “crisis” as in the 1980s “crisis of representation,” but like the diffusely articulated reflexively critical tendencies growing before the critique of ethnographic writing, there is now a comparable situation with regard to fieldwork. The Malinowskian *mise-en-scène* is by no means an empty term or guide, but it only roughly covers the forms and norms it actually takes now when applied to new projects.

In our recent work, we have been making a diverse range of arguments about this changing nature of fieldwork, especially for students in new topical arenas, grouped around the notion of what the multisited terrain of contemporary projects does to the focused Malinowskian *mise-en-scène* and around the concept of complicity as redefining the core relationship of collaboration in fieldwork on which authoritative ethnographic claims to knowledge have always depended. We have used the term *mise-en-scène* several times in referring to the imaginary that mediates and regulates the expression of method in anthropology. Fieldwork has been a vividly theatrical object of

thought in anthropology from its very inception and ideological consolidation by Malinowski as the key symbol, initiatory rite, and method of anthropology. Much of the rest of this chapter is devoted to elucidating the terms of a refunctioned ethnography.

■ FOR METHOD

In earlier post-1986 writing, we emphasized the problem of passing through zones of representation and somehow incorporating them into the purview of fieldwork. As we noted, *acting* on this problem immediately generates the special problems of multisited fieldwork to which we have been alluding. But our efforts here are also a specific response to the possibilities that we both have encountered in pursuing initially the ethnography of elites, and now the ethnography of expertise, in the potential for these figures to define the reflexive politics of positioning for any anthropological research on the contemporary. Probing the ecologies of discourse that orient fieldwork projects today is indeed what the ethnography of elites, and now experts, has most productively become.

If the opening gambit of the ethnography is an orienting foray into a strategically selected culture of expertise, then that milieu of fieldwork cannot be treated conventionally or traditionally. Experts are to be treated not as collateral colleagues helping to inform fieldwork to occur elsewhere but instead as subjects fully within our own analytical ambit whose cognitive purview and social action range potentially over multiple, if not countless, sites and locales. Nor can they be treated as conventional "natives" or tokens of their cultures to be systematically understood; instead, they must be treated as agents who actively participate in shaping emergent social realms. These subjects must be treated like collaborators or partners in research, a fiction to be sustained more or less strongly around the key concept of para-ethnography.¹

The para-ethnographic is a self-conscious critical faculty operating in expert domains as a way of dealing with contradictions, exceptions, and facts

that are fugitive, suggesting a social realm and social processes not in alignment with conventional representations and reigning modes of analysis. Making ethnography from the found para-ethnographic redefines the status of the subject or informant and asks what different accounts one wants from such key figures in the fieldwork process. We have conceptualized the para-ethnographic as a kind of *social* thought—expressed in genres such as "the anecdotal," "hype," and "intuition"—within institutions dominated by a technocratic ethos, an ethos that, under changed contemporary circumstances, simply does not discipline thought and action as efficiently as it once did.

The para-ethnographer is an expert subject like the genetic engineer who is perplexed by the significance of his or her own cognitive practices and who, in the shadow of his or her formal knowledge work, creates intricate *cultural* narratives that might never be fully voiced but nonetheless mimic the form and the content of an ethnographic engagement with the world. Various fragmentary discourses are continuously spun off from this kind of knowledge work that connects formal scientific inquiry to the existential condition of the scientist cum para-ethnographer, on the one hand, and to a wider social imaginary, on the other. Ethical and moral apprehensions as well as professional and commercial preoccupations, although typically not fully articulated, nonetheless circulate in complex relationship to formal scientific practices, thereby constituting the substance of para-ethnography as well as part of the ecology of discourse that creates the field or ground in which strategies and designs of anthropological research take form. The questions, motives, and purposes that project anthropologists into fieldwork are not simply those raised within the discipline of anthropology or posed by the contextualizing social theories or historical narratives of contiguous academic specializations; rather, they arise from orienting engagements with counterparts and actors already defined within the field of ethnographic inquiry. Through this process, the formal *problematic* of contemporary ethnography is established (Fischer, 1999, 2003; Marcus, 1999a; Rabinow, 2003).

Under the conditions we are stipulating, where meaning is fugitive and social facts are elusive, distinct dilemmas are created for the individual. Cultural innovations continually destabilize social consensus, posing characteristic struggles for the perplexed subject—struggles that gain expression through various manifestations of the para-ethnographic. We are interested in how these para-ethnographic narratives become linked together among different expert subjects, conferring a distinctive *social* character on, for the most part, technical knowledge. What we refer to as internarratives not only link domains of expertise, often in unlikely ways, but also allow expertise to be juxtaposed in ways that render them acutely relevant to a broad range of anthropological questions. Expertise in science, politics, law, business, finance, and art must increasingly confront reciprocal expertise (and subaltern discourses) on human rights, social justice, and environmentalism, to name just a few. These critical and insurgent discourses can emerge from what are very familiar ethnographic concerns—the economic, political, and/or environmental plights of subaltern subjects or indigenous peoples—but they gain articulation in courts and through legal proceedings, in government bureaus and scientific agencies, within universities and museums, in nongovernmental organizations and a diverse range of international forums as well as through our own anthropological practices of representation and advocacy. The interchange between and among various established and alternative domains of expertise can create decisive axes of analysis that can orient a multi-sited staging of fieldwork. Thus, these bridging discourses can link the ethnography of experts to the lives and struggles of ordinary people. In this way, inquiry into cultures of expertise may well become an aspect of virtually all major projects pursued by anthropologically informed ethnography, even those projects that start from highly localized sets of interests and concerns.⁴

Our delineation of para-ethnography developed out of analysis of the unusual expertise of an infamous political actor, the French nationalist Jean-Marie Le Pen. Observations of Le Pen and

his colleagues revealed an eerie convergence between their insurgent forms of political experimentation and those practices that encompass the professional *métier* of the ethnographer. Insurgent political narratives are, for the most part, designed not merely to circulate among experts but also to shape social thought and action across countless sites and among diverse publics. Le Pen's para-ethnography demonstrates the potential of this kind of narrative to establish a multi-sited scene providing the intellectual substance and the conceptual links between and among sites. By aligning the work of the anthropologist with that of highly problematic political figures such as Le Pen, we establish the problem of "complicity" as pivotal in defining the ethics and politics of fieldwork—in ways that were disguised in the Malinowskian scene in the off-stage presence of the colonial official.

■ SCHEMATIC EXCHANGE

We turn to a particular case of political expertise that illustrates the shift in the staging of the ethnographic encounter we have been discussing. We draw on an interview that was part of a multi-sited ethnographic project that moved from the rural districts of northeast Italy, to the political and bureaucratic precincts of the European Parliament in Strasbourg and Brussels, and finally to the impoverished districts of the East End of London. The subject of the exchange on which we focus here is Le Pen. Holmes conducted the interview at the headquarters of the European Parliament in Strasbourg during the early 1990s. The voice—the "I"—here is superficially that of Douglas Holmes, but it actually represents our combined responses to this unusual conversation.

What made it pivotal for our thinking is that the exchange began with rather conventional premises whereby the subject, Le Pen, served as an informant, as an interlocutor who could provide an "insider account" or the "native point of view," as it were, on a distinctive form of extreme right-wing French nationalism, but in the course of the exchange a series of disruptions introduced

by Le Pen (and tacitly accepted by Holmes) revealed the operation of what we are terming the para-ethnographic. In what follows, we show that what initially appeared to be a subtle shift in the staging of the encounter, in which Le Pen's role was recast from "key informant" to "para-ethnographer," can incite a wide-ranging reassessment of anthropological ethnography. We present the case as a scenario—as a thought experiment—that focuses on the nature of the encounter and how it operated in the service of anthropological knowledge. The scenario also encompasses the technical language and terminology that we have developed to rebuild and refunction ethnography.

Fieldwork at the European Parliament, the consultative body of the European Union (EU), was as part of a study of European integration that spanned the decade from late 1980s to the late 1990s, focusing on interviews with a very broad range of political figures. The meeting with Le Pen, leader of the National Front, was unplanned and came after discussions with other leaders of the party.⁵

The conversation with Le Pen defied my expectations and understanding of how the ethnographic relationship is staged and how ideas are shaped and exchanged through this kind of relationship. This sense that something about the ethnographic relation was shifting as I was participating in it had been building over the course of my work at the parliament. But only when I encountered Le Pen, with his lurid charms, his extravagance, and his audacity in openly challenging the tenets of the interview process, did I fully grasp the extent to which the ethnographic relationship was being recast. In one important way, this was not a surprise; Le Pen's theatricality is renowned, and his performances are widely acknowledged to be masterful and compelling despite (or because of) their extremist character. He prides himself on the texture, the subtlety, and the range of his emotional message. What others consider to be distasteful about his performance, Le Pen claims as the distinctive means by which he engages the intimate struggles that circumscribe the lives of his public. Linking the theatrical and emotional dimensions of his political

practice is a formidable intellectual tradition that intersects with the foundational concepts of humanistic anthropology—the traditions and lineages of what Isaiah Berlin terms the "Counter-Enlightenment." From this intellectual tradition, Le Pen distills what he believes to be the essence of human nature and the character of cultural affinity and difference, ideas that imbue fervent political yearning and foreshadow an exclusionary political economy.

The manner in which Le Pen insinuated this vision into our meeting was decisive in both defining the key *theoretical* issue of Holmes's project—the supranational character of advanced European integration—and fully revealing the possibilities of what we refer to here as the para-ethnographic. Acknowledging the operation of the para-ethnographic also exposed the interleaved affinities—or what we term "complicities"—linking the knowledge work of figures such as Le Pen and our own knowledge work.

My first impression during the meeting was that Le Pen was parodying and baiting me. In retrospect, I think that there is no doubt that was exactly what he was doing. It was, however, by no means merely a rhetorical maneuver on his part; rather, it was a deep substantive challenge. He was asserting that the distinctive domain of his political expertise was "culture." He was claiming a mastery over cultural ideas, cultural practices, and cultural meanings that far exceeded anything I, or any other mere academic, was capable of exercising.

To demonstrate his prowess, he laid out a remarkable vision of Europe, a vision predicated on solving the central conundrum—the core riddle of advanced European integration. He asserted that European integration that presents itself, at least at the time of the interview, as a wide-ranging economic undertaking was in fact a radical social and cultural project aimed at creating a *supranational* multiracial and multicultural Europe. Moreover, the project, as he understood it, was unfolding unmarked, unrecognized, and unnarrated. He had assumed for himself the task of giving voice to this process, giving the project of European integration a language and thereby a new political reality.

He recognized that at the heart of the project is a deep antagonism toward the political economy of the European nation-state, its regulatory regimes, and its cognitive purview. He saw integration as a wide-ranging scheme to usurp the powers of the nation-state, a scheme that ironically was engineered through the nation-state itself. The state, in this view, is by no means irrelevant, particularly as it has come to operate intergovernmentally within the EU; rather, it no longer constitutes the pre-eminent instrument defining *society* in Europe (Connolly, 1995; Milward, 1999; Moravcsik, 1998).

Framing Le Pen's insights are a number of fundamental analytical challenges. As the dominant position of the European nation-state is usurped through the process of integration, so too are many of the phenomenological, epistemological, and methodological assumptions that underpin the social sciences. Inquiry into the supranational operation of the EU reveals how deeply our extant repertoire of analytical concepts, our historical perspectives, and even our ethical and moral assumptions are predicated on the nation-state as a social fact. Thus, when we seek to examine European integration, we must confront phenomena that aggressively challenge all of our means and methods by which we produce knowledge. But of course, this is precisely what makes the EU—as it continually reinvents itself—such a profoundly important object of study (Holmes, 2003).

Le Pen's ambition during the early 1990s was to define the discourse on the emergence of a multiracial and multicultural society by eviscerating its moral and intellectual foundations. He thereby escaped the tightly sequestered world of right-wing French nationalism and established the premises of a supranational politics of Europe, a politics emphatically opposed to integration. Indeed, during the early 1990s, Le Pen was the first to elaborate what could be construed as a new political articulation of what is at stake in advanced European integration.

Le Pen's political innovations are compelling intellectually and have had a powerful appeal for new *European* constituencies—despite their overt fascist resonance. What Le Pen delineated exceeds what is conventionally understood as

"politics"; rather, he conjured a complex sociology and metaphysics that tethers the new political economy of the EU to emerging existential struggles taking shape in the lives of virtually all Europeans. He recognized that integration was paradoxically creating new domains of alienation and estrangement in which radical formation of meaning are being contested (Bauman, 1997; 2001; Holmes, 2000, pp. 59–74).

