

Traveling like in the Star Trek

Imagine a world where you're just one touch away from visiting your friend at any time or any place. You'd never be too far. Along with that, you'd be able to travel around the world (even the universe) much faster and fulfill your dreams. All you need is to wish for it. And of course, pay for it.

As a fan of sci-fi movies, I've always admired the possibility of teleportation. Specifically, in the Star Trek series, the teleport is regularly used and fully functional. In ^{the} real world, that would be much more complicated. Nowadays, ~~the~~ research is being carried out; furthermore, the first experiments with quantum particles ^{have been} ~~were~~ successful. However, there are many problems, e.g. teleported particles are identical, yet they are only copies of the original.

Present perfect!
non-specific time... before now

Let's look at the use of teleportation. If you'd be wealthy enough, you could afford your own teleporting machine as big as a phone booth at home. As for ordinary people, there could be a public network of teleporting stations, such as rail or bus infrastructure nowadays. Not only could you teleport yourself, but you could also send shipments much faster and more securely than by mail. That sounds great, doesn't it?

In my opinion, ^{the} future has a lot of amazing inventions in store for us. I'm really looking forward to many them. Surely, everything might be misused, and we should be aware of it. However, I believe that teleport ^{can} serve us well. / The process: "teleportation"

Good intro.

Good body P2 science
P3 effects

good language

Thanks -