Le Pen was hardly inclined to submit to the role of mere informant for someone else's project; on the contrary, he sought to both control and disrupt our interchange at every turn. As I became essentially the audience for his performance, I detected something oddly familiar about Le Pen's discourse, particularly the way in which he conceptualized overarching social and cultural struggles that could be read in the sacred and profane experience of situated subjects. The way in which he drew on anecdotal accounts to create intricately woven narratives about contemporary Europe sounded ethnographic to me; indeed, our exchange in some ways sounded like the musings of social anthropologists. His narratives were, of course, hardly disinterested, yet they seemed at least superficially to be ethnographic. In other words, what struck me was that Le Pen needed something akin to an ethnographic purview to pursue his political insurgency. This insight provoked a series of questions with which we continue to grapple. What is the nature of this kind of "ethnographic" purview? How does it operate? How do we draw these knowledge practices of our subjects into a broader anthropological project? How does this kind of collaborative knowledge practice recast our relationship to our subjects? And what are the ethical implications of this kind of collaboration? More broadly, we recognized even with this initial rendering of the para-ethnographic that new strategies and designs for problematizing research had become possible (Rabinow, 2003).

■ COMPLICITIES

As we examined carefully the intersection between ethnography and para-ethnography, we

developed the notion of the "illicit discourse" to mark out domains of complicity. Le Pen's discourse was overtly "illicit" insofar as it was predicated on malevolent cultural distinctions, but it was also "illicit" insofar as it challenges our claim as anthropologists to have a unique authority over this form of knowledge practice. More broadly, we have used the concept of illicit discourse to mark a conceptual space for working out the formidable moral and ethical challenges posed by the collaborative imperatives of para-ethnography. The para-ethnographer in this case is not merely involved in a complex "sensemaking" but rather is involved in an aggressive knowledge practice in the service of wide-ranging theoretical and ideological agendas. Le Pen's para-ethnography draws on "theory" and "ideology" that seek to explain cultural and racial affinity and difference in ways that challenge the culture concept as it has come to underwrite humanistic anthropology. On this kind of complex collaborative terrain, our ethical and moral conceits are open to direct challenge from the theoretically and ideologically informed positions of our subjects (Holmes, 2000).

The most powerful illicit discourse that we discerned from the engagement with Le Pen focused on the problem of "society" as key to our reciprocal practices of "ethnography." Le Pen and we sought constructions of European society as a moral framework, an analytical construct, and an empirical fact; we needed to conjure new representations of society to do our respective work. This was the foundation of a deep convergence of our ethnography and Le Pen's para-ethnography. Le Pen used his representation of society to configure deeply rancorous political meaning. We created a representation of society to configure a critical analysis of European politics, most notably of politics like those framed by Le Pen (Holmes, 1993).

Le Pen understands viscerally that as society framed by the bourgeois nation-state is eclipsed, a space is created for a radical politics that draws on latent cultural idioms to align a new conceptualization of collectivity. This view of society espoused by Le Pen could be used, as Holmes demonstrated, to frame an analytic of European

integration. But Le Pen's disturbing "theoretical" innovation also depends on a "method"—a para-ethnography—that allowed him to narrate the usurpation of the nation-state and its significance not just for those traditional political constituencies displaced and estranged by this process but also for all Europeans. Inlaid in his narrative was a complex structure of feeling that configured a new emotional landscape for a supranational Europe on which sublime yearnings are crosscut by acute fears and anxieties. Again, he recognized that integration was paradoxically creating new domains of alienation and estrangement in which radical formation of meaning were establishing the terms of struggle over multiracial and multicultural society. Le Pen had, in this way, defined a distinctive tableau not only for his political insurgency but also for our ethnographic experimentation. In other words, European integration became a domain that we could enter analytically via the ecology of discourses that Le Pen had articulated (Marcus, 1999a, 1999b).

■ CONNECTIVE TISSUE

Political narratives defining European pluralism are obviously designed not merely to circulate within the political precincts of the EU but also to shape social thought and action within countless sites across this burgeoning polity. Thus, Le Pen's para-ethnography is decisive in another crucial way in that he demonstrates the potential of what we term the "internarrative" in the construction of a multisited scene. Internarratives serve as the connective tissue and the intellectual substance, as it were, of multisited ethnography; they provide the conceptual bridges between and among sites.

Insurgent politicians seek to create narratives that can enter the lifeworlds of a newly constituted public. The initial trajectory of this kind of communicative action is, in the case of Le Pen, from his headquarters in Paris to the homes, bars, workplaces, sports clubs, and so on of French and European citizens, where his narratives circulate in informal conversations, in press accounts, and in the shop talk of local politicians. These political

narratives are interpreted and endowed with distinctive configurations of meaning in these diverse local contexts. They are also refracted back to Paris, to Le Pen's headquarters, and to the political offices of all those who seek to oppose him, where they can be recalibrated and recommunicated to align a complex discursive field.

By taking a marginal nationalist discourse and recrafting it as a supranational European discourse, Le Pen set the terms of debate on a multiracial and multicultural Europe and, for our purposes, established an analytical tableau that extends across innumerable sites. Thus, the discourse on pluralism that he crafted can take profoundly different forms depending, for example, on whether it is configured across the borderlands of Ireland or Poland within working-class neighborhoods of Marseille or Vilnius. In these diverse sites, this narrative enlivens distinctive human predicaments, conferring on them a fraught conceptual and emotional substance that can be explored ethnographically. Thus, a multisited ethnography was constructed across this tableau inspired by Le Pen, revealing how contemporary formulations of European pluralism gain expression as intimate cultural practices in rural districts of northeast Italy, as a racialized political economy within the institutions of the EU, and as a violent idiom of alienation and estrangement in the East End of London (Holmes, 2000). In this staging, multiple points of entry, through which one can discover countless interlocutors who endow European integration with diverse human voices, were established.

■ CREATIVE POSSIBILITIES

In our effort to reconcile the troubling affinities between the knowledge work of figures like Le Pen and our own knowledge work, we recognized a unusual creative process—an “intimate artifice”—whereby the ethnographer and paraethnographer create either a shared framework of analysis or frameworks that operate in some kind of reciprocal relationship through which interleaved formations of knowledge are generated

and exchanged dialectically. These collaborative exchanges operate at each stage of the ethnographic project.

The creative challenge posed by the type of fieldwork on which we focus here involves delineating the phenomenon to be studied, establishing an analytic tableau populated with human subjects who define it, endowing it with social form and cultural content. For us, this is a complex collaborative process whereby a discursive space on which a multisited ethnography can be staged is created, a discursive space where the actions of our subjects and our own analytical practices can be observed and where they and we shape a social reality.

In the case that we have discussed, a discursive space was circumscribed—Holmes terms it “integralism”—allowing us to view European integration simultaneously from the standpoints of its diverse theoretical underpinnings, its intellectual lineages, and its technocratic practices as well as allowing us to engage ethnographically the ways in which integrations inspire political insurgencies radically opposed to its abiding ideals. Moreover, the collaborative space encompassed by integralism created a dynamic purview from which we can view integration in terms of its manifold contradictions, revealing not merely its institutional manifestations but also its profoundly human character—the ways in which it has come to align consciousness and mediate intimacy. For us, this is the essence of a multisited *mise-en-scène*, a staging that can reveal the interplay between metatheoretical issues and the intricacies of human experience.

Inevitably, as we explore the dilemmas of expertise in other domains, we reciprocally expose our own professional limitations and liabilities. Not the least of these is the curious effect of observing how what we claim to be our distinctive practices as ethnographers can be deployed in creative ways by our subjects, conferring on their knowledge work a status that equals, if not exceeds, our own. To do an engaged and critical ethnography of expertise, we not only must build into our projects, as a methodological first principle, an acknowledgment of the uncertain nature of our own intellectual practices as

ethnographers but also must actively exploit this unsettling condition as a driving force of our inquiry. By drawing complicity to the heart of our methods and ethics, a circumstantial *activism* becomes plausible (Marcus, 1999b).

We view this kind of collaboration as not merely an elicitation of preexisting social and cultural elements but also the systematic crafting of discursive spaces that capture newly constituted social and cultural phenomena as they take form within a continuously unfolding contemporary. We believe that this kind of activism rekindles the most radical aspirations of the anthropological project. In this collaborative framing—this intimate artifice—an activism that is theoretical, empirical, ethical, political, and existential in its scope and purview can be built into the constitution of the ethnographic relationship (Fortun, 2001).

Thus, para-ethnography is not merely a matter of identifying a new ethnographic subject—an accomplished autodidact; rather, it opens far deeper questions of how culture operates within a continuously unfolding contemporary. What is at stake in our conceptualization of the para-ethnographic are formations of culture that are *not* fully contingent on convention, tradition, and “the past” but rather constitute future-oriented cognitive practices that can generate novel configurations of meaning and action. Indeed, this gives rise to our most radical assertion—that spontaneously generated para-ethnographies are built into the structure of the contemporary and give form and content to a continuously unfolding skein of experience.

■ NOTES

1. Most of the graduate projects that we supervise begin or end with such encounters, even though they may operate for considerable periods of time in the traditional *mise-en-scène* of anthropological fieldwork of sustained residence among ordinary (accessible?) people—in villages, on shop floors, in neighborhoods, on hospital wards, in classrooms. But these encounters are now given ethnographic import and treatment, and the main puzzle of fieldwork becomes their multileveled relation to these other more conventional and manageable sites of fieldwork. For example, we currently have

a student who is researching the implementation of “freedom of information act” laws in Poland as an index of “democratization” there, the initial challenge of which has been to understand, by self-conscious fieldwork strategy, the “local” intellectual and official culture by which these laws have been conceived and formulated. Another student who has worked on concepts of risk among financiers in Korea moved back and forth between and among firms and particular neighborhoods in Seoul, sites that offered her variably “thick” and “thin” ethnography but created the context of relationship in which she found her focused object of study—not what went on in either set of sites but rather the nature of the real and imaginary relationships between and among them. A third student has spent long periods among contemporary Mayan villagers who live on or near ancient ruins, but the project has achieved its cogency only by extending fieldwork into the daily operations of the formidable regional and national bureaucracies of cultural heritage in Mexico. Of work that has been published by former students, that of Bargach (2002), Fortun (2001), and Hernandez (2002) exemplifies this emergence of multilisted fieldwork in very different styles, but each study requires the sort of refashioning of traditional notions of fieldwork that we have described.

2. The ethnographic studies of contemporary politics, of science and technology, of corporate business and markets, and of art worlds are the primary arenas of contemporary life where the refashioning of ethnography that we describe has been emerging. The primary example that we work through in this essay comes from European politics. The recent study of Australian aboriginal painting by Myers (2002) is probably the most important example of such ethnography on art worlds. The *Late Editions* volume edited by Marcus (1998) provides sources on the ethnographic study of corporations. See also the work of Maurer (1995, 1999, 2002a, 2002b). However, it is in the burgeoning field of science and technology studies that the most impressive shift in the practice of ethnography can be observed. See Downey and Dumit (1997), Latour and Woolgar (1988), Marcus (1995), Pickering (1995), Rabinow (1999), Reid and Traweek (2000), Strathern (1992), and Traweek (1988).

3. Although we try to give our own specific conception to para-ethnography as an object of fieldwork investigation, it is certainly deeply connected to the long-standing interest in American cultural anthropology of probing “native points of view” through ethnographic investigation. Put simply, anthropology works through the understandings of others and the claim to be able to

achieve knowledge of these understandings through fieldwork investigation. The influential discussions in social theory (Beck, Giddens, & Lash, 1994) of the importance of reflexivity itself as a major structural dimension of contemporary life have only enhanced this traditionally rooted interest in the para-ethnographic as an object of ethnography. For an elaborated discussion of this connection between the native point of view and para-ethnography, see Holmes and Marcus (2004).

4. A superb case in point is the recent work by Petryna (2002) on Chernobyl nuclear accident survivors that was named winner of the best first book published by an anthropologist, awarded in 2003 by the American Ethnological Society. Petryna worked closely with a group of survivors, participating in their everyday lives, characteristic of the vantage point of traditional ethnography. But she quickly found that to do justice to her topic, and to her subjects, she had to conduct multiple parallel ethnography: "My decision to abstain from judgment is also supported on empirical grounds. . . . Worlds of science, statistics, bureaucracy, suffering, power, and biological processes coevolve here in particular and unstable ways. How to discern their patterns as locally observable realities that affect people's daily lives and sense of moral and bodily integrity—or put another way, how to do an ethnography of the relationships among biological, political, and social processes as those relationships evolve—is a major creative challenge of this work" (p. 120).

5. The anthropology of contemporary Europe is a particularly cogent setting for the refunctioning of ethnography based in multisited strategies of fieldwork. The emergence of the EU and its institutions has made every locally focused study in Europe—no matter the specific venue or topic—at the same time a study of the overarching EU frame. With everything parallel processed, so to speak, there is no likely topic on contemporary Europe that is not at least multisited in its social space. Thus, this area of anthropology has been especially prescient in the refunctioning of ethnography as we discuss it. To understand the new anthropology of Europe that has emerged around the problematic of advanced European integration, see Abélès (1992, 1995, 1996, 2000), Bellier (1994, 1997), and Shore (2000).

EPILOGUE

The Eighth and Ninth Moments—Qualitative Research in/and the Fractured Future

Yvonna S. Lincoln and Norman K. Denzin

The end of a work such as this should signal neither a conclusion nor a final word, but rather a punctuation in time that marks a stop merely to take a breath, and, indeed, that is what we intend in this epilogue. The breadth that the contributors to this volume have tried to span marks a multidimensional map of territory traversed, including multiple moments, multiple histories, multiple influences, and multiple paradigms, perspectives, and methods, as well as increasing sensitivity to and awareness of new issues and problems. The contributors have also marked out this territory as terra incognita to be explored. Many have been as provocative as they have been historical, and that is as it should be, for we merely pause now on the border of a new vision for the social sciences. We would characterize this new vision as the realization of the seventh moment (although not its fulfillment) and a course charted toward the eighth and ninth moments in qualitative research.

The realization of the seventh moment lies in two signal achievements. First, we see, with this *Handbook* and the growing body of literature on

specific methods, theoretical lenses, and paradigms, that a mature sophistication now characterizes the choices that qualitative researchers, practitioners, and theoreticians deploy in inquiring into social issues. No longer is it possible to categorize practitioners of various perspectives, interpretive practices, or paradigms in a singular or simplistic way. The old categories have fallen away with the rise of conjugated and complex new perspectives. Poststructuralist feminist qualitative researchers are joined by critical indigenous qualitative researchers. Critical poststructural feminist reconstructionists work in tandem with postmodern performance ethnographers. Labels perform double duty, or they are not applied at all. The important thing to note about many practicing interpretivists today is that they have been shaped by and influenced toward postmodern perspectives, the critical turn (as powerful an influence as the interpretive turn and the postmodern turn were in their own times), the narrative or rhetorical turn, and the turn toward a rising tide of voices. These are the voices of the formerly disenfranchised, the voices of subalterns everywhere,

the voices of indigenous and postcolonial peoples, who are profoundly politically committed to determining their own destiny. We are at the "end of history" (Fukuyama, 1989, 1992), or at least at the end of history as we have known it. We are all "after the fact" (Geertz, 1995).

Although Hammersley (1999) objects to our historicizing, or punctuating, moments in the awakening or creation of qualitative research, we believe that there are genuine ruptures in the fabric of our own histories, precise or fuzzy points at which we are irrevocably changed. A sentence, a luminous argument, a compelling paper, a personal incident—any of these can create a breach between what we practiced previously and what we can no longer practice, what we believed about the world and what we can no longer hold onto, who we will be as field-workers as distinct from who we have been in earlier research. Indeed, we would argue that what we call moments are themselves the appearances of new sensibilities, times when qualitative researchers become aware of issues they had not imagined before. They are the "ah-ha" moments, the epiphanies, much like the "click" moments so deliciously recounted 30 years ago in the pages of *Ms.* magazine by women coming to consciousness. So, believing in our project as one of description and interpretation—the ethnographer's job—we continue to think of even the most contemporary history as a history emphasized and underscored by revelatory moments that shudder through the interpretive communities we inhabit. Those are the moments we try to describe, with the full understanding that, in the poststructural moment, our textual descriptions fall far short of what the lived experiences of individual researchers and inquiry and disciplinary communities look and feel like.

We have called the current moment the *methodologically contested present*, and we have described it as a time of great tension, substantial conflict, methodological retrenchment in some quarters (see Denzin & Lincoln, Chapter 1, this volume), and the disciplining and regulation of inquiry practices to conform with conservative, neoliberal programs and regimes that make claims regarding Truth (Cannella & Lincoln,

2004a, 2004b; Lincoln & Cannella, 2004a, 2004b). It is also a time of great tension *within* the qualitative research community, simply because the methodological, paradigmatic, perspectival, and inquiry contexts are so open and varied that it is easy to believe that researchers are everywhere. What appears to be chaos to outsiders, however, is nothing less than the intense desire of a growing number of people to explore the multiple unexplored places of a global society in transition. But where these people study, what they study, with whom they study, how they study the phenomena of interest with a communitarian sensibility, what they write about what they have studied, who writes about what they have studied—all these are subject to debate and struggle.

Out of this debate, struggle, and contestation will come the next moment. In some ways, it will share characteristics with the present moment; for example, it seems clear that the next moment will also be methodologically contested. The National Research Council's *Scientific Research in Education* (2002) will now stand next to the National Science Foundation's *Workshop on Scientific Foundations of Qualitative Research* (Ragin, Nagel, & White, 2004) as a boundary of the contested ground. It may well be the case that, as Alasuutari (2004) contends, we are undergoing a stunning compression of time, of moments, at this period in our history. Certainly, from our perspective as the editors of this volume, we see that advances in qualitative methods and models of inquiry appear to be developing somewhat more swiftly than in the past, with inventions, improvisations, and other forms of bricolage becoming both more sophisticated and more highly adaptable and adapted. It is also clear that many "moments"—in the form of real practitioners facing real problems in real fields and bringing with them real and material practices—will continue to circulate at the same time. Thus practitioners, scholars, and researchers are spread out, to varying degrees, over nine moments, often moving between moments as they seek—or are found by—new sites for inquiry. We are not discomfited by this; on the contrary, we believe it adds to the strength of qualitative research as a

field and discipline, for it signifies that practitioners are willing to live with many forms of practice, many paradigms, without demanding conformity or orthodoxy.

There will also be some differences in the next moment. In the pages that follow, we try to portray some of the shifts, repositionings, and metamorphoses that we see coming and that we have asked this volume's contributors to address.

■ THE EIGHTH AND NINTH MOMENTS

Although methodological contestation will continue within and among the many disciplinary communities of qualitative research—business, marketing, nursing, psychology, communications studies, cultural studies, education, sociology, anthropology, medical clinical practice and epidemiology, and others—methodological sophistication will grow. The days when the teachers of qualitative research courses needed to search hard for good methodology texts are over; multiple enriched, cosmopolitan, transnational, and practice-seasoned literatures—and internal critiques of these same literatures—have been created, resulting in a veritable feast of paradigmatic arguments, interpretive practices, analytic and data management choices, and application issues. The problem for these scholars today is not in finding sound materials, but rather in choosing among and between them so as not to appear extravagant in assigning readings for classes.¹

The next generation of qualitative researchers will face the same areas of contestation as did their earlier counterparts, but they will also face several new improvisations on old issues. It seems to us that arguments around four major issues will characterize the forthcoming generations, or moments, of the history of qualitative research. These issues are the reconnection of social science to social purpose, the rise of indigenous social science(s) crafted for the local needs of indigenous peoples, the decolonization of the academy, and the return "home" of Western social scientists as they work in their own settings using approaches that are vastly different from those employed by their predecessors.

We provide some explanation of each of these major issues in the pages that follow. We then complete our forecast by discussing other issues that we believe will mark the next moment.

The Reconnection of Social Science to Social Purpose

Ruth Bleier (1984, 1986) has argued that the resources available to social science are too short, too scarce, to be used simply to satisfy scientific curiosity. Rather, she proposes, social science research should be driven by an ameliorative purpose; it should seek to solve some problem, to allay some maldistribution of resources, to meet a genuine need. Too often, however, guided by the modernist presupposition of objectivity in science, social scientists have lost sight of the purposive, intentional meanings of their work, circled back to their disciplinary roots, and left to chance and heaven the wending of findings into the policy arena. In contrast, seeking an engaged social science leads to what Conklin (2003) and Wildavsky (1975) have called "speaking truth to power." Addressing the issue of indigenous advocacy, Conklin (2003) suggests that "we can start to sort out these sticky issues," particularly the places where "the priorities of academic and activists diverge," by "locating points where professional ethics and political effectiveness converge" (p. 5). Roth (1990) suggests much the same thing when he observes that "anthropological knowledge [indeed, any putative knowledge] is also to be judged in regard to how it integrates with what else passes as knowledge" (p. 276).

The professional ethics issue that has begun to engage social scientists, particularly interpretivist qualitative researchers, most forcefully is the issue of social justice. The coupling of historically reified structures of oppression—whether educational, medical, ecological, nutritional, economic, social, or cultural—with unjust distribution of social goods and services creates a flood tide of injustice that threatens to engulf developed and developing nations and indigenous peoples alike.

The rise of a new ethic—communitarian, egalitarian, democratic, critical, caring, engaged,

performative, social justice oriented—and a new emphasis on ethics that includes the reformulation of ethical issues in response to the new felt ethic signals a new interpretive community (Christians & Traber, 1997; de Laine, 2000; Zeni, 2001; see also Christians, Chapter 6, this volume). This new community is characterized by a sense of “interpersonal responsibility” (Mieth, 1997, p. 93) and moral obligation on the part of qualitative researchers, responsibility and obligation to participants, to respondents, to consumers of research, and to themselves as qualitative fieldworkers. This includes the quality of “*being with* and *for* the other, not *looking at*” the other (de Laine, 2000, p. 16). The new participatory, feminist, and democratic values of interpretive qualitative research mandate a stance that is democratic, reciprocal, and reciprocating rather than objective and objectifying.

The methods and methodologies game is not for members of the Western or European interpretive community only, however. The rise of multiple voices, some of them previously all but ignored by Eurocentric researchers, heralds a new era in qualitative inquiry. The firmness with which African American, Asian American, Native American, Latina/o, and border voices have begun to assert themselves lends a frisson of excitement, uncertainty, anticipation, and unpredictability to the field. These developments are yet another characteristic of the next wave, the eighth and ninth moments.

The Rise of Indigenous Social Science(s)

The rise of a social science that is indigenously designed and indigenously executed, more or less independent of Western or colonial and postcolonial influences, except where invited, is already a reality (De Soto & Dudwick, 2000; Fahim, 1982; Gagelberger, 1996; Gupta & Ferguson, 1997, 1999; Harrison, 2001; Smith, 1999; see also in this volume Smith, Chapter 4; Bishop, Chapter 5). Indigenism, a label once paradoxically manipulated to distinguish between the so-called civilized and the uncivilized (Ramos, 1998), now provides a framework for both critique of Western

deployment of social science methods among native peoples and the creative genesis of new forms of systematic inquiry into community conditions, problems, and concerns devised by members of indigenous communities themselves. As we point out in Chapter 1 of this volume, Linda Tuhiwai Smith (1999) succinctly describes the state of social science research in her own Māori community as well as other indigenous communities: “The term ‘research’ is inextricably linked to European imperialism and colonialism” because “imperialism frames the indigenous experience. It is part of our story, our version of modernity” (pp. 1, 19).

Why should this generative spirit arise in social science at this particular moment in history? A tremendous number of forces have collided in the political economy of nations to create conditions that are favorable for subaltern and indigenous peoples to speak. Most prominent among these forces are the rising numbers of individuals from indigenous communities who have achieved terminal degrees and taken their places on faculties or in other positions where they can make their voices heard; the forces of globalization, which have enabled individuals all around the world to be connected via media in ways unknown a generation ago; a profound resistance to some forms of this same globalization and its Westernized, late-capitalist formations that result in the importation of Western ideas and corporatist values at the expense of local and indigenous languages, cultures, customs, and traditions; and the deep desire for self-determination among indigenous peoples everywhere. Education (and, more generally, literacy), access to means of mass communication (including the Internet), and powerful urges toward voice, liberty, and self-determination have foregrounded the dreams of oppressed peoples all over the globe. Indigenous voices are not all heard in the same ways, however; rather, the geography of place (Bhabha, 1990; Gupta & Ferguson, 1999) lends a distinctive tang to the expression of indigenous desire, as do indigenous peoples’ particular experiences of colonialism and postcolonialism.

Indigenous voices in Latin America. Yúdice (1996) has a slightly different take on the emergence of indigenous assertions to the right to speak:

More than any other form of writing in Latin America, the *testimonio* has contributed to the demise of the traditional role of the intellectual/artist as spokesperson for the "voiceless." As some major writers . . . increasingly take neoconservative positions and as the subordinated and oppressed feel more enabled to opt to speak for themselves in the wake of the new social movements, Liberation Theology, and other consciousness-raising grassroots movements, there is less of a social and cultural imperative for concerned writers to heroically assume the grievances and demands of the oppressed. . . .

In contrast, the *testimonialista* gives his or her personal testimony "directly," addressing a specific interlocutor. . . . The speaker does not speak for or represent a community but rather performs an act of identity-formation that is simultaneously personal and collective. (p. 42)

Yúdice's implication is that when the intellectual/artist retreated into neoconservative (or neoliberal) political stances, the subordinated found a need to speak for themselves. And they did so, although not through any genre or rhetorical form known in the conventions of Western writing, or from any political stance previously recognized in Western literary traditions. *Testimonio*, a particularly Latin American form, serves the critical historical function of witnessing (see in this volume Beverley, Chapter 22; Hartnett & Engels, Chapter 41), often in the form of testifying to events unknown or unwitnessed by Western and colonial/postcolonial observers. *Testimonio* serves the political function of supporting solidarity while also serving the psychological purpose of establishing a separate and clear cultural identity for the group whose identity is being witnessed. In some ways, *testimonio* is unique among indigenous writings in that both its form and its political capacity are quite unknown in the Eurocentric and colonial rhetorical panoply.

Native voices in India and the Middle East. The experience of postcolonialism and an oppositional

ethnographic method are worked out very differently in India and the Middle East (Mohanty, 1988; O'Hanlon, 1988). Whereas Latin American forms, particularly *testimonio* (but also other forms of writing around the oppressed), appear to focus little, if at all, on the relationship between the colonized and the colonizer, Indian, Middle and Near Eastern, and south Asian indigenous writings are frequently indexed to a sharp awareness of the presence of the colonizer and postcolonizer. The works of Ashis Nandy, Edward Said, Chandra Mohanty, Gayatri Spivak, and Homi Bhabha explore this colonial presence in several ways: by deconstructing how this presence has been responsible for suppressing or destroying portions of national or regional identities and languages, by capturing a mourning for what has been lost, by exploring indigenous means for recovering the lost "self" of national identity, and by providing critiques of the ways in which representations created—indeed, invented—by the West have shaped ongoing relations between the East and West (Said, 1979) in arenas as wide ranging as tourism and foreign policy. Indeed, as all of these authors have argued (albeit in different ways), social scientists' failure to grasp the cultural grounds and boundaries of the colonized has led to recurring missteps, gaffes, and social and political displacements. Much of the indigenous critique that proceeds from the Orient, consequently, revolves around the deconstruction of the culture-erasing effects of colonialism and postcolonialism; it does not seek a specific genre of ancient knowledge in which to ground new forms of social inquiry or autocritique (Conklin, 2003).

Indigenous inquiry at the antipodes and the United States. Harrison (2001) notes that the voices of the indigenous peoples of Australia, New Zealand, the United States, and Canada are often juxtaposed for the simple reason that

the First Nations peoples of Canada, Native Americans and Alaska Natives in the United States, Aborigines in Australia, and Māori in New Zealand have established regular means of communicating about the things that they now have in common. . . . Political movements aimed at achieving recognition

of sovereignty of indigenous groups have developed among the indigenous peoples in all four countries. (p. 23)

In these four countries, indigenous peoples have established a particular form of relationship with the federal governments that now shapes a distinctive collective dialogue around political movement toward self-determination for indigenous peoples as well as issues of education, health care, and social welfare, broadly conceived. It is from the indigenous peoples in these countries that we have both the clearest critique of modernist social science and the richest proposal for an indigenous knowledge-based education (Ah Nee-Benham & Cooper, 2000) and inquiry model (Smith, 1999).

A variety of indigenous groups have proposed guidelines for social science that take account of signal characteristics deeply embedded in non-Western cosmologies and epistemologies. Three elements of such guidelines are especially sensitive and telling. First, in manifestos and agreements indigenous peoples from these four countries and others have asserted their right to have "all investigations in our territories . . . carried out with our consent and under joint control and guidance" (Charter of the Indigenous Tribal Peoples of the Tropical Forests, as quoted in Smith, 1999, p. 119). This is a clear indication that although social scientists may find that collaboration is possible, or even useful, they can no longer carry on with their usual practice of simply inserting themselves into the context to study what and when they will.

Second, indigenous peoples in many parts of the world, but especially the four nations that frame this discussion, are troubling the entire process of researchers' seeking informed consent and institutional review board approval. One of us (Yvonna) first became aware of this at a conference in Australia when an audience member respectfully informed her that Aboriginal tribal elders consider the use of informed consent forms insulting, and so researchers working with this population in Australia simply do not use such forms. Given that Australian federal law requires a process similar to that required in the United

States, in that researchers must secure the informed consent of all human participants in a research project, Yvonna asked the audience member what researchers in Australia do about this requirement; he simply replied, shrugging his shoulders, "We ignore it." We have no idea how a local institutional review board may feel about this course of action, but it is quite clear that Australian Aborigines have made their own decisions regarding the utility of the informed consent process, and, as far as they are concerned, the federal government has no say in the matter. Indeed, Linda Smith (1999) outlines a whole series of objections that indigenous peoples have to this process, including the entirely Western assumption that it is the *individual* who owns knowledge and who can participate or withdraw from a study as she or he pleases. In many indigenous cultures this construction undermines the sense of the collective, the tribal, and the concept of communal and ancestral knowledge. That such knowledge should belong to all the members of a group is not a construct that rests easy in Western epistemologies, based as they are on 18th- and 19th-century philosophical formulations of the autonomous individual (Gergen, 1991).

Third, many indigenous peoples have now established their rights to exclusive ownership of their cultural and intellectual properties, including the right to "protect and control dissemination of that knowledge [about themselves]"; further, they have established that the "first beneficiaries of indigenous knowledge must be direct indigenous descendants of that knowledge" (Smith, 1999, pp. 118–119). Where tribal, cultural, or indigenous treaties, compacts, agreements, and other formal documents exist to support such rights, it is absolutely clear that Western scholars do not have first claim on the knowledge they may help to generate. Rather, they must negotiate for that knowledge and respect the forms in which the "owners" may wish to have it presented or re-presented. Indigenous peoples pursuing self-determination with ferocity and single-mindedness have successfully challenged Western scholars' propensity to believe that they can own whatever they appropriate.

In much the same way, and with the same effects, Canadian First Nations peoples have secured a status for themselves that includes extensive local control over education, Native language and cultural instruction, and health care and other social services. In some broad ways, Canadian First Nations peoples, the Māori in New Zealand, and Australia's Aborigines have stronger and clearer voices in their self-determination than do Native Americans and Native Hawaiians in the United States or South Pacific peoples (e.g., Tongans). Nevertheless, members of all these groups are able to articulate what respect for indigenous cultural customs and epistemologies might look like, and all have assumed increasing control over the form and shape of research conducted in their midst, with some groups retaining the right to determine the research agenda and the use of methods that display maximum cultural sensitivity. This is not true of indigenous peoples in all parts of the world (Reagan, 2005).

The Decolonization of the Academy

Finkelstein, Seal, and Schuster (1998) catalog the myriad changes currently under way in the American professoriate, none of which is more visible or has greater potential to change the face of academe than the "composition of the new entrants into the faculty" (p. xi). The startling gains of women in the past 15 years, of non-native-born faculty members, of faculty of color (the most impressive gains being made by women faculty of color), and of Asians and Pacific Islanders on faculties point to a dramatic demographic shift between new hires and senior faculty (those nearing retirement). Further, the greatest changes have occurred in public, doctoral-granting institutions, with public comprehensive institutions next and private doctoral-granting institutions third.²

Because the greatest demographic shift is occurring in institutions that grant doctoral and master's degrees, the most profound impact of this massive diversification in the faculty ranks is being felt, at least immediately, in graduate research (Finkelstein et al., 1998). Beyond the

forces impinging on graduate study, this shift is resulting in two additional changes. First, new faculty members are far less wedded to traditional forms of academic reporting than were their predecessors. Particularly in the social sciences, they are more interested in newer theoretical currents that suggest the dividing line between art and science is far more fluid and permeable than the previous academic generation believed it to be. As a consequence, the very shapes and forms of texts—whether books, journal articles, or conference presentations—are likely to be less traditional. Experimental, "messy," layered poetic and performance texts are beginning to appear in journals and on conference podiums. Second, the students of these new faculty tend to be equally comfortable with experimentation, and they are increasingly preparing research papers and dissertations that are, at a minimum, bilingual—writings that address the needs of multiple rather than singular audiences, often across national borders (see, for instance, González y González, 2004). They deploy this kind of strategy deliberately, with a globalized impact in mind. Models of academic research such as Anzaldúa's (1999) bilingual, border-focused work open up possibilities for students, especially as these many-layered and multilingual texts have become textbooks for graduate study. It is no longer unheard of, or even strange, for students to produce doctoral dissertations that include portions that some of the members of their dissertation committees may not be able to translate.

The decolonization of the academy is taking other forms as well. The influx into the American professoriate of vast numbers of individuals who were not born in the United States has brought cultural richness and diversity of experience to academia, but these individuals have also brought with them traditions that are different from those of earlier faculty, including the peculiarly American tradition of shared governance. A consequence of this may be an inadvertent undermining of the extent to which faculty participate in policy making and administrative decision making. In the same vein, just as new European theoretical currents have become deeply embedded in critical

research and curricular concerns, the globalizing influence of international faculty may lead to a more pronounced set of sensibilities regarding the cultural, political, and artistic variety that is possible and desirable as a positive outcome of globalization.

International faculty also bring to U.S. colleges and universities both subtle and pronounced differences in modes of graduate training and graduate mentoring. Institutions of higher education in the United States have grappled for some time with the issue of how to mentor graduate students, including how to socialize them into faculty roles of their own. The perspectives of international faculty members, as well as those of the increasing numbers of faculty of color, bring to the fore new considerations regarding what mentoring might mean and how different forms of mentoring might be effective for diverse students (and for diverse new young faculty members, for that matter; see Stanley & Lincoln, 2005) as well as how the academy's range and repertoire of possible collegial relationships may be expanded through mentoring. Each of these changes opens the academy to decolonization by lessening the hegemony of the Western canon and creating a new consciousness of global citizenry.

Most important, the infusion into U.S. institutions of non-Western, Indigenous, and "colored" epistemologies has created a vital mix of new paradigmatic perspectives, new methods and strategies for research, contested means for establishing validity in texts, new criteria for judging research and scholarship, and competing cosmologies from which knowledge and understanding might grow. The era of a shared and largely modernist model of inquiry has likely passed away. Some scholarship will still be presented and judged from a positivist paradigm, but other scholarship will be traveling the margins and borders, searching for new and innovative forms through which to express non-Western modes of knowing and being in the world.

The Homecoming of Western Social Science

Perhaps the most striking hallmark of the next moment will be the reconsideration of how the

social sciences are practiced in the West as well. The phenomenological, postpositivist, postmodern, emancipatory, qualitative, liberationist sensibility that challenges modernist master narratives holds within it the seeds of a reformulated vision of what the social sciences might accomplish and how ethnographers might reconnoiter what they have already produced for evidence of its contributions to a democratic imaginary on its own soil.

We are now approaching a serious moral confrontation in Western social science. On the one hand, some social scientists (including the two of us and the contributors to this volume) are examining critically the purposes and projects of past and future social science, questioning whether, when, and under what conditions our knowledge has served to enhance democratic ends and extend social justice as well as when and under what conditions it has served to reify historical power and resource distributions. On the other hand, other, equally responsible, inquirers and researchers are seeking to reestablish the supremacy of "one method/one truth," the "gold standard" of research strategies. Political battles that are normally fought in legislative circles, leaving social scientists untouched and unmoved, have shifted directly into the arenas of educational, social, and behavioral sciences. The evolving political struggles between liberal and neoconservative/neoliberal views of the world have become progressively sharper and more distinct in Western life, concomitantly creating more fissures in American life than have existed for a half century. This is reflected in legislation affecting education (e.g., the No Child Left Behind Act of 2001) and in policy documents that represent stances on what research designs are to be considered appropriate and meaningful (e.g., National Research Council, 2002).

This is the first of the serious fractures in the social science community. What had been a sometimes mild-mannered disagreement between research methodologists, leading to a courteous détente between schools of thought (Lincoln, 2004), has become a firefight, with substantial resources, including funding through grants and contracts, and political and policy power hanging

in the balance. This methodologically contested moment will not subside anytime soon.

In the meantime, qualitative research practitioners are engaged in earnest and consequential work of their own. Despite accusations of "advocacy" and of "ideology parading as intellectual inquiry" (Mosteller & Boruch, 2002, p. 2), post-positivist inquirers of all perspectives and paradigms have joined in the collective struggle for a socially responsive, democratic, communitarian, moral, and justice-promoting set of inquiry practices and interpretive processes (for a review of some of this literature, see Scheurich, 2002). The search for "culturally sensitive" research approaches—approaches that are attuned to the specific cultural practices of various groups and that "both recognize ethnicity and position culture as central to the research process" (Tilman, 2002)—is already under way (Anzaldúa, 1987; Bernal, 1998; Bishop, 1998; Collins, 2000; Dillard, 2000; Gutaratnam, 2003; Harrison, 2001; Hurtado, 1996; Parker & Lynn, 2002; Sandoval, 2000; Smith, 1999; Wing, 2000). Many of the issues associated with such approaches are captured with comprehensiveness and nuance in this volume. Qualitative researchers' concerns for social justice, moral purpose, and "liberation methodology" will mark this next moment with passion, urgency, purpose, and verve. When we argued in an earlier edition of this *Handbook* that qualitative research had "come of age," we were mistaken. It had merely reached a zesty and robustly athletic late youth. The genuine coming of age in methodology, we see now, will be the maturing of the field into a new set of practices and purposes—a new praxis that is deeply responsive and accountable to those it serves.

■ THE NEXT MOMENT, THE FRACTURED FUTURE

We predict that in the ninth moment the world of methods will enter what we term a *fractured future*—a future in which, unless an intervention we cannot currently imagine takes place, methodologists will line up on two opposing sides of a

great divide. Randomized field trials, touted as the "gold standard" of scientific educational research, will occupy the time of one group of researchers while the pursuit of a socially and culturally responsive, communitarian, justice-oriented set of studies will consume the meaningful working moments of another. A world in which both sides might be heard, and their results carefully considered as differently produced and differently purposed views on social realities, now seems somewhat far away, mixed-methods advocates notwithstanding.

In a battle where the warriors on the frontlines are fairly evenly matched and not much progress is being made, the skirmishes, conflicts, and engagements are likely to move elsewhere. We predict that the next encounter will be a scrimmage over federal ethics regulations. Extremely useful, but out of date for the purposes of qualitative research and entirely useless for the development of culturally, racially, and ethnically sensitive methods (for a critique of the ways in which federal regulations fail to respond to qualitative research, see Lincoln & Guba, 1989; but see also Lincoln, 2001), the current federal regulations—regarding informed consent, privacy of records, confidentiality, and the role of deception—form one kind of quality floor under research practices. As the American Association of University Professors (2001) has argued well, however, the current regulations and laws are better suited to biomedical research than to social science.

In the absence of a substantive effort to revisit the federal regulations on human subjects protections or any grave reconsideration of the applicability of the regulations either to the social sciences or, more specifically, to qualitative research (writ large, as in the pages of this book), several professional associations have constructed their own statements on professional and field ethics. The American Anthropological Association, the American Sociological Association, the American Historical Association, and the American Educational Research Association have all constructed exemplary statements on professional ethics. The American Anthropological

Association in particular has been extremely attentive to concerns about the rights of indigenous peoples, and the association's newsletter, *Anthropology News*, features a continuing dialogue, pursued for more than a decade, on field ethics, indigenous rights, and other ethical dilemmas of an "engaged anthropology."

We know from the applications of technology we see around us that technology frequently sweeps far ahead of both public policy and civic engagement in debates around public policy. The technologies associated with genetic engineering and cloning are good examples. Currently, scientists' ability to clone living organisms is much further advanced than any rational civic debate about whether and under what circumstances cloning should be allowed. We have no idea what Americans' "moral boiling point" is with respect to cloning. In precisely the same way, "McDonaldizing," "corporatizing," and globalizing efforts around the world have ensnared social scientists who wish to understand the effects of late capitalism's expansion and penetration around the globe. Technologies and technoinimaginaries of communication, travel, and cyberspace have far outpaced deliberate and considered debate about what is moral, useful, and culturally respectful. The ethics, aesthetics, and teleologies necessary for a globalized world have not yet come into being, although they are being born in this volume and elsewhere. Social scientists, men and women of conscience, are devising their own standards in collaboration with indigenous peoples, people of color, and marginalized groups everywhere, but it would be heartening to see the U.S. federal government take some additional leadership role in this arena.

Qualitative researchers in the next moment will face another struggle, too, around the continuing issue of representation. On the one hand, creating open-ended, problematic, critical, polyphonic texts, given the linearity of written formats and the poststructural problem of the distance between representation and reality(ies), grows more difficult. On the other hand, engaging performative forms of social science can be difficult in many venues. Traditional texts are far more portable,

albeit far less emotionally compelling. Performing social justice, examining ways in which our work can serve social justice, may be the teleological framework for a reimagined social science. Attention to the representations we make, to the possibility that messages may further disenfranchise or oppress (Fine, Weis, Weseen, & Wong, 2000; see also Tedlock, Chapter 18, this volume) when they begin circulating in the wider world, and respect for the wisdom of people who are not like us, who know all too well the unfortunate images that surround their lives, may be the start of our performance of justice. It is a place to begin.

■ NOTES

1. Ivan Brady (2004) makes this point in a recent journal article titled "In Defense of the Sensual," as do Hartnett and Engels in Chapter 41 of this volume: The "unfinalizable" nature of ethnography arises not so much from the problem of unknowables (although they always exist) as it does from the overriding problem of plural "knowabilities" and the frustration that having to choose among them causes. Worse still for the researcher is having someone choose for him or her, some individual or some institution with the power to enforce the choice. See Brady (2004, p. 632).

2. Finkelstein et al. (1998) make the point that public institutions of higher education have diversified more swiftly than have private institutions, likely because of public pressures to do so. This has resulted in the exposure of a broader range of graduate students to diversity, given that public institutions, as a group, typically produce more doctorates than do private institutions in any given period of time.

ABOUT THE EDITORS

Norman K. Denzin is Distinguished Professor of Communications, College of Communications Scholar, and Research Professor of Communications, Sociology, and Humanities at the University of Illinois, Urbana-Champaign. He is the author of numerous books, including *Interpretive Ethnography: Ethnographic Practices for the 21st Century*; *The Cinematic Society: The Voyeur's Gaze*; *Images of Postmodern Society*; *The Research Act: A Theoretical Introduction to Sociological Methods*; *Interpretive Interactionism*; *Hollywood Shot by Shot*; *The Recovering Alcoholic*; and *The Alcoholic Self*, which won the Charles Cooley Award from the Society for the Study of Symbolic Interaction in 1988. In 1997, the Study of Symbolic Interaction presented him the George Herbert Award. He is the editor of the *Sociological Quarterly*, coeditor of *Qualitative Inquiry*, and editor of the book series *Cultural Studies: A Research Annual* and *Studies in Symbolic Interaction*.

Yvonna S. Lincoln is Ruth Harrington Chair of Educational Leadership and Distinguished Professor of Higher Education at Texas A&M University. In addition to this volume, she is coeditor of the first and second editions of the *Handbook of Qualitative Research*, the journal *Qualitative Inquiry* (with Norman K. Denzin), and the Teaching and Learning section of the *American Educational Research Journal* (with Bruce Thompson and Stephanie Knight). She is the coauthor, with Egon Guba, of *Naturalistic Inquiry*, *Effective Evaluation*, and *Fourth Generation Evaluation*, the editor of *Organizational Theory and Inquiry*, and the coeditor of several other books with William G. Tierney and with Norman Denzin. She is the recipient of numerous awards for research and has published journal articles, chapters, and conference papers on higher education, research university libraries, and alternative paradigm inquiry.

ABOUT THE CONTRIBUTORS

Bryant Keith Alexander is Professor in the Department of Communication Studies at California State University, Los Angeles. His research is grounded in the social and performative construction of identity as related to issues of race, culture, and gender and uses qualitative, critical, and performative methodologies, including performative writing, interpretive ethnography, and autoethnography. Most recently, he has turned to cultural geography, studies in which he focuses on the spatial constitution of society through the mediating effects of culture. His essays have appeared in *Qualitative Inquiry*, *Theatre Annual*, *Theatre Topics*, *Callaloo*, and *Text and Performance Quarterly*, among others. He has chapters in *The Image of the Outsider*; *Beacon Best 2000: Best Writing of Men and Women of All Colors*; *Communication, Race, and Family*; and *The Future of Performance Studies*. He is coeditor of the *Performance Theories in Education: Power, Pedagogy, and the Politics of Identity* and serves as the section editor of the forthcoming *Handbook of Performance Studies* (Sage). In 2002, he was honored with the Norman K. Denzin Outstanding Qualitative Research Award from the Carl Couch Center, Department of Communication Studies, University of Northern Iowa for his essay, "(Re)Visioning the Ethnographic Site: Interpretive Ethnography as a Method of Pedagogical Reflexivity and Scholarly Production."

Michael V. Angrosino is Professor of Anthropology at the University of South Florida,

where his research and teaching specializations include mental health policy analysis, the influence of organized religion on contemporary social policy, and the methodology of oral history. He has served as editor of *Human Organization*, the journal of the Society for Applied Anthropology, and as general editor of the Southern Anthropological Society's Proceedings Series for the University of Georgia Press. Among his most recent books are *Opportunity House: Ethnographic Stories of Mental Retardation* (1998), an experiment in alternative ethnographic writing, and *The Culture of the Sacred*, an overview of the anthropology of religion.

Paul Atkinson is Distinguished Research Professor in Sociology at Cardiff University, United Kingdom. He is Associate Director of the ESRC Research Centre on Social and Economic Aspects of Genomics. His main research interests are the sociology of medical knowledge and the development of qualitative research methods. His publications include *Ethnography: Principles in Practice* (with Martyn Hammersley, 1983 and 1995), *The Clinical Experience* (1981 and 1997), *The Ethnographic Imagination* (1990), *Understanding Ethnographic Texts* (1992), *Medical Talk and Medical Work* (1995), *Fighting Familiarity* (with Sara Delamont, 1995), *Making Sense of Qualitative Data* (with Amanda Coffey, 1996), *Sociological Readings and Re-Readings* (1996), and *Interactionism* (with William Housley, 2003). Together with Sara Delamont, he edits the journal

Qualitative Research. He was coeditor of *The Handbook of Ethnography* (2002). His ethnographic study of an international opera company is published as *Everyday Arias: Making Opera Work* (2005). He is an Academician of the Academy for the Learned Societies in the Social Sciences.

Zygmunt Bauman is Professor Emeritus at Leeds and also at the University of Warsaw. Before coming to Leeds in 1972, he was with the University of Warsaw and the University of Tel Aviv. Dr. Bauman has held several visiting professorships and is known throughout the world as one of the 20th century's great social theorists and foremost sociologist of postmodernity. He has published more than 20 books, including *Legislators and Interpreters* (1987), *Modernity and the Holocaust* (1989), *Modernity and Ambivalence* (1991), and *Postmodern Ethics* (1993). In 1990, the year of his retirement, he was awarded the Amalfi European Prize and, in 1998, the Adorno Prize.

John Beverley is Professor and Chair of the Department of Hispanic Languages and Literatures at the University of Pittsburgh, where he has taught for 35 years. He was a founding member and co-coordinator of the Latin American Subaltern Studies Group between 1992 and 2002, the year of its demise. His recent books include *Subalternity and Representation* (1999, 2004), *From Cuba* (Ed., 2003); and *Testimonio: On the Politics of Truth* (2004). He coedits the University of Pittsburgh Press series *Illuminations: Cultural Formations of the Americas*.

Russell Bishop is foundation Professor and Assistant Dean for Māori Education in the School of Education at the University of Waikato, Hamilton, New Zealand. He has taught in secondary schools in New Zealand and the Cook Islands. Prior to his present appointment, he was a senior lecturer in Māori Education at the University of Otago and also Interim Director for Otago University's Teacher Education program. His research experience is in the area of collaborative storying in Māori contexts, having written a book *Collaborative Research Stories: Whakawhanaungatanga* and published

internationally on this topic. His other research interests include strategies for implementing the Treaty of Waitangi in tertiary institutions, intercultural education, and collaborative storying as pedagogy. The latter area is the subject of a book, *Culture Counts: Changing Power Relationships in Classrooms* (coauthored with Ted Glynn, 1999), which demonstrates how the experiences developed from within kaupapa Māori settings, schooling, research, and policy development can be applied to mainstream educational settings. He is currently the project director for a New Zealand Ministry-of-Education-funded research/professional development project that seeks to improve the educational achievement of Māori students in mainstream classrooms.

Ivan Brady is Distinguished Teaching Professor and Chair of Anthropology at the State University of New York at Oswego. A former President of the Society for Humanistic Anthropology and Chair of the Association for Social Anthropology in Oceania, he also served as Book Review Editor of the *American Anthropologist* for seven years. He is the editor or coeditor of several books and dozens of chapters, articles, and reviews. His poetry has appeared in various books and journals, including *Reflections: The Anthropological Muse* (1985); *The American Tradition in Qualitative Research* (2001); *The Qualitative Inquiry Reader* (2002); the *Neuroanthropology Network Newsletter*; *Anthropology and Humanism*; *drunken boat: online journal of the arts*; *Pendulum*; *Cultural Studies* ↔ *Critical Methodologies*; and *Qualitative Inquiry*. His latest book is *The Time at Darwin's Reef: Poetic Explorations in Anthropology and History*.

Kathy Charmaz is Professor of Sociology and Coordinator of the Faculty Writing Program at Sonoma State University in Rohnert Park, California. She assists faculty in writing for publication and leads three faculty seminars on writing. She teaches in the areas of sociological theory, social psychology, qualitative methods, health and illness, and gerontology. In addition to writing numerous chapters and articles, she has written or coedited five books, including *Good Days, Bad Days: The Self in Chronic Illness and Time*, which won awards from the Pacific Sociological Association and the Society for the Study of

Symbolic Interaction. Her recent publications focus on medical sociology, qualitative methods, and social psychology and include a number of articles and chapters on grounded theory. Dr. Charmaz has served as the president of the Pacific Sociological Association, vice-president of the Society for the Study of Symbolic Interaction, and editor of *Symbolic Interaction*. She is the chair-elect of the Medical Sociology Section of the American Sociological Association.

Susan E. Chase is Chair and Associate Professor of Sociology and a cofounder of the Women's Studies Program at the University of Tulsa. She is the author of *Ambiguous Empowerment: The Work Narratives of Women School Superintendents*, which analyzes how women educational leaders narrate their competence and accomplishments on one hand and their experiences of gender and racial discrimination on the other. She also coauthored *Mothers and Children: Feminist Analyses and Personal Narratives* (with Mary Rogers), a synthesis of feminist social science theory and research on mothers, mothering, and motherhood over the last 30 years.

Julianne Cheek is Professor at the University of South Australia in the Division of Health Sciences in Adelaide and Director of Early Career Researcher Development. She is recognized internationally for her expertise in qualitative research in health-related areas. She has attracted funding for many qualitative research projects, with some 19 projects funded in the past four years including five consecutive Australian Research Council grants. She has also attracted large sums of funding for projects related to teaching that have qualitative principles embedded within them. Professor Cheek has published over 60 refereed book chapters and journal articles, many of which explore the application of postmodern and poststructural approaches to health care. Her latest book is *Postmodern and Poststructural Approaches to Nursing Research* (Sage, 2000).

Clifford G. Christians is Research Professor of Communications at the University of Illinois, Urbana-Champaign. He has been a visiting

scholar in philosophical ethics at Princeton University and in social ethics at the University of Chicago, as well as a PEW Fellow in Ethics at Oxford University. He completed the third edition of Rivers and Schramm's *Responsibility in Mass Communication*, has coauthored *Jacques Ellul: Interpretive Essays* with Jay Van Hook, and has written *Teaching Ethics in Journalism Education* with Catherine Covert. He is also the coauthor, with John Ferre and Mark Fackler, of *Good News: Social Ethics and the Press* (1993). His *Media Ethics: Cases and Moral Reasoning* with Kim Rotzoll, Mark Fackler and Kathy McKee is now in its seventh edition (2005). *Communication Ethics and Universal Values*, coauthored with Michael Traber, was published in 1997, and his book with Sharon Bracci, *Moral Engagement in Public Life: Theorists for Contemporary Ethics* appeared in 2002. He has lectured or given academic papers on ethics in Norway, Russia, Finland, France, Belgium, Italy, Netherlands, England, Switzerland, Singapore, Korea, Scotland, Philippines, Slovenia, Canada, Brazil, Mexico, Puerto Rico, Spain, Sweden, Hong Kong, and Taiwan.

Benjamin F. Crabtree, Ph.D., is a medical anthropologist and Professor and Director of Research in the Department of Family Medicine, UMDNJ-Robert Wood Johnson Medical School. He is also Associate Editor for the *Annals of Family Medicine*. As a full-time primary care/health services researcher in family medicine for more than 15 years, Dr. Crabtree has contributed to numerous articles and chapters on both qualitative and quantitative methods, covering topics ranging from time series analysis and log-linear models to in-depth interviews, case study research, and qualitative analysis strategies. Dr. Crabtree is coeditor (with William Miller) of *Doing Qualitative Research*, a Sage book now in its 2nd edition. He has been principal investigator on federally funded grants from the Agency for Healthcare Research and Quality, the National Cancer Institute, and the National Heart, Lung, and Blood Institute. These grants integrate qualitative methods with concepts from complexity science to better understand the differential responses primary care practices have to

interventions and to design strategies for enhancing quality of patient care.

Sara Delamont is Reader in Sociology at Cardiff University, United Kingdom, and an Academician of the Academy for the Learned Societies in the Social Sciences. She was the first woman to be President of the British Education Research Association, and the first woman to be Dean of Social Sciences at Cardiff. Her research interests are educational ethnography, the anthropology of the Mediterranean and Brazil, and gender. Of her twelve published books, the best known is *Interaction in the Classroom* (1976 and 1983), and her favorites are *Knowledgeable Women* (1989) and *Appetities and Identities* (1995). Her most recent books are *Fieldwork in Educational Settings* (2002), *Feminist Sociology* (2003), and *Key Themes in Qualitative Research* (2003), written with Paul Atkinson and Amanda Coffey. She is coeditor of the journal *Qualitative Research* with Paul Atkinson. She is currently doing an ethnography of *capoeira* teaching in the UK.

Greg Dimitriadis is Associate Professor in the Department of Educational Leadership and Policy at the University at Buffalo, the State University of New York. He is the author of *Performing Identity/Performing Culture: Hip Hop as Text, Pedagogy, and Lived Practice; Friendship, Cliques, and Gangs: Young Black Men Coming of Age in Urban America*. He is first co-author, with Cameron McCarthy, of *Reading and Teaching the Postcolonial: From Baldwin to Basquiat and Beyond* and second co-author, with George Kamberelis, of *On Qualitative Inquiry*. Dimitriadis is first coeditor, with Dennis Carlson, of *Promises to Keep: Cultural Studies, Democratic Education, and Public Life*, and second coeditor, with Nadine Dolby and Paul Willis, of *Learning to Labor in New Times*. Dimitriadis has authored the following book: *Urban Youth Culture*. His next edited collection is the second edition of *Race, Identity, and Representation in Education*, coedited with Cameron McCarthy, Warren Crichlow, and Nadine Dolby.

Jamel Donnor is a Ph.D. candidate in the Department of Curriculum and Instruction at the

University of Wisconsin–Madison, majoring in educational communications and technology. His research focuses on examining issues of access to and equity of technology for African American students, critical race theoretical applications to education, and the education of African American male student-athletes.

Jeremy D. Engels is a Ph.D. candidate in the Department of Speech Communication at the University of Illinois, Urbana–Champaign. His research focuses primarily on the construction of national identity in the early American republic, and his political writings have been featured in Urbana–Champaign's independent newspaper, *The Public-I*, and also in the University of Illinois's student newspaper, *The Daily Illini*.

Michelle Fine is a Distinguished Professor of Psychology, Women's Studies, and Urban Education at the Graduate Center of the City University of New York. Committed to participatory action research in schools, prisons, and communities, her writings focus on theoretical questions of social injustice: how people think about unjust distributions of resources and social practices, when they resist, and how such inequities are legitimated. Interested in the combination of quantitative and qualitative methods as well as participatory action designs, her writings encompass questions of epistemology, methodology, and social change. Recent publications include *Echoes: Youth Documenting and Performing the Legacy of Brown v. Board of Education* (Fine, Roberts, Torre and Bloom, Burns, Chajet, and Guishard and Payne, 2004); *Working Method: Social Injustice and Social Research* (Weis and Fine, 2004); *Off White: Essays on Race, Power and Resistance* (Fine, Weis, Powell, Pruitt, and Burns, 2004); *Silenced Voices and Extraordinary Conversations* (Weis and Fine, 2003); *Construction Sites: Excavating Race, Class and Gender with Urban Youth* (Fine and Weis, 2001); *Speedbumps: A Student Friendly Guide to Qualitative Research* (edited with Lois Weis, 2000); and *Changing Minds: A Participatory Action Research Analysis of College in Prison* (2001, with Maria Elena Torre, Kathy Boudin, Iris Bowen, Judith Clark, Donna Hylton, Migdalia Martinez, "Missy," Rosemarie A.

Roberts, Pamela Smart, and Deborah Upegui). She has offered expert testimony in a number of cases involving race, gender, and/or class discrimination.

Susan Finley is Associate Professor of Educational Foundations, Literacy, and Research Methodology at Washington State University, Vancouver. She bases her pedagogy and inquiry in arts-based approaches to understanding social and cultural issues in educational contexts. She is an activist who has implemented educational efforts with street youths and economically poor children, youths, and adults, housed, and unhoused.

Douglas Foley is Professor of Anthropology and of Education at the University of Texas at Austin. He specializes in the anthropology of education, American race relations, and ethnographic field methods. He also served for several years as coeditor of the *International Journal of Qualitative Studies in Education*. He is the author of numerous articles and several ethnographies, including *The Heartland Chronicles*, *Learning Capitalist Culture*, and *From Peones to Politics*.

Andrea Fontana (Ph.D., University of California, San Diego) is Professor of Sociology at the University of Nevada, Las Vegas. He has published articles on aging, leisure, theory, and postmodernism. He is the author of the *Last Frontier: the Social Meaning of Growing Old*, coauthor of *Social Problems and Sociologies of Everyday Life*, and coeditor of *The Existential Self in Society and Postmodernism and Social Inquiry*. He is former president of the Society for the Study of Symbolic Interaction and former editor of the journal *Symbolic Interaction*. Among Fontana's most recent published essays are a deconstruction of the work of the painter Hieronymus Bosch; a performance/play about Farinelli, the castrato; an ethnographic narrative about land speed records at the Bonneville Salt Flats; and a performance based on *Six Feet Under*.

James H. Frey is retired Dean of the College of Liberal Arts and Emeritus Professor of Sociology at the University of Nevada, Las Vegas. He is the founder and past Director of the Center for Survey

Research at UNLV. He is the author of *Survey Research by Telephone* and *How to Conduct Interviews by Telephone and in Person* (with S. Oishi). He has published papers on survey research, group interviewing, sport sociology, deviance, and work in the leisure industry.

Davydd J. Greenwood is the Goldwin Smith Professor of Anthropology and Director of the Institute for European Studies at Cornell University, where he has served as a faculty member since 1970. He has been elected a Corresponding Member of the Spanish Royal Academy of Moral and Political Sciences. He served as the John S. Knight Professor and Director of the Mario Einaudi Center for 10 years and was President of the Association of International Education Administrators. He also has served as a program evaluator for many universities and for the National Foreign Language Center. His work centers on action research, political economy, ethnic conflict, community and regional development, the Spanish Basque Country, Spain's La Mancha region, and the Finger Lakes region of upstate New York, where he carried out a 3-year action research and community development project with communities along the Erie Canal corridor. The author of seven books and numerous articles, his works include *Unrewarding Wealth: The Commercialization and Collapse of Agriculture in a Spanish Basque Town*; *Nature, Culture, and Human History*; *The Taming of Evolution: The Persistence of Non-evolutionary Views in the Study of Humans*; *Las culturas de Fagor*; *Industrial Democracy as Process: Participatory Action Research in the Fagor Cooperative Group of Mondragón*; a collaborative monograph with students, *Teaching Participatory Action Research in the University in Studies in Continuing Education*; and *Introduction to Action Research: Social Research for Social Change* (with Morten Levin). He has edited two books, *Democracy and Difference: A Comparative Study of the Impact of Legal-Administrative Structures on Identity in the United States and Spain* and *Action Research and Rhetoric: The Scandinavian Action Research Development Program*.

Egon G. Guba is Professor Emeritus of Education, Indiana University. He received his Ph.D. from the University of Chicago in quantitative inquiry (education) in 1952, and thereafter served on the faculties of the University of Chicago, the University of Kansas City, the Ohio State University, and Indiana University. For the past 20 years, he has studied paradigms alternative to the received view and has espoused a personal commitment to one of these: constructivism. He is the coauthor of *Effective Evaluation* (1981), *Naturalistic Inquiry* (1985), and *Fourth Generation Evaluation* (1989), all with Yvonna S. Lincoln, and he is editor of *The Paradigm Dialog* (1990), which explores the implications of alternative paradigms for social and educational inquiry. He is the author of more than 150 journal articles and more than 100 conference presentations, many of them concerned with elements of new-paradigm inquiry and methods.

Jaber F. Gubrium is Professor and Chair of Sociology at the University of Missouri, Columbia. His research deals with the narrative organization and ethnography of personal identity, family, the life course, aging, and adaptations to illness. He is the editor of the *Journal of Aging Studies* and author of several monographs, including *Living and Dying at Murray Manor*, *Caretakers*, *Describing Care*, *Oldtimers and Alzheimer's*, *Out of Control*, and *Speaking of Life*. He has recently coedited *Qualitative Research Practice* for Sage and continues to analyze constructions of disability by stroke survivors.

Douglas Harper is Professor and Chair of the Department of Sociology at Duquesne University in Pittsburgh. He has written three ethnographies that rely heavily on photography, the most recent being *Changing Works: Visions of a Lost Agriculture* (2001). He is founding editor of *Visual Sociology*, now published as *Visual Studies*. His current research is on the social life of Italian food (coauthored by Patrizia Faccioli) and on expatriate communities in Hong Kong (coauthored by Caroline Knowles). He continues to refine and develop his use of still photography in sociological studies.

Stephen J. Hartnett is Associate Professor of Speech Communication at the University of Illinois. He is author of *Democratic Dissent & The Cultural Fictions of Antebellum America*, which won the National Communication Association's 2002 Winans and Wichelns Memorial Award for Distinguished Scholarship in Rhetoric and Public Address. He is coauthor, with the late Robert James Branham, of *Sweet Freedom's Song: "My Country 'Tis of Thee"* and *Democracy in America*. Based on 12 years of teaching in, writing about, and protesting at prisons across America, in 2003, he published *Incarceration Nation: Investigative Prison Poems of Hope and Terror*. His current projects include *Executing Democracy: Arguing About the Death Penalty in America, 1683–1850* and *The Rhetorics of Globalization and Empire in an Age of Terror*.

Phil Hodgkinson is Professor of Lifelong Learning in the Lifelong Learning Institute of the University of Leeds, England. He has an ongoing interest in research methodology from a broadly hermeneutical and interpretative perspective. He is currently researching learning in workplaces and college settings and learning lives and biographies.

Douglas R. Holmes teaches anthropology at Binghamton University. He has, over the last decade, written about the sociopolitical dynamics and cultural imperatives shaping advanced European integration. His current research examines the complex role of the European Central Bank in fostering economic integration across a rapidly expanding European Union. His collaborative work with George E. Marcus focuses on recasting ethnographic method to addresses the manifold challenges posed by anthropological research within cultures of expertise. He is the author of *Integral Europe: Fast-Capitalism, Multiculturalism, Neofascism and Cultural Disenchantment: Worker Peasantries in Northeast Italy*.

James A. Holstein is Professor of Sociology in the Department of Social and Cultural Sciences at Marquette University. He is the author or editor of

numerous books on qualitative research methods, social problems, deviance, and social control. In collaboration with Jaber F. Gubrium, he has published *The New Language of Qualitative Method*, *The Active Interview*, *Handbook of Interview Research*, *The Self We Live By*, and *Inner Lives and Social Worlds*. Holstein is currently the editor of the journal *Social Problems*.

Stacy Holman Jones is Assistant Professor in the Department of Communication at the University of South Florida. Her work focuses on socially resistive performance practices. She is the author of *Kaleidoscope Notes: Writing Women's Music and Organizational Culture* (1998) and the forthcoming *Music for Torching*.

Ernest R. House (Ed.D., University of Illinois) is Professor Emeritus of Education at the University of Colorado at Boulder and one of the world's leading evaluation experts. From 1969 to 1985, he was a professor of education at the University of Illinois in Urbana. He has been a visiting scholar at UCLA, Harvard, and New Mexico, as well as in England, Australia, Spain, Sweden, Austria, and Chile. His primary interests are evaluation and educational policy analysis. Books include *The Politics of Educational Innovation* (1974), *Survival in the Classroom* (with S. Lapan, 1978), *Evaluating with Validity* (1980), *Jesse Jackson and the Politics of Charisma* (1988), *Professional Evaluation: Social Impact and Political Consequences* (1993), *Schools for Sale* (1998), and *Values in Evaluation and Social Research* (with K. Howe, 1999). His evaluation novel, *Where the Truth Lies*, was published in 1992. He is the 1989 recipient (with W. Madura) of the Harold E. Lasswell Prize in the policy sciences and the 1990 recipient of the Paul F. Lazarsfeld Award for Evaluation Theory, presented by the American Evaluation Association. He has been editor (with R. Wooldridge) of *New Directions in Program Evaluation* (1982–1985), a featured columnist for *Evaluation Practice* (1984–89), and a Fellow at the Center for Advanced Study in the Behavioral Sciences, Stanford (1999–2000). He currently serves as federal court monitor in the bilingual education legal settlement in Denver.

George Kamberelis is Associate Professor in the School of Education at the University at Albany–SUNY. He teaches and conducts research on the history and philosophy of science and social science, qualitative inquiry, social theory, and literacy studies. Professor Kamberelis has published in the areas of qualitative inquiry (especially researcher–research participant relationships), discourse and identity, and genre studies. Some of his recent publications include “Ingestion, Elimination, Sex, and Song: Trickster as Premodern Avatar of Postmodern Research Practice” in *Qualitative Inquiry* and “The Rhizome and the Pack: Liminal Literacy Formations with Political Teeth” in *Space Matters: Assertions of Space in Literacy Practice and Research* (Kevin Leander and Margi Sheehy, editors). With Greg Dimitriadis, Kamberelis has just completed a book titled *On Qualitative Inquiry*.

Stephen Kemmis is Professor of Education, Charles Sturt University, Wagga Wagga, Australia. His research interests include research and evaluation methods in education and the social sciences, participatory action research, communicative evaluation, Indigenous education, university research development, and curriculum theory. His books include *Becoming Critical: Education, Knowledge, and Action Research* (with Wilfred Carr) and *The Action Research Planner* (with Robin McTaggart).

Joe L. Kincheloe is Professor of Education at City University of New York Graduate Center and Brooklyn College. He is Deputy Executive Officer of the Urban Education program at CUNY. He has written books and articles on research, cultural studies, critical education, and cognition, including *The Sign of the Burger: McDonald's and the Culture of Power* and *Kinderculture: The Corporate Construction of Childhood*.

Gloria Ladson-Billings is Professor in the Department of Curriculum and Instruction at the University of Wisconsin–Madison and a Senior Fellow in Urban Education of the Annenberg Institute for School Reform at Brown University. Her primary research interests are in the relationships between culture and school and critical race

theory. She is author of *The Dreamkeepers: Successful Teachers of African-American Children* and is editor of the Teaching, Learning, and Human Development section of the *American Educational Research Journal*.

Morten Levin is Professor in the Department of Industrial Economics and Technology Management at the Norwegian University of Science and Technology in Trondheim, Norway. He holds graduate degrees in engineering and in sociology. Throughout his professional life, he has worked as an action researcher with particular focus on processes and structures of social change in the relationships between technology and organization. The action research has taken place in industrial contexts, in local communities, and in university teaching, where he has developed and been in charge of a number of Ph.D. programs in action research. He is author of a number of books and articles, including *Introduction to Action Research: Social Research for Social Change*, and he serves on the editorial boards of *Systems Practice and Action Research*, *Action Research International*, *Action Research*, *The Handbook of Qualitative Inquiry*, and *The Handbook of Action Research*.

D. Soyini Madison is Associate Professor of Communication Studies in the area of performance studies at the University of North Carolina, Chapel Hill. Madison's Ph.D. from Northwestern University, under the direction of Dwight Conquergood, is one of the first scholarly examinations that focus on the intersections between performance studies and critical ethnography. She is the author of *Critical Ethnography: Methods, Ethics, and Performance* (Sage, 2005) and several articles ranging from film and performance criticism to examinations in critical race and gender studies. Madison is editor of the anthology, *The Woman That I Am: The Literature and Culture of Contemporary Women of Color*. She is a Senior Fulbright Scholar and recently completed a visiting lectureship at the University of Ghana at Legon. Her current project is an examination of staging/performing local debates surrounding human rights and traditional religious practices as these debates are

influenced by the global economy and national development.

George E. Marcus is Joseph Jamail Professor and Chair, Department of Anthropology, Rice University. He is coauthor of *Anthropology as Cultural Critique* and coeditor of *Writing Culture*. In 1998, he published *Ethnography Through Thick & Thin*. Through the 1990s, he created and edited the *Late Editions* series of annuals designed to document the fin-de-siècle in a number of arenas through ethnographic conversations. He is now at work on a memoir of his years supervising dissertations, which he views as a laboratory for the reinvention of anthropological method.

Annette N. Markham is Associate Professor of Communication and Founding Coordinator of the Center for Technology and Learning at the University of the Virgin Islands. Her research focuses on sensemaking practices in technologically mediated environments, ethical practices in qualitative Internet research, interpretive methodology, and organizational communication. Her book *Life Online: Researching Real Experience in Virtual Space* (1998) has been regarded as one of the first in-depth sociological studies of the Net. She has published several chapters and articles related to interpretive qualitative methods in Internet Studies. Her forthcoming edited collection *Qualitative Internet Research: Dialogue Among Scholars* (Sage) focuses on practical and philosophical challenges of conducting research in computer-mediated environments. Since moving to the Caribbean and realizing electricity is not ubiquitous, her research focus is shifting from the ethnographic inquiry of life online to the study of privilege and identity politics offline. Markham received her Ph.D. from Purdue University.

Kathryn Bell McKenzie is Assistant Professor in the Department of Educational Administration and Human Resources at Texas A&M University in College Station. Dr. McKenzie received her Ph.D. in Educational Administration from the University of Texas in Austin. Her research foci include equity and social justice in schools, school leadership, qualitative methodology, and critical white

studies. During her more than 20 years in public education, Dr. McKenzie was a classroom teacher, curriculum specialist, assistant principal, principal, and Deputy Director of the University of Texas at Austin Independent School District Leadership Academy. Her most recent publications include a chapter titled "The Unintended Consequences of the Texas Accountability System" in *Equity and Accountability* (Linda Skrla and James Joseph Scheurich, editors); with James Joseph Scheurich, the article "Equity Traps: A Useful Construct for Preparing Principals to Lead Schools That Are Successful With Racially Diverse Students" in *Educational Administration Quarterly*; an article in *Educational Theory* coauthored with James Joseph Scheurich titled "Corporatizing and Privatizing of Schooling: Critique, Research, and a Call for a Grounded Critical Praxis." Dr. McKenzie is regional editor for North America for the *International Journal of Qualitative Studies in Education*.

Peter McLaren is Professor, Division of Urban Schooling, Graduate School of Education and Information Studies, University of California, Los Angeles. Professor McLaren is the author and editor of over 40 books in a variety of areas that include the political sociology of education, critical pedagogy, and Marxist theory. His most recent books include *Capitalists and Conquerors: Teaching Against Global Capitalism and the New Imperialism* (with Ramin Farahmandpur) and *Red Seminars*. His writings have been published in 15 languages. Professor McLaren is the inaugural recipient of the Paulo Freire Social Justice Award, Chapman University.

Robin McTaggart is Professor and Pro-Vice-Chancellor of Staff Development and Student Affairs at James Cook University, Townsville and Cairns, North Queensland. He is Adjunct Professor in the International Graduate School of Management of the University of South Australia. He was Executive Dean of Law and Education (1998) and Executive Dean of Education and Indigenous Studies (1999) at James Cook University. Before moving to JCU, he was Director of International Programs in the Faculty of Education at Deakin University Geelong and was

Head of the School of Administration and Curriculum Studies at Deakin University from 1993 to 1995. He completed his Ph.D. at the Center for Instructional Research and Curriculum Evaluation at the University of Illinois, where he was a W. F. Connell Scholar. He has conducted evaluation and research studies of action research by educators, discipline-based arts education, arts programs for disadvantaged youth, instructional computing programs for intellectually disabled adults, coeducation and gender equity in private schooling, AIDS/HIV professional development for rural health workers, Aboriginal education in traditionally oriented remote communities, scientific literacies, and distance education provision in technical and further education. He has also conducted participatory action research and evaluation training programs for private and public sector managers, academics, technical and further education and training professionals, educators, educational consultants, and health professionals in Australia, Canada, Hong Kong, Indonesia, Malaysia, New Zealand, Singapore, Thailand, and the United States.

William L. Miller (M.D., M.A.) is a family physician anthropologist and the Leonard Parker Pool Chair of Family Medicine at Lehigh Valley Hospital and Health Network, Allentown, Pennsylvania. He is Professor of Family and Community Medicine, Pennsylvania State University College of Medicine. He is also consulting editor for the *Annals of Family Medicine*. For more than 15 years, Dr. Miller, in collaboration with Benjamin Crabtree, has been working to make qualitative research more accessible to health care researchers. He has written and contributed to book chapters and articles detailing step-by-step applications of qualitative methods and seeks to translate this work into the everyday clinical, educational, and administrative realms of health care. His research interests focus on applying the paradigm of ecological relationship-centeredness and the theory of complex adaptive systems to improving health care at the organizational, office, and encounter levels and co-creating a participatory community of practice-based research.

Much of this work is shared collaboratively with Dr. Crabtree through his federally funded grants.

Virginia L. Olesen, Emerita Professor of Sociology in the Department of Social and Behavioral Sciences at the University of California, continues to explore and write on critical issues in qualitative methods, women's health, feminist thought, sociology of emotions, and globalization. She is coeditor, with Sheryl Ruzek and Adele Clarke, of *Women's Health: Complexities and Diversities* (1997) and, with Adele Clarke, of *Revisioning Women, Health and Healing: Feminist, Cultural and Technoscience Perspectives* (1999). She is currently working on issues of skepticism in qualitative research and the problems of "the third voice" constituted between and among researchers.

Anssi Peräkylä is Professor of Sociology at the University of Helsinki. His research interests include medical communication, psychotherapy, emotional communication, and conversation analysis. He has published *AIDS Counselling* (1995) and articles on interaction in institutional settings in journals such as *Sociology*, *Social Psychology Quarterly*, *British Journal of Social Psychology*, and *Research on Language and Social Interaction*.

Ken Plummer is Professor in Sociology at the University of Essex in the United Kingdom and is a regular visitor at the University of California at Santa Barbara. He has written or edited some ten books and a hundred articles including *Intimate Citizenship* (2003), *Documents of Life-2* (2001), *Telling Sexual Stories* (1995), and *Sexual Stigma* (1975). In 2001, he was the first recipient of the American Sociological Association Gagnon and Simon Award for outstanding contributions to the study of sexualities. He is the founding editor of the journal *Sexualities*.

Laurel Richardson is Professor Emeritus of Sociology and Visiting Professor of Cultural Studies in Education at the Ohio State University. She is the author of more than one hundred articles. She has pioneered work on gender, poststructuralist theory, and alternative representations in qualitative research. Her book, *Fields of Play:*

Constructing an Academic Life (1997) was honored with the Society for the Study of Symbolic Interaction's Cooley Award. Her most recent book, *Travels With Ernest: Crossing the Literary/Sociological Divide* (2004) is an experimental writing project coauthored with her husband, the novelist Ernest Lockridge.

Paula Saukko, Ph.D., is a Research Fellow at the ESRC-Centre for Genomics in Society (Egenis) in the School of Historical, Political, and Sociological Studies at the University of Exeter and an Honorary Research Fellow at the Peninsula Medical School, both in the United Kingdom. Her research interests are qualitative methodology and cultural studies of science and medicine, and her topical projects have focused on genetic testing for common illnesses and discourses of eating disorders. She is the author of *Doing Research in Cultural Studies: An Introduction to Classical and Contemporary Methodological Approaches* (Sage, 2003). She is also coeditor (with L. Reed) of *Governing the Female Body: Gender, Health, and Networks of Power* (forthcoming) and coeditor (with C. McCarthy et al.) of *Sound Identities* (1999). She is a member of the editorial boards of *Cultural Studies/Critical Methodologies* and *Kulttuuritutkimus* and is currently writing a book on lived, social and historical dimensions of diagnostic discourses on anorexia.

James Joseph Scheurich received his Ph.D. from Ohio State University, spent 12 years as an assistant and associate professor at the University of Texas at Austin, and is now Professor and Head of the Department of Educational Administration and Human Resource Development at Texas A&M University. He has published five books, including *Anti-Racist Scholarship: An Advocacy, Research Methods in the Postmodern*, and *Leadership for Equity and Excellence* (the latter with Linda Skria as coauthor), as well as numerous peer-reviewed articles, monographs, chapters, book reviews, and newspaper editorials. He is the coauthor, with Miguel Guajardo, Patricia Sanchez, and Elissa Fineman, of a video documentary called *The Labors of Life/Labores de la Vida*. He currently serves on the American Educational Research

Association's (AERA) Publications Committee. He is currently coeditor, with Carolyn Clark, of the *International Journal of Qualitative Studies in Education* and serves on the editorial board for several other journals. He has successfully chaired nearly 25 dissertations and has had 18 of his students become university professors. Finally, he has authored or coauthored over \$3 million in grants and contracts.

John K. Smith is Professor of Education at the University of Northern Iowa. For the past 20 years, his interests have centered on the philosophy of social and educational inquiry, with a special emphasis on the issue of criteria. His work has appeared in such journals as the *Educational Researcher*, *Journal of Educational Administration*, and *Educational Analysis and Policy Analysis*. He also has authored two books: *The Nature of Social and Educational Inquiry* and *After the Demise of Empiricism*.

Linda Tuhiwai Smith is Professor of Education at the University of Auckland. She is Joint Director of Nga Pae o te Maramatanga The National Institute for Research Excellence in Māori Development and Advancement, a center of research excellence hosted by the University of Auckland. Dr. Smith is a leading Māori and indigenous educationist and is well sought after as a speaker and commentator. Her work is recognized internationally through her book *Decolonising Methodologies: Research and Indigenous Peoples*. She has also published research on the history of Māori schools, Māori women and education, and other social justice themes.

Elizabeth Adams St. Pierre is Associate Professor of Language Education and Affiliated Professor of both the Qualitative Research Program and the Women's Studies Institute at the University of Georgia. Her research interests focus on the work of language in the construction of subjectivity, on a critique of conventional qualitative inquiry, and on language and literacy studies. Recent published works include articles in *Qualitative Inquiry* and *Educational Researcher*, as well as chapters in *Dangerous Coagulations*

(B. Baker and K. Heyning, Editors, 2004) and *Feminist Engagements* (K. Weiler, Editor, 2001). She is coeditor with W. S. Pillow of *Working the Ruins: Feminist Poststructural Theory and Methods in Education* (2000).

Robert E. Stake is Emeritus Professor of Education and Director of the Center for Instructional Research and Curriculum Evaluation at the University of Illinois. Since 1963, he has been a specialist in the evaluation of educational programs. Among the evaluative studies he directed were works in science and mathematics in elementary and secondary schools, model programs and conventional teaching of the arts in schools, development of teaching with sensitivity to gender equity, education of teachers for the deaf and for youth in transition from school to work settings, environmental education and special programs for gifted students, and the reform of urban education. Stake has authored *Quieting Reform*, a book on Charles Murray's evaluation of Cities-in-Schools; two books on methodology, *Evaluating the Arts in Education* and *The Art of Case Study Research*; and *Custom and Cherishing*, and a book with Liora Bresler and Linda Mabry on teaching the arts in ordinary elementary school classrooms in America. Recently he led a multiyear evaluation study of the Chicago Teachers Academy for Mathematics and Science. For his evaluation work, in 1988, he received the Lazarsfeld Award from the American Evaluation Association and, in 1994, an honorary doctorate from the University of Uppsala.

Kathleen Stewart teaches anthropology and is Director of the Center for Cultural Studies at the University of Texas, Austin. She has done ethnographic fieldwork in West Virginia, Las Vegas, Orange County, California, New England, and Texas. Her first book, *A Space on the Side of the Road: Cultural Poetics in an "Other" America* (1996), was recognized by both the Victor Turner Prize and the Chicago Folklore Prize. Her second book is forthcoming and titled *Ordinary Impacts: the Affective Life of U.S. Public Culture*. She has also written about nostalgia, conspiracy theory, apocalyptic thinking, daydreams, country music,

trauma, and the pitfalls of the American dream. Her work has been performed in plays and has been supported by the Rockefeller Foundation, the National Endowment for the Humanities, the School of American Research, and the Institute for the Humanities, University of California, Irvine as well as by the University of Texas.

Barbara Tedlock is Distinguished Professor of Anthropology at the State University of New York at Buffalo. She served as editor-in-chief of the *American Anthropologist* (1993–1998). Her honors include the 1997 President's Award for distinctive leadership in forging a new vision for the flagship journal of the American Anthropological Association, the *American Anthropologist*, and for dedication and commitment to the profession of anthropology. She also received the 2002 Chancellor's Research Recognition Award for "Overall Excellence of Research in the Social Sciences," given by the Chancellor of the State University of New York. She is a former President of the Society for Humanistic Anthropology and a member of PEN (Poets-Essayists-Novelists). Her publications include six books and more than 100 articles and essays.

Angela Valenzuela is Associate Professor in the Department of Curriculum and Instruction at the University of Texas at Austin and also the Center for Mexican American Studies. She is author of

Subtractive Schooling: U.S. Mexican Youth and the Politics of Caring, winner of both the 2000 American Educational Research Association Outstanding Book Award and the 2001 Critics' Choice Award from the American Educational Studies Association. She is also the editor of *Leaving Children Behind: How Texas-Style Accountability Fails Latino Youth*. Her research interests are in the areas of urban education, race relations, high-stakes testing, and Latino education policy. Much of her current policy work stems from her position as Chair of the Education Committee for the Texas League of United Latin American Citizens (LULAC), the nation's oldest Mexican American civil rights organization.

Lois Weis is Professor of Sociology of Education at the University of Buffalo, State University of New York. She is the author or coauthor of numerous books and articles pertaining to social class, race, gender, and schooling in the United States. Her most recent books include *Class Reunion: The Remaking of the American White Working Class* (2004), *Working Method* (with Michelle Fine, 2004), and *Silenced Voices and Extraordinary Conversations: Re-Imagining Schools* (with Michelle Fine, 2003). She sits on numerous editorial boards and is the editor of the Power, Social Identity, and Education book series with SUNY Press.

The **SAGE Handbook of Qualitative Research, Third Edition**, represents the state of art for the theory and practice of qualitative inquiry. Built on the foundations of the landmark first and second editions (1994, 2000), the **Third Edition** moves qualitative research boldly into the 21st century. The editors and authors ask how the practices of qualitative inquiry can be used to address issues of social justice in this new century.

As with the second edition, the **Third Edition** represents a virtually new handbook. There are 14 totally new topics not touched upon in previous editions, including, among others, indigenous research, institutional review boards and human subject research, critical and performance ethnography, arts-based inquiry, narrative inquiry, Foucault, the ethics and strategies of online research, cultural and investigative poetics, and the politics of evaluation. Over half of the 45 chapters are written by authors new to the **Handbook**. Returning authors have thoroughly revised and updated their chapters. The organization is clear and sensible, moving from the general to the specific and from the past to the present and the future.

The SAGE Handbook of Qualitative Research is far-reaching and comprehensive, featuring a "who's who" in the human sciences. It is an absolutely essential text for any scholar interested in the art, science, and practice of qualitative research, as well as a critical resource for all academic and public libraries.

Praise for Previous Editions

"This book is a must for anyone teaching, or wishing to better understand, qualitative research. This handbook is destined to be a classic text in the field of qualitative research that belongs on every student's and researcher's bookshelf."

—HARVARD EDUCATIONAL REVIEW

"This may well be 'the one book on qualitative research' that one would want to take 'to a desert island,' as the editors hope."

—JOURNAL OF CONTEMPORARY ETHNOGRAPHY
